Preface to the Annotations	x
Preface to the First Edition of ‘Capital’	xiii
Postface to the Second Edition	xxii
I. Commodities and Money	1
1. The Commodity	2
1.1. Use-Value and Value	2
1.1.a. [The Commodity as Natural Object and Use-Value]	3
1.1.b. [From Exchange-Value to Value]	21
1.1.c. [From Value to Labor]	31
1.1.d. [The Quantity of Value and Individual Differences]	43
1.2. Double Character of Labor	58
1.2.a. [A Closer Look at Useful Labor]	59
1.2.b. [Labor Producing Value: Quality]	67
1.2.c. [Labor Producing Value: Quantity]	77
1.3. Form of Value	83
1.3.A. Simple, Isolated, or Accidental Form of Value	95
1.3.B. The Total or Expanded Form of Value	155
1.3.C. General Form of Value	163
1.3.D. Money Form	174
1.4. Fetish-Like Character and its Secret	178
1.4.a. [Exactly Which Aspects of the Commodity are Mysterious?]	179
1.4.b. [The Secret of the Fetish-Like Character]	196
1.4.c. [The Necessity of Bourgeois Political Economy]	204
1.4.d. [Examples of Non-Commodity Societies and Role of Religion] . . .	215
1.4.e. [The Fetishism of Bourgeois Political Economy]	227

Contents

2. Exchange Process	240
2.1. [Prerequisites of Commodity Production]	241
2.2. [Dilemmas of Barter]	247
2.2.a. [Commodity Versus Owner]	248
2.2.b. [Use-Value Depends on Exchange-Value and Vice Versa]	251
2.2.c. [Contradiction Between Social and Individual Aspect]	252
2.2.d. [More Specific Formulation of the Contradiction]	254
2.2.e. [The Deed]	255
2.3. [History of Commodity]	256
2.4. [Ideologies]	265
3. Money or the Circulation of Commodities	275
3.1. Measure of Value	276
3.1.a. [First Function of Gold: Measure of Value]	278
3.1.b. [Exchange-Value Becomes Price]	281
3.1.c. [Commodity Prices and the Value of Gold]	285
3.1.d. [Standard of Prices]	288
3.1.e. [Complementarity and Conflict between Measure of Values and Stan- dard of Prices]	290
3.1.f. [Separation of Money Names from Weight Names]	293
3.1.g. [Incongruities between Value and Price]	298
3.1.h. [From Measure of Value to Means of Circulation]	302
3.2. Means of Circulation	305
3.2.a. The Metamorphosis of Commodities	305
3.2.b. The Flow of Money	335
3.2.c. Coins and Symbols of Value	357
3.3. Money	369
3.3.a. Hoarding	371
3.3.b. Means of Payment	382
3.3.c. World Money	398
II. The Transformation of Money into Capital	408
4. General Formula of Capital	410
4.1. [M–C–M: Acts in Circulation and Motivation of the Agents]	413
4.1.a. [Description of M–C–M]	414
4.1.b. [What M–C–M and C–M–C Have in Common]	416
4.1.c. [How M–C–M and C–M–C Differ]	417
4.1.d. [Purposes of C–M–C and M–C–M]	422
4.1.e. [The Social Content Behind C–M–C and M–C–M]	422

4.2.	[The Definition of Capital]	424
4.2.a.	[Not $M-C-M$ but $M-C-M'$]	424
4.2.b.	[$C-M-C$ and $M-C-M'$ as Ongoing Processes]	427
4.2.c.	[Digression: The Curse of Money]	428
4.2.d.	[The Measure of $M-C-M'$]	430
4.3.	[The Capitalist]	433
4.4.	[Capital as Self-Expanding Value]	436
4.4.a.	[Capital as Value in Motion]	436
4.4.b.	[Money: Point of Reference in the Movement of Capital]	439
4.4.c.	[Capital as Self-Referencing Value]	440
4.4.d.	[$M-C-M'$ and Other Forms of Capital]	441
5.	Contradictions of $M-C-M$	443
5.1.	[Creation of Surplus-Value in Circulation]	446
5.1.a.	[Exchange of Equivalents]	446
5.1.b.	[Exchange of Nonequivalents]	454
5.1.c.	[Methodological Remark]	462
5.2.	[Surplus-Value Outside Circulation]	465
5.3.	[Both in and outside Circulation]	466
6.	Sale and Purchase of Labor-Power	470
6.1.	[How to Achieve $M-C-M'$?]	470
6.2.	[Labor-Power as a Commodity]	472
6.3.	[History and Economy]	478
6.4.	[Value of Labor-Power]	482
6.5.	[The Worker as Creditor]	490
6.6.	[From Circulation to Production]	494
III.	The Production of Absolute Surplus-Value	498
7.	Labor Process and Valorization Process	499
7.1.	Labor Process	499
7.1.a.	[The General Nature of Labor, Independently of its Social Form]	500
7.1.b.	[The Product]	509
7.1.c.	[The Capitalist's Role in the Production of <i>Use-Values</i>]	516
7.2.	Valorization Process	521
7.2.a.	[Creation of Value]	522
7.2.b.	[Creation of Surplus-Value]	530
7.2.c.	[Differences and Similarities]	540
7.2.d.	[Simple and Complicated Labor]	545

8.	Constant Capital and Variable Capital	550
9.	The Rate of Surplus-Value	575
9.1.	The Degree of Exploitation of Labor-Power	575
9.1.a.	[Rate of Surplus-Value]	575
9.1.b.	[Rate of Exploitation]	583
9.1.c.	[Rate of Surplus-Value Expresses Rate of Exploitation]	587
9.1.d.	[Example]	589
9.2.	Representation of Value of Product	593
9.3.	Senior's 'Last Hour'	598
9.4.	The Surplus Product	607
10.	The Working-Day	610
10.1.	Limits of Working-Day	610
10.1.a.	[Indeterminacy of the Working-Day]	610
10.1.b.	[Inherent Limits of Surplus Labor]	612
10.1.c.	[Point of view of the Capitalist]	616
10.1.d.	[Point of view of the Worker]	619
10.1.e.	[Conclusion: Right Against Right]	623
10.2.	Manufacturer and Boyard	624
10.3.	Branches With No Legal Bounds to Exploitation	640
10.4.	Day and Night Work. Relais System	663
10.5.	Compulsory Laws for Extension of Working-Day	678
10.5.a.	[What is a working-day?]	678
10.5.b.	[Legislation Extending the working-day]	692
10.6.	Limitation by Law of the Working Time. Factory Acts 1833–64	705
10.6.a.	[Industrial Revolution Overturns all Limits of Working-Day]	705
10.6.b.	[The Factory Act of 1833]	708
10.6.c.	[Efforts to Prevent and Circumvent the 1833 Law]	710
10.6.d.	[The Additional Factory Act from 1844]	712
10.6.e.	[Failed Attempts to Prevent the 1848 Ten-Hour Law]	716
10.6.f.	[Victorious Revolt of Capital against 10 Hours Bill]	720
10.6.g.	[Growing Resistance of the Proletariat]	732
10.6.h.	[“Wonderful Development” 1853–1860]	737
10.7.	Effect of English Factory Acts on Other Countries	743

IV.	The Production of Relative Surplus-Value	755
------------	---	------------

12. Concept of Relative Surplus-Value	756
12.1. [Introduction]	756
12.2. [Productivity]	764
12.3. [Individual Motivation]	767
12.4. [Value and Productivity]	777
13. Co-Operation	782
13.1. [Changes in the Capitalist Production Process which Precede The Specific Capitalist Mode of Production]	782
13.1.a. [Implications of the Employment of Many Laborers by the Same Capital]	782
13.1.b. [Effects of Employing Many Workers on the Same Premises]	789
13.2. [Simple Co-Operation]	792
13.2.a. [Stimulation of Animal Spirits]	794
13.2.b. [Implicit Division of Labor in Simple Co-Operation]	795
13.2.c. [Simple Co-Operation Can Lead to Division of Labor]	797
13.2.d. [Concentration in Time]	798
13.2.e. [Spatial Extension and Contraction of Arena]	799
13.2.f. [Summary: Social Productive Powers of Labor]	800
13.3. [The Capitalist Character of Co-operation]	801
13.3.a. [Minimum Size of Capital Determined by Technology]	802
13.3.b. [Capitalist becomes Supervisor in Co-Operation]	804
13.3.c. [The Social Productive Powers of Labor Belong to Capital]	809
13.4. [Historical Overview of Simple Co-Operation]	810
14. Division of Labor and Manufacture	817
14.1. Two-Fold Origin of Manufacture	817
14.2. The Specialized Worker and His Tools	823
14.3. Heterogeneous and Organic Manufacture	829
14.3.a. [Two Forms of Manufacture]	829
14.3.b. [The Basic Contradiction of Manufacture]	833
14.3.c. [Rebound effect of the System of Manufacture on the Laborer and his Instrument]	840
14.4. Division of Labor in Manufacture and in Society	846
14.4.a. [Communalities between Division of Labor in Society and in Manufacture]	847
14.4.b. [Connections between Division of Labor in Society and in Manufacture]	851
14.4.c. [Essential Differences between Division of Labor in Society and in Manufacture]	853
14.4.d. [Capitalist versus Pre-Capitalist Division of Labor]	857

14.5. The Capitalist Character of Manufacture	862
14.5.a. [Changes in the Capital-Labor Relations]	862
14.5.b. [Changes Imposed on the Individual Laborer by the Division of Labor]	865
14.5.c. [Division of Labor as a Means of Exploitation]	871
14.5.d. [Limitations of Division of Labor from Point of View of Capital]	877
15. Machinery and Modern Industry	881
15.1. The Development of Machinery	881
15.1.a. [Difference between Tool and Machine]	883
15.1.b. [The real definition of machinery]	887
15.1.c. [From the Individual Machine to the Machine System]	894
15.1.d. [The Machine System]	899
15.1.e. [Development of Industries Producing Machines, Demand for Machines, Transportation and Communication]	906
15.2. The Value Transferred by the Machinery to the Product	915
15.3. Proximate Effects of Machinery on the Worker	931
15.3.a. Employment of Women and Children	931
15.3.b. Prolongation of the Working-Day.	945
15.3.c. Intensification of Labor	957

V. The Production of Absolute and of Relative Surplus-Value 974

16. Absolute and Relative Surplus-Value	976
16.1. [The Specifically Capitalist Mode of Production]	976
16.1.a. [Extension and Narrowing of the Notion of Productive Labor]	976
16.1.b. [The Dialectic of Absolute and Relative Surplus-Value]	980
16.2. [Natural basis of surplus-value and capitalism]	984
16.2.a. [Link between Exploitation and the Productivity of Labor]	984
16.3. [Critique of John Stuart Mill]	992
17. Changes in Price of Labor-Power and Surplus-Value	998
I. Length and Intensity Constant, Productivity Variable	1001
I.a. [First Law: Total Value Created is Constant]	1001
I.b. [Second Law: Increases in Productivity lead to Increases in Surplus-value]	1002
I.c. [Third Law: Causality from Productivity to Surplus-Value]	1008
I.d. [A rise in the workers' consumption]	1010
I.e. [Ricardo]	1013
II. Length and Productivity Constant, Intensity Variable	1014
III. Productivity and Intensity Constant, Length Variable	1017

33. The Modern Theory of Colonization	1299

Preface to the Annotations

These Annotations discuss Marx's *Capital* paragraph by paragraph and, if necessary, sentence by sentence. They consist of a new translation of Marx's text, printed in parallel with the German, interspersed with comments. These comments try to make the micro-logical development of Marx's argument explicit, including those steps which Marx himself only indicated through his terminology, or which he took for granted and did not think he had to explain, or about which Marx was silent at this point for other reasons.

This interpretation of Marx is deeply indebted to Critical Realism, a philosophical current founded by Roy Bhaskar which, in my view, is the best systematic development of Marx's methodology available today. Critical Realism arose from modern philosophical critiques of positivism, and furnishes a derivation from first principles of many themes that are present in Marx's reasoning, but which are rarely explained by Marx himself.

Marx himself used a method inspired by Hegel, in which he tried to sink his thoughts into the subject-matter so deeply that he could see the subject-matter not from the point of view of a consciousness alien to the subject-matter but through its own logic. His derivations look therefore like a priori constructions but they are not; he is attuned to the subject matter in such a way that the inner logic of the environment in which Marx has immersed himself, shows itself as his spontaneous thinking. This can be justified by the fact that capitalism is the society which we reproduce every day with our own actions; therefore an intelligent introspection of our own acts should help us understand the structure of this society. Critical realism does not require this immersion; its frame of reference creates a scaffolding which allows us to see the structure of the society from the outside. This outside view makes all those things explicit which Marx himself, in his state of immersion, left implicit—but which nevertheless directed his thinking. The explanations given in these Annotations are not always identical to Marx's own explanations but I hope to show that they can nevertheless make sense of Marx's development at every step. I see my work not as a re-interpretation of Marx in Critical Realist terms, but I am trying to use Critical Realism to pull Marx's intuitions and thought processes out into the open. It is a more pedestrian approach than Marx's own, it is walking up the stairs of a well-organized scaffolding rather than climbing the rock itself. I hope this scaffolding can be traveled by many and therefore allows discussion at a level which was formerly inaccessible.

In keeping with their purpose making Marx more accessible, these Annotations are written for everyone, whether lay person or expert, who is interested in understanding Marx's *Capital*. Marx's *Capital* is an important but difficult philosophical work. A modern reader who is trying to work through it alone is likely to miss important aspects of it. The reading

of *Capital* has to be taught. On the other hand, anyone making the effort to understand how Marx argues in *Capital*, acquires tools which also allow a better understanding of modern capitalist society itself.

My interpretation of Marx is limited by the fact that I do not have a full understanding of Hegel's framework or, what would be necessary here, of Marx's view of Hegel's framework. Therefore I am still groping when I am talking about Hegelian concepts themselves, and any help by better experts than I will be appreciated.

These Annotations are freely available as pdf files. In their electronic version they contain thousands of live links which enable the reader to quickly switch from one part of the text to related passages elsewhere. They are part of a collection of pdf files with annotations to other economic writings of Marx. The comparison of different versions of the same argument is often useful for a better understanding of the argument itself. This collection also includes a glossary, which gives an overview how certain philosophical terms are used by Marx, and which I hope will help in the difficult task of translating Marx. Again, this glossary takes full advantage of the capability of the pdf readers to follow live links.

A special version of these Annotations is used as textbook for an on-line class which I regularly teach at the University of Utah. This class edition only uses excerpts of the full text, but has hundreds of study questions and additional material added. I owe thanks to the students in these classes, whose insights and also misunderstandings have helped me to refine my interpretation of Marx's text.

Page references to *Capital* refer to the Vintage resp. Penguin edition [Mar76]. The German text also displays the corresponding page number in the German Marx Engels Werke [Mar62], which is a reprint of the Fourth German edition. Karl Dietz Verlag gave me kind permission to use the page numbers and the translations of the footnotes from MEW. Along with the page numbers, also a count of the paragraphs is given. *Capital I*, 164:3/o means: the third paragraph starting on p. 164 in the Vintage edition. The "/o" indicates that this paragraph is going over to the next page.

Grundrisse, 94:1 denotes a passage in *Grundrisse*, Marx's first draft of *Capital*, which is reproduced in Volumes 28 and 29 of the *Marx Engels Collected Works* [Mar86] and [Mar87b], and which is also separately available in a Vintage/Penguin edition [Mar73]. This latter page number is the one used here, and the German page numbers come from [Mar74]. I also often refer to Marx's *Contribution to the Critique of Political Economy*, which is an earlier published version of the first part of *Capital I*. The English page numbers come from Volume 29 of the *Collected Works* [Mar87b], and the German page numbers from [Mar71].

Here are some of the other sources used: Marx's manuscript *Results of the Immediate Process of Production* is referred to in the translation included as appendix to the Vintage edition of *Capital I* [Mar76]. Sometimes I also refer to the French translation of *Capital*, which was done under Marx's close supervision, and about which Marx commented in the preface of *Capital I*, 105:3, that certain passages were clearer than the German. I have been using the MEGA edition [Mar89]. I am also using MEGA for the German text of the first edition [Mar83].

These Annotations here are one of a collection of interlinked pdf files; an overview of the other files is available in [overview.pdf](#).

The new translation contained in these Annotations has the purpose to make the precise meaning of Marx's text better intelligible to the English-speaking audience. I consulted the translations in [Mar76], [Mar70], and also the excellent translation [Mar30]. I did not try to reproduce all ambiguities of the German text. If the German can be understood in two different ways, and interpretation *a* is, in my view, clearly right while interpretation *b* is wrong, then my translation will only try to bring out interpretation *a*. Notes about the translations are typeset in small print in three columns.

In the translation, I sometimes translated Marx's examples in British currency into a decimal currency (dollars), at the exchange rate £1=\$4.80. £1 consists of 20 shillings, therefore 1 shilling=24 cents, and 1 shilling consists of 12 pence, therefore 1 penny=2 cents.

For the sake of this commentary, some chapters are divided into more sections and sub-sections than the division made by Marx himself. The newly introduced subtitles are given in square brackets.

These Annotations are under constant revision, but you will always find the current up-to-date version at the web site of the Economics Department of the University of Utah <http://www.econ.utah.edu/ehrbar/akmc.htm>. Hans is committed to keeping this work freely available and eventually the L^AT_EX source code will also be published.

Preface to the First Edition of ‘Capital’

This is the text of the preface to the first edition as it was included in the fourth edition. The original text of the first edition is available as a separate file *first.pdf*.

This preface begins with a few remarks about the connection between *Capital* and Marx’s earlier work *A Contribution to the Critique of Political Economy* (which is also included in this collection as a separate file *akmcq.pdf*).

89:1 This work, whose first volume I now submit to the public, forms the continuation of my book *Zur Kritik der Politischen Oekonomie*, published in 1859. The long pause between the first part and the continuation is due to an illness of many years’ duration, which interrupted my work again and again.

89:2 The substance of that earlier work is summarized in the first chapter of this volume. This is done not merely for the sake of connectedness and completeness. The presentation is improved. As far as circumstances in any way permit, many points only hinted at in the earlier book are here worked out more fully, while, conversely, points worked out fully there are only touched upon in this volume. The sections on the history of the theories of value and of money are now, of course, left out altogether. However, the reader of the earlier work will find new sources relating to the history of those theories in the notes to the first chapter.

Next come some interesting methodological remarks.

89:3/o Beginnings are always difficult in all sciences. The understanding of the first chapter, especially the section that contains

11:1 Das Werk, dessen ersten Band ich dem Publikum übergebe, bildet die Fortsetzung meiner 1859 veröffentlichten Schrift: „Zur Kritik der Politischen Oekonomie“. Die lange Pause zwischen Anfang und Fortsetzung ist einer langjährigen Krankheit geschuldet, die meine Arbeit wieder und wieder unterbrach.

11:2 Der Inhalt jener früheren Schrift ist resümiert im ersten Kapitel dieses Bandes. Es geschah dies nicht nur des Zusammenhangs und der Vollständigkeit wegen. Die Darstellung ist verbessert. Soweit es der Sachverhalt irgendwie erlaubte, sind viele früher nur angedeuteten Punkte hier weiter entwickelt, während umgekehrt dort ausführlich Entwickeltes hier nur angedeutet wird. Die Abschnitte über die Geschichte der Wert- und Geldtheorie fallen jetzt natürlich ganz weg. Jedoch findet der Leser der früheren Schrift in den Noten zum ersten Kapitel neue Quellen zur Geschichte jener Theorie eröffnet.

11:3/o Aller Anfang ist schwer, gilt in jeder Wissenschaft. Das Verständnis des ersten Kapitels, namentlich des Abschnitts,

Preface to the First Edition of ‘Capital’

the analysis of commodities, will therefore present the greatest difficulty. I have popularized the passages concerning the substance of value and the magnitude of value as much as possible.¹

¹ This seems the more necessary, in that even the section of Ferdinand Lassalle’s work against Schulze-Delitzsch in which he professes to give ‘the intellectual quintessence’ of my explanations on these matters contains important mistakes. If Ferdinand Lassalle has borrowed almost literally from my writings, and without any acknowledgement, all the general theoretical propositions in his economic works, for example those on the historical character of capital, on the connection between the relations of production and the mode of production, etc., etc., even down to the terminology created by me, this may perhaps be due to purposes of propaganda. I am of course not speaking here of his detailed working-out and application of these propositions, which I have nothing to do with.

After this, the foreword to the first edition 11:3/o says that especially the analysis of the form of value in the first edition was difficult to understand, because Marx had made the dialectic much “sharper” than in *Contribution*. Therefore the first edition contained a special appendix in which this analysis was explained in a simpler and even textbook-like (schulmeisterlich) manner. Beginning with the second edition, this appendix was worked into the main text, therefore the passage in the foreword explaining this appendix was omitted. Despite the reworking of this passage, it seems that Marx considered the analysis of the form of value, i.e., Section 1.3, to be the most difficult, because the most abstract, part of the book.

The value-form, whose fully developed shape is the money-form, is very simple and slight in content. Nevertheless, the human mind has sought in vain for more than 2,000 years to get to the bottom of it, while on the other hand there has been at least an approximation to a successful analysis of forms which are much richer in content and more complex. Why? Because the complete body is easier to study than its cells.

This is an explanation why he begins with the commodity.

der die Analyse der Ware enthält, wird daher die meiste Schwierigkeit machen. Was nun näher die Analyse der Werts substanz und der Wertgröße betrifft, so habe ich sie möglichst popularisiert.¹

¹ Es schien dies um so nötiger, als selbst der Abschnitt von F. Lassalles Schrift gegen Schulze-Delitzsch, worin er „die geistige Quintessenz“ meiner Entwicklung über jene Themata zu geben erklärt, bedeutende Mißverständnisse enthält. En passant. Wenn F. Lassalle die sämtlichen allgemeinen theoretischen Sätze seiner ökonomischen Arbeiten, z.B. über den historischen Charakter des Kapitals, über den Zusammenhang zwischen Produktionsverhältnissen und Produktionsweise usw. usw. fast wörtlich, bis auf die von mir geschaffene Terminologie hinab, aus meinen Schriften entlehnt hat, und zwar ohne Quellenangabe, so war dies Verfahren wohl durch Propagandarücksichten bestimmt. Ich spreche natürlich nicht von seinen Detailausführungen und Nutzenwendungen, mit denen ich nichts zu tun habe.

Die Wertform, deren fertige Gestalt die Geldform, ist sehr inhaltslos und einfach. Dennoch hat der Menschegeist sie seit mehr als 2000 Jahren vergeblich zu ergründen gesucht, während andererseits die Analyse viel inhaltvollerer und komplizierterer Formen wenigstens annähernd gelang. Warum? Weil der ausgebildete Körper leichter zu studieren ist als die Körperzelle.

Question 1 *What did Marx mean with his formulation “the value form is slight in content”?*

Question 2 *Why is the complete body easier to study than the cells?*

Moreover, in the analysis of economic forms neither microscopes nor chemical reagents are of assistance. The power of abstraction must replace both.

↑ Marx compares abstraction with a microscope or the setup of a chemical experiment. Abstraction is therefore not the process which leads us from the empirical surface phenomena to the underlying forces, but abstraction allows us to look at the surface phenomena in the right way (stripping off inessential contaminations, or cutting down to the simplest phenomena eschewing the too highly developed forms) so that conclusions about the underlying driving forces can be drawn.

But for bourgeois society, the commodity-form of the product of labor, or the value-form of the commodity, is the economic cell-form. To the uneducated observer, the analysis of these forms seems to turn upon minutiae. It does in fact deal with minutiae, but so similarly does microscopic anatomy.

The “commodity form of the product of labor” is not the same as the “value form of the commodity.” Their relationship is explained in 153:2/o. Both forms share the honor of being called here the economic “cell form” of capitalist society. I.e., capitalist society is not only based on every product of labor being produced as a commodity, but also on the agents on the surface of the economy treating the labor in these commodities as objective properties of the products.

Question 3 *Why does Marx say: the “commodity form of the product of labor” or the “value form of the commodity” are the economic cell form? Explain what each of these two forms is and how they are related. (Try this question only if you are able to answer question 259 below.)*

90:1 With the exception of the section on the form of value, therefore, this volume cannot stand accused on the score of difficulty. I assume, of course, a reader who is willing to learn something new and therefore to think for himself.

Bei der Analyse der ökonomischen Formen kann außerdem weder das Mikroskop dienen noch chemische Reagentien. Die Abstraktionskraft muß beide ersetzen.

Für die bürgerliche Gesellschaft ist aber die Warenform des Arbeitsprodukts oder die Wertform der Ware die ökonomische Zellenform. Dem Ungebildeten scheint sich ihre Analyse in bloßen Spitzfindigkeiten herumzutreiben. Es handelt sich dabei in der Tat um Spitzfindigkeiten, aber nur so, wie es sich in der mikroskopischen Anatomie darum handelt.

12:1 Mit Ausnahme des Abschnitts über die Wertform wird man daher dies Buch nicht wegen Schwerverständlichkeit anklagen können. Ich unterstelle natürlich Leser, die etwas Neues lernen, also auch selbst denken wollen.

Although Marx uses England as his main illustration, which had at his time the most highly developed and purest capitalism, his study was also relevant for those countries where capitalism was not yet developed as much, such as Germany:

90:2 The physicist observes natural processes either in situations where they appear in the clearest form with the least contamination by disturbing influences, or, wherever possible, he makes experiments under conditions which ensure that the process will occur in its pure state. What I have to examine in this work is the capitalist mode of production, and the relations of production and forms of intercourse that correspond to it. Until now, their locus classicus has been England. This is the reason why England is used as the main illustration of the theoretical developments I make. If, however, the German reader pharisaically shrugs his shoulders at the condition of the English industrial and agricultural workers, or optimistically comforts himself with the thought that in Germany things are not nearly so bad, I must plainly tell him: De te fabula narratur!

The things which Marx says here are generally valid for all sciences, not only political economy but also for physics. The subject of scientific inquiry are not the phenomena per se, not even the degree to which the underlying forces have generated social antagonisms, but these underlying forces themselves, which are as inexorably at work in Germany as they are in England. Germany will eventually look like England:

90:3/o Intrinsically, it is not a question of the higher or lower degree of development of the social antagonisms that spring from the natural laws of capitalist production. It is a question of these laws themselves, of these tendencies winning their way through and working themselves out with iron necessity. The country that is more developed industrially only shows, to the less developed, the image of its own future.

Marx's remarks about the scientific method in general are very similar to Bhaskar's ap-

12:2 Der Physiker beobachtet Naturprozesse entweder dort, wo sie in der prägnantesten Form und von störenden Einflüssen mindest getrübt erscheinen, oder, wo möglich, macht er Experimente unter Bedingungen, welche den reinen Vorgang des Prozesses sichern. Was ich in diesem Werk zu erforschen habe, ist die kapitalistische Produktionsweise und die ihr entsprechenden Produktions- und Verkehrsverhältnisse. Ihre klassische Stätte ist bis jetzt England. Dies der Grund, warum es zur Hauptillustration meiner theoretischen Entwicklung dient. Sollte jedoch der deutsche Leser pharisäisch die Achseln zucken über die Zustände der englischen Industrie- und Ackerbauarbeiter oder sich optimistisch dabei beruhigen, daß in Deutschland die Sachen noch lange nicht so schlimm stehn, so muß ich ihm zurufen: De te fabula narratur!

12:3 An und für sich handelt es sich nicht um den höheren oder niedrigeren Entwicklungsgrad der gesellschaftlichen Antagonismen, welche aus den Naturgesetzen der kapitalistischen Produktion entspringen. Es handelt sich um diese Gesetze selbst, um diese mit eherner Notwendigkeit wirkenden und sich durchsetzenden Tendenzen. Das industriell entwickeltere Land zeigt dem minder entwickelten nur das Bild der eigenen Zukunft.

proach in [Bha78], with one difference: in his *Realist Theory of Science*, Bhaskar does not talk about the *development* of the generative forces studied by the scientist. Only much later, in [Bha93], does Bhaskar say that his *Realist Theory of Science* must be dialecticized.

This said, Marx makes nevertheless some remarks about the situation in Germany.

91:1 But in any case, and apart from all this, where capitalist production has made itself fully at home amongst us, for instance in the factories properly so called, the situation is much worse than in England, because the counterpoise of the Factory Acts is absent. In all other spheres, and just like the rest of Continental Western Europe, we suffer not only from the development of capitalist production, but also from the incompleteness of that development. Alongside the modern evils, we are oppressed by a whole series of inherited evils, arising from the passive survival of archaic and outmoded modes of production, with their accompanying train of anachronistic social and political relations. We suffer not only from the living, but from the dead. Le mort saisit le vif!

91:2 The social statistics of Germany and the rest of Continental Western Europe are, in comparison with those of England, quite wretched. But they raise the veil just enough to let us catch a glimpse of the Medusa's head behind it. We should be appalled at our own circumstances if, as in England, our governments and parliaments periodically appointed commissions of inquiry into economic conditions; if these commissions were armed with the same plenary powers to get at the truth; if it were possible to find for this purpose men as competent, as free from partisanship and respect of persons as are England's factory inspectors, her medical reporters on public health, her commissioners of inquiry into the exploitation of women and children, into conditions of housing and

12:4/o Aber abgesehn hiervon. Wo die kapitalistische Produktion völlig bei uns eingebürgert ist, z.B. in den eigentlichen Fabriken, sind die Zustände viel schlechter als in England, weil das Gegengewicht der Fabrikgesetze fehlt. In allen andren Sphären quält uns, gleich dem ganzen übrigen kontinentalen Westeuropa, nicht nur die Entwicklung der kapitalistischen Produktion, sondern auch der Mangel ihrer Entwicklung. Neben den modernen Notständen drückt uns eine ganze Reihe vererbter Notstände, entspringend aus der Fortvegetation altertümlicher, überlebter Produktionsweisen, mit ihrem Gefolg von zeitwidrigen gesellschaftlichen und politischen Verhältnissen. Wir leiden nicht nur von den Lebenden, sondern auch von den Toten. Le mort saisit le vif!

15:1 Im Vergleich zur englischen ist die soziale Statistik Deutschlands und des übrigen kontinentalen Westeuropas elend. Dennoch lüftet sie den Schleier grade genug, um hinter demselben ein Medusenhaupt ahnen zu lassen. Wir würden vor unsren eignen Zuständen erschrecken, wenn unsre Regierungen und Parlamente, wie in England, periodische Untersuchungskommissionen über die ökonomischen Verhältnisse bestallten, wenn diese Kommissionen mit derselben Machtvollkommenheit, wie in England, zur Erforschung der Wahrheit ausgerüstet würden, wenn es gelänge, zu diesem Behuf ebenso sachverständige, unparteiische und rücksichtslose Männer zu finden, wie die Fabrikinspektoren Englands sind, seine ärztlichen Berichterstat-

nourishment, and so on. Perseus wore a magic cap so that the monsters he hunted down might not see him. We draw the magic cap down over our own eyes and ears so as to deny that there are any monsters.

Now some important remarks about the purpose of this theoretical analysis: Marx thought that the social processes which lead to the abolition of capitalism were well under way already in 1872:

91:3/o Let us not deceive ourselves about this. Just as in the eighteenth century the American War of Independence sounded the tocsin for the European middle class, so in the nineteenth century the American Civil War did the same for the European working class. In England the process of transformation is palpably evident. When it has reached a certain point, it must react on the Continent. There it will take a form more brutal or more humane, according to the degree of development of the working class itself.

The novel development in England is described as follows:

Apart from any higher motives, then, the most basic interests of the present ruling classes dictate to them that they clear out of the way all legally removable obstacles to the development of the working class. For this reason, among others, I have devoted a great deal of space in this volume to the history, the details, and the results of the English factory legislation.

↑ Capitalists do not act altruistically but in their own most selfish interest if they make room for the development of the working class. Why? Because the interests of the working class allow the capitalist mode of production to flourish better than the narrow class interests of the capitalists. Marx says something similar in 408:2/o.

One nation can and should learn from others. Even when a society has begun to track

ter über „Public Health“ (Öffentliche Gesundheit), seine Untersuchungskommissäre über die Exploitation der Weiber und Kinder, über Wohnungs- und Nahrungszustände usw. Perseus brauchte eine Nebelkappe zur Verfolgung von Ungeheuern. Wir ziehen die Nebelkappe tief über Aug' und Ohr, um die Existenz der Ungeheuer wegleugnen zu können.

15:2/o Man muß sich nicht darüber täuschen. Wie der amerikanische Unabhängigkeitskrieg des 18. Jahrhunderts die Sturmglocke für die europäische Mittelklasse läutete, so der amerikanische Bürgerkrieg des 19. Jahrhunderts für die europäische Arbeiterklasse. In England ist der Umwälzungsprozeß mit Händen greifbar. Auf einem gewissen Höhepunkt muß er auf den Kontinent rückschlagen. Dort wird er sich in brutaleren oder humaneren Formen bewegen, je nach dem Entwicklungsgrad der Arbeiterklasse selbst.

Von höheren Motiven abgesehn, gebietet also den jetzt herrschenden Klassen ihr eigenes Interesse die Wegräumung aller gesetzlich kontrollierbaren Hindernisse, welche die Entwicklung der Arbeiterklasse hemmen. Ich habe deswegen u.a. der Geschichte, dem Inhalt und den Resultaten der englischen Fabrikgesetzgebung einen so ausführlichen Platz in diesem Bande eingeräumt.

Eine Nation soll und kann von der andern lernen. Auch wenn eine Gesellschaft dem

down the natural laws of its movement—and it is the ultimate aim of this work to reveal the economic law of motion of modern society—it can neither leap over the natural phases of its development nor remove them by decree. But it can shorten and lessen the birth-pangs.

↑ This is against voluntarism. (Marx discusses voluntarism also in 184:3/oo.)

Question 4 What is voluntarism?

↓ Finally, Marx emphasizes that the target of his critique is the social structure, not the individuals themselves.

92:1 To prevent possible misunderstandings, let me say this. I do not by any means depict the capitalist and the landowner in rosy colours. But individuals are dealt with here only in so far as they are the personifications of economic categories, the bearers of particular class-relations and interests. My standpoint, which views the development of the economic formation of society as a process of natural history, can less than any other make the individual responsible for relations whose creature he remains socially, however much he may subjectively raise himself above them.

↑ If the development of the social structure is a process of natural history, this means it cannot be explained by the attitudes of the individuals living today. Marx says here that one cannot blame today's individuals for capitalism, because we all are the products of our society (despite the fact that some may subjectively rise themselves far above this).

Now some remarks about the sociology of economics:

92:2/o In the domain of political economy, free scientific inquiry does not merely meet the same enemies as in all other domains. The peculiar nature of the material it deals with summons into the fray on the opposing side the most violent, sordid and malignant passions of the human breast, the Furies of private interest. The Estab-

Naturgesetz ihrer Bewegung auf die Spur gekommen ist—und es ist der letzte Endzweck dieses Werks, das ökonomische Bewegungsgesetz der modernen Gesellschaft zu enthüllen—, kann sie naturgemäße Entwicklungsphasen weder überspringen noch wegdekretieren. Aber sie kann die Geburtswehen abkürzen und mildern.

16:1 Zur Vermeidung möglicher Mißverständnisse ein Wort. Die Gestalten von Kapitalist und Grundeigentümer zeichne ich keineswegs in rosigem Licht. Aber es handelt sich hier um die Personen nur, soweit sie die Personifikation ökonomischer Kategorien sind, Träger von bestimmten Klassenverhältnissen und Interessen. Weniger als jeder andere kann mein Standpunkt, der die Entwicklung der ökonomischen Gesellschaftsformation als einen naturgeschichtlichen Prozeß auffaßt, den einzelnen verantwortlich machen für Verhältnisse, deren Geschöpf er sozial bleibt, sosehr er sich auch subjektiv über sie erheben mag.

16:2 Auf dem Gebiete der politischen Ökonomie begegnet die freie wissenschaftliche Forschung nicht nur demselben Feinde wie auf allen anderen Gebieten. Die eigentümliche Natur des Stoffes, den sie behandelt, ruft wider sie die heftigsten, kleinlichsten und gehässigsten Leidenschaften der menschlichen Brust, die Furien des Privat-

lished Church, for instance, will more readily pardon an attack on thirty-eight of its thirty-nine articles than on one thirty-ninth of its income. Nowadays atheism itself is a culpa levis, as compared with the criticism of existing property relations. Nevertheless, even here there is an unmistakable advance. I refer, as an example, to the Blue Book published within the last few weeks: 'Correspondence with Her Majesty's Missions Abroad, Regarding Industrial Questions and Trades' Unions'. There the representatives of the English Crown in foreign countries declare in plain language that in Germany, in France, in short in all the civilized states of the European Continent, a radical change in the existing relations between capital and labor is as evident and inevitable as in England. At the same time, on the other side of the Atlantic Ocean, Mr. Wade, Vice-President of the United States, has declared in public meetings that, after the abolition of slavery, a radical transformation in the existing relations of capital and landed property is on the agenda. These are signs of the times, not to be hidden by purple mantles or black cassocks. They do not signify that tomorrow a miracle will occur. They do show that, within the ruling classes themselves, the foreboding is emerging that the present society is no solid crystal, but an organism capable of change, and constantly engaged in a process of change.

Now a summary of the different volumes Marx was planning to write:

93:1 The second volume of this work will deal with the process of the circulation of capital (Book II) and the various forms of the process of capital in its totality (Book

interesses, auf den Kampfplatz. Die englische Hochkirche z.B. verzeiht eher den Angriff auf 38 von ihren 39 Glaubensartikeln als auf 1/39 ihres Geldeinkommens. Heutzutage ist der Atheismus selbst eine culpa levis, verglichen mit der Kritik überlieferter Eigentumsverhältnisse. Jedoch ist hier ein Fortschritt unverkennbar. Ich verweise z.B. auf das in den letzten Wochen veröffentlichte Blaubuch: „Correspondence with Her Majesty's Missions Abroad, regarding Industrial Questions and Trades Unions“. Die auswärtigen Vertreter der englischen Krone sprechen es hier mit dünnen Worten aus, daß in Deutschland, Frankreich, kurz allen Kulturstaaten des europäischen Kontinents, eine Umwandlung der bestehenden Verhältnisse von Kapital und Arbeit ebenso fühlbar und ebenso unvermeidlich ist als in England. Gleichzeitig erklärte jenseits des Atlantischen Ozeans Herr Wade, Vizepräsident der Vereinigten Staaten von Nordamerika, in öffentlichen Meetings: Nach Beseitigung der Sklaverei trete die Umwandlung der Kapital- und Grundeigentumsverhältnisse auf die Tagesordnung! Es sind dies Zeichen der Zeit, die sich nicht verstecken lassen durch Purpurmäntel oder schwarze Kutten. Sie bedeuten nicht, daß morgen Wunder geschehen werden. Sie zeigen, wie selbst in den herrschenden Klassen die Ahnung aufdämmert, daß die jetzige Gesellschaft kein fester Kristall, sondern ein umwandlungsfähiger und beständig im Prozeß der Umwandlung begriffener Organismus ist.

17:1 Der zweite Band dieser Schrift wird den Zirkulationsprozeß des Kapitals (Buch II) und die Gestaltungen des Gesamtprozesses (Buch III), der abschließende dritte

III), while the third and last volume (Book IV) will deal with the history of the theory.

93:2 I welcome every opinion based on scientific criticism. As to the prejudices of so-called public opinion, to which I have never made concessions, now, as ever, my maxim is that of the great Florentine:

‘Segui il tuo corso, e lascia dir le genti.’

93:3 Karl Marx

93:4 London, 25 July 1867

(Buch IV) die Geschichte der Theorie behandeln

17:2 Jedes Urteil wissenschaftlicher Kritik ist mir willkommen. Gegenüber den Vorurteilen der sog. öffentlichen Meinung, der ich nie Konzessionen gemacht habe, gilt mir nach wie vor der Wahlspruch des großen Florentiners:

Segui il tuo corso, e lascia dir le genti!

17:3 *London*, 25. Juli 1867

17:4 *Karl Marx*

Postface to the Second Edition

At the present time, only the second half of this postscript is included here, in which Marx discusses his method.

99:2 That the method employed in Capital has been little understood is shown by the various mutually contradictory conceptions that have been formed of it.

99:3/o Thus the Paris Revue Positiviste reproaches me for, on the one hand, treating economics metaphysically, and, on the other hand imagine this!—confining myself merely to the critical analysis of the actual facts, instead of writing recipes (Comtist ones?) for the cook-shops of the future. Professor Sieber has already given the answer to the reproach about metaphysics:

‘In so far as it deals with actual theory, the method of Marx is the deductive method of the whole English school, a school whose failings and virtues are common to the best theoretical economists.’

Mr M. Block—in *Les Théoriciens du socialisme en Allemagne*. Extrait du *Journal des Economistes*, Juillet et Aout 1872—makes the discovery that my method is analytic, and says:

‘With this work, M. Marx can be ranged among the most eminent analytical thinkers.’

The German reviewers, of course, cry out against my ‘Hegelian sophistry’. The *European Messenger* (*Vyestnik Evropy*) of St. Petersburg, in an article dealing exclusively with the method of Capital (May 1872 issue, pp. 427–36), finds my method of inquiry strictly realistic, but my method of presentation, unfortunately, German-dialectical. It

25:1 Die im „Kapital“ angewandte Methode ist wenig verstanden worden, wie schon die einander widersprechenden Auffassungen derselben beweisen.

25:2–3 So wirft mir die Pariser „Revue Positiviste“ vor, einerseits, ich behandle die Ökonomie metaphysisch, andererseits—man rate!—, ich beschränke mich auf bloß kritische Zergliederung des Gegebenen, statt Rezepte (comtistische?) für die Garküche der Zukunft zu verschreiben. Gegen den Vorwurf der Metaphysik bemerkt Prof. Sieber:

„Soweit es sich um die eigentliche Theorie handelt, ist die Methode von Marx die deduktive Methode der ganzen englischen Schule, deren Mängel und Vorzüge den besten theoretischen Ökonomen gemein sind.“

25:4–5 Herr M. Block—„*Les Théoriciens du Socialisme en Allemagne*. Extrait du *Journal des Économistes*, juillet et août 1872“—entdeckt, daß meine Methode analytisch ist, und sagt u.a.:

„Par cet ouvrage M. Marx se classe parmi les esprits analytiques les plus éminents.“

25:6–7 Die deutschen Rezensenten schreiben natürlich über Hegelsche Sophistik. Der Petersburger „Europäischer Bote“, in einem Artikel, der ausschließlich die Methode des „Kapital“ behandelt (Mainummer 1872, p. 427–436), findet meine Forschungsmethode streng realistisch, die Darstellungsmethode aber unglücklicherweise deutsch-

says:

‘At first sight, if the judgement is made on the basis of the external form of the presentation, Marx is the most idealist of philosophers, and indeed in the German, i.e. the bad sense of the word. But in point of fact he is infinitely more realist than all his predecessors in the business of economic critique . . . He can in no sense be called an idealist.’

I cannot answer the writer of this review in any better way than by quoting a few extracts from his own criticism, which may, apart from this, interest some of my readers for whom the Russian original is inaccessible.

100:1/00 After a quotation from the preface to my *Zur Kritik der Politischen Ökonomie*, Berlin, 1850, p. iv–vii., where I have discussed the materialist basis of my method, the reviewer goes on:

‘The one thing which is important for Marx is to find the law of the phenomena with whose investigation he is concerned; and it is not only the law which governs these phenomena, in so far as they have a definite form and mutual connection within a given historical period, that is important to him. Of still greater importance to him is the law of their variation, of their development, i.e. of their transition from one form into another, from one series of connections into a different one. Once he has discovered this law, he investigates in detail the effects with which it manifests itself in social life . . .

↑ So far, Kaufman has characterized Marx as a developmental depth realist: Marx is interested in (1) the law of the phenomena, (2) the law of the change and development of these laws, and (3) the manifestations of this law. ↓ The next passage is more epistemological:

Consequently, Marx only concerns himself with one thing: to show, by an exact scientific investigation, the necessity of successive determinate orders of social relations, and to establish, as impeccably as possible, the facts from which he starts out and on which he depends. For this it is quite enough, if he

dialektisch. Er sagt:

„Auf den ersten Blick, wenn man nach der äußern Form der Darstellung urteilt, ist Marx der größte Idealphilosoph, und zwar im deutschen, d.h. schlechten Sinn des Wortes. In der Tat aber ist er unendlich mehr Realist als alle seine Vorgänger im Geschäft der ökonomischen Kritik . . . Man kann ihn in keiner Weise einen Idealisten nennen.“

25:8 Ich kann dem Herrn Verfasser nicht besser antworten als durch einige Auszüge aus seiner eignen Kritik, die zudem manchen meiner Leser, dem das russische Original unzugänglich ist, interessieren mögen.

25:9–27:0 Nach einem Zitat aus meiner Vorrede zur „Kritik der Pol. Ök.“, Berlin 1859, p. IV–VII, wo ich die materialistische Grundlage meiner Methode erörtert habe, fährt der Herr Verfasser fort:

„Für Marx ist nur eins wichtig: das Gesetz der Phänomene zu finden, mit deren Untersuchung er sich beschäftigt. Und ihm ist nicht nur das Gesetz wichtig, das sie beherrscht, soweit sie eine fertige Form haben und in einem Zusammenhang stehn, wie er in einer gegebenen Zeitperiode beobachtet wird. Für ihn ist noch vor allem wichtig das Gesetz ihrer Veränderung, ihrer Entwicklung, d.h. der Übergang aus einer Form in die andre, aus einer Ordnung des Zusammenhangs in eine andre. Sobald er einmal dies Gesetz entdeckt hat, untersucht er im Detail die Folgen, worin es sich im gesellschaftlichen Leben kundgibt . . .

Demzufolge bemüht sich Marx nur um eins: durch genaue wissenschaftliche Untersuchung die Notwendigkeit bestimmter Ordnungen der gesellschaftlichen Verhältnisse nachzuweisen und soviel als möglich untadelhaft die Tatsachen zu konstatieren, die ihm zu Ausgangs- und Stützpunkten dienen. Hierzu

proves, at the same time, both the necessity of the present order of things, and the necessity of another order into which the first must inevitably pass over; and it is a matter of indifference whether men believe or do not believe it, whether they are conscious of it or not. Marx treats the social movement as a process of natural history, governed by laws not only independent of human will, consciousness and intelligence, but rather, on the contrary, determining that will, consciousness and intelligence . . .

↑ Kaufman does not say how Marx proves these necessities which are independent of the intentions and consciousness of the agents, although he refers to empirical facts as points of departure and support. The missing concept here is that of second-order arguments. ↓ The next passage discusses the role of human consciousness:

If the conscious element plays such a subordinate part in the history of civilization, it is self-evident that a critique whose object is civilization itself can, less than anything else, have for its basis any form or any result of consciousness. This means that it is not the idea but only its external manifestation which can serve as the starting-point. A critique of this kind will confine itself to the confrontation and comparison of a fact, not with ideas, but with another fact. The only things of importance for this inquiry are that the facts be investigated as accurately as possible, and that they actually form different aspects of development vis-a-vis each other. But most important of all is the precise analysis of the series of successions, of the sequences and links within which the different stages of development present themselves.

↓ Now Kaufman turns to the historical dimension of Marx’s method:

It will be said, against this, that the general laws of economic life are one and the same, no matter whether they are applied to the present or the past. But this is exactly what Marx denies. According to him, such abstract laws

ist vollständig hinreichend, wenn er mit der Notwendigkeit der gegenwärtigen Ordnung zugleich die Notwendigkeit einer andren Ordnung nachweist, worin die erste unvermeidlich übergehn muß, ganz gleichgültig, ob die Menschen das glauben oder nicht glauben, ob sie sich dessen bewußt oder nicht bewußt sind. Marx betrachtet die gesellschaftliche Bewegung als einen naturgeschichtlichen Prozeß, den Gesetze lenken, die nicht nur von dem Willen, dem Bewußtsein und der Absicht der Menschen unabhängig sind, sondern vielmehr umgekehrt deren Wollen, Bewußtsein und Absichten bestimmen . . .

Wenn das bewußte Element in der Kulturge-schichte eine so untergeordnete Rolle spielt, dann versteht es sich von selbst, daß die Kritik, deren Gegenstand die Kultur selbst ist, weniger als irgend etwas andres, irgendeine Form oder irgendein Resultat des Bewußtseins zur Grundlage haben kann. Das heißt, nicht die Idee, sondern nur die äußere Erscheinung kann ihr als Ausgangspunkt dienen. Die Kritik wird sich beschränken auf die Vergleichung und Konfrontierung einer Tatsache nicht mit der Idee, sondern mit der andren Tatsache. Für sie ist es nur wichtig, daß beide Tatsachen möglichst genau untersucht werden und wirklich die eine gegenüber der andren verschiedene Entwicklungsmomente bilden, vor allem aber wichtig, daß nicht minder genau die Serie der Ordnungen erforscht wird, die Aufeinanderfolge und Verbindung, worin die Entwicklungsstufen erscheinen.

Aber, wird man sagen, die allgemeinen Gesetze des ökonomischen Lebens sind ein und dieselben; ganz gleichgültig, ob man sie auf Gegenwart oder Vergangenheit anwendet. Grade das leugnet Marx. Nach ihm existieren solche

do not exist ... On the contrary, in his opinion, every historical period possesses its own laws ... As soon as life has passed through a given period of development, and is passing over from one given stage to another, it begins to be subject also to other laws. In short, economic life offers us a phenomenon analogous to the history of evolution in other branches of biology ...

↓ Now the depth dimension of economic laws:

The old economists misunderstood the nature of economic laws when they likened them to the laws of physics and chemistry. A more thorough analysis of the phenomena shows that social organisms differ among themselves as fundamentally as plants or animals. Indeed, one and the same phenomenon falls under quite different laws in consequence of the different general structure of these organisms, the variations of their individual organs, and the different conditions in which those organs function. Marx denies, for example, that the law of population is the same at all times and in all places. He asserts, on the contrary, that every stage of development has its own law of population ... With the varying degrees of development of productive power, social conditions and the laws governing them vary too. While Marx sets himself the task of following and explaining the capitalist economic order from this point of view, he is only formulating, in a strictly scientific manner, the aim that every accurate investigation into economic life must have ... The scientific value of such an inquiry lies in the illumination of the special laws that regulate the origin, existence, development and death of a given social organism and its replacement by another, higher one. And in fact this is the value of Marx's book.'

102:1 Here the reviewer pictures what he

abstrakte Gesetze nicht ... Nach seiner Meinung besitzt im Gegenteil jede historische Periode ihre eignen Gesetze ... Sobald das Leben eine gegebene Entwicklungsperiode überlebt hat, aus einem gegebenen Stadium in ein andres übertritt, beginnt es auch durch andre Gesetze gelenkt zu werden. Mit einem Wort, das ökonomische Leben bietet uns eine der Entwicklungsgeschichte auf andren Gebieten der Biologie analoge Erscheinung ...

Die alten Ökonomen verkannten die Natur ökonomischer Gesetze, als sie dieselben mit den Gesetzen der Physik und Chemie verglichen ... Eine tiefere Analyse der Erscheinungen bewies, daß soziale Organismen sich voneinander ebenso gründlich unterscheiden als Pflanzen- und Tierorganismen ... Ja, eine und dieselbe Erscheinung unterliegt ganz und gar verschiedenen Gesetzen infolge des verschiedenen Gesamtbaus jener Organismen, der Abweichung ihrer einzelnen Organe, des Unterschieds der Bedingungen, worin sie funktionieren usw. Marx leugnet z.B., daß das Bevölkerungsgesetz dasselbe ist zu allen Zeiten und an allen Orten. Er versichert im Gegenteil, daß jede Entwicklungsstufe ihr eignes Bevölkerungsgesetz hat ... Mit der verschiedenen Entwicklung der Produktivkraft ändern sich die Verhältnisse und die sie regelnden Gesetze. Indem sich Marx das Ziel stellt, von diesem Gesichtspunkt aus die kapitalistische Wirtschaftsordnung zu erforschen und zu erklären, formuliert er nur streng wissenschaftlich das Ziel, welches jede genaue Untersuchung des ökonomischen Lebens haben muß ... Der wissenschaftliche Wert solcher Forschung liegt in der Aufklärung der besondern Gesetze, welche Entstehung, Existenz, Entwicklung, Tod eines gegebenen gesellschaftlichen Organismus und seinen Ersatz durch einen andren, höheren regeln. Und diesen Wert hat in der Tat das Buch von Marx.“

27:1 Indem der Herr Verfasser das, was er

takes to be my own actual method, in a striking and, as far as concerns my own application of it, generous way. But what else is he depicting but the dialectical method?

↓ Marx differentiates between the mode of inquiry and the mode of representation of the results of this inquiry:

102:2 Of course the method of presentation must differ in form from that of inquiry. The latter has to appropriate the material in detail, to analyse its different forms of development and to track down their inner connection. Only after this work has been done can the real movement be appropriately presented. If this is done successfully, if the life of the subject-matter is now reflected back in the ideas, then it may appear as if we have before us an a priori construction.

Marx's methodological Introduction to *Grundrisse*, [mecw28]37:2–38:1, illustrates this distinction between research and representation in much more detail.

Term Paper Topic 5 Discuss Marx's methodology as explained in the Introduction to *Grundrisse*.

↓ The remark about a priori constructions refers to Hegel and his followers. Marx adds some important remarks about the relation between his method and Hegel:

102:3 My dialectical method is, in its foundations, not only different from the Hegelian, but exactly opposite to it. For Hegel, the process of thinking, which he even transforms into an independent subject, under the name of 'the Idea', is the creator of the real world, and the real world is only the external appearance of the idea. With me the reverse is true: the ideal is nothing but the material world reflected in the mind of man, and translated into forms of thought.

102:4/o I criticized the mystificatory side of the Hegelian dialectic nearly thirty years

meine wirkliche Methode nennt, so treffend und, soweit meine persönliche Anwendung derselben in Betracht kommt, so wohlwollend schildert, was andres hat er geschildert als die dialektische Methode?

27:2 Allerdings muß sich die Darstellungs-

weise formell von der Forschungsweise unterscheiden. Die Forschung hat den Stoff sich im Detail anzueignen, seine verschiedenen Entwicklungsformen zu analysieren und deren innres Band aufzuspüren. Erst nachdem diese Arbeit vollbracht, kann die wirkliche Bewegung entsprechend dargestellt werden. Gelingt dies und spiegelt sich nun das Leben des Stoffs ideell wider, so mag es aussehn, als habe man es mit einer Konstruktion a priori zu tun.

27:3 Meine dialektische Methode ist der Grundlage nach von der Hegelschen nicht nur verschieden, sondern ihr direktes Gegenteil. Für Hegel ist der Denkprozeß, den er sogar unter dem Namen Idee in ein selbstständiges Subjekt verwandelt, der Demiurg des wirklichen, das nur seine äußere Erscheinung bildet. Bei mir ist umgekehrt das Ideelle nichts andres als das im Menschenkopf umgesetzte und übersetzte Materielle.

27:4 Die mystifizierende Seite der Hegelschen Dialektik habe ich vor beinah 30

ago, at a time when it was still the fashion. But just when I was working at the first volume of *Capital*, the ill humoured, arrogant and mediocre epigones who now talk large in educated German circles began to take pleasure in treating Hegel in the same way as the good Moses Mendelssohn treated Spinoza in Lessing's time, namely as a 'dead dog'. I therefore openly avowed myself the pupil of that mighty thinker, and even, here and there in the chapter on the theory of value, coquetted with the mode of expression peculiar to him. The mystification which the dialectic suffers in Hegel's hands by no means prevents him from being the first to present its general forms of motion in a comprehensive and conscious manner. With him it is standing on its head. It must be inverted, in order to discover the rational kernel within the mystical shell.

The comments about Hegel are followed by comments about the dialectical method in general:

103:1 In its mystified form, the dialectic became the fashion in Germany, because it seemed to transfigure and glorify what exists. In its rational form it is a scandal and an abomination to the bourgeoisie and its doctrinaire spokesmen, because it includes in its positive understanding of what exists a simultaneous recognition of its negation, its inevitable destruction; because it regards every historically developed form as being in a fluid state, in motion, and therefore grasps its transient aspect as well; and because it does not let itself be impressed by anything, being in its very essence critical and revolutionary.

↑ Marx emphasizes here that dialectics not only looks at what is, but also at what is not, at the absences. It explores how things negate themselves and how they must be criticized.

↓ Finally, from dialectic in general Marx goes over to dialectical contradictions:

Jahren, zu einer Zeit kritisiert, wo sie noch Tagesmode war. Aber grade als ich den ersten Band des „Kapital“ ausarbeitete, gefiel sich das verdrießliche, anmaßliche und mittelmäßige Epigonentum, welches jetzt im gebildeten Deutschland das große Wort führt, darin, Hegel zu behandeln, wie der brave Moses Mendelssohn zu Lessings Zeit den Spinoza behandelt hat, nämlich als „toten Hund“. Ich bekannte mich daher offen als Schüler jenes großen Denkers und kokettierte sogar hier und da im Kapitel über die Werttheorie mit der ihm eigentümlichen Ausdrucksweise. Die Mystifikation, welche die Dialektik in Hegels Händen erleidet, verhindert in keiner Weise, daß er ihre allgemeinen Bewegungsformen zuerst in umfassender und bewußter Weise dargestellt hat. Sie steht bei ihm auf dem Kopf. Man muß sie umstülpen, um den rationellen Kern in der mystischen Hülle zu entdecken.

27:5/o In ihrer mystifizierten Form ward die Dialektik deutsche Mode, weil sie das Bestehende zu verklären schien. In ihrer rationalen Gestalt ist sie dem Bürgertum und seinen doktrinären Wortführern ein Ärgernis und ein Greuel, weil sie in dem positiven Verständnis des Bestehenden zugleich auch das Verständnis seiner Negation, seines notwendigen Untergangs einschließt, jede gewordene Form im Flusse der Bewegung, also auch nach ihrer vergänglichen Seite auffaßt, sich durch nichts imponieren läßt, ihrem Wesen nach kritisch und revolutionär ist.

103:2 The fact that the movement of capitalist society is full of contradictions impresses itself most strikingly on the practical bourgeois in the changes of the periodic cycle through which modern industry passes, the summit of which is the general crisis. That crisis is once again approaching, although as yet it is only in its preliminary stages, and by the universality of its field of action and the intensity of its impact it will drum dialectics even into the heads of the upstarts in charge of the new Holy Prussian-German empire.

Karl Marx

London, 24 January 1873

28:1 Die widerspruchsvolle Bewegung der kapitalistischen Gesellschaft macht sich dem praktischen Bourgeois am schlagendsten fühlbar in den Wechselfällen des periodischen Zyklus, den die moderne Industrie durchläuft, und deren Gipfelpunkt—die allgemeine Krise. Sie ist wieder im Anmarsch, obgleich noch begriffen in den Vorstadien, und wird durch die Allseitigkeit ihres Schauplatzes, wie die Intensität ihrer Wirkung, selbst den Glückspilzen des neuen heiligen, preußisch-deutschen Reichs Dialektik einpauken.

Karl Marx

London, 24. Januar 1873

Part I.

Commodities and Money

1. The Commodity

Moore and Aveling translate the chapter title “*Die Ware*” as “Commodities.” The plural is unfortunate, since it suggests that

the outward behavior of *commodities* will be discussed, rather than the inner structure of *the commodity*. Our translation

“the commodity” is the same as Fowkes’s.

Chapters One, Two, and Three of the first volume of *Capital* are grouped into part One. They discuss commodities and money, but not yet capital.

1.1. The Two Factors of a Commodity: Use-Value and Value (Substance of Value, Magnitude of Value)

Marx uses the word ‘value’ in a very specific meaning. Value (sometimes Marx calls it ‘commodity value’) is that property inherent in the commodity which is responsible for its ability to be exchanged on the market. ‘Value’ is not an ethical category. It also does not indicate a subjective valuation (how much someone values something). Instead, it is an *economic* category.

Also the word ‘use-value’ is used in a specific meaning: the use-value of a commodity is the menu of possible uses of the commodity. Although ‘use-value’ and ‘value’ both contain the word ‘value’, use-value is *not* a particular kind of value. In his *Notes on Wagner’s Textbook of Political Economy* [mecw24]545:1, Marx calls use-value the “opposite” of value, “which has nothing in common with value, except that ‘value’ occurs in the word ‘use-value’.”

Question 6 *The first thing that Marx says about the commodity is that it presents itself to the economic agents as a thing with two different properties, use-value and exchange-value. Why does the title of the first section then say that the two factors of the commodity are use-value and value, instead of use-value and exchange-value?*

According to the title of section 1.1, the two factors of the commodity are use-value and value. In the first unpublished draft version of this title in [Mar87a, p. 1], the factors had been use-value and exchange-value—more about this in 152:1. The parentheses in the title indicate that value is considered here under the aspect of *substance* and *magnitude*. The *third* aspect of value, its *form*, will be analyzed later, in section 1.3.

Although Marx does not subdivide section 1.1 into subsections, the present Annotations divide it into four subsections, numbered 1.1.a – 1.1.d, and use additional unnumbered sub-titles in the first of these subsections.

Subsection 1.1.a (125–126:1) briefly surveys the use-value of things.

Subsection 1.1.b (126:2–127:1) begins with the observation that in addition to use-value, the commodity has “exchange-value”—in other words, instead of *using* a commodity the owner also has the option to *exchange* it. Then Marx takes a closer look at the exchange relations between commodities, in order to conclude that the commodities’ ability to be exchanged, i.e., their exchange-value, is the manifestation of a deeper-lying property of commodities, called “value.”

In subsection 1.1.c (127:2–128:3), Marx focuses on the question: “what is value?” Just as a detective makes inferences about what actually happened from the traces left at the scene of the crime, so will Marx make inferences about the “substance” of value from the “forms” under which the economic agents deal with value. This so-called *retroductive argument* leads to the conclusion that the substance of value is *congealed abstract labor*.

Subsection 1.1.d (128:4–131:1) discusses a different aspect of value: not its substance but its magnitude; not why products must enter the market and be exchanged, but how the exchange proportions are determined which the market generates for them.

Section 1.2 concentrates once more on the *substance* of value, which plays a pivotal role in Marx’s theory. Section 1.3 takes a closer look at the *form* of value. Section 1.4 represents a switch in the level of the discourse: Marx points out a certain incongruity between content and form and asks “why this content takes that form” 173:1/oo.

1.1.a. [The Commodity as Natural Object and Use-Value]

[The Commodity Form of Wealth]

125:1 The wealth of those societies, in which the capitalist mode of production reigns, presents itself as an “immense heap of commodities.”¹

¹ *Karl Marx, Zur Kritik der Politischen Oekonomie*, Berlin 1859, p. 3.

↑ This reference is 269:1.

49:1 Der Reichtum der Gesellschaften, in welchen kapitalistische Produktionsweise herrscht, erscheint als eine „ungeheure Warensammlung“,¹ ...

¹ *Karl Marx, „Zur Kritik der Politischen Oekonomie“, Berlin 1859, pag. 3.*

Ben Fowkes, the translator in [Mar76], translates “Warensammlung” as “collection of commodities.” This is unfortunate, since “collection” connotes a systematic purposeful act. Marx does not want to imply that people are collecting

commodities. His starting point is the observation that *all* elements of wealth are commodities. He uses the word “*Sammlung*” as synonymous to “*Ansammlung*.” The Moore-Aveling translation “accumulation” is better here. The adjective “*ungeheure*,” which is

colloquial German, underlines the informal meaning of this sentence. Our translation mixes the levels of formality as well: it uses the more formal “immense” (immeasurably large) alongside the informal “heap.”

1. The Commodity

We will discuss this sentence word for word, first “wealth,” then “capitalist mode of production,” “reigns,” “commodity,” and “presents itself.”

Wealth: “Wealth” is anything that enhances human life. Marx means here *material* wealth, i.e., *things* which enhance human life.

Question 9 *Can one say that happiness is the only true wealth?*

Question 10 *Wouldn’t scarcity be a better starting point for understanding how a given society is functioning than wealth? When there is scarcity, this means there is a need to act, whereas wealth consists of dead things. Scarcity leads us to discover what drives society, wealth does not.*

Nowadays one often reads that the subject of economics is scarcity. Marx differs in two respects: he does not call it “economics” but “political economy,” and he does not begin with scarcity but with wealth. In *Grundrisse*, the first draft of *Capital*, he says on p. 852:1/o: Political economy has to do with the specific social forms of wealth, or rather of the production of wealth.

Die politische Ökonomie hat es mit den spezifischen gesellschaftlichen Formen des Reichtums oder vielmehr der Produktion des Reichtums zu tun.

A similar point of view is implied by the title of Adam Smith’s book [Smi65] *An Inquiry into the Nature and Causes of the Wealth of Nations*. This title announces the topic of the book as the wealth of *nations*. Here in the first sentence of *Capital*, Marx speaks not of the wealth of nations but the wealth of *societies*.

One usually thinks of wealth as the wealth of individuals, as the amount of things owned by an individual. This is a superficial view. Wealth is intrinsically social:

- Certain aspects of wealth can not be attached to individuals. Public parks or beaches, clean air, lack of noise or crime, a livable city layout, are all elements of wealth which either everybody in society has, or nobody has.
- Even private wealth, which only benefits one or few individuals, has a social dimension. A rich person not only has access to things but, more importantly, has the ability to make others work for him or her. See 764:1/o. Someone must produce the things a wealthy person consumes.

Marx uses the word “wealth” not only for the *abundance* or *extravagance* of things enhancing human life; *anything* which enhances human life, however modest it may be, is part of society’s wealth.

Capitalist Mode of Production: At this point, the phrase ‘capitalist mode of production’ is only a name for the topic to be investigated. This name, however, already indicates that capitalist society is characterized by its organization of *production*. It is one of the

basic tenets of Marx's theory of society that the organization of production has a profound influence on all the other social relations.

Marx's *Capital* therefore offers an explanation of those aspects of capitalism which pertain to the *economy*: money, wage-labor, economic growth, globalization, the business cycle, the coexistence of wealth and poverty, the persistence of economic underdevelopment, etc. Marx's *Capital* does not give an explanation of capitalist democracy, international political relations, or the recurrence of wars. Occasionally it is possible to draw inferences from the economic structure about the political structures necessary to maintain this economic structure, compare 158:5/o, 178:1/o, 270:3/o. This information about the requirements which the state must meet in order to sustain capitalist economic relations does not yet constitute a theory of the state itself.

The reference to the 'capitalist mode of production' in the first sentence indicates that the subject of this chapter is not some historical "simple commodity production" or some utopian "fair and equitable" society, but capitalism. Marx's *Capital* is not a blueprint for a socialist economy. It is an attempt to gain a thorough understanding of *capitalism*. It is necessary to understand capitalism in order to overcome it.

Reigns: The word "reigns" has two meanings. One the one hand it simply means: where the capitalist mode of production prevails, where it is the main form of production. However, Marx's word is not "*vorherrscht*" (prevails) but the shorter and stronger "*herrscht*," whose principal meaning is "to rule." Perhaps Marx wanted to express one of the following points with this:

- All relations of production known today, whether capitalist or not, can be said to "rule", because of the fundamental role of those social relations having to do with *production* among the broader social relations.
- If the capitalist mode of production comes in contact with other modes of production, it tends to corrode them and supplant them by capitalist relations.

The French edition says "reigns," while the Moore-Aveling translation says "prevails." In a letter to Engels on April 2, 1858, Marx uses the unambiguous

transitive verb "dominates" (*beherrscht*), but the subject is not capitalism but exchange: "presupposes ... the elimination ... of all undeveloped,

pre-bourgeois modes of production, which are not dominated to their full extent by exchange." [mecw40]298:5/o

Commodity: A commodity is *something produced for sale or exchange*. This is what the reader needs to know about the commodity in order to follow the argument. In English business parlance, the word 'commodities' is used for products which are available from many suppliers, and which are standardized, so that there is no reason, apart from price, for the buyer to prefer one supplier over another. Marx does *not* mean it this way. For him, a commodity is everything, whether raw material or finished good, whether a specialized brand name article or a staple, that is produced for sale.

Exam Question 11 *What is a commodity? Marx does not give the definition of a commodity but an analysis. How would you define the thing he analyzes? (The answer can be given in one sentence.)*

Presents Itself as an Immense Heap of Commodities: Two different assertions are woven together in this clause:

- In capitalist society, wealth takes the form of commodities, i.e., almost all the things which make up the riches of capitalist society are produced for and traded in markets. They are produced not because they constitute wealth, but because they can be sold at favorable prices. "Even during a famine, corn is imported because the corn-merchant thereby makes money, and not because the nation is starving." (Marx quoting Ricardo in *Contribution*, 389/o.)
- This is *obvious*, everyone is aware of it, and the members of capitalist society handle commodities and purposefully treat them as commodities every day. (We will see later that many other important aspects of capitalist social relations do *not* enter general awareness but arise "behind the back" of purposeful activity.)

The word that is translated here as "presents itself" is in German "*erscheint*," i.e., literally, "appears." Marx conscientiously uses the word "appear" whenever he discusses the manifestation of some invisible background on an accessible stage. Here this invisible background is social wealth. Much of what is done in any society has to do with the production and disposition of wealth. In capitalism, this wealth confronts the practical activity of the individuals mainly in the form of commodities.

Fowkes translates "*erscheint*" with "appears," i.e., he, like Marx himself, emphasizes the first assertion; by contrast, the Moore-Aveling translation

("presents itself") and the French translation ("*s'annonce comme*") emphasize the second assertion. Earlier versions of this sentence in Marx's other publications or

manuscripts *separate* these two assertions more clearly than the very condensed formulation here in *Capital*. Compare *Contribution*, 269:1 and *Grundrisse*, 881:2.

Question 15 *Give examples for alternative forms, other than the commodity form, in which material wealth confronts the individual member of society (either in non-capitalist societies, or non-commodity wealth in capitalist societies).*

First Sentence as a Whole: The clause "wealth presents itself as an immense heap of commodities" is critical of the social form taken by wealth in capitalist society, not of wealth itself. Wealth has become a *collection of things*, and therefore has only a very extraneous relation to the individuals who avail themselves of this wealth. The ownership of money

or commodities does not require any essential relation between the owner and the object—while wealth of sheep, for instance, in earlier societies was only possible if the owner was a capable shepherd; see *Grundrisse* 221/222.

Question 20 Describe a situation in daily life in which the extraneous character of the relation between wealth and wealth holder becomes an issue.

Question 23 Is capitalism the only type of society known to us in which all wealth takes the form of commodities? (In order to answer this question properly you should already have some knowledge of Marx's *Capital*.)

Question 24 What does the study of commodities have to do with the classes in capitalist society (capitalist class and working class)?

[Invitation to Begin the Analysis of Capitalism with the Commodity]

All this was a discussion of the first sentence only. It is time to go on:

The single commodity appears as the elementary form of this wealth.	... die einzelne Ware als seine <i>Elementarform</i> .
---	--

↑ This means on the one hand that the commodity is a simple or *elementary* (as in elementary algebra) form of wealth. Indeed, a one-line definition sufficed to define the commodity, a commodity is anything produced for sale or exchange. In the *Introduction* to *Grundrisse*, [mecw28]37:2–38:1, Marx says that the mind has to begin with such simple categories in order to assimilate the world, even though these simple categories may not refer to the most fundamental relations in reality. In his *Notes on Wagner*, [mecw24]545:2/o Marx calls the commodity “the simplest economic concretum,” i.e., it is not an abstract concept but something concrete that one can touch, but it is the simplest such thing. Instead of saying that in capitalism, most wealth takes the form of commodities, it would also have been true to say that most labor takes the form of wage-labor—but the definition of wage-labor is not elementary but presupposes the definition of many other economic categories first.

On the other hand, Marx says here that the commodity is the elementary form of *wealth*, i.e., that other forms of wealth can be reduced to, or are developments of, the commodity form. In the preface to the first edition of *Capital*, p. 89:3/o, Marx brings a fitting metaphor: the study of the commodity is just as important for an understanding of the capitalist economy as the study of a *single undifferentiated cell* is for an understanding of the human body. We cannot yet know at this point whether this is true, i.e., Marx announces here how one will be able to justify this starting point once the investigation of all social forms of wealth is complete.

The analysis of the commodity will therefore be the starting point of our investigation.

Unsere Untersuchung beginnt daher mit der Analyse der Ware.

1. The Commodity

This sentence has a “therefore” in it, i.e., Marx is drawing an inference from what was just said about the commodity. Regarding the character of this inference, textual evidence is ambiguous.

- The Moore/Aveling translation says that the analysis of the commodity “must be the starting point,” which is stronger than the German “will be the starting point.” We can assume for sure that Marx and Engels knew about and approved the “must” in the English version. This text variant indicates that Marx has convinced himself that the commodity is the necessary starting point, perhaps because it is the elementary form of wealth as just explained, even though he cannot give a full proof of this here.
- In the formulation in the German edition, “will be the starting point,” Marx uses what was just said as grounds to begin his book with the commodity, without claiming that this is the only possibility. It can be seen as an invitation: if commodities are so prevalent in capitalist society, then an analysis of the commodity looks like a good place to begin the investigation of capitalism. Therefore let's do it!

In the debate around “where to begin,” two questions should not be confused. One is whether certain things must be explained before others, for instance, whether it is necessary to explain the commodity before one can explain capital. Marx clearly argues that it is. Reality has different layers, i.e., certain real things are built on top of other things (which are themselves equally real). Somehow, the commodity is “simpler” than money, and money “simpler” than capital. In *Grundrisse*, 259, Marx writes:

In order to develop the concept of capital, it is necessary to begin not with labor but with value or, more precisely, with the exchange-value already developed in the movement of circulation. It is just as impossible to pass directly from labor to capital as from the different human races directly to the banker, or from nature to the steam engine.

Um den Begriff des Kapitals zu entwickeln, ist es nötig nicht von der Arbeit, sondern vom Wert auszugehen, und zwar von dem schon in der Bewegung der Zirkulation entwickelten Tauschwert. Es ist ebenso unmöglich, direkt von der Arbeit zum Kapital überzugehen, als von den verschiedenen Menschenrassen direkt zum Bankier oder von der Natur zur Dampfmaschine.

The other question is whether it is necessary to furnish a proof, already at the beginning, that this is where one should begin. This is impossible and also unnecessary. In order to know what a good starting point is one must have results, but we are just at the beginning, i.e., we do not yet have any results. As long as the reader cannot take issue with the content of the writer's arguments, he or she should therefore not interrupt the writer at the beginning with the question “why do you begin here?”

Question 25 Would it have been possible to start the book *Capital* with a more common-sense definition of capitalism, such as, capitalist production is production for profit?

Exam Question 27 *If Marx wanted to start his book with first principles, why did he pick the analysis of the commodity and not the analysis of the production process or the analysis of value?*

Question 28 *How does Marx's starting point differ from usual approaches to economics?*

After Marx's two-sentence justification why one should begin with the commodity, the analysis of the commodity begins without further ado. It will take up the whole chapter One.

[Every Commodity is a Useful Thing]

In his *Notes to Wagner*, [mecw24]544:6/o, Marx writes that his point of departure is the "form of appearance" of the commodity, i.e., the form in which the commodity enters the practical activity of the economic agents. ↓ Let us therefore imagine that Marx is interviewing someone living in a capitalist society. Marx gives this person a commodity and says: "Here is a commodity. I would like to know what this commodity is for you. Please describe to me what you see." The first answer Marx is likely to get is: "Oh, I see a useful object."

125:2 The commodity is at first an exterior object, a thing, which by its properties satisfies human wants of one sort or another.

49:2 Die Ware ist zunächst ein äußerer Gegenstand, ein Ding, das durch seine Eigenschaften menschliche Bedürfnisse irgendeiner Art befriedigt.

Fowkes translates this sentence as: "The commodity is, first of all, an external object, a thing which through its qualities satisfies human needs of whatever kind." The formulation "first of all" can be misunderstood to mean that this is the main property of the commodity, that the other properties of the commodity are secondary. It is not Marx's intention to say this. Even if one interprets the formulation "first of all" as a matter of order in the representation, not a matter of importance, it wrongly evokes the image that we could say many things about the commodity, but this is what we choose to say first. However we do not have this

choice: the other things cannot be said without saying this thing first, they should therefore not be imagined to be coexistent with this first thing. The "all" of which this is the "first" do not yet exist. And looking at the end of the sentence, Fowkes's formulation "of whatever kind" collapses two steps into one: (1) the commodity satisfies some want, and (2) it does not matter which want it satisfies. Step (2), the *indifference* towards the kind of want, comes only in the next sentence. But in defense of Fowkes one could say that the French translation, which was closely edited by Marx himself, collapses these two steps as well. The Moore-Aveling translation is:

"The commodity is, in the first place, an object outside us, a thing which by its properties satisfies human wants of some sort or another." The formulation "in the first place" makes this first step too static: it gives it a permanent "place" instead of formulating it as a transient point of entry, which one has to pass through in order to get to the other things. And calling the commodity "an object outside us" adds the interpretation to the text that this is what the commodity is for us, the reader, although I think Marx is describing here what the commodity is for those handling the commodity.

The commodity is called an "exterior" object because it exists outside humans. Despite its independent existence, this object "satisfies human wants of one sort or another." This

1. The Commodity

has important implications. In order to survive, humans must consume exterior things which they must produce socially with the help of other exterior things. If the social control over these things is such that one part of society is forced to work for another part of society, this is called "exploitation." Marx is therefore very aware of the exterior character of these useful things. He addresses it in his Introduction to *Grundrisse* [mecw28]31:2/o with respect to the finished product, and in his *Critique of the Gotha Programme* [mecw] with respect to the means of production. In *Capital* itself, he takes up this theme in chapter Two, p. 181:3/o, and chapter Nineteen, p. 675:3.

Although a commodity is more than just a useful object—the reader should think of it as a useful object produced for the exchange—the first thing the practical agents notice when they hold a commodity in their hands is that it is such a useful object. This is the place where one has to start if one wants to know what the commodities are for the practical agents and what they, therefore, do with the commodities. Despite its familiarity, the concept of a useful object it is not entirely trivial. Marx is using almost a page to elaborate on it. The remainder of the current paragraph clarifies what "useful" means, the next paragraph will say a few things about "exterior objects," and the paragraph after this asks how such exterior objects can be useful.

The nature of such wants, whether they arise, for instance, from the stomach or from imagination, makes no difference.²

Die Natur dieser Bedürfnisse, ob sie z.B. dem Magen oder der Phantasie entspringen, ändert nichts an der Sache.²

"Phantasie" is translated here with *imagination*. A commodity which

has no use whatever, but people think it does, has a use-value.

↑ Marx does not mean to say here that all human wants are equal. He merely says that the nature of the want which a commodity satisfies has no bearing on its economic role as a *commodity*. Market relations do not ask whether a product is socially desirable or not. They do not distinguish between use-values that satisfy some basic needs, and those that are not immediately necessary for human survival. The only thing that matters is whether it can be sold at a favorable price.

Because of this indifference, the commodity form can become the general form of wealth only in societies which have achieved material abundance. Productivity must be quite high for society to be able to "afford" a social form of wealth which is indifferent towards the use-value. Marx says something to this effect in his *Introduction* manuscript, p. [mecw28] 41:2–42:0. Even today, some branches of production are exempted from the commodity form because the commodity form has socially undesirable ramifications: education, roads. Increases in wealth and productivity allow more and more of such services to be "privatized."

Question 31 *Using modern experience, describe some implications, good or bad, of the indifference of market relations towards the nature of the needs which the commodity satisfies.*

This indifference makes it possible that some people are undernourished and homeless in

the midst of great wealth and waste. However this indifference is also a liberation from the mediocrity and boredom of a strictly needs-based production.

In footnote 2, Marx cites someone who, in his enthusiasm about the liberation from a pre-determined circle of needs, denies that there are any differences between different types of wants:

² “Desire implies want; it is the appetite of the mind, and as natural as hunger to the body ... The greatest number (of things) have their value from supplying the wants of the mind.” Nicholas Barbon [Bar96, pp. 2, 3]

² „Verlangen schließt Bedürfnis ein; es ist der Appetit des Geistes, und so natürlich wie Hunger für den Körper ... die meisten (Dinge) haben ihren Wert daher, daß sie die Bedürfnisse des Geistes befriedigen“. Nicholas Barbon [Bar96, pp. 2, 3]

↑ By proclaiming the equality of all wants as an eternal truth, Barbon gives legitimation to emerging capitalism, in which production is determined only by the buying power of the consumers, not by the hierarchy of their needs.

↓ The next sentence in the main text clarifies that producer goods satisfy human wants, but they do so indirectly.

Nor does it matter here *how* the object satisfies these human wants, whether directly as object of consumption, or indirectly as means of production.

Es handelt sich hier auch nicht darum, *wie* die Sache das menschliche Bedürfnis befriedigt, ob unmittelbar als Lebensmittel, d.h. als Gegenstand des Genusses, oder auf einem Umweg, als Produktionsmittel.

In the Moore/Aveling translation, this last sentence begins with “neither are we here concerned to know how” instead of “nor does it matter here.” Also the French edition has the word “savoir” (to know) in this sentence. This reference to “our concerns to know” is out of place. Marx is discussing here the social properties of commodities: although they are inanimate things they harness human activity. The commodities’ practical usefulness acts as a lense which focuses the diffuse activities of those human individuals who deal with them. This focusing power is so strong that it is no longer correct to say that the commodities are the objects of individual actions; instead, the actions of the individuals handling the commodities must be seen as the effects of the social power located in the commodity. It is not the commodity owners who act, but the commodities act *through* their owners.

The commodity’s ability to focus human activity is the same whether the commodity satisfies the needs of the stomach or the needs of human imagination, whether it satisfies them directly as means of consumption or indirectly as means of production. This is relevant information about capitalist society. It is a statement about the real world, not an announcement of the topics Marx chooses to discuss here. In other words, it is meant as an ontological statement, whereas the Moore/Aveling translation converts it into an epistemological statement. This transposition of ontological into epistemological facts is called the “epistemic fallacy.” It is a form of irrationalism, since it shifts all the activity into the head and does not see the activity in the world. Fowkes’s translation has it right this time, but similar errors appears many times in both translations.

From the indifference of the social powers of the commodity towards the nature of the

use-values follows that the key to an understanding of the commodity cannot be found in the wants it satisfies! This is the point where Marx parts ways with all of utility theory. Had Marx foreseen how entrenched the “subjective” concept of value would become (which does derive the value of a thing from the wants it satisfies), he would probably have said more about it at this point. The only place where he addresses the subjective concept of value is a brief remark about the disutility of labor in footnote 16 paragraph 137:1 in section 1.2. Also Marx’s criticisms of Jeremias Bentham (see for instance footnote 63 to paragraph 758:1/oo in chapter Twenty-Four) are criticisms of the foundations of modern neoclassical utility theory.

Question 32 *What might Marx have said about the subjective value concept at this point?*

Although Marx is right to emphasize here, at the very beginning of the investigation, that the social powers of commodities have nothing to do with their use-values, we will get to know later several important cases in which the use-value does have economic implications. The use-value of gold mimics the social properties of value (this is why gold became the money commodity) 183:2/o, the use-value of labor-power is the value which it creates 270:1, the use-value aspects of production give rise to the economic categories of constant capital and fixed capital, etc.

Exam Question 33 *Does the use-value of a commodity depend on the person using it?*

125:3/o Every useful thing, such as iron, paper, etc., is to be looked at under two aspects: *quality* and *quantity*.

49:3/o Jedes nützliche Ding, wie Eisen, Papier, usw., ist unter doppeltem Gesichtspunkt zu betrachten, nach *Qualität* und *Quantität*.

By “quality of a thing” Marx means those characteristics which distinguish different kinds of things. Such qualitative differences have a deep significance for commodities; if all commodities were qualitatively equal, there would be no need for exchange. But even if the qualities are the same, things can still differ quantitatively. Quantities play an important role for commodities as well; in order to exchange different kinds of commodities, the quantities must be adjusted accordingly. Marx is therefore discussing here the foundations, the basic alphabet, from which commodity relations are constructed. ↓ He discusses quality first:

Every such thing is an assemblage of many properties, and can therefore be useful in various ways. The discovery of the different aspects of things and therefore of their manifold uses is a historical deed.³

Jedes solche Ding ist ein Ganzes vieler Eigenschaften und kann daher nach verschiedenen Seiten nützlich sein. Diese verschiedenen Seiten und daher die mannigfachen Gebrauchsweisen der Dinge zu entdecken ist geschichtliche Tat.³

↑ How can a thing have properties which are not obvious but must be discovered? The answer lies in a throwaway remark of Marx’s in 149:2/o, according to which the properties of things manifest themselves in their relations with other things. This is a secret critique

of Hegel's *Logic*. In Hegel's system, the properties of things are more basic than the things themselves. For Marx, the existence of the things is the basic given. The properties slumber inside the things and must be awakened through practical interaction with them.

The example in footnote 3 illustrates the importance of this historical process of discovery:

³ "Things have an intrinsic virtue" (this is Barbon's special term for use-value) "which in all places have the same virtue; as the loadstone to attract iron" [Bar96, p. 6]. The property which the magnet possesses of attracting iron, became of use only after discovery, by means of that property, of the polarity of the magnet.

³ „Dinge haben einen intrinsick vertue“ (dies bei Barbon die spezifische Bezeichnung für Gebrauchswert), „der überall gleich ist, so wie der des Magnets, Eisen anzuziehen“ [Bar96, p. 6]. Die Eigenschaft des Magnets, Eisen anzuziehen, wurde erst nützlich, sobald man vermittelst derselben die magnetische Polarität entdeckt hatte.

↑ Marx does not agree with Barbon that the use-value of something is always the same. The magnet's ability to attract iron, which has been known for centuries, for a long time remained a mere curiosity. The main use of magnets was not their ability to attract iron, but the compass (there is no iron at the North Pole, and the North Pole does not attract the compass needle, it only turns it). Only after scientists, in their attempts to explain these magnetic phenomena, discovered the electromagnetic field (Marx calls it "magnetic polarity"), did electromagnetic phenomena obtain a major impact on human life (electric lights, telegraph, radio waves).

Things which have the same quality can still differ quantitatively. Hegel's basic definition of quantity is that it is a characteristic of the thing which does not define the thing. Even if you change the quantity of a thing you still have the same thing. However if this was the whole truth then one would find everything in all quantities. But elephants are always big and mice always small. To do justice to this, Hegel introduces the concept of "measure" for the right quantity for a given quality.

For Hegel, the measures, just like the qualities, are intrinsic to the things. In Marx's paradigm, not only the qualities but also the measures depend on practical (social) activity: So is also the establishment of social *measures* for the *quantities* of these useful objects.

So die Findung gesellschaftlicher *Maße* für die *Quantität* der nützlichen Dinge.

Fowkes's "socially recognized standards of measurement" is imprecise. On the one hand, social *recognition* is only one part of

sociality. On the other, Marx distinguishes between *Maß* and *Maßstab*. The main historical deed is not the finding of a unit of

measurement but to discover qualitatively how something should be measured.

Since the qualities are different, also the measurements for the different use-values are different. In *Contribution*, 269:2, Marx gives examples:

Different use-values have different measures appropriate to their different characteristics; for example, a bushel of wheat, a quire of paper, a yard of linen.

Ihrer natürlichen Eigenschaften gemäß besitzen verschiedene Gebrauchswerte verschiedene Maße, z.B. Scheffel Weizen, Buch Papier, Elle Leinwand, usw.

These examples show that not only the measuring units themselves, but also the question whether the object is measured by its weight, volume, length, energy content, etc., are determined socially. Some things have more than one measure. For instance, wages can be measured in several different ways, see 683:4/o.

Question 36 Can you think of an example in which the quantity of something affects its quality, for instance some physical matter two litres of which are qualitatively different than one litre of it?

Marx concludes his brief discussion of quantity with the observation that the quantitative measures are only in part determined by the qualities of those things; in part, they depend on social convention—for instance, the measuring units:

The diversity of these measures of commodities originates in part from the diverse nature of the objects to be measured, and in part from convention.

Die Verschiedenheit der Warenmaße entspringt teils aus der verschiedenen Natur der zu messenden Gegenstände, teils aus Konvention.

After these general considerations about the nature of the things themselves Marx goes into more detail how these things can be useful for humans. One might say that the preceding paragraph discussed the useful *thing*, while the next paragraph will discuss the *useful* thing.

126:1 The usefulness of a thing makes it a *use-value*.⁴

50:1 Die Nützlichkeit eines Dings macht es zum *Gebrauchswert*.⁴

This introduction of the term "use-value" sounds like a tautology—but it is not. For a correct understanding of this sentence, it is necessary to clarify the difference between the *properties* of a thing, its *usefulness*, and its *use-value*:

- Properties are intrinsic to a thing. One should consider them as something dormant, the thing's potential. These properties wake up and manifest themselves only when the thing is placed in a *relation* with other things.
- The usefulness of a thing (in the first edition of *Capital*, 18:2, Marx writes more explicitly: usefulness for human life) is the manifestation of its properties in one particular relation, namely, in its relation to humans. The usefulness of a thing is therefore not intrinsic to the thing itself, but it is a relationship *between* the thing's properties and human needs. It depends not only on the thing but also on humans. "A sheep would hardly consider it to be one of its 'useful' qualities that it can be eaten by human beings" [mecw24]538:6/o. A thing is useful if its properties are able to serve human needs. Since human needs depend on social factors, such as fashions, technology, and customs, usefulness inherits this dependence.
- The sentence "the usefulness of a thing makes it a use-value" is the definition of "use-value." The use-value of a thing is its usefulness—which, as was just explained, is a relative concept—*considered as a property of the thing itself*. The use-value of a thing is therefore not one of the properties of the thing, but the relationship between

these properties and human needs or wants that is *attributed to the thing as if* it was a property of the thing. (The modern concept of “utility function” attributes this same relationship to the human rather than the thing.)

There are many other examples of such relative “properties”; *beauty* is perhaps the most familiar one. It is, strictly speaking, not a property of a thing to be “beautiful.” Rather, “beauty” is a relationship between the properties of the thing and the human senses and feelings, which is nevertheless attributed to the thing alone. The proverb “beauty is in the eye of the beholder” reminds us of the relative character of the concept.

Question 37 Bring other examples of relative “properties” such as *beauty* or *use-value*.

Things which are useful for human life are given special names, they are called “goods” or “articles,” because people are practically appropriating them in the production process and also have to haggle with others over these things. This is why they first practically and then theoretically distinguish the things which are useful to them from all other things. All this is explained in Marx’s notes on Wagner, beginning with [mecw24]538:6/o.

The attribution of the usefulness to the thing itself is not just a theoretical exercise but it reflects social reality. There is a subtle difference between saying: “I am using the thing” and: “the thing has use-value for me.” In the first phrase, the human is the agent in control, in the second phrase, the human has become the consumer of the beneficial properties of the thing. The individual’s ability to use external things to serve his or her needs has become a power of the thing itself. Marx’s statement that commodities have use-value is a statement about how commodity-producing society relates to things: things are viewed as imbued with powers.

Question 38 Why is the usefulness for human life attributed to the thing as if it was a property of the thing itself?

Locke’s definition of use-value (which he calls “natural worth”) in footnote 4 is in full accord with Marx’s: it vividly describes how a relative concept (“fitness for human life”) becomes an attribute of the thing itself.

⁴ “The natural worth of anything consists in its fitness to supply the necessities, or serve the conveniences of human life.” *John Locke*, [Loc77, p. 28].

⁴ „Der natürliche worth jedes Dinges besteht in seiner Eignung, die notwendigen Bedürfnisse zu befriedigen oder den Annehmlichkeiten des menschlichen Lebens zu dienen“. *John Locke*, [Loc77, p. 28].

Question 39 What is the meaning of “natural” in the term “natural worth”?

In the remainder of the footnote, Marx argues that “natural worth” should be interpreted as “use-value” instead of “value:”

^{4 ctd} In English writers of the 17th century we frequently find “worth” in the sense of use-value,

^{4 ctd} Im 17. Jahrhundert finden wir noch häufig bei englischen Schriftstellern „Worth“ für Ge-

and “value” in the sense of exchange-value. This is quite in accordance with the spirit of a language that likes to use a Teutonic word for the immediate thing, and a Romance word for the reflected thing.

brauchswert und „Value“ für Tauschwert, ganz im Geist einer Sprache, die es liebt, die unmittelbare Sache germanisch und die reflektierte Sache romanisch auszudrücken.

The translation “the actual thing” versus “its reflection” is

misleading, since it denies that the reflected thing is actual too.

Question 40 Take some simple object, a shoe or a rubber ball, and differentiate between its properties, its usefulness, and its use-value.

↓ The practical mind does not notice the difference between the use-value of a thing and its properties, because one needs possession of the thing in order to be able to take advantage of its usefulness. Marx formulates this as follows:

But this usefulness does not dangle in mid-air. Conditioned by the physical properties of the body of the commodity, it has no existence apart from the latter.

Aber diese Nützlichkeit schwebt nicht in der Luft. Durch die Eigenschaften des Warenkörpers bedingt, existiert sie nicht ohne denselben.

The translation “derived” is wrong. The usefulness of a thing cannot be derived from its physical properties; one also needs to

consider the humans involved, both physically and socially. Marx means “conditioned” mainly in an enabling sense here, although the

modern meaning emphasizes more its restrictive dimension.

The terminology “body of the commodity” shows that for Marx, the thing which physically makes up a commodity cannot be identified with the commodity itself—just as a person cannot be identified with his or her body. (The social “soul” of a commodity, its value, will be discussed shortly.)

To paraphrase Marx’s argument: what people really want is the use-value of the things, not the things themselves, but they can only benefit from these use-values when they have possession of the things themselves. This is the basis for the social rules in a commodity society regulating who can have access to which *things*.

Question 42 Do transportation, electricity, information, services, patents, other so-called “immaterial” commodities, fit under the definition of a commodity given here?

Some products have a use-value which does not require the presence of the original product but which can be conveyed by simple copies of the product. Often, capitalism has created institutions (patents and copyrights) which mimic the basic relationship described here that the use-value is only available if the unique original product is present. While capitalism extends commodification in some areas, it also restricts it in others. Things which according to their use-values are perfectly capable of being traded as commodities, do not take

commodity form for overriding social reasons: the use of roads, public education, radio/TV, certain banking services, etc.

Finally it may be worth pointing out that the formulation “does not dangle in mid-air” is again a critique of Hegel and of all idealist philosophy. For Plato and Hegel, the properties of things *were* dangling in the air, they had their separate existence as ideals.

After having introduced, ever so briefly, the relationship between use-value and the properties of the commodity, and the distinction between the commodity and the body of the commodity, Marx obtains permission from the reader to simplify his wording by calling the body of the commodity “a use-value.”

The <i>body</i> itself of the commodity, such as iron, wheat, diamond, etc., is therefore a <i>use-value</i> or a good.	Der <i>Warenkörper</i> selbst, wie Eisen, Weizen, Diamant usw., ist daher ein <i>Gebrauchswert</i> oder Gut.
---	--

This sentence cannot be understood in the Moore-Aveling translation: “A commodity, such	as iron, corn, or a diamond, is therefore, so far as it is a material thing, a use-value, something	useful.”
---	---	----------

The version of this sentence in the First Edition of *Capital*, 18:2, leaves no doubt that this is a terminological convention:

For the sake of brevity, the useful thing itself or, in other words, the <i>body of the commodity</i> , such as iron, wheat, diamond, etc., will be called a <i>use-value</i> , good, article.	Abkürzend nennen wir das nützliche Ding selbst oder den <i>Warenkörper</i> , wie Eisen, Weizen, Diamant usw., <i>Gebrauchswert</i> , Gut, Artikel.
--	--

In the later editions, it is still a terminological convention, but since Marx furnishes a better logical justification for it, and at the same time uses a terser formulation, it has become more difficult to see that it is merely a convention. The argument is: In order to avail oneself of the use-value of a commodity, nothing more nor less is necessary than its physical presence. Therefore it is justified, when speaking about the body of the commodity, to simply call it “a use-value.” The word is therefore used in two meanings, which do not conflict with each other.

Use-value can also be attached to the absence of things: the absence of illness, crime, pollution, etc. Since these use-values cannot be commodified as readily, they are neglected in a commodity society.

↓ After saying that for the enjoyment of the use-value the physical presence of the commodity is needed, Marx emphasizes that this is all that is needed.

This characteristic of a commodity does not depend on whether appropriating its useful properties costs more or less labor.	Dieser sein Charakter hängt nicht davon ab, ob die Aneignung seiner Gebrauchseigenschaften dem Menschen viel oder wenig Arbeit kostet.
---	--

It is the physical properties of the good and only those that convey its use-value. The labor producing the product is no longer there. It has disappeared into the product; it is

sublated (*aufgehoben*) in its result. About *Aufhebung* compare Hegel’s Logic, [Heg69a, pp. 106–108].

↓ The usefulness of a commodity not only depends on its properties with reference to human needs (its use-value), but also on its quantity. One milligram of milk will not do for the baby. This is the reason why society does not abstract from the quantities of the use-values—they play an important part in exchange relations. Our theoretical discourse about economic relations has to follow suit:

When examining use-values, we always assume to be dealing with well-defined quantities, such as <i>dozens</i> of watches, <i>yards</i> of linen, or <i>tons</i> of iron.	Bei Betrachtung der Gebrauchswerte wird stets ihre quantitative Bestimmtheit vorausgesetzt, wie <i>Dutzend</i> Uhren, <i>Elle</i> Leinwand, <i>Tonne</i> Eisen usw.
--	---

This is all Marx says about use-value here. Since the commodity form is (at first) indifferent towards the kinds of use-values, any closer consideration of the particularities of use-values cannot enlighten us about the character of social and economic relations in capitalism. Of course, this does not mean that use-values are irrelevant for practical life:

The use-values of commodities furnish the material for a special branch of knowledge, whose textbooks are the commercial product manuals. ⁵	Die Gebrauchswerte der Waren liefern das Material einer eignen Disziplin, der <i>Warenkunde</i> . ⁵
--	--

⁵ In bourgeois societies the legal fiction prevails that every one, as a buyer, possesses an encyclopedic knowledge of commodities.

⁵ In der bürgerlichen Gesellschaft herrscht die *factio juris*, daß jeder Mensch als Warenkäufer eine enzyklopädische Warenkenntnis besitzt.

↑ This knowledge is not taught in schools but passed on informally: hardware is a popular conversation topic.

Transition to Exchange-Value

The remainder of the paragraph paves the ground for the discussion of the next major topic, the *exchange-value*.

Use-value actualizes itself only by use or consumption.	Der Gebrauchswert verwirklicht sich nur im Gebrauch oder der Konsumtion.
---	--

The Moore-Aveling translation has a colon between this sentence and	the next. I replaced it with a period, as in the German and also	the Fowkes translation. I see no reason for a colon here.
---	--	---

A thing may have the most beneficial properties for humans, people will not benefit from it unless they take a specific act of “using” the thing. This act of using is often, but not always, at the same time the “consumption” of the things, i.e., it destroys the thing or makes its use-value unavailable for others.

The above sentence also clarifies the terminology: if one exchanges things, or also if one collects them in the basement in the hope that they will appreciate, one does *not* use them. “Use” is seen here in contradistinction to exchange.

Question 45 *Is it also true that exchange-value only realizes itself in exchange? (Difficult question which requires good knowledge of Marx.)*

Question 46 *Certain use-values are produced with the purpose never to be used. For instance nuclear weapons which are developed for the sake of deterrence. It is true for these use-values too that their use-value actualizes itself only in its use?*

Use-values constitute *the material content of wealth*, whatever its *social form* may be.

Gebrauchswerte bilden *den stofflichen Inhalt des Reichtums*, welches immer seine *gesellschaftliche Form* sei.

↑ A thing which has properties useful for human life, considered from the point of view of its possible uses by humans, is called “use-value.” People handle use-values every day. Their existence depends on use-values. This is true in every society. The available use-values constitute the material wealth of a society. ↓ But in capitalism, useful things have an additional specific social power: they can be traded or sold on the market.

In the form of society we are about to consider, they are, in addition, the material carriers of—exchange-value.

In der von uns zu betrachtenden Gesellschaftsform bilden sie zugleich die stofflichen Träger des—Tauscherts.

I avoided translating “*stoffliche Träger*” with “material depository.” The emphasis is not

on someone or something *depositing* exchange-value in the article, but that any commodity

whose use-value is intact has the additional power of being exchangeable.

↑ Exchange-value is that social relation or social custom which allows commodities to be traded for each other or for money. Marx’s short sentence introducing the exchange-value makes the following implicit claims:

- Exchange-value is social, not individual. If two individuals decide to exchange something which is not commonly exchanged, this does not give this thing an exchange-value.
- Exchange-value resides in the commodities themselves. The exchange of commodities is not embedded in a bigger social ritual (as the exchange of wedding rings is embedded in the marriage ceremony), but the things themselves are exchangeable (if they are commodities). Exchange-value is also not attributed to the commodity owner, but the commodity itself. Although the commodity owner names the exchange proportions and decides on the exchange, these exchange proportions are considered to belong to the commodity, not its owner.

1. The Commodity

- Exchange-value cannot be derived from the use-values involved. Rather, commodities have a second quality, separate from their use-values, which allows them to be traded on the market.

Marx characterizes the relation between use-value and exchange-value with the words: use-values are the material “*carriers*” of exchange-value. What does this mean? If a commodity loses its use-value then it also loses its exchange-value. Nevertheless the use-value is not the source of the exchange-value: if a certain use-value becomes freely available to all (bread growing on wild trees) then it still is a use-value but no longer has exchange-value. Marx will elaborate on this relationship in 131:1, after we know better where exchange-value comes from.

Question 47 *Which of the following did Marx say, and could he also have said any of the others?*

- The commodity is the carrier of exchange-value.*
- The use-value is the carrier of exchange-value.*
- The commodity is the carrier of value.*
- The use-value is the carrier of value.*

Exam Question 50 *What is the exchange-value of a commodity? (Give its definition, not an analysis where it comes from).*

Question 51 *Joseph, who lives in a capitalist society, regularly swaps his wife with the wife of his friend. Does this mean Joseph’s wife has exchange-value in capitalism?*

Question 52 *In the United States of America, children who lose their baby teeth often get a quarter for each tooth from their mother who pretends to be the tooth fairy. Does this mean that baby teeth have exchange-value in this society?*

Question 53 *If husband and wife exchange wedding rings during their marriage ceremony, does this establish a special exchange-value for these rings?*

Question 54 *What would a Marxist say about the following argument: the exchange-value of an item is created through demand, not by the item itself. If nobody demands the item, it cannot be traded for anything. In other words, exchange-value is created by people wanting the item.*

Exam Question 55 *Explain in your own words what it means to say that use-values are the “material carriers” of exchange-value.*

Question 57 *If the exchange-value of a commodity cannot be derived from its use-value, then a used commodity should have the same exchange-value as a new commodity, as long as it is not broken. Right or wrong?*

Question 58 *The use-value of a commodity is the utility one gets from using it; the exchange-value is the utility one gets from using those things one can trade the commodity for. Right or wrong?*

1.1.b. [From Exchange-Value to Value]

In the practical activity involving commodities, two different aspects of each commodity demand the attention of its owner: on the one hand, its use-value, and on the other, the quality which was just introduced, namely, its exchange-value. This double character of the commodity is so basic that in *Contribution*, 269:1, it is the first thing Marx says about the commodity. In *Capital*, by contrast, these two aspects are introduced sequentially. Marx first gives a brief discussion of use-value and only afterwards introduces exchange-value. Right now we are at the beginning of the discussion of exchange-value. Imagine Marx still interviewing the individual in capitalist society, this time asking “tell me about the exchange-value of your commodity.” Most likely, this person would reply: “The exchange-value consists in the amount of other commodities which I can get for mine.” This is the most striking practical implication of the exchange-value of a given commodity:

126:2 Exchange-value manifests itself at first as the *quantitative relation*, the proportion, in which use-values of one sort are exchanged against use-values of another sort⁶— ...

50:2/o Der Tauschwert erscheint zunächst als das *quantitative Verhältnis*, die Proportion, worin sich Gebrauchswerte einer Art gegen Gebrauchswerte anderer Art austauschen,⁶ ...

Marx writes here “at first” because (a) on the one hand, the quantitative exchange proportion between two use-values is the first thing one sees of the exchange-value of a commodity, but (b) on the other hand, the exchange proportion between two isolated commodities is not a full manifestation of exchange-value. For instance, Marx will show in section 1.3 that the existence of money, the thing that can buy every commodity, is also a manifestation of the exchange-value of the commodities.

[Discovery of a Contradiction]

Interestingly, the first manifestation of exchange-value does not fit together with the things said (or implied) about exchange-value when it was introduced just a paragraph ago. Exchange-value was introduced as something attached to (or “carried” by) a commodity’s use-value. The obvious first manifestation of exchange-value, the exchange proportion, however, cannot be attributed to any *one* commodity; rather it is a relation between *two* commodities.

↓ Marx will remark on this discrepancy shortly, but first he points out that exchange proportions are relative also in a different sense: they are affected by exterior circumstances. At different times and different places, the same commodities may be exchanged at wildly different proportions.

... —a proportion which constantly changes with time and place.

... ein Verhältnis, das beständig mit Zeit und Ort wechselt.

Everybody living in capitalism is familiar with the relativity and variability of exchange-proportions, i.e., Marx is not saying anything new here. But this variability seems to refute the things said or implied when exchange-value was first introduced. If exchange-value is something immanent in the commodity, one should not expect it to manifest itself as a relation *between* commodities, a relation which is moreover highly variable depending on the circumstances:

Hence exchange-value seems to be something accidental and purely *relative*. A “*valeur intrinsèque*,” i.e. an immanent exchange-value, that resides in the commodities, seems therefore a contradiction in terms.⁷

Der Tauschwert scheint daher etwas Zufälliges und rein *Relatives*, ein der Ware innerlicher, immanenter Tauschwert (*valeur intrinsèque*) also eine *contradictio in adjecto*.⁷

An “accidental” outcome is an indeterminate outcome which is not subject to an inner necessity. “Purely relative” means: it does not come from the commodities themselves, but only from their relation to each other.

The source of the French quote “*valeur intrinsèque*” is not clear. Marx possibly refers to the definition of “value” in footnote 6, which was originally given in French (compare footnote 6 to paragraph 18:3 in the first edition).

Although Marx makes it sound as if this was a contradiction in his reasoning about the exchange-value, this is really a contradiction in the thinking and the experiences of people living under capitalism. Both of the discrepant notions which Marx contrasts here with each other are part of common consciousness. Not only is the variability of exchange-proportions obvious to all, but on the other hand people also have the intuition that exchange-value is something anchored in the commodity, it is a second property which commodities have in addition to their use-values. (This is how exchange-value was introduced earlier.) People have contradictory notions in their heads because their lived experience is contradictory.

Marx shared the view of many Hegelians of the time that empirical evidence is full of contradictions, although people often do not recognize them as such. Compare *Contribution*, 275:1/o, and the postface to the Second edition of *Capital*, p. 103:2. Just as Marx considers it a contradiction that money is at the same time a thing and a social relation, so he also considers it a contradiction that exchange-value is at the same time immanent to the commodities and a relation between commodities.

Exam Question 60 *Which empirical evidence might lead to the conclusion that exchange-value is not something inherent in the commodity?*

Question 62 *In 126:2, Marx says that certain superficial evidence seems to indicate that exchange-values are accidental and relative. How much truth is there to this? To what extent are exchange-values indeed accidental, and to what extent are they indeed relative? (This question requires familiarity with things Marx says later.)*

Question 63 *Are there other places in Capital where Marx says that the exchange values seem accidental?*

In a dialectical investigation, the discovery of contradictions is as important as their subsequent resolution. Marx just pinpointed a contradiction in the empirical evidence of commodity-producing economies. This is a scientific achievement. People living in commodity producing societies typically do not notice that this is a contradiction.

Question 64 *Marx discusses at length the question whether value is intrinsic to the commodity or relative. What is the view of mainstream economics? Does it consider value to be intrinsic or relative?*

Evidence which is contradictory cannot be used as a basis for logical inferences. What should a scientist do if the evidence is contradictory? Marx's formulation that the exchange-value "*seems*" accidental is a hint. The word "*seems*" stresses the limited character of this inference, which was obtained by looking only at the first manifestation of exchange-value and nothing else. ↓ If this limited viewpoint leads to contradictions, then it is necessary to take a more thorough look at the evidence:

Let us consider the matter more closely. | Betrachten wir die Sache näher.

Exam Question 66 *Why does Marx's inquiry sometimes reach an impasse which can only be resolved by "considering the matter more closely"?*

↑ This is a standard formulation of Marx's when his investigation reaches an impasse (compare e.g. pp. 180:2 and 300:1/o). Such an impasse does not mean that an error has been made, but that it has become necessary to probe into deeper layers of reality. The next three paragraphs will be devoted to this "closer consideration of the matter," but let us first look at the footnotes to the above paragraph.

[Footnotes]

In the Preface to the Third edition, p. 108:1, Engels writes that the footnotes document "where, when and by whom an economic idea conceived in the course of development was first clearly enunciated." ↓ The first footnote 6 justifies Marx's entry point into exchange-value by documenting that the view of exchange-value as mere quantitative proportions can be found in the literature.

⁶ "The value consists in the exchange proportion between one thing and another, between this amount of one product and that of another." Le Trosne [LT46, p. 889]

⁶ „Der Wert besteht in dem Tauschverhältnis, das zwischen einem Ding und einem anderen, zwischen der Menge eines Erzeugnisses und der eines anderen besteht.“ Le Trosne [LT46, p. 889]

↑ This point of view reflects the practical concerns of the commodity traders, see footnote 17 to 140:3/o, but it is one-sided. A theoretical analysis has no hope of uncovering the real connections if it does not take all aspects into consideration, even if (or especially if) they are contradictory.

Question 67 *The French economist Le Trosne wrote that the value of a thing consists in its exchange-proportions with other things. Does Marx agree with this, or how would he re-formulate this proposition to make it correct?*

↓ Footnote 7 shows that also the subsequent step in Marx's argument, which seems to come to the conclusion that exchange-value cannot be inherent in the commodity, has precedents in the literature.

⁷ "Nothing can have an intrinsic value" Barbon [Bar96, p. 6] or, as Butler says, "For what is worth in anything but so much money as 'twill bring."

⁷ „Nichts kann einen inneren Tauschwert haben“ Barbon [Bar96, p. 6], oder wie Butler sagt: „Der Wert eines Dings ist grade so viel wie es einbringen wird.“

↑ Marx takes the perceptions of these earlier economists seriously. They usually have their justification, even if the authors themselves do not place them in the right context.

Question 68 *The English economist Barbon wrote that nothing can have an intrinsic exchange-value. Does Marx agree with this, or how would he re-formulate this proposition to make it correct?*

Question 69 *How is Barbon's statement that nothing can have an intrinsic exchange-value related to Butler's statement that the worth of something consists in the amount of money for which it can be exchanged?*

[First Thought Experiment]

After this look at the footnotes let us go back to the main text. The "closer consideration" announced by Marx consists of two thought experiments in which Marx draws out the implications of two additional familiar facts. Each of these thought experiments picks out a familiar aspect of the activity of individuals when they deal with commodities, and then makes inferences about the social relations which induce individuals to engage in these activities.

↓ The first thought experiment reminds us that one quarter of wheat can not only be exchanged for one other commodity, say *a* lbs. of iron, but for many different commodities:

127:1 Any given commodity, one quarter of wheat for instance, is exchanged for *x* shoe polish, or *y* silk, or *z* gold, etc.—in short, for other commodities in the *most diverse proportions*.

51:1 Eine gewisse Ware, ein Quarter Weizen z.B., tauscht sich mit *x* Stiefelwichse oder mit *y* Seide oder mit *z* Gold usw., kurz mit andern Waren in den *verschiedensten Proportionen*.

The evidence of actual exchange-value yields therefore two variabilities. Exchange proportions not only vary with time and place, but also with the nature of the equivalent exchanged. While the first variability is beyond the control of individuals and is considered an irregularity, the second variability is a generally accepted and expected property of exchange-values.

Marx focuses on this second kind of variability, the ability of the wheat to be exchanged for many different other goods, because it makes the explanation implausible which offered itself for the first variability. If we consider only one pair of commodities, say 1 quarter wheat versus a lbs. of iron, then it might be plausible to conjecture that their exchange proportion depends on a special relationship between the wheat owner and the iron owner, or on the circumstances of the exchange. But if the wheat is exchanged for many other commodities, it is much less plausible to assume that each of these many exchange proportions depends on special relationship which the wheat owner has with the owners of the many other commodities. Rather, this evidence is consistent with it that those different exchanges are but different ways of signaling something that has to do with the wheat owner himself or herself.

Since this may be an unfamiliar kind of reasoning, I will give here an example where something happened to me personally which prompted me to apply the same logic in a different context. Once I was driving my car in the evening hours, and some car facing me in the opposite lane blinked its lights at me. First I thought: this must have been someone who knew me, i.e., I assumed that the reason for the blinking was something between the driver of the other car and myself, something *relative*. But since it was getting dark I couldn't make out who was sitting in the other car. Only after *other* cars blinked their lights at me, too, did I realize I had forgotten to turn on my own headlights. I.e., their blinking did not signal a relationship between them and me, but it signaled something about *me* alone.

Marx, of course, does not bring the example with the blinking cars, but he makes essentially the same argument in terms of a dialectical negation of negation. ↓ The present step is the negation of the original “use-values are the material carriers of exchange-value,” in which it had been tacitly understood that each use-value has *one* exchange-value only:

Instead of one exchange-value, the wheat has, therefore, a great many.	Mannigfache Tauschwerte also hat der Weizen statt eines einzigen.
--	---

↓ The negation of the negation uses the fact that shoe-polish, silk, etc., are all received in exchange for *wheat*. One does not need to be a friend or relative of the owners of shoe-polish or silk to make these exchanges, all that is necessary is that one owns wheat. Therefore each trader who made one of these exchanges could in principle also have made any of the others. This is the meaning of the word “replaceable” in the next sentence:

But since x shoe polish, as well as y silk, as well as z gold, etc., is the exchange-value of one quarter of wheat, x shoe polish, y silk, z gold, etc., must be exchange-values replaceable by each other or equal in magnitude.	Aber da x Stiefelwichse, ebenso y Seide, ebenso z Gold usw. der Tauschwert von einem Quarter Weizen ist, müssen x Stiefelwichse, y Seide, z Gold usw. durch einander ersetzbare oder einander gleich große Tauschwerte sein.
---	--

↑ How did Marx make the step from “replaceable” to “equal in magnitude”? The “replaceability” has the implication that none of these exchanges is inherently more favorable than the others. The trader who exchanged his quarter of wheat against 5 lbs of shoe polish cannot say he got a worse deal than the one who exchanged her quarter of wheat against 1

yard of silk. Had he preferred the silk he could have exchanged his wheat for silk instead of shoe polish. ↓ But if the exchange-values can be compared with each other quantitatively, they must be based on an equal quality. All the exchange-values of the wheat therefore are just different ways to say the same thing about wheat (just as the different cars blinking their headlights said the same thing about my own headlights).

It follows therefore, firstly: the valid exchange-values of a given commodity express an equal content.

Es folgt daher erstens: Die gültigen Tauschwerte derselben Ware drücken ein Gleiches aus.

Moore-Aveling and Fowkes both write: express something equal. The word “something” is unfortunate here because it suggests that the equal content is a thing. Marx himself avoids this connotation: instead of writing “die gültigen Tauschwerte derselben Ware drücken etwas

Gleiches aus” he uses the slightly more awkward formulation “... drücken ein Gleiches aus.” Indeed, right now we only know that all the different exchange-values are the expression of some equal underlying *social relation*. Only Marx's second thought experiment will show that this underlying

social relation can be reduced to a substance (i.e., a “thing”) inside each commodity. It is therefore important that the translation not already anticipate the result of this second thought experiment, because otherwise the reader will not be able to understand the point of the second thought experiment.

↑ Marx writes here “*valid* exchange-values” presumably because only those exchange-values are replaceable with each other which have general validity, not those coming from special circumstances such as the trader having to make a fire sale or being mis-informed about the exchange-value of his or her product.

Question 70 Why does Marx write in 127:1 “*the valid exchange-values,*” instead of simply “*the exchange-values*”?

So far Marx has argued from the point of view of the individual commodity-owners. These commodity-owners treat the many exchange-values of their commodities as replaceable expressions of the same thing. ↓ In a second step, Marx argues that this expression is the reason why commodities have to go through the exchange:

But secondly, exchange-value itself cannot be anything other than the mere *mode of expression*, “form of appearance,” of some content distinguishable from it.

Zweitens aber: Der Tauschwert kann überhaupt nur die *Ausdrucksweise*, die „Erscheinungsform“ eines von ihm unterscheidbaren Gehalts sein.

Moore-Aveling has: “secondly, exchange-value, generally, is only the mode of expression, the phenomenal form, of something contained in it, yet distinguishable from it.” This is problematic for the reason already pointed out in the preceding translation note. The word “something contained in it”

suggests that exchange-value is reducible to some *substance* contained in the commodities. Although this is true, it will only be derived in the second thought experiment. If this result is already pronounced now, then the purpose of the second thought experiment becomes unintelligible. At the

present time we only know that the source of exchange-value does not lie in the sphere of circulation but elsewhere. Nothing is said yet about it that this source is a substance residing in the commodities.

↑ In other words, exchange-value is a social relation which allows the expression of some deeper content in the sphere of exchange. This means, exchange-value does not originate in the sphere of exchange at all, it is so-to-say remotely controlled: it is the form in which a deeper social relation manifests itself on the surface.

Question 71 *What is the difference between mode of expression and form of appearance?*

Question 72 *First give Marx's arguments how one can come to the conclusion that exchange-value is not something inherent in the commodity. Then reproduce, in your own words, Marx's rebuttal that, despite these arguments, exchange-value seems to be something inherent to the commodity after all.*

Although Marx says here only that the content underlying the exchange-value must be *different* from exchange-value, the understanding is that this content, which drives the exchange-value, does not originate in the sphere of exchange at all but in *production*. Obviously, the commodity exchange is only the second act in a two-act drama, the first act being the production of the commodities. Production is private, and the market is the only arena through which the producers come in contact with each other and the consumers. These basic facts about our society must be kept in mind to understand the development here. Marx wrote in the *Introduction to Grundrisse*, [mecw28]37:2–38:1:

“The subject, society, must always be envisaged ... as the pre-condition of comprehension even when the theoretical method is employed.”

Auch bei der theoretischen Methode daher muß das Subjekt, die Gesellschaft, als Voraussetzung stets der Vorstellung vorschweben.

Question 73 *Is there other surface evidence, other than the variability of exchange proportions, indicating that exchange-value is the expression of some deeper relation of production?*

If exchange-value is the form of appearance of some social relation located not in the sphere of circulation itself, this explains the variability of exchange-value with time and place which prompted us to embark on our thought experiment. If exchange-value is only the surface-echo of an underlying social relations having to do with the production of wheat, then we should expect that this echo might also be affected by other circumstances. Marx will say more about this in chapter Three, p. 195:2/o.

[Second Thought Experiment]

This was only the first of two thought experiments constituting Marx's “closer consideration of the matter.” It came to the conclusion that exchange-value is remotely controlled; it is the surface expression of some deeper but invisible social relation. This explains the variability of exchange-value, but it does not yet explain how exchange-value can also be inherent. How can something as relative and symmetric as an exchange relation between two commodities

be attached to one of the two commodities, i.e., be considered an exchange-value *of* the wheat? In order to solve this puzzle, Marx makes a second thought experiment:

127:2 Let us furthermore take two commodities, e.g., wheat and iron.

51:2 Nehmen wir ferner zwei Waren, z.B. Weizen und Eisen.

Marx goes back to the exchange relation between *two* commodities. He picks two commodities which were politically relevant at his time; wheat and iron are a reference to the corn laws. [Cle79]

The proportions in which they are exchangeable, whatever the numbers may be, can always be represented in an equation in which a given quantity of wheat is equated to some quantity of iron, say 1 quarter wheat = x lbs. iron.

Welches immer ihr Austauschverhältnis, es ist stets darstellbar in einer Gleichung, worin ein gegebenes Quantum Weizen irgendeinem Quantum Eisen gleichgesetzt wird, z.B. 1 Quarter Weizen = a Ztr. Eisen.

In his first thought experiment in the previous paragraph 127:1, Marx had pointed out that not only one, but many different commodities give a signal to the wheat. Their signal can therefore not be a private communication *between* each commodity and the wheat, but the reflection of a social property of wheat itself, i.e., of the social relations which govern the production of wheat. He could have made this argument even if the signal between the commodities had not been a relationship as symmetric as an exchange relation (but, for instance, cars blinking their lights). Now Marx takes the additional fact into his argument that the signal sent by the other commodities is the *symmetric* relationship of exchangeability.

Since exchangeability of wheat for iron also implies exchangeability of iron for wheat, the iron itself possesses that what it attests to the wheat (while, by contrast, the cars blinking their lights at me had most likely not forgotten to turn on their own headlights). In other words, this relationship between wheat and iron is the expression of an *equality*. It is a different equality than that which had been the focus of the first thought experiment. There, in 127:1, Marx referred to the equality of shoe polish, silk, gold, (and also iron) with each other as expressions of the exchange-value of the wheat. Now he refers to the equality between any one of these expressions, say iron, and the wheat itself.

What does this equation say?

Was besagt diese Gleichung?

↑ This is a surprising question, which seems more appropriate to literature critique than economics. Why is Marx interested in what the surface interactions “say”? Answer: he looks at the surface interactions in order to understand the relations of production that are reflected in and mediated by them. By asking what these interactions “say” he is investigating the messages filtering down to the private producers if the commodity traders on the surface routinely exchange their commodities.

Question 74 *Comment about the following critique of Marx: When Marx asks what is the meaning of the exchange relation between two commodities, he commits the error of treating the economy like a literary text. The actions of the economic agents must be causally explained, but any reflection about their “meaning” is an interpretation which does not help us understand what is really going on.*

That in two different things—in 1 quarter of wheat and in x lbs. of iron—exists a “common something” in the same quantity.

Daß ein Gemeinsames von derselben Größe in zwei verschiedenen Dingen existiert, in 1 Quarter Weizen und ebenfalls in a Ztr. Eisen.

↑ By exchanging their commodities, the market agents act as if their commodities, despite their different use-values, were equal. ↓ Since the messages which these exchange relations send down to the producers say that all commodities are equal, Marx concludes that, from the point of view of production, these commodities are indeed equal:

The two things are therefore equal to a third, which is in itself neither the one nor the other.

Beide sind also gleich einem Dritten, das an und für sich weder das eine noch das andere ist.

↑ This step from the surface expressions to the underlying relations is based on the assumption that the surface activity on the market is congruent with the structures in the hidden sphere of production. In other words: exchange, in which the commodities are treated as equals, can only then play the important role in the capitalist economy which it does play, if the commodities are not made equal through the exchange but already equal *before* being exchanged.

↓ Marx concluded from his first thought experiment that exchange-value is only a form of appearance of some content different from exchange-value, but he left the nature of this content unspecified. All we know is that it is some underlying social relation, presumably having to do with the production of the wheat. The second thought experiment allows him to say more about this content: it is some equal *substance* which the commodities contain already before they are exchanged. This greatly simplifies the task of understanding the exchange relations. All we need to know is: what is this substance, and how much of it is in each commodity? Marx formulates this idea as follows (and the use of the word “reduce” is significant here):

Each of the two, so far as it is exchange-value, must therefore be reducible to this third.

Jedes der beiden, soweit es Tauschwert, muß also auf dies Dritte reduzierbar sein.

↑ In the first edition, p. 19:1, and in *Value, Price, and Profit*, p. [mecw20]121:2, this sentence contains the additional clause that each must be reducible to this third *independently of the other* (my emphasis). This makes it clearer what Marx means with the word “reduce” here. It is the reduction of a relation *between* the things to a substance contained *within* each of the partners in the relation.

[Polygon Analogy]

↓ The next paragraph brings a metaphor clarifying this reduction.

127:3 A simple geometrical example may make this clear. In order to determine and compare the areas of polygons, one decom-

51:3 Ein einfaches geometrisches Beispiel veranschauliche dies. Um den Flächeninhalt aller gradlinigen Figuren zu bestim-

poses them into triangles. Every triangle is then reduced to an expression that is quite different than the triangle’s visible shape, namely, half the product of the base times the altitude $ba/2$.

↑ The clearest formulation of this polygon illustration can be found in *Value, Price, and Profit*, p. [mecw20]121:3. Here is my own explanation of the point Marx is trying to make. Polygons (i.e., figures bounded by straight lines) are related with each other in the following way: of two arbitrary polygons the first is either bigger than, smaller than, or equally large as the second. In order to show that polygon *A* is bigger than or equally large as polygon *B*, one might proceed as follows: cut polygon *A* into pieces and place these pieces on top of *B* in such a way that *B* is completely covered by them. Although this is a conceptually simple prescription, in practice this cutting can be a tricky geometrical exercise. There is indeed a procedure which can be implemented much more easily in practice. All one has to do is to measure the area of both polygons separately, by decomposing each into triangles and adding the areas of these triangles. These two numbers fully indicate which is bigger and by how much. The existence of such a procedure, which only requires one to look inside each polygon separately in order to know how they relate to each other, is what Marx means by the formulation that, for the purposes of this relation, “each is, independently of the other, reducible to a third.” ↓ After this metaphor, Marx announces what the next step in the derivation must be:

In the same way, it is our task to reduce the exchange-values of the commodities to a *common substance* of which they represent a greater or smaller amount.

men und zu vergleichen, löst man sie in Dreiecke auf. Das Dreieck selbst reduziert man auf einen von seiner sichtbaren Figur ganz verschiedenen Ausdruck—das halbe Produkt seiner Grundlinie mit seiner Höhe.

Ebenso sind die Tauschwerte der Waren zu reduzieren auf ein *Gemeinsames*, wovon sie ein Mehr oder Minder darstellen.

Question 77 *Marx argues that commodities are exchangeable only because they contain some common substance. Bailey denies this. He compares the exchange-value of commodities with the distance between points, which is not based on a commonality between the two points but is purely relative: “As we cannot speak of the distance of any object without implying some other object between which and the former this relation exists, so we cannot speak of the value of a commodity but in reference to another commodity compared with it. A thing cannot be valuable in itself without reference to another thing any more than a thing can be distant in itself without reference to another thing.” [mecw32]329:3. Comment.*

The identification of what this substance is (a substance which Marx calls “value,” see 128:4), will be the subject of the next passage, called here subsection 1.1.c. If such a substance can be found, this would explain why the exchange proportions between wheat and many other commodities are considered the exchange-value *of* the wheat: because they are reducible, in the sense just explained, to a substance inside the wheat itself. After Marx has found such a substance, his whole study of the value relations will be reduced to the study

of this substance. Whenever Marx speaks of the commodity “as values,” he is referring to this common substance inside the commodities.

Therefore a resolution can be offered to the contradiction Marx grappled with in the passage called here subsection 1.1.b, that exchange-value seems on the one hand intrinsic to the commodities, and on the other purely relative and accidental. Exchange-value seems intrinsic because it is the expression of a substance *inside* the commodities, and it seems relative because this expression takes the form of a *relation* between different commodities.

1.1.c. [From Value to Labor]

[Substance of Value has Nothing to do with Physical Matter]

After spending several paragraphs with the subtle and painstaking inference that exchange-value must be the expression of some common substance inside the commodities, the next paragraph seems to shatter this result again. In this paragraph, Marx comes to the conclusion that there can be no such substance inside the physical bodies of the commodities themselves. This conclusion is stated right at the beginning:

127:4–128:1 This common substance cannot be a geometrical, physical, chemical, or any other natural property of the commodities.

51:4–52:2 Dies Gemeinsame kann nicht eine geometrische, physikalische, chemische oder sonstige natürliche Eigenschaft der Waren sein.

[Argument in Value, Price, and Profit] *Value, Price, and Profit*, p. [mecw20]121:5/o, comes to this conclusion by the simple argument that exchange-value is social and therefore has nothing to do with the natural qualities of the things.

Question 78 *What is wrong with Marx’s argument in Value, Price, and Profit, why did he change his argument later?*

[Argument in the First edition of Capital] The First edition, p. 19:3, arrives at the same conclusion (and more) from a closer look at the character of the exchange relations. This argument starts with the observation that market relations represent an abstraction. This argument is then elaborated in the second and later editions, but we will first look at it in its version in the first edition. Marx’s writes here: That the substance of exchange-value is something quite independent and different from the physical-tangible existence of the commodity, or from the commodity’s determinate being as *use-value*, can be seen by a first glance at the exchange-proportion. It is exactly characterized by *abstraction from use-value*. For, if considered according to

Daß die Substanz des Tauschwerths ein von der physisch-handgreiflichen Existenz der Waare oder von ihrem Dasein als *Gebrauchswerth* durchaus Verschiedenes und Unabhängiges, zeigt ihr Austauschverhältniß auf den ersten Blick. Es ist charakterisirt eben durch die *Abstraktion vom Gebrauchswerth*. Dem Tauschwerth nach betrachtet

its exchange-value, one commodity is just as good as any other, as long as it is present in the right proportion.⁸

ist nämlich eine Waare grade so gut als jede andere, wenn sie nur in richtiger Proportion vorhanden ist.⁸

↑ As I already said, the main argument here is that the market exchange contains an abstraction. This “abstraction” does not mean that commodity traders disregard use-value when they make their exchanges! In chapter Two, 179:1, Marx will discuss the dilemmas for the commodity traders, who must reconcile their individual needs for use-values with the social constraints imposed by the exchange-values. But what matters at the present point in the derivation is that the market as a whole changes different use-values into each other, no use-values have special roles, none have a permanent footprint. The messages which the exchange relations on the market send to the producers, who watch the market in order to make their production decisions, do not single out particular use-values, all are the same. Whatever role the use-values may play in individual exchange decisions, it is not apparent to an observer of the overall exchange relations.

Question 79 *In 127:4–128:1, Marx says that the exchange relation is characterized by an abstraction from use-values. What does this mean? Explain it in such a way that your 12-year old would understand.*

Question 80 *Marx says that the exchange-relations are characterized by an abstraction from use-values. But use-values do affect the exchange proportions. If a use-value is in high demand compared to supply, then it commands a higher exchange-value. If a competitor brings out a better product, the firm’s own product may not sell any more. Can this be reconciled with the claim of abstraction from use-value?*

[Argument in the Second and later editions of Capital] In the later editions, this argument is broken up into three somewhat tedious steps taking up the rest of paragraph 127:4–128:1. (In the MEW edition and the translations, this paragraph is broken up because the Barbon quote was turned into a display quote. But Marx had originally written it as one solid paragraph.) If you are willing to accept the conclusion you may skip over the rest of this paragraph and continue with 128:2. For those with enough patience, here is the version of this argument as it is made in the most recent editions of *Capital*. The first step is the following:

The bodily properties of commodities enter the picture only in so far as they make the commodities useful, i.e., turn them into use-values.

Ihre körperlichen Eigenschaften kommen überhaupt nur in Betracht, soweit selbe sie nutzbar machen, also zu Gebrauchswerten.

The Moore-Aveling translation says: “Such properties claim our attention only in so far as they affect the utility of those commodities, make them use-values.” It is wrong to speak

here about “our” attention. Marx is not explaining why he as a researcher looks at the bodily properties of the commodities, but he investigates how the economic agents themselves relate to their

commodities. One might say that the translation turned an ontological question into an epistemological one.

↑ The bodily properties of a commodity are also relevant for *production*. But this does not concern the commodity traders in the sphere of circulation. For them, the bodily properties are only interesting to the extent that they affect the use-values of the finished products. ↓ But these use-values cannot contribute to the common substance which the commodities have as exchange-values, because it is exactly the purpose of exchange to replace one use-value by another. Marx calls this an abstraction:

On the other hand, however, it is exactly the abstraction from the use-values of the commodities which evidently characterizes their exchange relation.

Andrerseits aber ist es grade die Abstraktion von ihren Gebrauchswerten, was das Austauschverhältnis der Waren augenscheinlich charakterisiert.

In the French edition [mecw], the above sentence has two parts. The first half of the sentence speaks about the actions of the commodity traders:

But on the other hand it is evident that one abstracts from the use-value of the commodities when one exchanges them . . .

Mais d'un autre côté il est evident que l'on fait abstraction de la valeur d'usage des marchandises quand on les échange

Again, this cannot mean that the trading partners disregard the use-values, but that the act of exchange itself is an act of abstracting of the use-values, since it replaces one use-value by another. In the second half, Marx makes the transition from the individual acts of exchange to the exchange relations "themselves:"

. . . and that every exchange relation is itself characterized by this abstraction.

et que tout rapport d'échange est même caractérisé par cette abstraction.

When he writes that the exchange relations are "characterized by," Marx presumably refers to the information available to the producers from analyzing the multitude of exchange acts happening on the market. ↓ All one can see from looking at the exchange relations from afar is that the market allows any two use-values to be exchanged against each other. This is "evident" because of the following simple and well-known fact about the exchange relations:

In this exchange relation, one use-value is just as good as another, as long as it is present in the proper quantity.

Innerhalb desselben gilt ein Gebrauchswert grade so viel wie jeder andre, wenn er nur in gehöriger Proportion vorhanden ist.

↑ This short proof of Marx's subsidiary claim that the exchange-relations are characterized by an abstraction from use-values concludes the proof that use-value cannot enter the "common substance," and in the First edition, this paragraph ends here. ↓ In the Second edition, the paragraph is made longer. First Marx adds some quotes documenting that this abstraction from use-values has been observed in the literature:

Or, as old *Barbon* says, "One sort of wares are as good as another, if the values be equal. There is no difference or distinction in things of equal value."⁸

Oder, wie der alte *Barbon* sagt: „Die eine Warensorte ist so gut wie die andre, wenn ihr Tauschwert gleich groß ist. Da existiert keine Verschiedenheit oder Unterscheidbarkeit zwischen Dingen von gleich großem Tauschwert.“⁸

Footnote 8 gives the reference [Bar96, p. 53], and adds a different passage from the same

source [Bar96, p. 7], which again says that exchange relation make abstraction from use-values:

⁸ "One sort of wares are as good as another, if the values be equal. There is no difference or distinction in things of equal value . . . One hundred pounds worth of lead or iron, is of as great a value as one hundred pounds worth of silver and gold." (N. Barbon, l.c. pp. 53 and 7.)

⁸ „One sort of wares are as good as another, if the values be equal. There is no difference or distinction in things of equal value . . . One hundred pounds worth of lead or iron, is of as great a value as one hundred pounds worth of silver and gold.“ (N. Barbon, l.c. p. 53 u. 7.)

[Alternative Argument in the Second and later editions] ↓ Marx concludes the paragraph with an alternative short but very abstract proof that the common substance cannot have anything to do with use-value. The connection to the previous argument lies in the fact that commodities are exchanged because their use-values are qualitatively different. So far as they are exchange values, however, commodities can only have quantitative differences. These exchange-values can therefore not derive from their qualitatively different use-values. As use-values, commodities are, above all, of different qualities; as exchange-values they can only be of different quantities, and consequently do not contain an atom of use-value.

Als Gebrauchswerte sind die Waren vor allem verschiedner Qualität, als Tauschwerte können sie nur verschiedner Quantität sein, enthalten also kein Atom Gebrauchswert.

↑ This is an application of the general principle that two things which are quantitatively different must be qualitatively equal—since one cannot compare apples and oranges. It should be noted here that despite Marx's arguments here that value cannot come from use-value, neoclassical economics does derive value from use-value.

[Commodities Have Labor in Common]

This is again an impasse: the commodities must contain something equal, but this equal thing cannot have anything to do with their use-values. ↓ Marx resolves this with the bold assertion that there is only one other thing which the commodities have in common:

128:2 If we then disregard the use-value of commodities, they have only one property left, that of being products of labor.

52:3 Sieht man nun vom Gebrauchswert der Warenkörper ab, so bleibt ihnen nur noch eine Eigenschaft, die von Arbeitsprodukten.

↑ This is formulated as if one could reach this conclusion through a purely deductive thought process, i.e., as if abstraction from use-value would lead one immediately to labor as the only property left. In *Contribution* and in the first edition of *Capital*, however, Marx does not make the sweeping claim that labor is the *only* property left. In *Contribution*, 270:3/o, Marx says that the use-values traded as commodities have a dual character: on the one hand, they are means to support human life, and on the other, they are also the products of human life. While the first aspect does not give commonality to the commodities, the

second aspect does. In the first edition, 19:5, Marx first says that the common substance must be something *social* since it is not natural, and then he introduces labor—with a dash, and without the claim that this is the only possibility.

While the second and later editions of *Capital* formulate the transition to labor as if it was a logical necessity, they make even fewer efforts than the first edition or *Contribution* to give a *proof*. Obviously, the second and later editions do not bring all the possible arguments in favor of this conclusion. The transition to labor must therefore be considered an additional judgment about commodity producing societies, which is *related* to the earlier judgments, but cannot be *derived* from them. Although it is possible to read off the surface relations that exchange-value must be a form of appearance of something (which Marx calls value) located in a different sphere, these surface relations by themselves do not allow us to deduce where value is located and how it originates. The distinction between what the commodities themselves tell us and that what has to be found out by going beyond the sphere of circulation is also made in the manuscript 4:2, and in 166:2/o, Marx says: “Value ... does not have it written on its forehead *what* it is.”

Question 83 “Exchange-value cannot be anything other than the mode of expression, the ‘form of appearance’, of some substance distinguishable from it” (p. 127:1).

- a) How did Marx come to this conclusion by observing the exchange relations between commodities?
- b) What is this substance distinguishable from the exchange-value?
- c) Does mainstream economics distinguish between exchange-value and the substance expressed by exchange-value?
- d) Why is this substance equal for all commodities?
- e) How does Marx argue that this substance does not come from their use-values?
- f) How does Marx come to the conclusion that this substance comes from labor?

Since it was generally accepted in classical theory (the economic mainstream when Marx wrote) that there was a link between value and labor, Marx apparently did not find it necessary to bring more arguments that such a link exists. In *Contribution*, 275:1/o, Marx writes: Everybody understands more or less clearly that the relations of commodities as exchange-values are rather the relations of the persons to the productive activities of one another.

Es schwebt allen mehr oder minder vor, daß das Verhältnis der Waren als Tauschwerte vielmehr Verhältnis der Personen zu ihrer wechselseitigen produktiven Tätigkeit ist.

This does not mean that the labor theory of value itself was part of common consciousness. But as long as the labor theory of value was the consensus view among economic theorists, the pre-scientific reflection that labor must matter for the exchange-values of the goods had become common sense. Marx would probably have made a more forceful defense of the link between labor and value had he foreseen that eventually, such a link would become deeply discredited in mainstream economics.

Question 85 Why did Ricardo’s discovery of the determination of value by labor attract the following critique: “Mr. Ricardo’s system is one of discords ... its whole tends to the production of hostility among classes and nations ... His book is the true manual of the demagogue, who seeks power by means of agrarianism, war and plunder.” [Car48]

[Metaphor of the Corrosive Glare]

↓ Instead of spending many words on defending the labor theory of value, Marx builds on it. He emphasizes one aspect of it which the classical economists had ignored, namely, the *quality* of the labor which is reflected in value. The argument which follows next is Marx’s own; it cannot be found in the earlier versions of the labor theory of value in classical political economy.

However, the product of labor has already undergone a change in our hands.

Jedoch ist uns auch das Arbeitsprodukt bereits in der Hand verwandelt.

French edition, p. 22:1: “Mais déjà le produit de travail lui-même est métamorphosé à notre insu.”

Fowkes: “Even the product of labor has already been transformed in our hands.” Moore-Aveling has

an “itself” which is not in the German, but in the French.

↑ The phrase “in our hands” makes it clear that Marx is not yet talking about the quality of labor in the production process, but still about the products of labor traded on the market. Of course, these products themselves are not changed because the surface activity makes abstraction of their use-values. The change Marx is talking about here is one between the products of labor as seen by the surface agents, and the signals which the handling of these products on the surface sends to the private producers. But instead of saying: if abstraction is made from this and this on the market, then only that and that remains visible to the producers who take their cues from the market, Marx uses the metaphor of us, the readers, picking up the product with our hands and looking at it with a look that abstracts from its use-value, and the product itself changing because we look at it (as if our abstract glare had set it on fire).

↓ The next several sentences stay with this metaphor that “we,” the readers of *Capital*, change the products of labor by abstracting from their use-values. Marx proceeds slowly and thoroughly, first going from the use-value of the product of labor to its bodily forms:

If we abstract from the use-value of the product of labor, then we abstract at the same time from the bodily constituents and forms that make it a use-value.

Abstrahieren wir von seinem Gebrauchswert, so abstrahieren wir auch von den körperlichen Bestandteilen und Formen, die es zum Gebrauchswert machen.

↑ Here is the interpretation of this passage assuming that Marx uses the metaphor of the corrosive glare in order to describe the signals sent from the market to the producers observing the market. If the handling of the products of labor by the commodity traders makes abstraction of their use-values (this is a relationship between the commodity and its owner handling it on the surface) then this means for the products of labor themselves that

their bodily shapes and components have become irrelevant (this is the implication of this relationship for the commodity itself). The switch from the use-value to the bodily character of the thing seems pedantic—after all, in 126:1 Marx had obtained permission to ignore this distinction—but here it is necessary because it is a switch from the perspective of the consumers, who look at the commodities as use-values, to the perspective of the producers, for whom the commodities are things which need to receive certain useful bodily properties in the production process.

It is no longer a table, a house, yarn, or any other useful thing. All its sensual properties are extinguished.

Es ist nicht länger Tisch oder Haus oder Garn oder sonst ein nützlich Ding. Alle seine sinnlichen Beschaffenheiten sind ausgelöscht.

↑ The “it” in this last sentence is the product of labor. Of course, it is still relevant that the thing does have some useful properties, but due to the magic of the markets, which can turn every use-value into every other use-value, it no longer matters which useful properties a given product of labor has. (One might object here that some use-values are more in demand than others, but at the present stage of his derivation Marx does not yet talk about the mechanisms which bring supply and demand in line, but assumes instead that every use-value is needed.) ↓ Next, Marx discusses the implications for production: the abstraction from the bodily shapes and components of the product of labor makes the kind of labor irrelevant whose product it is:

It is therefore no longer the product of carpentry, masonry, spinning, or any other specific kind of productive labor.

Es ist auch nicht länger das Produkt der Tischlerarbeit oder der Bauarbeit oder der Spinnarbeit oder sonst einer bestimmten produktiven Arbeit.

To avoid confusion, the translation used the words “carpentry,” “masonry,” and “spinning,” and

stayed away from any composites which have “labor” in them. The choice of labors parallels the

sentence before last: “It is no longer a table, a house, yarn.”

↓ Although the question on the table is still: “how did the *products* of labor change in our hands?” the next long sentence no longer discusses the *products* of labor but the labor whose products are traded on the market. Along with the changes in the products of labor, the labor itself changes as well. This is an extension of Marx’s original metaphor: our abstract glare not only sets the products on fire but also retroactively modifies the labor which produced the products. This extension of the metaphor signifies an extension of Marx’s field of vision: he no longer limits himself to looking at the signals which the market sends to the producers, but he also looks at the producers’ reactions to these signals. If they see that all commodities on the market are treated as equals, regardless of the bodily shapes and components of these things, the producers’ reaction must be that they themselves disregard the differences between the labors producing these different useful things.

Along with the useful characteristics of the products of labor, the useful characteristics

Mit dem nützlichen Charakter der Arbeitsprodukte verschwindet der nützliche Cha-

of the various kinds of labor represented in them disappear.

rakter der in ihnen dargestellten Arbeiten, ...

↑ This only tells us what is erased by this abstraction, i.e., it tells us which aspects of labor do *not* contribute to the value of the product and therefore are considered irrelevant by the producers. ↓ But what remains? The assumption is here that something *must* remain. Exchange relations on the surface are real, they have causal powers. This causal power cannot come from nothing, there must be something real at the bottom of it. The reduction of the exchange relations on the surface to one common substance is not merely a way of thinking about these relations, but this common substance itself is real. It is real, but it is not a physical aspect of the bodies of the commodities. Instead, it is a physical aspect of the production process of the commodities—an aspect so tangible that everybody has first-hand experience of it whenever they work.

↓ To prepare the answer to the question what this tangible (and sometimes smelly) aspect of production is, Marx observes that the useful character of labor is not only what makes it productive of useful things, but it is also that aspect of labor which differentiates one kind of labor from another.

Therefore, also the different concrete forms of these labors disappear.

... es verschwinden also auch die verschiedenen konkreten Formen dieser Arbeiten,

↓ And since our abstraction erases that which makes the different labors different, what remains must be what all labor have in common:

They no longer differ from each other, but are altogether reduced to equal human labor, human labor in the abstract.

... sie unterscheiden sich nicht länger, sondern sind allzusamt reduziert auf gleiche menschliche Arbeit, abstrakt menschliche Arbeit.

↑ That what all human labors have in common is called here “human labor in the abstract,” which means, labor “indifferent towards the particular form of labor” (*Contribution*, 271:1). Marx also uses the formulation “equal human labor,” which contains the hint that this substance of value is something social (since equality is a relation between *different* labors). But the implications of this will not be unpacked until 129:2; for now the argument proceeds as if the value of a commodity came from the actual labor which produces that particular commodity.

Let us take stock again where we are. If the exchange relations on the surface abstract from the useful qualities of the products of labor, this has an impact on the private producers, who observe the market relations for their production decisions. It does not lead them to abstract from labor altogether, but it leads them to abstract from the characteristics which differentiate the different labors from each other. In other words, they are led to treat all labors as equal, as one homogeneous mass.

But it is possible for them to do this consistently and successfully only if the labors are indeed a homogeneous mass. The background assumption is here again that the system as a whole fits together, that the surface relations would have been modified or discarded if they did not fit together with the underlying production relations. The question arises therefore:

what do all the different activities which we call “labor” have in common? Language already anticipates that they have *something* in common since we are using the same word “labor” for them. (Marx remarks on this in the Introduction to *Grundrisse*, [mecw28]40:2/o.) At the present point, Marx does not answer this question other than by giving a name to that which is common to all labors (he calls it equal human labor or abstract human labor). But at this point we can only guess what this name refers to.

Question 86 Take two very different kinds of labor, such as teaching and construction work, and discuss in what respect they are equal.

This is the end of the corrosive glare metaphor, and also the end of the paragraph. This end is a little abrupt, since the reader is left wondering what it is that all human labors have in common. Marx will devote the entire section 2 of chapter One to this, but for now he returns from the short digression about what happens to the labor itself to his earlier, still unanswered question, namely, what happens to the *product* of labor if one abstracts from its use-value. Interspersed in this further development, however, is a brief remark which is relevant for the present digression about labor: In the middle of this next step in the derivation, at 128:3, Marx says that all labors are expenditures of human *labor-power*. This is, in a nutshell, what the labors themselves have in common. The presentation of the French edition of *Capital* is improved. In French, the term “labor-power” is introduced already at the end of this paragraph here, p. 22:1, where it belongs, with the words:

Only the common character of these labors remains: they are reduced to equal human labor, to an expenditure of human labor-power without consideration of the particular form in which it was spent.

Il ne reste donc plus que le caractère commun de ces travaux; ils sont tous ramenés au même travail humain, à une dépense de force humaine de travail sans égard à la forme particulière sous laquelle cette force a été dépensée.

In the French edition, therefore, the brief digression about the character of commodity-producing labor has a more satisfactory conclusion—while in the German and English editions this digression ends before the last step is made, this last step being supplied a little later as a side remark in the further development.

Question 87 Marx says that as use-values commodities do not contain an atom of value. Would he also say that the labor process does not contain an atom of abstract labor?

If Marx therefore inferred earlier that the ubiquitous exchanges on the surface must be guiding a production structure which keeps track of something equal in the commodities, and that this common substance cannot have anything to do with their use-values, he argues now that this substance must have to do with labor, but it cannot be *useful* labor but must be labor as expenditure of human labor-power.

Question 88 In 128:2, Marx says that the products of labor change if one disregards their use-value, and that this change in the products also causes the labor itself to change. Does this argument, in which the causal order of things seems exactly reversed, have any validity?

[The Value Quasi-Material]

The explanation of the quality of abstract labor as the expenditure of human labor-power is the deepest insight about value so far, but it is not the end of the current train in Marx’s argument. ↓ The next paragraph returns to the original question and tells us how the *product of labor* has changed. (Later, in 142:2, Marx emphasizes the necessity of this additional step from abstract labor to congealed abstract labor.) The products of labor, when bathed in the market’s corrosive abstractness, emerge as something quite different than their bodily shapes:

128:3 Let us consider now what remains of the products of labor. Nothing has remained of them except the same ghostlike material, ...

52:4 Betrachten wir nun das Residuum der Arbeitsprodukte. Es ist nichts von ihnen übriggeblieben als dieselbe gespenstige Gegenständlichkeit, ...

This is finally the answer to the question how the products of labor have been mutated in our hands. As exchange-values, the products of labor only count as the ghosts of the labor-power which was consumed during their production. Section 3, 138:2/o, picks up from here and shows that these ghosts will not rest until they find reincarnation in money, the second form which the commodity needs besides its natural form. And just as a ghost consists of matter which is not of this world—it can be seen but it interpenetrates with earthly matter—so do commodities, as values, consist of a non-physical yet material-like substance which Marx, literally, calls “value materiality” (*Wertgegenständlichkeit*). The definition of “materiality” (*Gegenständlichkeit*) as opposed to “material” (*Gegenstand*) is here: something which is like a material object without being a material object—just as the appellation “your royal highness” (*königliche Hoheit*) denotes someone who is elevated without sitting on a mountain. Marx’s term “(*Wertgegenständlichkeit*)” will therefore be translated with the clumsy but (as I understand it) precise expression “value quasi-material.”

In the first edition of *Capital*, 30:1, Marx says

In order to grasp linen as the material expression of mere human labor, one must disregard everything that actually makes it an object. The materiality of human—labor that is abstract, lacking further quality and content—is, of necessity, an abstract materiality, a *thing made of thought*. Thus, cloth woven from flax becomes a phantom spun by the brain.

Um Leinwand als bloß dinglichen Ausdruck menschlicher Arbeit festzuhalten, muß man von allem absehen, was sie wirklich zum Ding macht. Gegenständlichkeit der menschlichen Arbeit, die selbst abstrakt ist, ohne weitere Qualität und Inhalt, ist notwendig abstrakte Gegenständlichkeit, ein *Gedankending*. So wird das Flachsgewebe zum Hirngespinnst.

↑ This abstract materiality of labor is what we call here the value quasi-material.

Question 89 Is Marx’s concept of “value quasi-material” attached to commodities, but separate from their physical material, a metaphor? Is it a phantasy, an invention, which Marx needs to hold his labor theory of value together? Is Marx going overboard here? Or does the value quasi-material really exist?

According to the editors of MEGA in [Mar87a, p. 23*], this colorful formulation raised doubts whether Marx's analysis was indeed materialist; therefore the later editions of *Capital* express the same idea in more muted terms:

Question 90 Does Marx's "value quasi-material" (*Wertgegenständlichkeit*) have properties similar to physical matter?

... a mere congelation of undifferentiated human labor, i.e., of the expenditure of labor-power without regard to the form of its expenditure.

... eine bloße Gallerte unterschiedsloser menschlicher Arbeit, d.h. der Verausgabung menschlicher Arbeitskraft ohne Rücksicht auf die Form ihrer Verausgabung.

The metaphor "congelation" is significant. A congelation is an immobilized, frozen liquid. This metaphor indicates that the abstract labor spent in producing the commodity is still present as labor. In this respect, the abstract labor differs from the useful labor producing the commodity, which no longer exists as labor, but is objectified in the use-value of the commodity. Here are more details about this:

- The commodity as use-value is produced in a process in which the useful labor is used up. After the production process is finished, the useful labor no longer exists as labor but is sublated (*aufgehoben*) in its result (Marx uses the terminology that it is now *objectified* labor). In chapter Seven, p. 289:2, Marx gives an example where this process of sublation is incomplete: an inept laborer will remind the user of himself every time the product is used, by the flaws in the product. But the skillful laborer disappears behind the product.
- As value, however, the labor itself lingers on, it is accumulated in the commodity. It is what makes the commodity exchangeable. Marx calls it sometimes "crystallized," sometimes "congealed." This terminology indicates that the labor is no longer liquid, but it has also not disappeared into its product, it still exists *as labor*. The laborer who produced this product still remembers his labor and keeps track of it, because he needs the product as proof that he or she has performed this labor and is therefore entitled to the products of the labors of others. One can get this labor back out of the commodity and convert it into the congelation of a different kind of labor, by exchanging the commodity for some other commodity.

The fact that the abstract labor lives on in the commodity *as labor* is spelled out most clearly in Marx's draft manuscript for the second edition of *Capital*, published in [Mar87a, p. 32:4]:

What remains is a merely phantastic objectivity—objectivity of abstract human labor, *objective form* of abstract human labor, i.e., human labor, in a congealed state rather than a liquid state, in a state of rest rather than a

Was übrigbleibt ist eine rein phantastische Gegenständlichkeit—Gegenständlichkeit abstrakt menschlicher Arbeit, *gegenständliche Form* abstrakt menschlicher Arbeit, also menschliche Arbeit, statt in flüssi-

state of motion.

gem Zustand, in geronnenem Zustand, statt in der Form der Bewegung, in der Form der Ruhe.

But let us return to the text of the fourth edition:

These things represent nothing but that in their production human labor-power has been expended, human labor has been accumulated.

Diese Dinge stellen nur noch dar, daß in ihrer Produktion menschliche Arbeitskraft verausgabt, menschliche Arbeit aufgehäuft ist.

Marx does not write here: "the commodity embodies the labor" but "the commodity represents the labor." Compare 296:3/o. In other words, the commodity still vividly remembers that the expenditure of human labor was necessary to produce it, and it walks around telling everybody, "I am the product of social abstract labor." However the commodities say it in the only language they are capable of, by their exchange relations (compare 143:3/o).

As crystals of this social substance which they have all in common they are values—commodity values.

Als Kristalle dieser ihnen gemeinsamen gesellschaftlichen Substanz sind sie Werte—Warenwerte.

Question 92 In every society, production implies the expenditure of human labor-power. Value is the crystallization of abstract human labor, and abstract human labor is the expenditure of human labor power. Does this mean value is a category which applies to every society?

Two explanations are necessary here.

(1) In the above sentence, abstract labor is called a "social" substance, although from the development so far it would rather seem that it is a physiological substance. The social character of abstract human labor will be thematized in the next step of Marx's discussion, in 129:2.

(2) Marx does not say that commodities *have* value, but that they *are* values "as crystals of abstract human labor." On many future occasions, for instance in 134:2, Marx says that "as values," the commodities are crystals of abstract labor, or that in a commodity producing society, individuals treat their products "as values." Here is an attempt to explain this terminology. Value is a social relation. The typical social relation dictates that specific individuals must have certain kinds of interactions. The social relation "value" has a different implication for individual activity: everybody in society is compelled to act as if commodities, besides their physical body, also had some invisible material-like substance inside them, which is equal for all commodities (evidenced, for instance, by the price of the commodity). Value is therefore an object-like social relation, i.e., it has two contradictory aspects: on the one hand it is a social relation, on the other it is an object. If Marx speaks of it under the aspect of it being an object, he calls it "value quasi-material."

Marx is not satisfied with saying: "two commodities are exchangeable because both labors producing them are the expenditures of human labor-power." Instead he says: commodities are exchangeable because they are the congelations of abstract human labor. I.e., he derives

that what the commodities do from what the commodities are. This is an important additional step. Value is real. A price tag can be as effective as a brick wall in preventing access. People can, so to say, bump their heads against price tags. They can starve because of them. A price tag must therefore be the expression of *something*, a nothing cannot be so powerful. This something is abstract human labor, a real aspect of every labor process.

Exam Question 93 *What is value (according to Marx)?*

Since the concept of value was introduced in the above paragraph, it should be noted that Marx uses the word “value” in a very specific meaning. It does not refer to a “worth” or “relevance” of something to an individual, that can be defined in any society. It is that social property which makes things exchangeable in a commodity society. If in other societies certain things are generally highly “valued” (in the usual broad understanding of the concept), but they are not available for sale, Marx would not assign value to them. “Value,” as Marx is using this word, is not derived from worth, but from abstract social labor, and also does not express worth. Perhaps it is better to disregard the fact that Marx uses the word “value” for it, he might as well have used the acronym “CAL,” for “congealed abstract labor.” In other words, prices, for Marx, do not express intrinsic worth. On the contrary, the measurement of everything by abstract labor distorts society’s priorities. For a beginner, this central point of Marx’s theory is easy to misunderstand.

Question 94 *Use-value is the quality of the commodity, and exchange-value is its quantity. Right or wrong?*

1.1.d. [The Quantity of Value and Individual Differences]

Section 1.1.d (which is our name for the last part of section 1.1) and section 1.2 investigate value independently of its form. The difference between section 1.1.d and section 1.2 is that section 1.1.d discusses commodities of *one* kind, the *quantity* of value, and *individual* differences in competences and dexterity of the workers producing the *same kind* of product, while section 1.2 discusses commodities which are the products of *different kinds* of labor, the *quality* of value, and the reduction of skilled labor to simple labor.

We are at a turning point in our investigation. Until now we have dug deeper and deeper into the hidden structures underlying the exchange of commodities, in order to lay bare the value of a commodity and the substance of which value consists, namely, abstract human labor. From now on, the investigation is focused on value itself, not merely as that which explains the exchange-value, but in its own right.

This new beginning is marked by a short summary. This summary is not present in the first edition or the French edition, but the second edition, p. 72:3, contains it in exactly the same wording as the fourth edition. An earlier version of this paragraph is preserved in Marx’s preparatory notes for the second edition, p. 4:2. It will be useful to look at the beginning sentences of this draft first:

1. The Commodity

One has seen: The exchange relation itself of the commodities, or the form of their *exchange-value*, characterizes this exchange value as *abstraction from use-value*. This abstraction, if actually carried out, yields the *value*, as it was just determined.

Man hat gesehen: Das Austauschverhältniß der Waaren oder die Form ihres *Tauschwerths* selbst charakterisirt ihn als *Abstraktion vom Gebrauchswerth*. Die letztere, wenn wirklich vollzogen, ergiebt den *Werth*, wie er so eben bestimmt ward.

Warning, I went out on a limb with this translation here!

↑ Marx distinguishes here between those things which one can read off directly from the surface, and those which require digging. The exchange-relations themselves, through the form in which they appear on the surface, tell us that exchange-value is an abstraction. No digging required for that. But they cannot reveal the basis for this abstraction. To say it again: By looking at the exchange-relations we could see that all commodities are treated as equals, but the basis for this equality was not apparent from these exchange-relations. Additional research was necessary, which probed into deeper layers beneath the exchange relations on the surface, to find this basis. Marx refers to this second step of the derivation with the words “if this abstraction is actually carried out.” In this second step, the abstraction is no longer the negative act of disregarding certain aspects, but the positive act of identifying that which remains after these aspects have been disregarded, as Marx says in section 2, p. 134:3/o.

After this, we are in a better position to decipher this summary in its final version in the second and later editions. ↓ It is formulated in a contracted way, but Marx obviously still had the same reasoning in mind:

128:4 In the exchange relation of the commodities themselves, their exchange-value appeared to us as something quite independent from their use-values.

53:1 Im Austauschverhältnis der Waren selbst erschien uns ihr Tauschwert als etwas von ihren Gebrauchswerten durchaus unabhängiges.

↑ The commodities themselves, through their exchange-relations on the surface, are telling us that their exchange-value is an abstraction. “Appeared to us” is in the past tense because Marx refers here to his discussion in 127:4–128:1. ↓ But the commodities are not telling us what the basis of this abstraction is. To find this basis, we had to actively investigate the situation—not simply read off what was already apparent, but find the hidden influences beneath the surface phenomena:

Now if one really abstracts from the use-values of the products of labor, one obtains their value, as it was just determined.

Abstrahiert man nun wirklich vom Gebrauchswert der Arbeitsprodukte, so erhält man ihren Wert, wie er soeben bestimmt ward.

↑ This is a reference to and shorthand summary of the development in the two immediately preceding paragraphs, from the abstraction from use-values implied in the exchange relation in 128:2 to the homogeneous character of the “abstract human labor” represented in

the value of the commodities in 128:3. Marx writes here “value, *as it was just determined*” (my emphasis) because “value” is no longer a placeholder word for that which underlies exchange-value, as the word was used in the first edition in 19:4, but we know now what value is, it is congealed abstract labor.

The common substance which is represented in the exchange relation or exchange-value of the commodities is therefore their value.

↑ We have thus answered the question posed at the end of 127:3: what is the substance inside the commodities of which exchange-value is the form of appearance?

As our investigation proceeds, it will take us back to the exchange-value as the necessary mode of expression or form of appearance of value. For the present, however, we have to consider value independently of this form.

↑ The discussion of the forms of appearance of value can be found in section 1.3. But right now Marx is going to discuss quantity and quality of value, not its form. The remainder of section 1.1 focuses on the *quantity* of value (and the changes in its quantity), while section 1.2 takes another detailed look at its quality.

129:1 We saw that a useful article has commodity value only because abstract human *labor* is *objectified* or *materialized* in it.

Das Gemeinsame, was sich im Austauschverhältnis oder Tauschwert der Ware darstellt, ist also ihr Wert.

Der Fortgang der Untersuchung wird uns zurückführen zum Tauschwert als der notwendigen Ausdrucksweise oder Erscheinungsform des Werts, welcher zunächst jedoch unabhängig von dieser Form zu betrachten ist.

53:2 Ein Gebrauchswert oder Gut hat also nur einen Wert, weil abstrakt menschliche Arbeit in ihm *vergegenständlicht* oder *materialisiert* ist.

Fowkes translates it as “A use-value, or useful article, therefore has value only because...” Some readers may think here that “having value” in this sentence means to be ethically

valuable, and others my think that “value” is a short form for “use-value.” In the German, such confusion is warded off by the colloquial use of the indefinite article “*einen Wert*.” In the

translation, I tried to preclude this same confusion by suppressing the formulation “use-value” altogether and writing “commodity value” instead of “value.”

↑ Marx is no longer speaking about exchange-value here, but about value. Value manifests itself in exchange-value, i.e., it has real effects. Therefore it must itself be real. The above formulation reminds us that value is created in a real process, the production process, by the expenditure of human labor-power. After the end of the production process, when the labor-power has been spent, this expenditure of labor-power still exists—as value. The labor is not only (qua concrete labor) objectified in the product (meaning that it no longer exists as labor), but also, qua abstract labor, accumulated in the product and still present as labor (value is *congealed* labor). This congealed abstract labor is the common substance *inside* the commodities which manifests itself in the exchange relations, and to which these exchange relations *between* the commodities can be *reduced*. In the First edition, 38:1, Marx describes this reduction as follows:

Their *social* relation consists exclusively in counting for each other as only quantitatively different, but qualitatively equal (and therefore replaceable by one another and exchangeable with another) expressions of this social substance which they share.

Ihr *gesellschaftliches* Verhältniß besteht ausschließlich darin einander als nur quantitativ verschiedene, aber qualitativ gleiche und daher durch einander ersetzbare und mit einander vertauschbare Ausdrücke dieser ihrer gesellschaftlichen Substanz zu gelten.

Since values only differ quantitatively, Marx looks now how the magnitude of value is determined:

How, then, to measure the *magnitude* of this value?

Wie nun die *Größe* seines Werts messen?

The answer to this question will not given in one shot but will be developed step by step. The first step seems obvious:

By the *amount* of the value-constituting substance, i.e. labor, contained in the article.

Durch das *Quantum* der in ihm enthaltenen „wertbildenden Substanz“, der Arbeit.

↑ A useful article can exchange itself for other articles on the market because its production required part of society’s pool of abstract labor, just like the production of the other goods on the market. The question of the magnitude of value, i.e., the question of how much of this pool of abstract labor is represented by a given commodity, is decided by how much living labor was used in the production of this commodity.

Marx means here not only the *direct* labor content (labor input in the last production process making this specific commodity), but the *total* labor that went into the product and into the materials of which the product consists, and also a pro-rated portion of the labor needed to produce the machinery and buildings. This may complicate things in practice, but the principle seems simple enough: ↓ one just has to go into the factory with a stop watch.

The quantity of labor, again, is measured by its *duration*, the *labor-time*, which finds its standard of measurement in *well-defined pieces of time* like hour, day, etc.

Die Quantität der Arbeit selbst mißt sich an ihrer *Zeitdauer*, und die *Arbeitszeit* besitzt wieder ihren Maßstab an *bestimmten Zeitteilen*, wie Stunde, Tag usw.

In the previous sentence, Marx had said: the magnitude of value is measured by the *Quantum* of the labor contained in it. Now he says: the *Quantität* of labor itself is

measured by its duration. Both *Quantum* and *Quantität* are usually translated as quantity. The difference is subtle: a *Quantum* of something is that thing, considered

from its quantitative aspect (one might translate it as “amount”), while the quantity of the thing is this quantitative aspect itself.

Question 96 *Why is labor measured here by labor-time, and not by counting how many movements were made, or by the drops of sweat of the laborer, or by the discomfort of the laborer?*

↑ This seems an obvious and straightforward prescription. ↓ Nevertheless it leads to absurd results:

129:2 It might seem that if the value of a commodity is determined by the amount of labor spent in its production, the more lazy and inept the laborer, the more valuable his commodity would be, because more time would be required in its production.

53:3 Es könnte scheinen, daß, wenn der Wert einer Ware durch das während ihrer Produktion verausgabte Arbeitsquantum bestimmt ist, je fauler oder ungeschickter ein Mann, desto wertvoller seine Ware, weil er desto mehr Zeit zu ihrer Verfertigung braucht.

“It might seem that” is a better translation than: “some people might think that.” Also *Value*,

Price, and Profit has: it might seem that. It is not a subjective matter, not a matter of the

individual stupidity of the observer, but this semblance is baked into the reality itself.

Question 97 *Is it a character flaw to be lazy in an exploitive system?*

↑ Once again we ended up in an impasse. Let us recapitulate the argument. We observed that commodities, on the market, were treated as equals. Since they are not equal as physical objects, their only commonality being that they are products of labor, this equality must be the surface echo of the fact that in production, the labors producing these commodities count as equal. Of course, the producers can only then successfully and enduringly treat the different labors as equal if there is something actually equal in them. We found such a thing: the actual equality of all labor processes consists in all labor being the expenditure of human labor-power.

But when we tried to use this insight to determine the quantity of value, we ran into the paradox of the lazy or incompetent laborer. What did we overlook? We tried to explain a social relation by a physiological fact, i.e., we committed the error of reductionism. The physiological equality of all labor is the material basis, the *condition*, for the social relation of abstract labor, but it is not that social relation itself. In other words, the fact that all labors are the expenditure of human labor makes it *possible* for society to treat all labors as equal, but is by itself not yet this equal treatment. This equal treatment is a social act. Until now, human labor in the abstract had been introduced simply as the expenditure of human labor-power, without a social element. The lazy worker reminds us that abstract labor is indeed social.

By the way, in *Contribution*, the social character of abstract labor was thematized much earlier. Already during the introduction of abstract labor, in 271:1, Marx said that value-producing labor was not only abstract but also *general*, i.e., it transcended the individuality of the producers. But when Marx wrote *Capital*, he made no mention of this general character of abstract labor, although it was implicitly there (and hidden away) in the word “equal.” In *Contribution* 273:1, Marx introduces socially necessary labor-time, with much less fanfare than here, not triggered by an impasse as it is here in *Capital*.

On the other hand, if we look at the first edition of *Capital* 20:2, the argument until this point is identical to that in the later editions.

↓ The resolution of the impasse is therefore the reminder that the substance of value is equal human labor. Marx had already said in 128:2 that the substance of value is made up of

“equal human labor, human labor in the abstract,” but until now he had not drawn attention to the social relation hidden in the little word “equal.” Now is a good opportunity to make this point, because it is obvious to the reader that the labor of the slow worker produces less value per hour than that of the fast worker.

The labor, however, which constitutes the substance of value is equal human labor, expenditure of the same human labor-power.

Die Arbeit jedoch, welche die Substanz der Werte bildet, ist gleiche menschliche Arbeit, Verausgabung derselben menschlichen Arbeitskraft.

↑ It is easy to feel misled or entrapped here. First Marx lulls the reader into forgetting that he is not talking about concrete labor because he uses the word “labor” several times without the attribute “abstract” or “equal.” Then he makes a big fuss about it that he has arrived at an absurd result. Why didn’t he say the correct thing already at the beginning, which would have prevented the paradox of the lazy worker from cropping up? Why did Marx wait until now to explicitly address the social dimension of abstract labor, where the failure to do so hit him in the face with the paradox of the lazy worker? Here are some thoughts about this:

On the one hand, this paradox is a convincing reminder that equal labor is a *social* determination, that equality is a *relation* between different labors.

On the other hand, just as our theoretical development ran into the dilemma of the lazy worker, every commodity producer is confronted with this same dilemma in his or her daily practical activity. Commodity producers themselves do not know either how much value their commodity has, all they know is how much time their concrete labor takes. Nevertheless, their production decisions will ultimately lead to the outcome that exchange-values are governed by abstract social labor. The step from the concrete labor-time to the magnitude of value, which Marx brings here in his abstract derivation, must be made by them in their practical activity. Marx shows awareness of this connection when he says in 167:1/o that the quantitative movements of the exchange proportions force the producers to actually equalize their labors.

Finally, one might answer this question on merely stylistic terms: as long as Marx could wait until now, as long as his earlier derivation could proceed *without* mentioning that abstract human labor is really something social, it was ok not to mention it. Marx tries to make his derivation immanent; he follows the inner development of those determinations he has already found and does not take in new facts or new ideas until this immanent development requires it. This is more than just a matter of style; this “lazy” way of bringing in new arguments causes these arguments to be discussed at that point where they are relevant in practice.

Question 99 *Regarding the question how to measure the quantity of value, Marx first gives a wrong answer, which is based on an oversight, and then corrects it. Why doesn’t he give the right answer right away?*

The last sentence we just read in 129:2, which reminds the reader that abstract human labor is a social relation because it is “equal human labor,” is the very next sentence after

Marx makes the social character of equal labor drastically clear by the paradox of the lazy worker. But, as soon as Marx introduces this social character, he immediately shows how to get away from this social character again. Let us see how. In the above sentence, the transition from labor to labor-power is accompanied by a transition from “equal” to “same.” The labors are *equal* to each other because they are expenditures of one and the *same* human labor-power. Being expenditures of one and the same human labor-power explains why they are equal to each other—and now we no longer have to deal with the social relation of equality but with the glob of human labor-power from which these labors are derived. We reduced the social relation of equality to a substance, similar again to the polygon metaphor in 127:3.

↓ But if we look at this substance, we notice that this glob of human labor-power is composed of many individual labor-powers:

The total labor-power of society, which is represented in the values of the commodities produced by that society, counts here as one and the same human labor-power, although it is composed of innumerable individual labor-powers.

↓ The next question is therefore: how are the individual labor-powers, which have individual differences between them, combined to form this overall body constituting society’s aggregate labor-power? This is an issue that arises in every society. One rational way to resolve this might perhaps be to pair the unskilled workers with skilled workers who can train them. In computer issues, there are many mailing lists in which “newbies” can get advice from experienced technicians. In a market system, this combination is done on much harsher and more punitive terms: each individual labor-power makes its contribution to the whole only to the extent that it conforms to the social average.

Each of these individual labor-powers is the same human labor-power as any other, to the extent that it has the character of the average labor-power of society and takes effect as such, and therefore requires, for producing a commodity, no more labor-time than is necessary on an average, no more than is *socially necessary*.

↑ It cannot be otherwise in a market economy, in which the individual labors relate to each other only as equal labor.

In this last passage, the word “average labor-power” is used twice. What is an average labor-power? In its modern definition, the word “average” denotes the arithmetic mean of all actual labor processes. Such an approach to the computation of socially necessary labor-time was taken in [Fla83]. Although this is acceptable for a simplified mathematical model,

Die gesamte Arbeitskraft der Gesellschaft, die sich in den Werten der Warenwelt darstellt, gilt hier als ein und dieselbe menschliche Arbeitskraft, obgleich sie aus zahllosen individuellen Arbeitskräften besteht.

Jede dieser individuellen Arbeitskräfte ist dieselbe menschliche Arbeitskraft wie die andere, soweit sie den Charakter einer gesellschaftlichen Durchschnitts-Arbeitskraft besitzt und als solche gesellschaftliche Durchschnitts-Arbeitskraft wirkt, also in der Produktion einer Ware auch nur die im Durchschnitt notwendige oder *gesellschaftlich notwendige* Arbeitszeit braucht.

it should not be taken literally. Marx’s concept of “average” does not specify whether the median or the arithmetic mean or some other formula is meant. Mathematical formulas know nothing about the specific circumstances. It would be magic if a formula existed that could tell what the socially normal level is in every concrete circumstance. The question which labor process is socially necessary must be decided on a case-by-case basis. The fact that Marx wrote “*necessary* on the average” and not “*needed* on the average” is consistent with this interpretation that “average” is not an empirical category.

Question 100 *Imagine you were studying Marxism together with a friend, and the friend said to you: Doesn’t the labor theory of value imply that, the more lazy and inept the laborer, the more valuable his commodity would be? How would you answer your friend?*

Question 102 *Why is value determined by the labor-time needed under the socially average conditions of production, rather than by the best conditions of production attained in society?*

Question 103 *The value of the product is determined by the socially necessary labor-time. What are the implications of this for a capitalist supervising his employees?*

↓ In order to determine when a given production method is *socially necessary*, Marx looks at two things: the labor-power used (skill and intensity) and technology.

The labor-time socially necessary is that required to produce an article under the prevailing socially normal conditions of production and with the socially average degree of skill and intensity.

Gesellschaftlich notwendige Arbeitszeit ist Arbeitszeit, erheischt, um irgendeinen Gebrauchswert mit den vorhandenen gesellschaftlich-normalen Produktionsbedingungen und dem gesellschaftlichen Durchschnittsgrad von Geschick und Intensität der Arbeit darzustellen.

Later, in 303:1, Marx clarifies that the skill-level of the laborer and the intensity of the labor must be that which is normal *for the branch of production in question*.

Labor-power and technology enter the concept of socially necessary labor-time as follows:

- Regarding labor-power, different labor-powers are not exactly equal; and not every individual has the same talents, skills, or is putting in the same effort. But it is well known what the average is because most labor-powers *are* average. The reduction of a given labor-power to this average labor-power is made by the speed of the output (i.e., a labor-power that produces twice as fast as the average also produces twice the value).
- Regarding technology, that production method is the socially normal one which is prevalent and/or up to date. It is an abstraction from individual circumstances of production as well as from production methods which deviate from the norm. This notion of “necessary” is compatible with the fact that in an economy in which innovations are constantly made, some of the productive resources are of necessity always outdated.

Exam Question 104 *The value of a commodity does not increase if it is made by a slow or inept laborer. Explain carefully why not. Whose decision is it to keep the value of the output of a slow worker below the time actually used for its production? How is it enforced?*

Socially necessary labor-time is therefore a well-defined concept, but as the word already indicates, it is not identical to the labor-time actually used. The following example illustrates this difference:

The introduction of power looms into England probably reduced by one half the labor required to weave a given amount of yarn into cloth. The English hand-loom weavers, as a matter of fact, continued to require the same time as before; but after the change, the product of one hour of their individual labor represented only *half* an hour's social labor, and consequently fell to one-half its former value.

Nach der Einführung des Dampfwebstuhls in England z.B. genügte vielleicht halb so viel Arbeit als vorher, um ein gegebenes Quantum Garn in Gewebe zu verwandeln. Der englische Handweber brauchte zu dieser Verwandlung in der Tat nach wie vor dieselbe Arbeitszeit, aber das Produkt seiner individuellen Arbeitsstunde stellte jetzt nur noch eine *halbe* gesellschaftliche Arbeitsstunde dar und fiel daher auf die Hälfte seines frühern Werts.

In this example, the socially necessary labor-time is not the average of the old and new production methods, but the labor-time required by the new method. Why? Because power loom weaving is not only much cheaper production but also production on a much larger scale, so that hand weavers simply cannot coexist. In the Machinery chapter, p. 557:1/oo, Marx elaborates on this example in a way which makes the brutality of the reign of socially necessary labor-time much more explicit.

Now Marx summarizes his findings:

129:3/o That which determines the magnitude of the value of any article is therefore only the amount of *socially necessary labor*, or the *labor-time socially necessary for its production*.⁹

54:1 Es ist also nur das *Quantum gesellschaftlich notwendiger Arbeit*, oder die zur *Herstellung eines Gebrauchswerts gesellschaftlich notwendige Arbeitszeit*, welche seine Wertgröße bestimmt.⁹

The footnote cites an early source which expresses this concept of socially necessary labor very clearly.

⁹ "The value of them (the necessities of life), when they are exchanged the one for another, is regulated by the quantity of labor necessarily required, and commonly taken in producing them." [Ano39, p. 36] This remarkable anonymous work written in the eighteenth century bears no date. Its content makes it clear, however, that it appeared in the reign of George II about 1739 or 1740.

⁹ „Der Wert von Gebrauchsgegenständen, sobald sie gegeneinander ausgetauscht werden, ist bestimmt durch das Quantum der zu ihrer Produktion notwendig erheischten und gewöhnlich angewandten Arbeit.“ [Ano39, p. 36] Diese merkwürdige anonyme Schrift des vorigen Jahrhunderts trägt kein Datum. Es geht jedoch aus ihrem Inhalt hervor, daß sie unter Georg II., etwa 1739 oder 1740, erschienen ist.

Exam Question 105 *Carefully explain how the “socially necessary labor-time” for the production of an article is determined. Is it the same as the time needed in the average to produce this article?*

Question 106 *Did Marx introduce additional assumptions in order to resolve the paradox of the lazy worker, or does his solution follow from assumptions made or results derived in section 1.1.d?*

Question 107 *Marx argues in chapter One that the quantity of value is determined by socially necessary labor-time. Does this mean the exchange-proportions between commodities must be proportional to the socially necessary labor-time necessary to produce these commodities?*

At the level of chapter One, which discusses commodity production in general, not yet capitalism, socially necessary labor is the *measuring stick* of the extent to which individual labor creates value. Under capitalism this measuring stick becomes a real *limit*:

The capitalist sees to it that he (the worker) . . . only uses as much labor-time as is necessary in the average for the production of the product. (*Results* 1010:1/o, related also 1020:3).

A worker who is slower than the others will not find a job in capitalism.

After his discussion of socially necessary labor-time, Marx gives an alternative, quite different argument why the labor necessary under normal circumstances, instead of the actual labor used, determines the value of a product.

The individual commodity counts here generally as an average sample of its kind.¹⁰ Die einzelne Ware gilt hier überhaupt als Durchschnittsexemplar ihrer Art.¹⁰

↑ Marx writes “here generally” (*hier überhaupt*), because commodities count as average samples of their kind not only with respect to labor-time, but also with respect to their use-values, etc. See 200:4/o and 317:4/o. ↓ One can also find this in the literature:

¹⁰ “All products of the same kind in fact form only one mass, the price of which is determined generally and without regard of the particular circumstances.” Le Trosne, [LT46, p. 893]

¹⁰ „Alle Erzeugnisse der gleichen Art bilden eigentlich nur eine Masse, deren Preis allgemein und ohne Rücksicht auf die besonderen Umstände bestimmt wird.“ Le Trosne, [LT46, p. 893]

This alternative argument is very brief, but easily elaborated. Even if the socially necessary labor-time is not actually contained in a particular article for sale, it usually is contained in the majority of other articles which have the same use-value. And as long as the use-values are identical, the buyers will not pay a higher price for one than for the other. An exceptionally slow worker must therefore compete with identical articles made by average laborers, therefore he cannot fetch a better price than they.

Isn't this a much clearer and more convincing argument than the earlier abstract reasoning about socially necessary labor-time? Why didn't Marx make this the centerpiece of his

discussion? Answer: because this alternative argument stays entirely on the surface of the economy, in the competition between the different goods brought to the market. Marx says again and again that knowledge of these competitive mechanisms is not necessary, that the basic character of capitalism can be derived without looking at competition. The derivation of socially necessary labor earlier in this subsection can therefore be viewed as the derivation of a result which is familiar to all of us because it is the competitive outcome from the basic organization of production in capitalism, but the derivation proceeds without resorting to competition. Marx says more explicitly, as a side remark in chapter Fourteen, 464:1/o, that the extraneous competitive interactions force the producers to adhere to the law of socially necessary labor-time (a basic law of capitalism which does not derive from competition):

In the production of commodities generally, the labor-time expended on a commodity must not exceed that which is socially necessary for its production. This takes the form of an external compulsion by competition, since, in the surface interactions, each individual producer is obliged to sell his commodity at its market-price.

Daß auf eine Ware nur die zu ihrer Herstellung gesellschaftlich notwendige Arbeitszeit verwandt wird, erscheint bei der Warenproduktion überhaupt als äußerer Zwang der Konkurrenz, weil, oberflächlich ausgedrückt, jeder einzelne Produzent die Ware zu ihrem Marktpreis verkaufen muß.

Marx stresses on various places throughout his economic writings, for instance in 433:1, that competition, i.e., the interaction of the economic agents on the surface, *enforces* the laws of “capital in general,” but these laws cannot be *derived* from competition. Rather they must be derived from an analysis of the economic core structure itself, from what Marx calls the “immanent laws of capitalist production” or the “inner nature of capital.”

Question 108 What does Marx mean with the statement that “the individual commodity must here generally be considered as an average sample of its kind”? Give examples. Also try to give a reasoning why Marx’s statement might be true.

Question 109 The magnitude of value is not determined by the labor-time actually in the product, but by the labor-time socially necessary to produce the product, because on the market, a product made under exceptional circumstances is indistinguishable from a product made under normal circumstances.

Is this Marx’s argument? If you think it is, don’t answer this question but go back and re-read the text. If you agree that it is not, this question is for you: Why did Marx not make the above simple argument?

Next, Marx summarizes the results of his derivation:

Commodities, therefore, in which equal amounts of labor are embodied, or which can be produced *with the same labor-time*, have *the same magnitude of value*. The value of one commodity is to the value of

Waren, worin gleich große Arbeitsquantia enthalten sind oder die in *derselben Arbeitszeit* hergestellt werden können, haben daher *dieselbe Wertgröße*. Der Wert einer Ware verhält sich zum Wert jeder andren Ware

any other, as the labor-time necessary for the production of the one is to that necessary for the production of the other. “As values, all commodities are only greater or smaller amounts of *congealed labor-time*.”¹¹

¹¹ K. Marx, l.c., p. 6

This last sentence is a literal quote from *Contribution* 271:2/o, with the only difference that *Contribution* wrote “exchange-value” instead of “values.”

After this determination of the magnitude of value, Marx discusses now circumstances under which this magnitude changes:

130:1/o The value of a commodity remains constant as long as the labor-time required for its production also remains constant. But the latter changes with every variation in the *productive power of labor*. The productive power of labor is determined by many different circumstances, such as the workers’ average degree of skill, the level of development of science and of its technological applicability, the social organization of the production process, the extent and effectiveness of the means of production, the conditions found in the natural environment, and others.

With so many factors affecting the value of a commodity, one should not expect it to be constant for long. Agriculture is a notorious example:

For example, the same quantity of labor is present in eight bushels of wheat in favorable seasons and in only four bushels in unfavorable seasons.

In a second example, Marx discusses the value of raw materials:

The same quantity of labor provides more metal in rich mines than in poor. Diamonds are of very rare occurrence on the earth’s surface, and hence their discovery requires *on an average* a great deal of labor-time. Consequently they represent much labor in a small volume.

wie die zur Produktion der einen notwendige Arbeitszeit zu der für die Produktion der andren notwendigen Arbeitszeit. „Als Werte sind alle Waren nur bestimmte Maße *festge-ronnener Arbeitszeit*.“¹¹

¹¹ K. Marx, l.c., p. 6

54:2/o Die *Wertgröße* einer Ware bliebe daher konstant, wäre die zu ihrer Produktion erheischte Arbeitszeit konstant. Letztere wechselt aber mit jedem Wechsel in der *Produktivkraft der Arbeit*. Die Produktivkraft der Arbeit ist durch mannigfache Umstände bestimmt, unter anderen durch den Durchschnittsgrad des Geschickes der Arbeiter, die Entwicklungsstufe der Wissenschaft und ihrer technologischen Anwendbarkeit, die gesellschaftliche Kombination des Produktionsprozesses, den Umfang und die Wirkungsfähigkeit der Produktionsmittel, und durch *Naturverhältnisse*.

Dasselbe Quantum Arbeit stellt sich z.B. mit günstiger Jahreszeit in 8 Bushel Weizen dar, mit ungünstiger in nur 4.

Dasselbe Quantum Arbeit liefert mehr Metalle in reichhaltigen als in armen Minen usw. Diamanten kommen selten in der Erdrinde vor, und ihre Findung kostet daher *im Durchschnitt* viel Arbeitszeit. Folglich stellen sie in wenig Volumen viel Arbeit dar.

Question 112 *How is the value of raw materials determined in Marx's theory? How does the scarcity of these materials influence their value? Is Marx's argument still valid in the case of an exhaustible resource, which is present only in finite supply?*

According to a naive neoclassical approach, natural scarcity affects the price in the following way: supply is limited, and therefore a high price is necessary to keep demand in line with supply. Marx postulates a different mechanism: due to the natural scarcity of the materials, a lot of labor is needed to extract the materials, and the high price is a reflection of this quantity of labor.

Next Marx gives empirical evidence which seems to contradict his own thesis: namely, that market prices of scarce materials are *below* their labor content. The "Jacob" he refers to here is [Jac31, Vol. 2, p. 101].

Jacob questions whether gold has ever been paid for at its full value. This applies still more to diamonds. According to *Eschwege*, the total product of the Brazilian diamond mines for the eighty years ending in 1823 still did not amount to the price of 1 1/2 years' average product of the sugar and coffee plantations of the same country, although the diamonds represented much more labor, therefore more value.

Jacob bezweifelt, daß Gold jemals seinen vollen Wert bezahlt hat. Noch mehr gilt dies vom Diamant. Nach *Eschwege* hatte 1823 die achtzigjährige Gesamtausbeute der brasilischen Diamantgruben noch nicht den Preis des 1 1/2jährigen Durchschnittsprodukts der brasilischen Zucker- oder Kaffeeplantagen erreicht, obgleich sie viel mehr Arbeit darstellte, also mehr Wert.

Marx does not explain why there is a discrepancy between labor content and market price. Like all laws, the law that the magnitude of value is set by the quantity of labor is only a tendential law, whose effect may be modified or blocked by other effects. This itself is nothing remarkable. But it is relevant that in this case prices are *below* instead of above labor content. If scarcity were to affect prices directly, i.e., through deficient supply, rather than through labor content, then one should expect prices of scarce materials to be above their values. In his "Notes to Wagner" [mecw24]536:8/o, Marx discusses situations in which a commodity is scarce, in which case, he says, their prices are above values. Since in the present situation prices are below their values determined by their labor content, scarcity cannot have been the reason for these prices.

Question 113 *After claiming that the value of scarce goods is determined by labor-time, Marx brings the example where one scarce good, gold, historically never has traded at prices proportional to the labor-time embodied in it. What is Marx trying to prove with this counterexample to his own theory?*

At the end, Marx returns from the discussion of raw materials to the discussion of technical change in general. Diamonds lend themselves well to this transition, since industrial production of diamonds is thinkable.

With richer mines, the same quantity of labor would represent itself in more diamonds, and their value would fall. If man succeeded, without much labor, in transforming carbon into diamonds, their value might fall below that of bricks.

Technological progress induces a discrepancy, even a contradiction between value and real wealth:

In general, the greater the productive power of labor, the less the labor-time required to produce an article, the lower the mass of labor crystallized in that article, and the lower its value. Inversely, the lower the productive power of labour, the greater the labor-time necessary to produce an article, and the greater its value. The value of a commodity, therefore, varies directly as the quantity, and inversely as the productive power, of the labor which comes to fruition in the commodity.

Mit reichhaltigeren Gruben würde dasselbe Arbeitsquantum sich in mehr Diamanten darstellen und ihr Wert sinken. Gelingt es, mit wenig Arbeit Kohle in Diamant zu verwandeln, so kann sein Wert unter den von Ziegelsteinen fallen.

Allgemein: Je größer die Produktivkraft der Arbeit, desto kleiner die zur Herstellung eines Artikels erheischte Arbeitszeit, desto kleiner die in ihm kristallisierte Arbeitsmasse, desto kleiner sein Wert. Umgekehrt, je kleiner die Produktivkraft der Arbeit, desto größer die zur Herstellung eines Artikels notwendige Arbeitszeit, desto größer sein Wert. Die Wertgröße einer Ware wechselt also direkt wie das Quantum und umgekehrt wie die Produktivkraft der sich in ihr verwirklichenden Arbeit.

With changes of productive powers of labor, the relationship between the use-value and the value of a commodity changes. It is therefore fitting that this section concludes with some more general remarks about the relationship between use-value and exchange-value.

131:1 A thing can be a use-value without being a value. This is the case whenever labor is not necessary to mediate its utility to man. Air, virgin soil, natural meadows, unplanted forests, etc. A thing can be useful, and a product of human labor, without being a commodity. He who satisfies his own need with the product of his own labor creates use-values, but not commodities. In order to produce the latter, he must not only produce use-values, but use-values for others, social use-values. {And not merely for others. The medieval peasant produced a grain-rent for the feudal lord and a grain-tithe for the priest; but neither the grain-rent nor the grain-tithe became commodities simply by being produced for others. In

55:1 Ein Ding kann Gebrauchswert sein, ohne Wert zu sein. Es ist dies der Fall, wenn sein Nutzen für den Menschen nicht durch Arbeit vermittelt ist. So Luft, jungfräulicher Boden, natürliche Wiesen, wildwachsendes Holz usw. Ein Ding kann nützlich und Produkt menschlicher Arbeit sein, ohne Ware zu sein. Wer durch sein Produkt sein eigenes Bedürfnis befriedigt, schafft zwar Gebrauchswert, aber nicht Ware. Um Ware zu produzieren, muß er nicht nur Gebrauchswert produzieren, sondern Gebrauchswert für andre, gesellschaftlichen Gebrauchswert. {Und nicht nur für andre schlechthin. Der mittelalterliche Bauer produzierte das Zinskorn für den Feudalherrn, das Zehntkorn für den Pfaffen. Aber weder Zinskorn

order to become a commodity, the product must be transferred to the other person, for whom it serves as a use-value, through the medium of exchange.} ^{11a} Finally, nothing can be a value without being an object of utility. If the thing is useless, so is the labor contained in it; the labor does not count as labor, and therefore does not create value.

Part of this passage was written by Engels:

^{11a} [Note by Engels to the fourth German edition:] I have inserted the passage between braces because, through its omission, the misconception has very frequently arisen that Marx regarded every product consumed by someone other than the producer a commodity.

This remark about the relationship between use-value and exchange-value concludes section 1.1. Here is a related passage from *Capital III*, 786:1:

Use-value is the carrier of exchange-value, but not its cause. If the same use-value could be obtained without labor, it would have no exchange-value, yet it would retain, as before, the same natural usefulness as use-value. On the other hand, a thing cannot have exchange-value without having use-value, i.e., without being such a natural carrier of labor.

The second sentence in this excerpt argues that the use-value is not the cause of exchange-value, since there are use-values which are not exchange-values, and the third sentence argues that it is the carrier, because there are no exchange-values without a use-value.

In the first edition, 21:2, the following paragraph follows now, which introduces the subject of section 1.2:

We know now the *substance* of value. It is *labor*. We know the *measure of its magnitude*: it is *labor-time*. Its *form*, which is what makes the *value* an *exchange-value* remains to be analyzed. But first, the determinations which we have already found must be developed a little more closely.

noch Zehntkorn wurden dadurch Ware, daß sie für andre produziert waren. Um Ware zu werden, muß das Produkt dem andern, dem es als Gebrauchswert dient, durch den Austausch übertragen werden.} ^{11a} Endlich kann kein Ding Wert sein, ohne Gebrauchsgegenstand zu sein. Ist es nutzlos, so ist auch die in ihm enthaltene Arbeit nutzlos, zählt nicht als Arbeit und bildet daher keinen Wert.

^{11a} Note zur 4. Aufl.—Ich schiebe das Eingeklammerte ein, weil durch dessen Weglassung sehr häufig das Mißverständnis entstanden, jedes Produkt, das von einem andern als dem Produzenten konsumiert wird, gelte bei Marx als Ware.—F.E.

So ist der Gebrauchswert überhaupt Träger des Tauscherts, aber nicht seine Ursache. Derselbe Gebrauchswert, könnte er ohne Arbeit verschafft werden, hätte keinen Tauschwert, behielte aber nach wie vor seine natürliche Nützlichkeit als Gebrauchswert. Andererseits aber hat ein Ding keinen Tauschwert ohne Gebrauchswert, also ohne solchen natürlichen Träger der Arbeit.

Wir kennen jetzt die *Substanz* des Werths. Es ist die *Arbeit*. Wir kennen sein *Größenmaß*. Es ist die *Arbeitszeit*. Seine *Form*, die den *Werth* eben zum *Tausch-Werth* stempelt, bleibt zu analysiren. Vorher sind jedoch die bereits gefundenen Bestimmungen etwas näher zu entwickeln.

1.2. Double Character of the Labor Represented in Commodities

After an introductory paragraph, Marx first discusses labor producing use-value and then labor producing value. He looks at the latter both from qualitative and quantitative angles.

131:2/o Originally, the *commodity* appeared to us as something *two-edged*, use-value *and* exchange-value.

56:1 Ursprünglich erschien uns die *Ware* als ein *Zwieschlächtiges*, Gebrauchswert *und* Tauschwert.

The original use of *zwieschlächtig* is *zwieschlächtiges Schwert* (two-edged sword), hence the translation “two-edged.” Here is the Moore Aveling translation: “At first sight a commodity presented itself to us as a complex of two things—use-value and

exchange-value.” It should not be called “a complex,” since the connection between the two does not strike the eye “at first sight”; at first sight, there is more likely to be a confusing muddle between the two. Use-value and exchange-value can also not be called “things,” “moments” or

“edges” is more adequate. The words “moments” (as in angular moments) or “edges” (as in the two edges of a sword) imply that one cannot exist without the other (value cannot exist without use-value), while “things” has the connotation that both can exist separately.

↑ This two-edged character of the commodity is easy to see. Everybody handling commodities on the surface of the economy has to grapple with it. ↓ But the following observation is not immediately obvious from surface experience:

Later on, it turned out that also the labor, so far as it finds expression in value, no longer possesses the same characteristics which belong to it as creator of use-values.

Später zeigte sich, daß auch die Arbeit, soweit sie im Wert ausgedrückt ist, nicht mehr dieselben Merkmale besitzt, die ihr als Erzeugerin von Gebrauchswerten zukommen.

Question 115 *If the product is different, then the labor producing this product must be different as well. Isn't this obvious? Why does Marx act as if this was a scientific insight?*

↑ Note that Marx has switched from “exchange-value” in the first sentence of the paragraph to “value.” Marx refers here to the analysis in 128:2 starting with the words “the product of labor has already undergone a change in our hands.” Most of that earlier analysis had focused on the common substance which the *products* of labor have as values, but starting in the middle of 128:2 until the end of that same paragraph Marx had also said something about the labor producing these commodities. The present section looks at this labor in much more detail.

One of the emphases of the earlier analysis was that the social value quasi-material inside the products is real. These Annotations tried to make this palpable by saying it is as real as a brick wall. The analogy of a brick wall is even strengthened in the present section, because Marx argues here that, just like a brick wall, the value quasi-material has to be produced by a real process. The labor process must therefore accomplish two things at the same time. On the one hand, it produces the use-value of the commodity, and on the other it also produces

this value quasi-material. The present section shows that these two goals are not in harmony with each other, because they depend on different aspects of the labor process. The French version of the above sentence, p. 25:1, defines this disharmony more explicitly than the German:

Later on, we saw that all the characteristics which distinguish the labor producing use-values disappear as soon as the labor expresses itself in value.

The fact that the labor process has two conflicting goals is an important characteristic of capitalism:

I was the first to critically prove¹² this twofold nature of the labor contained in commodities.

¹² l.c., pp. 12, 13, and passim

↑ The reference in the footnote is *Contribution*, p. 276:1–277.

Ensuite nous avons vu que tous les caractères qui distinguent le travail productif de valeurs d'usage disparaissent dès qu'il s'exprime dans la valeur proprement dite.

Diese zwieschlächtige Natur der in der Ware enthaltenen Arbeit ist zuerst von mir kritisch nachgewiesen worden.¹²

¹² l.c. p. 12, 13 und passim

Question 117 How did Marx “critically prove” (131:2/o) that labor under capitalism has a two-edged character?

Marx considers this as one of the most important points in *Capital*. In a letter to Engels dated August 24, 1867 he writes:

The best in this book is, 1., (and this is what *all* understanding of the FACTS is based upon) the *double character of labor*, according to whether it expresses itself in use-value or exchange-value, which I emphasize already in the *first* chapter.

In the next sentence now in *Capital*, the importance of this point is emphasized as well: Since this point is pivotal for an understanding of political economy, it will be explained here in more detail.

Why is this such a pivotal insight? Although the value of the commodities is not physical—it is only a quasi-material and not a material—one should not say it is a social fiction. It has a physical basis because the process which creates value is a physical process. Value is a social relation which has a material basis, and with the two-fold character of labor Marx addresses this material basis.

1.2.a. [A Closer Look at Useful Labor]

132:1 Let us take two commodities such as a coat and 10 yards of linen. Assume the

56:2 Nehmen wir zwei Waren, etwa einen Rock und 10 Ellen Leinwand. Der erste-

1. The Commodity

former has double the value of the latter, so that, if 10 yards of linen = W , the coat = $2W$.

Marx begins with two arbitrary commodities with different use-values. In the right proportions they can be exchanged against each other. But for the discussion that follows it is not necessary that they have equal values; in the example the coat has twice the value of the linen. For the discussion of use-values it would not even be necessary to look at two commodities, one would be enough. And indeed, Marx focuses here on the coat:

132:2 The coat is a use-value that satisfies a particular want.

(Of course, linen is a use-value too.)

To bring it into existence, a *specific sort of productive activity* is necessary, specified by its purpose, mode of operation, object, means, and result.

re habe den zweifachen Wert des letzteren, so daß, wenn 10 Ellen Leinwand = W , der Rock = $2W$.

56:3 Der Rock ist ein Gebrauchswert, der ein besonderes Bedürfnis befriedigt.

Um ihn hervorzubringen, bedarf es einer *bestimmten Art produktiver Tätigkeit*. Sie ist bestimmt durch ihren Zweck, Operationsweise, Gegenstand, Mittel und Resultat.

The word that is translated with “bring into existence” is in German “*Hervorbringen*” (bring forward). “Bring forward” is the

etymological meaning of “produce”: pro is forward, and ducere is to lead. This choice of words signals a transformational

view of production: production is not the creation of something new, but it only “brings forward” what is already there.

↑ Coats do not grow on trees. They cannot exist without “productive activity.” The word “productive activity” refers to the purposeful and conscious activity which only humans can perform, see 283:2/o. In chapter Seven, Marx will discuss this activity in more detail. At the present point, the double character of labor is discussed as a necessary implication of the commodity relation. In chapter Seven, it will be discussed as the deliberate procedure how to exploit the laborer. Presently Marx is making a comparison: he highlights those aspects of labor which are different if the activity is seen as the production of use-values than if seen as the production of value. The first point picked out by Marx is that for the production of use-value, each such productive activity must be very specific. It must satisfy certain conditions without which the desired use-value simply will not materialize. What is translated here with “specification” is in German the Hegelian “determination.” Marx brings five such determinations or specifications defining the labor process producing coats. The first is its purpose: “What do I want to get done?” The next question is: “What kind of activity is necessary to achieve this?” Hence, “What to work on, and what to work with?” And finally, “Are my efforts yielding the desired result?” If not, the labor process must be modified until it does. In 295:4/o Marx reiterates that these are the aspects of human productive activity.

Question 121 Can you think of determinants of the labor process which do not belong to it as useful labor?

↓ The rest of the paragraph defines the terminology. (a) Whenever we refer to labor under the aspect of the usefulness of its product, we call it “useful labor.”

The labor whose usefulness represents itself in the use-value of its product, or in the fact that its product is a use-value, will simply be called *useful labor*.

Die Arbeit, deren Nützlichkeit sich so im Gebrauchswert ihres Produkts oder darin darstellt, daß ihr Produkt ein Gebrauchswert ist, nennen wir kurzweg *nützliche Arbeit*.

The phrase “labor whose usefulness represents itself in the use-value of its product” can be understood in two different ways:

- labor is useful if it produces a product that has any use-value of whatever kind,
- labor is useful to the extent that its product is useful.

In order to remove this ambiguity, Marx adds the clause “or in the fact that its product is a use-value.” This means, the first meaning applies here. The term “useful labor” does not involve a judgment about the use-value of the product. Even if the end product is useless or even destructive, the labor producing it is called “useful labor” as long as it manages to produce this end product. E.g., the labor producing nuclear weapons falls under the category of “useful labor” as defined here.

↓ (b) Conversely, if we use the term “useful labor” we refer to its effect on the use-value of the product (and not to any other effects it may have on the worker etc.).

Whenever we call it such, we will consider it with respect to its *useful effect*.

Unter diesem Gesichtspunkt wird sie stets betrachtet mit Bezug auf ihren *Nutzeffekt*.

Question 122 *If the product is useless, can the labor producing it still be considered useful labor?*

↓ Marx started with two commodities, coat and linen. Each has a very specific kind of labor in it. I.e., the labors needed to produce the different use-values are very *different* from each other.

132:3 Just as the use-values of coat and linen are *qualitatively different*, so also are the activities that mediate the useful properties of coat and linen, *tailoring* and *weaving*.

56:4 Wie Rock und Leinwand *qualitativ verschiedene Gebrauchswerte*, so sind die ihr Dasein vermittelnden Arbeiten *qualitativ verschieden*—*Schneiderei* und *Weberei*.

↑ Labor is called here the mediator, not the creator of the use-value, because the potential for use-values is contained in the physical qualities of the things.

A more literal translation of the sentence we just read would be:

Just as the coat and the linen are two *qualitatively different use-values*, so also

are the activities that mediate their determinate being, *tailoring* and *weaving*.

The term “determinate being” is a translation of the German

“*Dasein*”—an often-used colloquial term which was given a philosophical meaning by Hegel. The determinate being of something is a form of existence in which certain inner traits of that thing (here: those relevant for human life) are brought forward.

↓ The qualitative difference between the labors is even *necessary* because we began with two commodities which are (in the right proportions) *exchangeable* against each other.

Were these two objects not qualitatively different use-values and therefore the products of useful labors of different quality, they could not face each other as *commodities*. Coats are not exchanged for coats. The same use-value is not exchanged for the same use-value.

Wären jene Dinge nicht qualitativ verschiedene Gebrauchswerte und daher Produkte qualitativ verschiedener nützlicher Arbeiten, könnten sie sich überhaupt nicht als *Waren* gegenüber treten. Rock tauscht sich nicht aus gegen Rock, derselbe Gebrauchswert nicht gegen denselben Gebrauchswert.

↓ Generalizing this from our two example commodities to all commodities, one sees that commodity production has a big system of division of labor in the background:

132:4 In the totality of all different use-values or bodies of commodities appears a totality of equally diverse useful labors, differing in order, genus, species and variety—a *social division of labor*.

56:5/o In der Gesamtheit der verschiedenartigen Gebrauchswerte oder Warenkörper erscheint eine Gesamtheit ebenso mannigfaltiger, nach Gattung, Art, Familie, Unterart, Varietät verschiedener nützlicher Arbeiten—eine *gesellschaftliche Teilung der Arbeit*.

Since commodities can only be exchanged if their use-values are different, Marx concludes that a social division of labor must be present whenever the products are generally produced as commodities. Although a social division of labor is one of the *prerequisites* of commodity production, it enters this derivation here *after* commodity production. Marx begins with the premise that commodity producing societies exist and function, and asks what else we know about a society if we know that it produces commodities. ↓ This does not mean that the division of labor developed *in order to* make commodity production possible. Marx addresses this in his next point. Not every society with division of labor produces commodities.

This division of labor is a necessary condition for the production of commodities, though it does not follow, conversely, that the production of commodities is a necessary condition for the division of labor. In the primitive community in India there is social division of labor without the *products* becoming *commodities*. Or, to take a less remote example, in every factory the labor is systematically divided, but this division is not mediated by the operatives exchanging their *individual products*.

Sie ist Existenzbedingung der Warenproduktion, obgleich Warenproduktion nicht umgekehrt die Existenzbedingung gesellschaftlicher Arbeitsteilung. In der altindischen Gemeinde ist die Arbeit gesellschaftlich geteilt, ohne daß die *Produkte* zu *Waren* werden. Oder, ein näher liegendes Beispiel, in jeder Fabrik ist die Arbeit systematisch geteilt, aber diese Teilung nicht dadurch vermittelt, daß die Arbeiter *ihre individuellen Produkte* austauschen.

↓ An additional element, in addition to division of labor, is necessary for commodity production.

Only the products of *mutually independent self-directed private labors* face each other as commodities.

Nur Produkte selbständiger und von *einander unabhängiger Privatarbeiten* treten *einander als Waren* gegenüber.

Question 123 *How does the division of labor in commodity-producing societies differ from that in other societies? (Some material for answering this Question is in Grundrisse, 102:2–105:0).*

132:5/o We have therefore seen:

57:1 Man hat also gesehen:

This paragraph recapitulates what has been said about useful labor in this section.

The use-value of every commodity incorporates useful labor, i.e., a specific purposeful productive activity.

In dem Gebrauchswert jeder Ware steckt eine bestimmte zweckmäßig produktive Tätigkeit oder nützliche Arbeit.

↑ This summarizes 132:2.

Use-values cannot confront each other as *commodities*, unless they are produced by qualitatively different useful labors.

Gebrauchswerte können sich nicht als *Waren* gegenüber treten, wenn nicht qualitativ verschiedene nützliche Arbeiten in ihnen stecken.

↑ This is a summary of 132:3.

In a society in which products *generally* take the form of *commodities*, i.e., in a society of commodity producers, this qualitative difference between the useful labors that are carried on independently from each other as the private businesses of self-directed producers, develops into a system with many components, a social division of labor.

In einer Gesellschaft, in der die Produkte *allgemein* die Form der Ware annehmen, d.h. in einer Gesellschaft von Warenproduzenten, entwickelt sich dieser qualitative Unterschied der nützlichen Arbeiten, welche unabhängig voneinander als Privatgeschäfte selbständiger Produzenten betrieben werden, zu einem vielgliedrigen System, zu einer gesellschaftlichen Teilung der Arbeit.

↑ This final passage of the paragraph repeats 132:4: division of labor is a precondition of commodity production. Marx adds here that this precondition is reproduced and extended by commodity production itself. This is the only new observation in this paragraph, but it is an important recurring theme. By reproducing its prerequisites, commodity production makes itself independent of these prerequisites—without this it would not be able to gain a life of its own. In 252:2/o and 711:1, Marx shows that also in other respects, the capitalist system reproduces its prerequisites.

Exam Question 126 (a) *Why is it necessary for the exchange of commodities that they contain qualitatively different kinds of useful labor?*

(b) *Can commodity production exist without division of labor?*

(c) *Can division of labor exist without commodity production?*

(d) *How does commodity production influence the division of labor?*

Before turning to exchange-value, Marx makes two side remarks, each in a separate paragraph, addressing possible misunderstandings of the above.

(1) Since use-values must be produced in all societies, one might think that everything said so far is valid in all societies. This is true with one important caveat: although useful labor is a transhistorical necessity, and although the labor processes producing different use-values can be very different from each other and require specific skills, it does not follow that specific individuals must be tied to specific labor processes on a full-time basis:

133:1 Anyhow, it makes no difference to the coat whether it is worn by the tailor or by the tailor's customer. In either case it serves as a use-value.

57:2 Dem Rock ist es übrigens gleichgültig, ob er vom Schneider oder vom Kunden des Schneiders getragen wird. In beiden Fällen wirkt er als Gebrauchswert.

↑ The use-value of the coat is the same whether or not the person who consumes the coat has also produced it. (By contrast, a coat produced for self-consumption does not count as *value*).

Question 127 *Marx says in 133:1 that it does not matter for the use-value of the coat whether it is worn by the tailor or by someone else. Is this correct for every use-value? If you write a computer program for yourself then you often obey different principles than if you write it for others to use. A program which “works for me” is often poorly documented and does not consider all the possible situations which different users of the program might find themselves in.*

↓ Not only is it irrelevant, from the point of view of use-value, whether the coat is *consumed* by the person who made it or by someone else, but the principles governing the *production* of this use-value are also not affected by it whether tailoring has become a separate profession:

Nor is the relation between the coat and the labor producing it altered in and for itself by the circumstance that tailoring becomes a particular trade, a separate branch of the social division of labor.

Ebensowenig ist das Verhältnis zwischen dem Rock und der ihn produzierenden Arbeit an und für sich dadurch verändert, daß die Schneiderei besondere Profession wird, selbständiges Glied der gesellschaftlichen Teilung der Arbeit.

↓ Coats can be produced without anyone being a tailor:

Forced by the want for clothing, humans tailored for thousands of years before anyone became a tailor.

Wo ihn das Kleidungsbedürfnis zwang, hat der Mensch jahrtausendlang geschneidert, bevor aus einem Menschen ein Schneider ward.

↑ Marx is well aware that every production process is by necessity co-operative and therefore social. In his *Introduction to Grundrisse*, [mecw28]18:1, he writes that solitary production is as unthinkable as solitary language. But Marx's point is here that it is not necessary to have the same person tied to one production process for their whole lives. As he famously

remarked, people can be tailors in the morning and philosophers in the afternoon. *Contribution* 278:1 seems relevant for the preceding passage, although it addresses a slightly different issue.

Question 129 *Would a society in which people tailor in the morning and philosophize in the afternoon not be filled with dilettante tailors and philosophers neither of whom has time to get to the bottom of their profession?*

↓ Although the division of humankind into specialized professions is not a transhistorical necessity, useful labor itself is:

But at all times, a special purposeful productive activity, assimilating particular nature-given materials to particular human wants, has been necessary to mediate the useful properties of coat, linen, and all other elements of *material wealth* not spontaneously provided by Nature.

↑ This sounds as if a solitary human being would be able to produce. Marx neglects to say here that production requires skills and the produced means of production, which make every production process a truly social matter. This omission does not affect the point Marx is trying to make here, namely: ↓ Since produced use-values are necessary for human life, so is useful labor.

So far as labor forms use-values, i.e., as *useful labor*, it is therefore a necessary condition, independent of all forms of society, for the existence of the human race; it is an eternal nature-imposed necessity, in order to mediate the metabolism between man and nature, and thus human life.

(2) In his second side remark, Marx reminds us that human labor cannot produce use-values without the contribution of nature.

133:2/o Any of the use-values coat, linen, etc., in short any body of a commodity, is a *combination of two elements*—matter and labor. If we take away the useful labor expended upon them, a material substratum is always left, which is furnished by nature without the help of man. In his production man can proceed only in the same way as nature itself does, i.e., by *changing the forms of matter*.¹³

Aber das Dasein von Rock, Leinwand, jedem nicht von Natur vorhandenen Element des *stofflichen Reichtums*, mußte immer vermittelt sein durch eine spezielle, zweckmäßig produktive Tätigkeit, die besondere Naturstoffe besonders menschlichen Bedürfnissen assimiliert.

Als Bildnerin von Gebrauchswerten, als *nützliche Arbeit*, ist die Arbeit daher eine von allen Gesellschaftsformen unabhängige Existenzbedingung des Menschen, ewige Naturnotwendigkeit, um den Stoffwechsel zwischen Mensch und Natur, also das menschliche Leben zu vermitteln.

57:3/o Die Gebrauchswerte Rock, Leinwand, usw., kurz die Warenkörper, sind *Verbindungen von zwei Elementen*, Naturstoff und Arbeit. Zieht man die Gesamtsumme aller verschiedenen nützlichen Arbeiten ab, die in Rock, Leinwand usw. stecken, so bleibt stets ein materielles Substrat zurück, das ohne Zutun des Menschen von Natur vorhanden ist. Der Mensch kann in seiner Produktion nur verfahren, wie die Na-

The *transformational* view of production implied here is emphasized in the footnote.

¹³ “All phenomena of the universe, whether they are produced by the hand of man or by the general laws of physics, are not actual creations but solely modifications of matter. ‘Putting together’ and ‘separating’ are the only elements which can be found in analyzing the idea of reproduction; and the same applies to the reproduction of value” (use-value, though Verri in his controversy with the Physiocrats is not quite certain himself which kind of value he is speaking of) and of wealth, when earth, air, and water transmute themselves in the fields into grain, or if by the hand of man the secretion of an insect transmutes itself into silk, or if some metal pieces are arranged in order to form a watch.” [Ver04, pp. 21, 22]

Now back to the main text: Nature not only delivers the material on which labor acts, but the labor process itself is assisted by natural forces.

What is more, in this labor of forming he is constantly helped by natural forces.

↓ Summary: However indispensable labor is, it is not the only ingredient necessary to produce the use-values which humans need. Nature is indispensable too.

We see, then, that *labor is not the only source of the use-values it produces* or of *material wealth*. As William Petty puts it: labor is its father and the earth its mother.

Question 130 *When Marx wrote that labor is the father and natural forces are the mother of use-values, should he also have included produced means of production in addition to nature and labor?*

Exam Question 132 *Is labor the only source of the use-values of its products, or do other factors contribute to the use-values as well? Is labor the only source of the values of its products, or do other factors contribute to the values as well? (“Value” is here the property which makes things exchangeable.)*

tur selbst, d.h. nur die *Formen der Stoffe ändern*.¹³

¹³ „Alle Erscheinungen des Weltalls, seien sie hervorgerufen von der Hand des Menschen oder durch die allgemeinen Gesetze der Physik, sind nicht tatsächliche Neuschöpfungen, sondern lediglich eine Umformung des Stoffes. Zusammensetzen und Trennen sind die einzigen Elemente, die der menschliche Geist immer wieder bei der Analyse der Vorstellung der Reproduktion findet; und ebenso verhält es sich mit der Reproduktion des Wertes“ (Gebrauchswert, obgleich Verri hier in seiner Polemik gegen die Physiokraten selbst nicht recht weiß, von welcher Sorte Wert er spricht) „und des Reichtums, wenn Erde, Luft und Wasser auf den Feldern sich in Korn verwandeln oder auch wenn sich durch die Hand des Menschen die Abscheidung eines Insekts in Seide verwandelt, oder einige Metallteilchen sich anordnen, um eine Repetieruhr zu bilden.“ [Ver04, pp. 21, 22]

Noch mehr. In dieser Arbeit der Formung selbst wird er beständig unterstützt von Naturkräften.

Arbeit ist also *nicht die einzige Quelle der von ihr produzierten Gebrauchswerte*, des *stofflichen Reichtums*. Die Arbeit ist sein Vater, wie William Petty sagt, und die Erde ist seine Mutter.

In his *Critique of Gotha Programme*, marginal note to the first part of §1, p. [mecw24] 81:2, Marx says the same thing:

Labor is *not the source* of all wealth. *Nature* is just as much the source of use-values (and it is surely of such that material wealth consists!) as labor, which itself is only the manifestation of a force of nature, human labor-power.

Die Arbeit ist *nicht die Quelle* alles Reichtums. Die *Natur* ist ebensosehr die Quelle der Gebrauchswerte (und aus solchen besteht doch wohl der sachliche Reichtum!) als die Arbeit, die selbst nur die Äußerung einer Naturkraft ist, der menschlichen Arbeitskraft.

Question 134 *Saying that labor is the source of all wealth seems a pro-worker stance. In [mecw24]81:2, Marx argues on the contrary that the assertion that labor is the only source of use-values is a pro-capitalist and anti-worker ideology. Can you guess, without going to Marx's text, how that can be the case?*

1.2.b. [Labor Producing Value: Quality]

134:1 Let us now pass from the commodity, so far as it is a useful object, to the *value* of commodities.

We are still looking at the same two commodities as in 132:1, but now we are looking at them as values instead of use-values:

134:2 By our assumption, the coat is worth twice as much as the linen. But this is merely a *quantitative* difference, which does not yet interest us at this point.

58:1 Gehn wir nun von der Ware, soweit sie Gebrauchsgegenstand, über zum Waren-Wert.

58:2/o Nach unserer Unterstellung hat er Rock den doppelten Wert der Leinwand. Dies ist aber nur ein *quantitativer* Unterschied, der uns zunächst noch nicht interessiert.

When discussing the use-value aspect of labor, in 132:3, Marx had begun with the differences between the *use-values* of coat and linen. Now he begins with the differences between their *values*. But the difference between their values is *merely* a quantitative, instead of a qualitative, difference. Why “merely”? Because if one starts from a quantitative difference it is easy to get equality:

We recall, therefore, that if the value of the coat is double that of 10 yds. of linen, 20 yds. of linen have the *same magnitude of value* as one coat.

Wir erinnern daher, daß, wenn der Wert eines Rockes doppelt so groß ist als der von 10 Ellen Leinwand, 20 Ellen Leinwand *die-selbe Wertgröße* haben wie ein Rock.

“Doppelt so groß als” should be “doppelt so groß wie.” Marx often confuses “als” and “wie.”

Marx will return to the *quantitative difference* on p. 136:1; but right now we arrived, by the simple trick of doubling the amount of linen, at two commodities which can be exchanged for each other.

As values, the coat and the linen are things of a *like substance*, objective expressions of *labor of the same kind*.

This was the result gained earlier, in 128:2. At that earlier point, Marx did not explain very well what that means. This explanation is given here. Marx begins with the remark that tailoring and weaving, as useful labors, cannot be the basis for value, because they are (as was stressed in 132:3 during the discussion of the use-value aspect of labor) qualitatively different:

But *tailoring* and *weaving* are two qualitatively different labors.

Als Werte sind Rock und Leinwand Dinge von *gleicher Substanz*, objektive Ausdrücke *gleichartiger Arbeit*.

Aber Schneiderei und Weberei sind qualitativ verschiedene Arbeiten.

↓ Despite these differences, Marx brings now three examples in which different kinds of labors are treated as equal—not on the market but in production itself:

There are, however, states of society in which *one and the same man* does tailoring and weaving alternately, so that these two forms of labor are mere *modifications of the labor of the same individual* and not yet specialized and fixed functions of different persons; just as the coat which our tailor makes one day, and the trousers which he makes another day, require only a variation in the labor of one and the same individual. Moreover, we see at a glance that, in our capitalist society, *a given portion of human labor* is, in accordance with the varying demand, at one time supplied in the form of spinning, and at another in the form of weaving. This change may not always take place without friction, but take place it must.

Es gibt jedoch Gesellschaftszustände, worin *derselbe Mensch* abwechselnd schneidert und webt, diese beiden verschiedenen Arbeitsweisen daher nur *Modifikationen der Arbeit desselben Individuums* und noch nicht besondere feste Funktionen verschiedener Individuen sind, ganz wie der Rock, den unser Schneider heute, und die Hosen, die er morgen macht, nur Variationen derselben individuellen Arbeit voraussetzen. Der Augenschein lehrt ferner, daß in unserer kapitalistischen Gesellschaft, je nach der wechselnden Richtung der Arbeitsnachfrage, *eine gegebene Portion menschlicher Arbeit* abwechselnd in der Form von Schneiderei oder in der Form von Weberei zugeführt wird. Dieser Formwechsel der Arbeit mag nicht ohne Friktion abgehen, aber er muß gehen.

↑ To recapitulate, these three examples are (1) there are societies in which the same person routinely weaves and tailors, i.e., there is no division of labor between these two activities; (2) even today when the division of labor is deeper, each individual still performs different labors in turn; and (3) under capitalism, workers frequently change jobs, i.e., they switch from one compartment of this social division of labor to another. (Note that this undermines the justification of the division of the working class into separate professions: if most people are able to do most kinds of labor, then this compartmentalization is not necessary.)

↓ Now Marx brings the resolution, explaining in what respect different labors are equal (and why the just-mentioned switches between different labors are possible and indeed so common).

134:3/o If we disregard the specificity of the productive activity and therefore the useful character of the labor, then nothing remains of it but that it is an *expenditure of human labor-power*. Tailoring and weaving, though qualitatively different productive activities, are both the productive expenditures of *human* brains, nerves, and muscles, and in this sense are both *human labor*.

Sieht man ab von der Bestimmtheit der produktiven Tätigkeit und daher vom nützlichen Charakter der Arbeit, so bleibt das an ihr, daß sie eine *Verausgabung menschlicher Arbeitskraft* ist. Schneiderei und Weberei, obgleich qualitativ verschiedene produktive Tätigkeiten, sind beide produktive Verausgabung von *menschlichem* Hirn, Muskel, Nerv, Hand, usw., und in diesem Sinn beide *menschliche Arbeit*.

All these labor processes have something in common. By using the same phrase “human labor” for the different activities weaving, spinning, etc., our language already implies that they have something in common. Marx will discuss this again in 142:1. Footnote 17a to that later paragraph 142:1 refers explicitly to the use of the word “labor.” The mind can make abstractions in various ways, and not all of them have social significance. For instance, in his discussion of the various attempts to explain what a machine is, in 492:3/o, Marx gives examples of abstractions which are useless for an understanding of the economic function of machinery under capitalism. The abstraction “labor,” by contrast, has been singled out by Marx in *Grundrisse* 103:1–105:1 as an abstraction which, although it is valid in all epochs, obtains its “full validity” only under capitalism—because under capitalism, labor has social significance only as abstract labor.

Question 136 Define abstract labor and explain why Marx’s theory can be summarized as: “Under capitalism, labor has social significance only as abstract labor.”

On the one side, the labor process is the application of human skills which transforms the bodily properties of the product; on the other side, it is the expenditure of human brain, muscles, nerves, etc. Abstract labor is, as the word says, an abstraction, but it is a “real” abstraction. In *Contribution*, 272:3/o, Marx calls the reduction of different labors to undifferentiated, homogeneous, simple labor a “real abstraction”:

This reduction takes the form of an abstraction, but it is an abstraction that is made every day in the social process of production. The dissolution of all commodities into labor-time is no greater an abstraction, and is no less real, than the dissolution of all organic bodies into air.

Not only can a chemist, in his mind, make the “abstraction” that all organic compounds are basically the combination of carbon and hydrogen atoms, but the process of burning, which transforms *C* into *CO₂* and *H* into *H₂O*, implements this abstraction in reality. The fact that all organic compounds consist of *C* and *H* atoms makes it possible for them to burn, but this fact alone does not mean that they are indeed burning. (But the fact that our world is in

Diese Reduktion erscheint als eine Abstraktion, aber es ist eine Abstraktion, die in dem gesellschaftlichen Produktionsprozeß täglich vollzogen wird. Die Auflösung aller Waren in Arbeitszeit ist keine größere Abstraktion, aber zugleich keine minder reelle als die aller organischen Körper in Luft.

a combustible state, far from chemical equilibrium, should remind us that the environment we live in is the creation of living organisms—the word “organic” has therefore a modern justification as well.) Just as burning is a real abstraction in nature, so the reduction of all commodities to the expenditure of human labor-power contained in them is a real abstraction made in society whenever there is commodity production. Note that Marx uses air in a different metaphor in 166:2/o.

Question 137 Carefully explain the meaning of the statement: “The dissolution of all commodities into labor-time is no greater an abstraction, and is no less real, than the dissolution of all organic bodies into air.”

Question 138 Why is the abstraction which leads to abstract labor a “real” abstraction? At the same time you should also explain why the abstraction of all organic bodies into air is a “real” abstraction.

Since this is so important, I will bring here three more passages underlining that this abstraction has a basis in reality. In 164:1, Marx writes:

For in the first place, however varied the useful labors or productive activities might be, it is a *physiological* truth that they are functions of the *human* organism, and that each such function, whatever may be its nature or its form, is essentially the *expenditure* of human brain, nerves, muscles, sense organs, etc.

Denn erstens, wie verschieden die nützlichen Arbeiten oder produktiven Tätigkeiten sein mögen, es ist eine *physiologische* Wahrheit, daß sie Funktionen des *menschlichen* Organismus sind und daß jede solche Funktion, welches immer ihr Inhalt und ihre Form, wesentlich *Verausgabung* von *menschlichem* Hirn, Nerv, Muskel, Sinnesorgan usw. ist.

The following passage, as the preceding one, is taken from the commodity fetishism section, 166:1:

Equality of entirely *different kinds of labor* can be arrived at only by an *abstraction from their real inequality*, by a reduction to the characteristic they have in common, that of being the *expenditure of human labor-power*, being *human labor* in the abstract.

Die *Gleichheit* toto coelo *verschiedener Arbeiten* kann nur in einer *Abstraktion* von ihrer wirklichen *Ungleichheit* bestehn, in der Reduktion auf den gemeinsamen Charakter, den sie als *Verausgabung menschlicher Arbeitskraft*, abstrakt *menschliche Arbeit*, besitzen.

Finally another place from section 3 of chapter One, 150:2:

In tailoring, as well as in weaving, human labor-power is expended. Both, therefore, possess the general property of being human labor, and there may be cases, such as the production of value, in which they must be considered only under this aspect.

In der Form der Schneiderei wie in der Form der Weberei wird menschliche Arbeitskraft verausgabt. Beide besitzen daher die allgemeine Eigenschaft menschlicher Arbeit und mögen daher in bestimmten Fällen, z.B. bei der Wertproduktion, nur unter diesem Gesichtspunkt in Betracht kommen.

Exam Question 139 *What is abstract human labor? I want you to say what it is, not what its significance is in commodity-producing society! These are two different questions.*

To sum up, labor is the expenditure of human brain, muscle, etc. in all societies. This abstraction of labor can always be made theoretically. But only in commodity production is this abstraction made not only by a theoretical onlooker but by society itself. And the difference is as drastic as the difference between a chemist analyzing the chemical composition of organic matter and organic matter burning. After this digression about real abstractions, let us turn back to the text we are presently discussing. After discussing abstract labor, Marx looks more closely at that what these abstract labors have in common. This leads to the concept of labor-power:

They are but two different forms of expending human labor-power.

Es sind nur zwei verschiedene Formen, menschliche Arbeitskraft zu verausgaben.

Exam Question 141 *What is the difference between labor and labor-power?*

Although tailoring and weaving are usually done by different people, they could in principle be done by the same person. The concept of human labor-power (potential labor instead of actual labor) contains an abstraction from the various useful activities in which the labor-power can be realized. What the different labors have in common is that all labors are the expenditure of human labor-power.

Let us take stock where we are in the argument. We will backtrack a little, in order to show the parallel questions arising on different levels.

Looking at the sphere of exchange, Marx made the observation that through the exchange, the different use-values are treated as equals. This led to the question: what are the grounds for this equal treatment? Is it a social fiction valid only on the surface of the economy, or are the commodities really somehow equal?

Since the commodities as *use-values* have nothing in common, Marx concludes that their equality must come from the labor producing them. But there is a problem. Although labor is something all commodities have in common, the labors producing different commodities are clearly not equal either. The dilemma is still there, it is merely shifted from the surface to the sphere of production. But here, on the level of the labors, this dilemma can indeed be solved—because the labor processes producing these various use-values *really have something in common*, whereas the commodities as use-values do not. All labor, whatever its concrete form, is also “abstract labor”—not because we can think about it in the abstract, but because all labor is the expenditure of human labor-power, i.e., human nerves, brains, muscles etc. Abstract labor in this definition is a real aspect of every labor process.

Finally, if one takes a closer look at labor-power, the same dilemma pops up for a third time. After encountering it on the level of use-values and on the level of labor, we encounter it now on the level of labor-power. The dilemma is: although we arrived at labor-power in our search for something that is equal in commodities and therefore for the basis for the equalization of all commodities through the exchange, and although it is true that the labor-powers of different individuals are largely similar, they are still not entirely equal.

It is true, human labor-power itself must be more or less developed before it can be expended in different forms. But the value of a commodity represents human labor plain and simple, the expenditure of *human labor* in general.

Allerdings muß die menschliche Arbeitskraft selbst mehr oder minder entwickelt sein, um in dieser oder jener Form verausgabt zu werden. Der Wert der Ware aber stellt menschliche Arbeit schlechthin dar, Verausgabung *menschlicher Arbeit* überhaupt.

Fowkes translates “*allerdings*” with “of course.” This gives a wrong connotation. After “of course,” one expects an objection

whose refutation was already implied in what was said before. But Marx is about to bring some new arguments which have not

been anticipated above. Moore-Aveling write “it is true,” which is the better translation.

The clause “it is true” (*allerdings*) is Marx’s admission that we still haven’t arrived at something entirely homogeneous. Although most people in society could perform, or could be trained to perform, most jobs in society, not everybody could do every job. There are still differences in labor-power. This is what Marx is going to discuss next.

Marx’s formulation “this human labor-power itself must be more or less developed before it can be expended in different forms” is a little misleading: it might create the impression that all differences between different labor-powers are of a purely quantitative nature (“*more or less*”). Quantitative differences between labor-powers are consistent with market relations, because quantitative differences imply qualitative equality.

But the qualitative differences between different labor-powers can arise in different ways:

1. Labor-power may differ by its development (schooling, training, experience). This can be naturally reduced to a quantitative difference, since one can say the value of the product not only comes from the time the laborer is working productively, but also from the training time. If a surgeon spends 15 years learning to perform a certain operation, and then performs this operation for another 15 years, then every hour he is working in the latter 15 years would be creating *twice* as much value as an unskilled laborer. If one includes the labor performed by his teachers and the labor necessary to produce the materials and equipment used during this training, one obtains an even higher ratio. (Nevertheless, the higher earnings of a surgeon in the U.S. more than make up for this, but we are talking here about value created, not income earned.)
2. However there are some differences between labor-powers which cannot be reduced to quantitative differences. There are things certain individuals can do and others cannot do, even with the best training.

Marx only mentions differences in development at this point, because most differences between labor-powers are only differences in development, and because this gives him a good transition to simple unskilled labor which Marx will discuss next. But from other scattered remarks it can be inferred that Marx was aware that some such differences do not have to do

with development. Especially interesting is the footnote 18 to p. 304:3/o, almost at the end of chapter Seven, where Marx makes the following points:

- The differences in labor-powers are smaller than is generally believed, and these differences may have accidental causes.
- With the development of capitalist production these differences tend to be reduced further by progressively de-skilling many labor processes.
- Whatever differences remain, they are reflected in *quantitative* differences as to how much value one hour of labor creates—although the differences between different labor-powers are by no means always of a quantitative nature.

Here is therefore a complete solution of the third dilemma, that by exchanging the products of labor, society acts as if all labor-powers were equal, but in reality they are not: Most differences between labor-powers are differences in training, and these differences can be naturally reduced to quantitative differences. Some qualitative differences between labor-powers remain which have nothing to do with training. There is no general law governing the reduction of these remaining differences to quantitative differences. The terms of their quantitative reduction are decided case by case; it may depend on the constellation of demand and supply, or on the relative strength of the contending interests at the given time.

Question 143 *The exchange of commodities poses a dilemma: what are the grounds for treating tangibly different commodities as equals? This dilemma is then also echoed on the level of the labors producing these commodities, and on the level of labor-powers. On each of these three levels the dilemma has a different resolution. Describe these three different resolutions.*

In the passage we are presently discussing, Marx's emphasis is not on the modalities of this reduction, but on the character of that kind of labor-power which serves as the measuring stick, that to which all other labor-powers are reduced. He argues that it is the simple "unskilled" labor everyone in the given society is able to perform, and before even saying this he comments that this amounts to a shoddy treatment of the human factor in capitalist society:

And just as in bourgeois society a general or a banker plays a great role, while mere *man*, on the other hand, has a very shabby part,¹⁴ so here with *human labor*. It is the expenditure of *simple* labor-power, i.e., of labor-power which, on the average, apart from any particular development, exists in the organism of every ordinary individual.

Wie nun in der bürgerlichen Gesellschaft ein General oder Bankier eine große, der *Mensch* schlechthin aber eine sehr schäbige Rolle spielt,¹⁴ so steht es auch hier mit der *menschlichen Arbeit*. Sie ist Verausgabung *einfacher* Arbeitskraft, die im Durchschnitt jeder gewöhnliche Mensch, ohne besondere Entwicklung, in seinem leiblichen Organismus besitzt.

¹⁴ Hegel, *Philosophy of Right*, §190.

¹⁴ Vgl. Hegel, „Philosophie des Rechts“, Berlin 1840, §190.

Footnote 14 is a reference to Hegel, *Philosophy of Right*, §190.

“Bourgeois society” is a term occasionally used by Marx for capitalist society. In capitalist society, humans are defined by the social functions they assume, whereas usually little attention is paid to the human individual supporting these functions. In the same way, a society in which *congealed* labor, value and capital, is in highest esteem, assigns to *living* labor a very shabby part. It is a sociological paradox that unskilled labor, which creates all value, is generally sneered at in capitalist society.

The first edition, p. 24:2/o, gives here the example that the labor of a farm hand may produce twice as much value per day than that of a tailor. Next Marx remarks that there are national differences regarding the character of simple and unskilled labor. Although this is important for an understanding of international trade, it will be disregarded here:

Simple average labor, it is true, varies its character in different countries and different cultural epochs, but is given once the society is given.

Die *einfache Durchschnittsarbeit* selbst wechselt zwar in verschiedenen Ländern und Kulturepochen ihren Charakter, ist aber in einer vorhandenen Gesellschaft gegeben.

Next Marx discusses how the labor which is *not* simple labor is expressed in value:

More complicated labor counts merely as *potentiated* or rather *multiplied* simple labor, so that a smaller amount of complicated labor is equal to a bigger amount of simple labor.

Kompliziertere Arbeit gilt nur als *potenzierte* oder vielmehr *multiplizierte* einfache Arbeit, so daß ein kleineres Quantum komplizierter Arbeit gleich einem größeren Quantum einfacher Arbeit.

“Potentiated” means here: labor of higher potency. The word “multiplied,” which Marx prefers to the word “potentiated,” better expresses that the difference is quantitative, not qualitative. Marx does not say here: “more complicated labor *is* multiplied simple labor,” but he uses the formulation “*counts as* multiplied simple labor.” There is a qualitative difference between simple and complicated labor; one cannot get the latter by multiplying the former. Even if you assemble 1,000 construction workers, and give them all the time they need, they still won't be able to do the work of a doctor or a scientist or a virtuoso musician. But commodity producing society acts as if complicated labor were a mere multiple of simple labor. This is what Marx means with the word “counts.” The word “merely” in “counts *merely as*” stresses that a qualitative difference, that between simple and complicated labor, is reduced to a *merely* quantitative one (this phrase is used in 134:2).

That this reduction is constantly being made is shown by experience.

Daß diese Reduktion beständig vorgeht, zeigt die Erfahrung.

Question 145 *Which experience is Marx referring to when he says in 134:3/o: “That this reduction is constantly being made is shown by experience.”?*

What experience? The experience that markets, which pretend that all labor-powers are equal or at most quantitatively different, flourish despite the fact that there are qualitative

differences among labor-powers. Marx's appeal to experience here is on the one hand an admission that there is no general law governing this reduction, and on the other hand he can only appeal to experience because markets survived despite this indeterminacy. Even if the different kinds of labor-power may not have been allocated rationally, the markets have done a good enough job to regulate the economy.

A commodity may be the product of the most complicated labor, but its *value* equates it to the product of simple labor, therefore this value only represents a certain amount of simple labor.¹⁵

↓ In a footnote, Marx reminds us that at the present time we are not yet talking about the income received by the workers, but about the value they produce:

¹⁵ The reader must be aware that we are not speaking here of the *wages* or values that the laborer receives for a given labor-time, but of the *value* of the commodity in which that labor-time is materialised. Wages is a category that does not even exist yet at this stage of our presentation.

↑ This footnote explicitly refers to Marx's method of taking up one thing after another; certain things do not yet "exist." [Rei70, p. 131]

Question 146 In a footnote to 134:3/o, Marx says that the category of wages does not yet exist at the present stage of the representation. Find other places in Capital where he says that certain categories do not yet "exist" for him.

The different proportions, in which different sorts of labor are reduced to simple labor as their *standard*, are established by a social process that goes on behind the backs of the producers and, consequently, seems to be fixed by custom. For simplicity's sake we shall henceforth consider every kind of labor-power to be immediately *simple* labor-power; by this we do no more than save ourselves the trouble of making the reduction.

It has sometimes been argued that the reduction of complicated to simple labor is a circular argument invalidating the labor theory of value. I see it as an instance in which the "dirty" reality is not entirely congruous with the forms of social interaction that have developed in a capitalist economy. Although commodity exchange presumes that all labor-powers are equal, there are in fact differences, which are however usually small. To repeat,

Eine Ware mag das Produkt der kompliziertesten Arbeit sein, ihr *Wert* setzt sie dem Produkt einfacher Arbeit gleich und stellt daher selbst nur ein bestimmtes Quantum einfacher Arbeit dar.¹⁵

¹⁵ Der Leser muß aufmerken, daß hier nicht vom *Lohn* oder Wert die Rede ist, den der Arbeiter für etwa einen Arbeitstag erhält, sondern vom *Warenwert*, worin sich sein Arbeitstag vergegenständlicht. Die Kategorie des Arbeitslohns existiert überhaupt noch nicht auf dieser Stufe der Darstellung.

Die verschiedenen Proportionen, worin verschiedene Arbeitsarten auf einfache Arbeit auf ihre *Maßeinheit* reduziert sind, werden durch einen gesellschaftlichen Prozeß hinter dem Rücken der Produzenten festgesetzt und scheinen ihnen daher durch das Herkommen gegeben. Der Vereinfachung halber gilt uns im Folgenden jede Art Arbeitskraft unmittelbar für *einfache* Arbeitskraft, wodurch nur die Mühe der Reduktion erspart wird.

this has two consequences. Under developed commodity exchange (capitalism) there is the tendency to equalize and de-skill the labors. This well-known fact itself corroborates the thesis that abstract labor constitutes the substance of value. The remaining differences are treated as quantitative differences only. This reduction of qualitative to quantitative differences in labor-power does not follow a general law but depends on constellational, irregular ("accidental") circumstances, such as discrepancies between demand and supply, or custom.

Question 147 Is Marx's appeal to experience regarding the reduction of complicated to simple labor a circular argument?

The next paragraph gives a summary, parallel to 132:5/o. This summary compares the things said about value and abstract labor to the things said about use-value and concrete labor. This comparison backs up the claim made in 131:2/o that the characteristics of labor creating use-value are different than those of labor creating value. Here is the first of three comparisons:

135:1/o In the *values* coat and linen, abstraction is made from the difference of their *use-values*; now we have seen that also in the *labor* that represents itself in these values, abstraction is made from the difference of its *useful forms* tailoring and weaving.

59:1/o Wie also in den *Werten* Rock und Leinwand von dem Unterschied ihrer *Gebrauchswerte* abstrahiert ist, so in den *Arbeiten*, die sich in diesen *Werten* darstellen, von dem Unterschied ihrer *nützlichen Formen*, der *Schneiderei* und *Weberei*.

Moore-Aveling again transpose it into the epistemological realm when they write: "Just as,

therefore, in viewing the coat and linen as values, we abstract from their different use-values." Fowkes

makes the same error.

Second comparison:

The *use-values* coat and linen are the *combinations* of purposeful productive activities with cloth or yarn. The *values* coat and linen are, in contrast, mere *homogenous congelations of labor*. Now we have seen that also the labor contained in these *values* does not count by virtue of its productive functions towards cloth and yarn, but only as *expenditures of human labor-power*.

Third comparison:

Tailoring and weaving are necessary elements in the creation of the *use-values* coat and linen, precisely by their *different* qualities, but they are the *substance* of the *values*

Wie die *Gebrauchswerte* Rock und Leinwand *Verbindungen* zweckbestimmter, produktiver Tätigkeiten mit Tuch und Garn sind, die *Werte* Rock und Leinwand dagegen bloße *gleichartige Arbeitsgallerten*, so gelten auch die in diesen *Werten* enthaltenen Arbeiten nicht durch ihr produktives Verhalten zu Tuch und Garn, sondern nur als *Verausgaben menschlicher Arbeitskraft*.

Bildungselemente der *Gebrauchswerte* Rock und Leinwand sind *Schneiderei* und *Weberei* eben durch ihre *verschiednen* Qualitäten; *Substanz* des Rockwerts und Lein-

of coat and linen only in so far as *abstraction* is made from their particular qualities and both possess the *same quality*, the *quality of human labor*.

Question 148 *Just as a horse has muscles and bones in it, a commodity has useful labor and abstract labor in it. Explain. Is this also true for a product which is not a commodity?*

1.2.c. [Labor Producing Value: Quantity]

Now the quantitative aspects of abstract human labor will be discussed. Some of this discussion repeats 130:1/o, but important additions are made.

136:1 Coats and linen, however, are not merely values in general, but values of given magnitudes and, following our assumption, the coat is worth twice as much as the 10 yards of linen. Where does this difference in value come from? From the fact that the linen contains only half as much labor as the coat, i.e., labor-power has to be expended twice as long to produce the second as to produce the first.

↑ The formulation “the coat *contains* twice as much labor as the linen” is a metaphor. The second half of the last sentence above explains how this metaphor is to be read: labor-power has to be expended twice as long to produce the coat than the linen. Not “is” expended but “has to be” expended because the *necessary* labor is twice as long. Marx will be much more explicit about this point later, in 676:2/o.

136:2 While, therefore, with reference to use-value, the labor contained in a commodity counts only qualitatively, with reference to value it counts only quantitatively, after being reduced to human labor pure and simple. In the former case it was a matter of the ‘how’ and the ‘what’ of labor, in the latter of the ‘how much’, of the temporal duration of labor.

Question 149 *Marx says in 136:2: “With reference to use-value, the labor contained in a commodity counts only qualitatively.” This seems to be in contradiction to things he says elsewhere. More labor produces more product, and the quantity of a product is relevant for its use-value. In 126:1 Marx says: “When examining use-values, we always assume to be*

wandwerts sind sie nur, soweit von ihrer besondern Qualität *abstrahiert* wird und beide *gleiche Qualität* besitzen, die *Qualität menschlicher Arbeit*.

60:1 Rock und Leinwand sind aber nicht nur Werte überhaupt, sondern Werte von bestimmter Größe, und nach unsrer Unterstellung ist der Rock doppelt soviel wert als 10 Ellen Leinwand. Woher diese Verschiedenheit ihrer Wertgrößen? Daher, daß die Leinwand nur halb soviel Arbeit enthält als der Rock, so daß zur Produktion des letzteren die Arbeitskraft während doppelt soviel Zeit verausgabt werden muß als zur Produktion der erstern.

60:2 Wenn also mit Bezug auf den Gebrauchswert die in der Ware enthaltene Arbeit nur qualitativ gilt, gilt sie mit Bezug auf die Wertgröße nur quantitativ, nachdem sie bereits auf menschliche Arbeit ohne weitere Qualität reduziert ist. Dort handelt es sich um das Wie und Was der Arbeit, hier um ihr Wieviel, ihre Zeitdauer.

dealing with well-defined quantities, such as dozens of watches, yards of linen, or tons of iron.” Is this an inconsistency in Marx’s theory?

↓ This has important implications:

Since the magnitude of the value of a commodity represents nothing but the quantity of labor embodied in it, it follows that all commodities, when taken in the right proportions, must be equal in value.

↑ The equalization of all commodities on the surface through the exchange-relations has therefore a counterpart in production. In the production process, all commodities are equalized because they all represent abstract human labor.

↓ From here until the end of the section, Marx discusses changes in productivity:

136:3 If the productivity of all the different sorts of useful labor required, let us say, for the production of a coat remains unchanged, the total value of the coats produced will increase along with their quantity. If one coat represents x days’ labor, two coats will represent $2x$ days’ labor, and so on. But now assume that the duration of the labor necessary for the production of a coat is doubled or halved. In the first case, one coat is worth as much as two coats were before; in the second case two coats are only worth as much as one was before, although in both cases one coat performs the same service, and the useful labor contained in it remains of the same quality. One change has taken place, however: a change in the quantity of labor expended to produce the article.

Rising wealth can therefore be accompanied by decreasing value.

136:4/o In itself, an increase in the quantity of use-values constitutes an increase in material wealth. Two coats will clothe two men, one coat will only clothe one man, etc. Nevertheless, an increase in the amount of material wealth may correspond to a simultaneous fall in the magnitude of its value.

↓ Next Marx asks where does this discrepancy in the movement come from? (Marx does not talk here about two movements, one of the use-values and one of the values, but

Da die Wertgröße einer Ware nur das Quantum der in ihr enthaltenen Arbeit darstellt, müssen Waren in gewisser Proportion stets gleich große Werte sein.

60:3 Bleibt die Produktivkraft, sage aller zur Produktion eines Rocks erheischten nützlichen Arbeiten unverändert, so steigt die Wertgröße der Röcke mit ihrer eignen Quantität. Wenn 1 Rock x , stellen 2 Röcke $2x$ Arbeitstage dar usw. Nimm aber an, die zur Produktion eines Rocks notwendige Arbeit steige auf das Doppelte oder falle um die Hälfte. Im ersten Fall hat ein Rock soviel Wert als vorher zwei Röcke, im letztern Fall haben zwei Röcke nur soviel Wert als vorher einer, obgleich in beiden Fällen ein Rock nach wie vor dieselben Dienste leistet und die in ihm enthaltene nützliche Arbeit nach wie vor von derselben Güte bleibt. Aber das in seiner Produktion verausgabte Arbeitsquantum hat sich verändert.

60:4/o Ein größres Quantum Gebrauchswert bildet an und für sich größren stofflichen Reichtum, zwei Röcke mehr als einer. Mit zwei Röcken kann man zwei Menschen kleiden, mit einem Rock nur einen Menschen usw. Dennoch kann der steigenden Masse des stofflichen Reichtums ein gleichzeitiger Fall seiner Wertgröße entsprechen.

he considers it one movement which is self-opposed.) In order to find the origin of this opposition, note that “how productive is a given labor?” is the same kind of question as: “which use-value does a given labor produce?” It refers to the concrete useful labor, not the abstract labor.

This self-opposed movement arises out of the two-edged character of labor. Productivity, of course, is always the productivity of concrete, useful labor; it determines how effective a purposeful productive activity can be in a given period of time. Useful labor becomes, therefore, a more or less abundant source of products in direct proportion as its productivity rises or falls. As against this, however, variations in productivity in themselves have zero impact on the labor represented in value. As productivity is an attribute of labor in its concrete useful form, it naturally ceases to have any bearing on that labor as soon as we abstract from its concrete useful form. The same labor, therefore, performed for the same length of time, always yields the same amount of value, independently of any variations in its productivity. But it provides different quantities of use-values during equal periods of time; more, if productivity rises; fewer, if it falls. For this reason, the same change in productivity which increases the fruitfulness of labor, and therefore the amount of use-values produced by it, also brings about a reduction in the value of this increased total amount, if it cuts down the total amount of labor-time necessary to produce the use-values. The converse also holds.

Since labor has a double character, it has two effects, that can be contradictory. The first German edition 26:3/o has here an additional paragraph emphasizing this contradiction:

It follows from what has been said so far that, although it is not true that the commodity contains two different kinds of labor, nevertheless the *same* labor has differ-

Diese gegensätzliche Bewegung entspringt aus dem zwieschlächtigen Charakter der Arbeit. Produktivkraft ist natürlich stets Produktivkraft nützlicher, konkreter Arbeit und bestimmt in der Tat nur den Wirkungsgrad zweckmäßiger produktiver Tätigkeit in gegebenem Zeitraum. Die nützliche Arbeit wird daher reichere oder dürftigere Produktenquelle im direkten Verhältnis zum Steigen oder Fallen ihrer Produktivkraft. Dagegen trifft ein Wechsel der Produktivkraft die im Wert dargestellte Arbeit an und für sich gar nicht. Da die Produktivkraft der konkreten nützlichen Form der Arbeit angehört, kann sie natürlich die Arbeit nicht mehr berühren, sobald von ihrer konkreten nützlichen Form abstrahiert wird. Dieselbe Arbeit ergibt daher in denselben Zeiträumen stets dieselbe Wertgröße, wie immer die Produktivkraft wechselt. Aber sie liefert in demselben Zeitraum verschiedene Quanta Gebrauchswerte, mehr, wenn die Produktivkraft steigt, weniger, wenn sie sinkt. Derselbe Wechsel der Produktivkraft, der die Fruchtbarkeit der Arbeit und daher die Masse der von ihr gelieferten Gebrauchswerte vermehrt, vermindert also die Wertgröße dieser vermehrten Gesamtmasse, wenn er die Summe der zu ihrer Produktion notwendigen Arbeitszeit abkürzt. Ebenso umgekehrt.

Aus dem Bisherigen folgt, daß in der Ware zwar nicht zwei verschiedene Sorten Arbeit stecken, wohl aber *dieselbe* Arbeit verschiedenen und selbst entgegengesetzt bestimmt ist,

ent and even opposite determinations, according to whether it is seen in relation to the *use-value* of the commodity as its *product* or to the *commodity-value* as labor's own *material* expression. Just as the commodity must above all be a useful object in order to be value, so labor must above all be useful labor, purposeful productive activity, in order to count as *expenditure of human labor-power* and therefore as *human labor* pure and simple.

↑ The French edition [mecw] has a similar paragraph with the memorable formulation that “the same labor is here opposed to itself” (*le même travail y est opposé à lui-même*).

Question 150 *Since productivity is a quality of useful labor, one might not expect it to play a great role in capitalism. But it does. Why?*

Question 151 *Discuss the implications of the fact that an increase in material wealth in the form of commodities may be accompanied by a decrease in the total amount of their value. Do you know examples from modern capitalism where this perverse relationship has detrimental effects?*

Question 152 *It is easy to see that with higher productivity a greater amount of use-values may represent a lower commodity-value (which depends on labor-content). But Marx's Capital 136:4/o says more than that. Marx claims that this discrepancy and even opposition comes from the two-edged character of labor. How does he argue this claim, or how might one argue for or against such a proposition?*

137:1 On the one hand, all labor is an expenditure, in the physiological sense, of human labor-power, and in this quality of being equal human labor or abstract human labor, it forms the value of commodities. On the other hand, all labor is an expenditure of human labor-power in a particular form and with a specific aim, and in this quality of being concrete useful labor, it produces use-values.¹⁶

je nachdem sie auf den *Gebrauchswert* der Ware als ihr *Product* oder auf den *Waren-Wert* als ihren bloß *gegenständlichen* Ausdruck bezogen wird. Wie die Ware vor allem Gebrauchsgegenstand sein muß, um Wert zu sein, so muß die Arbeit vor allem nützliche Arbeit, zweckbestimmte produktive Tätigkeit sein, um als *Verausgabung menschlicher Arbeitskraft* und daher als *menschliche Arbeit* schlechthin zu zählen.

61:1 Alle Arbeit ist einerseits Verausgabung menschlicher Arbeitskraft im physiologischen Sinn, und in dieser Eigenschaft gleicher menschlicher oder abstrakt menschlicher Arbeit bildet sie den Warenwert. Alle Arbeit ist andererseits Verausgabung menschlicher Arbeitskraft in besonderer zweckbestimmter Form, und in dieser Eigenschaft konkreter nützlicher Arbeit produziert sie Gebrauchswerte.¹⁶

Three of these four statements are valid in all modes of production, while one statement, “and in this quality of being equal human labor or abstract human labor, it forms the value of commodities” is only valid in commodity producing societies.

In footnote 16, Marx plays two quotes from Adam Smith against each other:

¹⁶ In order to prove that ‘labor alone is the ultimate and real standard by which the value of all commodities can at all times and places be estimated and compared’, Adam Smith says this:

The first quote sounds unobjectionable if taken by itself: “labor alone” is the ultimate standard of value. However in a second quote Smith adds that labor always has the same value to the laborer:

^{16 ctd} ‘Equal quantities of labor, at all times and places, must have the same value for the laborer. In his ordinary state of health, strength and activity; in the ordinary degree of his skill and dexterity, he must always lay down the same portion of his ease, his liberty, and his happiness.’ *Wealth of Nations* [Smi39, Bk. I, ch. 5, pp. 104–5].

From the juxtaposition of these two quotes Marx draws four conclusions:

(1) When Smith wrote in the first quote “labor alone,” he did not really mean labor but he meant the value of labor to the worker. Otherwise he would not have found it necessary to prove, in the second quote, that the value of labor is always the same.

^{16 ctd} On the one hand, Adam Smith here (but not everywhere) confuses the determination of the values of commodities by the quantity of labor expended in their production with the determination of the values of commodities by the value of labor. This is why he finds it necessary to prove that equal quantities of labor always have the same value.

(2) Now, “on the other hand,” Marx remarks that Smith’s attempt to prove that labor always has the same value also reflects some correct thinking:

^{16 ctd} On the other hand, he has the hunch that, in so far as labor manifests itself in the value of commodities, it only counts as an expenditure of labor-power.

A proof that labor always has the same value is on the one hand necessary to round out Smith’s mistaken theory that the value of the products derives from the value of labor. But on the other hand this proof also reflects the correct insight that that which creates value must indeed be *homogeneous*. According to Marx, this homogeneous substance is not the value of labor but abstract human labor, the expenditure of labor-power. According to Smith, it is the disutility of labor (i.e. its value according to a subjective concept of value). It is not very far-fetched to confuse the expenditure of labor-power with the disutility of labor, since the expenditure of labor-power does take effort, which may create disutility.

(3) After finding a kernel of truth in Smith’s error, Marx shows that even in this most

¹⁶ Um zu beweisen, „daß die Arbeit allein das endgültige und reale Maß ist, woran der Wert aller Waren zu allen Zeiten geschätzt und verglichen werden kann“, sagt A. Smith:

^{16 ctd} „Gleiche Quantitäten Arbeit müssen zu allen Zeiten und an allen Orten für den Arbeiter selbst denselben Wert haben. In seinem normalen Zustand von Gesundheit, Kraft und Tätigkeit und mit dem Durchschnittsgrad von Geschicklichkeit, die er besitzen mag, muß er immer die nämliche Portion seiner Ruhe, seiner Freiheit und seines Glücks hingeben.“ „Wealth of Nations“ [Smi39, Bk. I, ch. 5, pp. 104–5].

^{16 ctd} Einerseits verwechselt A. Smith hier (nicht überall) die Bestimmung des Werts durch das in der Produktion der Ware verausgabte Arbeitsquantum mit der Bestimmung der Warenwerte durch den Wert der Arbeit und sucht daher nachzuweisen, daß gleiche Quantitäten Arbeit stets denselben Wert haben.

^{16 ctd} Andererseits ahnt er, daß die Arbeit, soweit sie sich im Wert der Waren darstellt, nur als Verausgabung von Arbeitskraft gilt, ...

favorable reading, Smith is not completely right but makes an additional error:

^{16 ctd} But then he views this expenditure merely as the sacrifice of ease, liberty, and happiness, not also as man’s normal life activity.

^{16 ctd} ... faßt diese Verausgabung aber wieder bloß als Opfer von Ruhe, Freiheit und Glück, nicht auch als normale Lebensbetätigung.

According to Smith, it is the sacrifice and pain of the worker which creates value, while according to Marx, the value of the product arises from the fact that the worker’s life activity is directed towards this and not some other product. Smith’s transposition of labor itself into that what labor is for the humans is the error of *methodological individualism*.

Exam Question 153 *How does Marx’s labor theory of value differ from an explanation of value by what today would be called the “disutility of labor,” i.e., the “sacrifice of ease, liberty, and happiness”?*

(4) Finally, Marx remarks that Smith’s second error was inspired by the evidence of the modern wage relation:

^{16 ctd} He is guided here by the evidence of the modern wage laborer.

^{16 ctd} Allerdings hat er den modernen Lohnarbeiter vor Augen.

Smith’s thesis that the value comes from the disutility of labor reflects the experience of the modern wage laborer in two ways:

(a) The payment of the price of labor to the laborer can be seen by everyone, while the fact that labor is the source of value (of more value than the laborer gets) is hidden. This leads to the assumption that the visible *price* of labor is the source of the value of the product, not the labor itself. This price is then explained by the value of the labor to the laborer.

(b) The exploitation inherent in capitalism leads to painful and abusive labor processes.

Question 154 *How was Smith influenced by the evidence of the modern wage laborer when he formulated his thesis that the value of a product is determined by the laborer’s “sacrifice of ease, liberty, and happiness”? (Attempt this Question only if you know the answer to Question 153, and know something about Marx’s theory of wage labor.)*

The influence of the wage labor relation on Smith’s thinking is reminiscent of Marx’s argument in 151:4, that Aristotele’s analysis of the commodity, despite promising beginnings, did not advance past a certain point, due to the limitations of Greek society. However the next quote shows that other economists did not share Smith’s error:

^{16 ctd} Adam Smith’s anonymous predecessor, cited in note 9, is much nearer the mark when he says: ‘One man has employed himself a week in providing this necessary of life ... and he that gives him some other in exchange, cannot make a better estimate of what is a proper equivalent, than by computing what cost him just as much labor and time: which in effect is no more than exchanging one man’s labor in one thing for a

^{16 ctd} —Viel treffender sagt der Note 9 zitierte anonyme Vorgänger von A. Smith: „Ein Mann hat eine Woche auf die Herstellung dieses Bedarfsgegenstandes verwandt ... und der, welcher ihm einen anderen Gegenstand im Austausch gibt, kann nicht richtiger abschätzen, was wirklich gleichwertig ist, als durch die Berechnung, was ihm ebensoviel labor und Zeit kostet. Das bedeutet in der Tat den Austausch der la-

time certain, for another man's labor in another thing for the same time' [Ano39, p. 39].

bor, die ein Mensch in einer bestimmten Zeit auf einen Gegenstand verwandt hat, gegen die labor eines andren, in der gleichen Zeit auf einen andren Gegenstand verwandt.“ [Ano39, p. 39]

The end of footnote 16 is a remark by Engels about the whole section 2, “The Double Character of Labor.”

^{16 ctd} [Note by Engels to the fourth German edition:] The English language has the advantage of possessing two separate words for these two different aspects of labor. Labor which creates use-values and is qualitatively determined is called ‘work’ as opposed to ‘labor’; labor which creates value and is only measured quantitatively is called ‘labor’, as opposed to ‘work’.

^{16 ctd} — {Zur 4. Auflage: Die englische Sprache hat den Vorzug, zwei verschiedene Worte für diese zwei verschiedenen Aspekte der Arbeit zu haben. Die Arbeit, die Gebrauchswerte schafft und qualitativ bestimmt ist, heißt work, im Gegensatz zu labor; die Arbeit, die Wert schafft und nur quantitativ gemessen wird, heißt labor, im Gegensatz zu work. Siehe Note zur englischen Übersetzung, p. 14.—F. E.}

1.3. The Form of Value, or the Exchange-Value

Marx is in the midst of his discussion of value, which follows a simple scheme. After having discussed its substance (abstract labor) and magnitude (socially necessary labor-time), Marx discusses now its *form* (exchange-value), in a section bearing the title: “The Form of Value, or the Exchange-Value.”

Question 155 *If the first chapter is such a systematic discussion of value, why is it then called “Commodities” and not “Value”?*

[From Form of Commodity to Form of Value]

[Marx's Definition of Form of Value]

In capitalism, production is private, i.e., there is no direct coordination among producers or between producers and consumers. The main channel through which the many private production processes are in communication is the value generated in these production processes. Value is a homogeneous “quasi-material” inside the commodities which, although invisible, sends socially highly effective signals to producers and consumers. In the present section 1.3 Marx is investigating these signals or, in his terminology, he is investigating the *form* in which the value created in the private production processes manifests itself to the economic agents.

While value itself is a social relation of *production*, a *form* of value is a social relation governing the interactions on the *surface* of the economy. Since these surface relations are commodity relations, they are attached to commodities, i.e., they are socially generated

properties of commodities. Such a social property is a *form* of value if it enables the commodity to which it is attached as Marx paraphrases in the First edition 631:1, “*to appear* to other commodities *as value*, *to count as value*, and *to act on it as value*.” This summary is very general. In his detailed argumentation Marx is more specific. Capitalism is an ongoing social system which reproduces itself because the forms of value attached to the commodities enable the economic agents to take two kinds of actions: (1) they give the producers the information necessary so that they can produce their products as values, and (2) they allow the agents to take advantage of the values of the commodities in their possession. Marx never formulates these two criteria explicitly, but most of the time he talks about “forms of value” he one of these two criteria.

[Summary of Marx's Argument]

The result of the current section 1.3 will be that two complementary forms of value together generate and transmit the information needed by the private producers to produce their products as commodities. One specific commodity (gold, but in principle it can be any commodity) is designated by society as *money*, i.e., it is accepted in exchange for all other commodities. All other commodities entering circulation have *prices*, i.e., their owners publicly announce how much money is necessary to buy them. Being money and having a price are both forms of value, both are socially generated properties of commodities in circulation. A system of prices denominated in the same monetary unit enables the producers to select those production methods which only require socially necessary amounts of labor, and to allocate their labor to those areas of production which are in high demand on the market. This is Marx's basic explanation of money. For the genesis of money, therefore, the informational criterion (1) for the form of value plays the dominant role.

Chapter Two will then show that these monetary relations also help the market participants resolve the practical difficulties of the trade of their commodities, i.e., that monetary relations also satisfy criterion (2) for the form of value. This is an important supplementary result; without it, the market agents would not be motivated to establish monetary relations between their commodities.

In chapter Three, the two above criteria for the form of value reappear as “functions of money”; criterion (1) in the first section, dealing with the function of money as measure of value, and criterion (2) in the second section, the function of money as means of circulation. The third section shows that the necessities of mediating commodity production and circulation have turned money into a too powerful tool, which can do much more than merely being a compass for production and aid in circulation.

[The Commodity Needs a Double Form]

After this overview let us now begin with the discussion of section 1.3. Marx does not begin the section with the form of *value* but with a brief discussion of the form of the *commodity*. The first paragraph 138:1 has the same point of departure as 125:2 (the very first paragraph

of chapter One)—namely, the commodity. But there is a difference. Marx’s earlier point of departure had been the “form of appearance” of the commodity (use-value and exchange-value), since he was investigating the practical activity of the market participants in order to make inferences about the underlying commodity relations. By contrast, here in section 1.3 Marx looks at the *production* of the commodity, and he uses the results of his earlier analysis of the commodity to interpret what he sees:

138:1 Commodities come into the world in the form of use-values or articles, as iron, linen, corn etc.

62:1 Waren kommen zur Welt in der Form von Gebrauchswerten oder Warenkörpern, als Eisen, Leinwand, Weizen usw.

The translation “article” is based on the following passage in the First Edition, p. 18:2: “For the

sake of brevity, we will call the useful thing itself or the *body of the commodity*, such as iron,

wheat, diamond, etc., a *use-value*, good, article.”

The German word that is translated here as “article” is, in a more literal translation, “body of the commodity,” a phrase which resonates with the birth metaphor “commodities come into the world.” The comparison of the production of a commodity with the birth of a baby is fitting. Humans can survive only in *society*, and the birth of a baby is the culmination of a complex social process. But the baby itself does not yet have the skills, such as language etc., which would enable it to sustain itself and meet its needs in the social context; it still has to grow up. Similarly one can say that the use-value, as it emerges from the private production process, still has to grow up: it does not know how to find its way to the consumer, nor how it can nourish those who produced it, or pass on its own experience to other use-values coming after it. This section explores the establishment of these connections.

Question 159 *The first section and the third section of chapter One of Capital both begin with the individual commodity. Nevertheless the treatment is quite different. Explain how the treatment differs, and why.*

This is their home-grown bodily form.

Es ist dies ihre hausbackene Naturalform.

↑ The “body” of the commodity, i.e., the commodity as a physical object, is called here its “bodily form” (my emphasis). In the first edition, 626:1, Marx calls it its *use-value form*. Here Marx uses the above criterion (2) for a form, because physical possession of the body of the commodity allows humans to benefit from its use-value. The terminology that the physical object is called a “form” may seem less odd if you keep in mind that individuals do not need the objects themselves but their use-values. But they cannot acquire the use-value without the object because usually one must have this physical object in one’s possession in order to benefit from its useful properties. Possession of the object is therefore the interface through which the consumers of the commodity can access the use-value of the commodity. Marx mentioned this already in 126:1, without using the word “form.”

Although our definition of form of value included that it is a social relation, physical possession of an object is *not* a social relation. (Ownership rights *are* social relations, but

one does not have to own the commodity in order to take advantage of its use-value. It is equally possible with a stolen commodity. Marx alludes to this in 178:1/o). Since this form is not a social relation Marx calls it a “home-grown” form. Whereas production is always and everywhere a social process (Marx says that solitary production is as impossible as solitary language), consumption is not. As a rule, individuals do not need social relations to use their commodities. Criterion (1) is fulfilled automatically for the use-value form because people know how to consume things in their possession. In *Contribution*, 283:1/o, Marx says that as means of consumption, the commodities “do not acquire a new economic form determination.”

Question 164 *In Contribution, 270:1, Marx writes: “Although use-values serve social needs and therefore exist within a social context, they are not an expression of a social relation of production.” Is this correct? For many products, consumers need product information, instructions how to use it, assistance in setting up the product, warranty services if the product is defective, and maintenance. Are these not relations of production?*

↓ I just emphasized that production in every society is a *social* process. Even the “private” production of *commodities* is from the beginning social—because for the producers, the commodities are not use-values (the producers themselves don’t need the particular commodities they are producing) but values:

But they are more than use-values. They are commodities, i.e., useful objects *and* carriers of value.

Sie sind jedoch nur Waren, weil *Doppeltes*, Gebrauchsgegenstände und zugleich Wertträger.

Moore-Aveling tried to capture the overly complicated German “*nur ... weil*” construction as follows: “They are, however, commodities, only because they are something twofold, both objects of utility, and, at the same time, depositories

of value.” Unfortunately, the “only” ended up on the wrong place. A paraphrase of this translation which has the “only” at the right place would be: “However they only are commodities because they are

something twofold.” This is not only a matter of definition but can be viewed in a very practical way: they are only produced because of this other quality which they have in addition to being use-values.

↑ It is instructive to compare the above sentence with its earlier version in the first edition, 31:2/o:

The commodity is, since the moment it is made, something *twofold*, use-value *and* value, the product of useful labor *and* the congelation of abstract labor.

Die Ware ist von Haus aus ein *zwieschlächtig* Ding, Gebrauchswert *und* Wert, Produkt nützlicher Arbeit *und* abstrakte Arbeitsgalerte.

↑ The commodity is *use-value* since the moment it is made, because its production process has exactly the purpose to give it its use-value. It is *value* since the moment it is made, because its producer produces it only for the sake of its value, i.e., he puts his labor into the commodity in order to retrieve from the market someone else’s equal abstract labor in a use-value that suits his needs. This resonates with things Marx explained earlier: value is an

invisible but real social substance which the commodities acquire already in the production process. It also resonates with the definition “a commodity is something produced for the exchange” used in section 1.1 (even though Marx never formulated this definition explicitly).

Question 166 *If a commodity is only produced because of its value, why did Marx not say that commodities come to the world in the form of values?*

↓ Since a commodity is both use-value and value, and since its natural body is only a form for its use-value, Marx concludes that it also needs a *value form*:

In order to appear as commodities, i.e., have the form of commodities, they need therefore a *double form*, a bodily form and a value form.

Sie erscheinen daher nur als Waren oder besitzen nur die Form von Waren, sofern sie *Doppelform* besitzen, Naturalform und Wertform.

↑ In the first edition, the corresponding sentence 31:2/o comes much later: After showing that the commodity has two forms, Marx says this may seem strange but on further reflection it is necessary because the commodity has a double character and therefore needs two forms. But the argument that the commodity has a double character and therefore needs two forms can be made even before we know these two forms, and indeed the discussions of the form of value in the appendix of the first edition, and in the second and later editions, shifted the need of the commodity for a double form to the very beginning.

Question 169 *Why can commodities not express their values in their own use-values? (Note that we are not asking here why the value of a commodity is not determined by its use-value. The expression of value is not the same as the determination of value.)*

↓ This is the second time that Marx uses the concept of “form.” After the *use-value* form (or “bodily” form) of the commodity, he discusses now its *value* form. Both times, criterion (2) are in the foreground: just as the “use-value form” of the commodity must enable the commodity owners to take advantage of the use-values of their commodities, the “value form” must enable them to take advantage of the values of their commodities. The following quote from Theories of Surplus-Value III, [mecw32]331:4/o, makes it explicit that the need for a double form is driven by criterion (2) for the form of value.

Because the product is not produced as an immediate object of consumption for the producers, but only as a *carrier of value*, as a claim, so to speak, on a certain quantity of all manifestations of social labor, all products are compelled to give themselves as *values* a form of existence distinct from their existence as use values.

Weil das Produkt nicht als unmittelbarer Gegenstand der Konsumtion für die Produzenten produziert wird, sondern nur als *Träger des Werts*, sozusagen als Anweisung auf bestimmtes Quantum aller Darstellungen der gesellschaftlichen Arbeit, sind alle Produkte gezwungen, als *Werte* sich eine von ihrem Dasein als Gebrauchswerte unterschiedne Daseinsform zu geben.

↑ The form of value is necessary so that the producer can get credit for and benefit from having produced the product. Now one might argue against this that the commodity does

not need a value form separate from its use-value form—all the producer has to do in order to take advantage of the value in the commodity is to barter it away for something he or she can use. Marx discusses this possibility in chapter Two, p. 182:1. It works in simple circumstances, but not in a developed commodity economy in which many different products enter the market as commodities. The higher developed forms of value up until the money form, which will be derived below, become less and less dispensable as the extent and complexity of commodity production evolves.

The need of the commodity to have a double form provides the transition from the form of the commodity to the form of value, and from now on Marx only speaks about the form of value. But from this introductory passage about the commodity form we know that a form of value is a social surface relation attached to a commodity.

Question 171 *The title of Section 3 is “Form of value.” Why does Marx then start his discussion with the form of the commodity?*

[The Only Access Route to the Value Quasi-Material]

According to criterion (2), the form of value is a relation which allows the commodity owners to take advantage of the value of their commodities. In order to see how they can do this, we have to draw on what we know about value. It was derived earlier, in 127:3, that as exchange-values commodities are reducible to a common substance. This common substance is the “value quasi-material” embedded in the commodity which Marx first mentions in 128:3. It complements the commodity’s bodily form just as the soul complements the human body. According to a draft manuscript for the second edition of *Capital* published in [Mar87a, p. 7:2], Marx considered writing the following after the sentence with the home-grown bodily form:

Their ghost-like *value quasi-material* by

Ihre gespensterhafte *Werthgegenständlichkeit* ist dagegen nicht wahrnehmbar.

The need for a form of value can therefore be paraphrased as: the commodity owners must find a way to make the invisible value quasi-material in their commodities beneficial for them. This reference to the value quasi-material did not make it into the second or later editions of *Capital*. As I already mentioned in the annotations of 128:3, Marx may have been a little cautious with his formulations so that he would not be accused of idealism. It seems to me that Marx is leaving a little gap in his argument here, apparently counting on it that the reader understands that, when he talks about the body of the commodity, he implicitly also talks about the body’s “opposite,” the value quasi-material (another formulation which did not make it into the final editions, see [Mar87a, p. 7:1]). Instead of first saying that the form of value must make the invisible value quasi-material accessible to the economic agents, Marx’s next step is already to point out an obstacle in reaching this (unstated) objective:

138:2/o The quasi-material that makes up the value of a commodity differs in this re-

62:2 Die Wertgegenständlichkeit der Ware unterscheidet sich dadurch von der Wittib

spect from Dame Quickly, that one does not know “where to have it.”

↑ Dame Quickly is a character in Shakespeare’s *Henry IV*. In part 1, act 3, scene 3, Falstaff says: “Why, she’s neither fish nor flesh; a man knows not where to have her.” Dame Quickly: “Thou art an unjust man in saying so: thou or any man knows where to have me, thou knave, thou!”

Question 172 Explain the metaphor in which Marx compares a commodity’s value quasi-material with Dame Quickly. (This is for someone who knows Shakespeare!)

The reference to Dame Quickly is a poetic description of the trials and tribulations of the commodity producer on the market. He spent a lot of time producing his commodity, but the particular labor he has put into it does not benefit him because he does not need the use-values he is producing. He produced this use-value only in order to embed abstract human labor in his commodity. This abstract human labor is his claim-check for the things he needs, which are themselves the product of abstract human labor. Therefore he somehow has to get access to the abstract human labor in his commodity, to get hold of the *value quasi-material* in the commodity he produced. But this material is elusive.

The question is therefore where this value quasi-material can be had, i.e., how the commodity producers can get access to and therefore benefit from the value produced by their own labor. Marx uses an elimination argument based on the following two alternatives spelled out in the first edition of *Capital*, 30:1:

Commodities are objects. Whatever they are they must either be as objects or show in their own objective relationships.

Waren sind Sachen. Was sie sind, müssen sie sachlich sein oder in ihren eigenen sachlichen Beziehungen zeigen.

Question 173 Give an example of an object for which it is not true that it is what it is as an object.

↓ The first alternative is therefore: can we find the value quasi-material in the commodity as an object? The answer is “no.” That so and so much abstract labor was used up in the production of the linen is not evident from its use-value:

Unlike the crude tangible material of which use-values are composed, this value quasi-material does not contain a single atom of physical matter.

Im graden Gegenteil zur sinnlich-groben Gegenständlichkeit der Warenkörper geht kein Atom Naturstoff in sie ein.

Question 174 How does Marx’s statement in 138:2/o that a commodity’s value quasi-material “does not contain a single atom of physical matter” relate to his other statement in 177:3–4 that “no chemist has ever discovered exchange-value in pearl or diamond.” Do they say the same thing or something different?

↓ Hence it is impossible to get access to the value inside the commodity through direct physical interaction with the commodity:

However much one may tilt and turn a single commodity, one will not be able to lay one’s hands on it as a thing consisting of value.

Man mag daher eine einzelne Ware drehn und wenden, wie man will, sie bleibt unfafßbar als Wertding.

↓ Therefore only the other alternative remains: this value must manifest itself in the *relationships* which these commodities have with each other.

If we remember, however, that commodities contain the value quasi-material only in so far as they are expressions of the same social unity, human labor, i.e., that their value quasi-material is something purely social, then we will understand that it can only manifest itself in the social relation of commodity to commodity.

Erinnern wir uns jedoch, daß die Waren nur Wertgegenständlichkeit besitzen, sofern sie Ausdrücke derselben gesellschaftlichen Einheit, menschlicher Arbeit, sind, daß ihre Wertgegenständlichkeit also rein gesellschaftlich ist, so versteht sich auch von selbst, daß sie nur im gesellschaftlichen Verhältnis von Ware zu Ware erscheinen kann.

[Digression: Social Versus Interpersonal Relations]

↑ The same word “social” occurs three times in this long sentence, but it has a slightly different meaning in its third occurrence than in the first two. I will digress here in order to clarify some basic concepts, so that we can properly understand Marx’s argument. First a word about the concept of *social relations*. When Marx speaks of social relations, he often uses the formulation that they are relations “of” the individuals, not “between” the individuals. An explanation of this can be found in the following statement in *Grundrisse*, p. 265:0, which may at first seem astonishing: Society does not consist of individuals, but expresses the sum of connections, relations, in which these individuals stand with respect to each other.

Die Gesellschaft besteht nicht aus Individuen, sondern drückt die Summe der Beziehungen, Verhältnisse aus, worin diese Individuen zueinander stehen.

Question 175 Marx writes: “Society does not consist of individuals, but expresses the sum of relations in which the individuals stand.” Why did he switch from “consist” to “express,” i.e., why did he not write “society consists of the sum of relations in which the individuals stand”?

If we use the word “society” we are mainly referring to relations and not individuals. The relations pre-exist any individuals that may slip into these relations and give them life. For instance, the roles of a mother or a teacher are very clearly circumscribed social roles which preexist any individual mother or teacher living today. Today’s mothers or teachers did not create these roles, but their behavior reproduces these roles and, often unintentionally, transforms them.

Society is therefore not seen as a group of individuals with rubber bands between them, but as a building with many different rooms inhabited by the individuals. Its architecture can be studied before one knows anything about the individuals living in these rooms.

The declaration that “society does not consist of individuals” implies that “the social” is not reducible to the conscious actions and intentions of individuals. This view deeply permeates *Capital*. The social relation “value” for instance is not explained by the goals and preferences of the commodity owners, but by the organizational structure of social production.

In capitalism, all labor counts as equal, all labor counts as the expenditure of a part of the mass of the human labor-power available to society. In every society, labor-power must be expended to shape the use-values of the products. In capitalism, the labor process has a second effect: people remember how much labor-power they spent in the production of the use-value because this use-value is their claim on the products of the labors of the others. The labor-power, therefore, does not disappear when it is used up but it is accumulated in the value of the product. This accumulated past labor-power is the “value quasi-material” Marx is talking about.

Now we know that Marx means when he says that the value quasi-material is something social. Now what does he mean with the phrase that it can only manifest itself in the relationship of commodity to commodity?

The error of trying to reduce society to individuals is made so often because nothing happens in society without some individual carrying it out. The social structure grows, so-to-say, behind the backs of the individuals, and is not controlled by the individuals, nevertheless their individual activity is the motor maintaining the social structure. Example: if a commodity has value, this causes people to act in certain ways with respect to it, and on the other hand, only if this activity occurs will a commodity have value. The commodity owner can therefore benefit from the value in his or her commodity only through the value-sustaining behavior of other individuals—there is no way to benefit from the value just in a direct physical interaction between the commodity-owner and the commodity itself. Any form of value must therefore involve interpersonal activity, i.e., activity involving other commodity owners. And since commodity owners are only the “character masks” acting out the relations of the commodities themselves, this interpersonal activity must be kindled by a relationship from commodity to commodity. Unfortunately, Marx’s terminology does not have a separate word for “interpersonal” as opposed to “social” relations but used the same word “social relations” for them. But the formulation “social relation of commodity to commodity” makes it clear that Marx means here a relationship in which the commodities come in direct contact with each other, i.e., an “interpersonal” relationship between commodities.

Question 177 Find other passages of Marx where he is explicitly speaking of interpersonal or inter-commodity instead of structural social relations.

To sum up, this long digression tried to show that the passage 138:2/o can be paraphrased as: Value is a social relation, therefore we have to look at the direct interactions between

commodities if we want to know how individuals can benefit from the values in their commodities. Now let’s continue reading Marx’s text.

[Two Brief Digressions by Marx]

Before doing what he said he had to do (namely, investigate the direct social interactions between commodities in order to find the channels through which commodity owners exchange information and benefit from their commodities), Marx himself makes two brief digressions. ↓ In his first digression, he remarks that a look at the direct interactions between commodities was also the starting point for a different investigation, namely, the earlier derivation of what value is.

The exchange-value or exchange relation of commodities was in fact the starting point in our search for their value hidden inside it.

Wir gingen in der Tat vom Tauschwert oder Austauschverhältnis der Waren aus, um ihrem darin versteckten Wert auf die Spur zu kommen.

↓ Already in 127:1, Marx comes to the conclusion that the exchange relations of the commodities are the “form of appearance” (*Erscheinungsform*) of something which he later calls “value.” And in a brief commentary about his starting point in the *Notes to Wagner*, p. [mecw24]544:6/o, Marx says that he initially analyzes the commodity in the “form in which it appears.”

We must now come back to this form of appearance of value.

Wir müssen jetzt zu dieser Erscheinungsform des Werts zurückkommen.

↑ We are therefore arguing in a circle. We started with the form of appearance of value, then we inferred from this what value is, and now we have arrived back at where we started. But this roundtrip was not a waste of time; it allows us now to ask the intelligent questions about what is visible, for instance, to what extent these surface forms satisfy criteria (1) and (2) defined above. These questions will also propel us from the simplest form of value to the more developed forms of value. The circular course of the investigation—from the phenomena to the underlying mechanisms and then back to a fuller understanding of the phenomena—is not an accident. In 102:2 and in the *Introduction to Grundrisse*, [mecw28] 37:2–38:1, Marx describes it as a necessary procedure in social sciences.

↓ Marx’s second digression surveys what must be accomplished:

139:1 Everyone knows, if he knows nothing else, that commodities have a value form common to them all which presents a marked contrast to the varied bodily forms of their use-values—namely, their money form.

62:3 Jedermann weiß, wenn er auch sonst nichts weiß, daß die Waren eine mit den bunten Naturalformen ihrer Gebrauchswerte höchst frappant kontrastierende, gemeinsame Wertform besitzen—die Geldform.

↑ The “money form” of a commodity is a concept which belongs into chapter Three, see 203:3/oo. When Marx uses this word already here, he refers to the fact of life that all commodities can be turned into money, and indeed *must* be turned into money if their

producer is to benefit from having produced them.

↓ The money form itself is so striking that it has attracted a lot of attention, but nobody ever tried to explain the *genesis* of the money form.

Here however, a task is set to us, which bourgeois economics never even tried to accomplish, namely, to trace the genesis of this money form,

Hier gilt es jedoch zu leisten, was von der bürgerlichen Ökonomie nicht einmal versucht ward, nämlich die Genesis dieser Geldform nachzuweisen,

Question 182 *Why did bourgeois economics never attempt to derive the genesis of the money form?*

The most casual observer known that in capitalism, money can buy everything. One can fully understand this only if one is aware of an equally peculiar but less visible fact about our society: that production is private and its coordination is mediated through surface interactions on the market. The “genesis of the money form” links the striking and astonishing money form to this equally remarkable underlying fact. ↓ The second half of the sentence names the results of such a needed “genetic” approach to explaining the money form:

i.e., to pursue the development of the value expression contained in the value relation of the commodities from its simplest, almost unnoticeable shape to the blinding money form.

also die Entwicklung des im Wertverhältnis der Waren enthaltenen Wertausdrucks von seiner einfachsten unscheinbarsten Gestalt bis zur blendenden Geldform zu verfolgen.

Question 183 *Give other examples where a relationship is at the same time an expression about one of the parties in that relationship.*

↑ The boast that nobody did this before is Marx’s opener for a quick summary how he is going to proceed in his genetic approach to the value form. He begins with the value interactions of the commodities, i.e., the interactions which commodities have with each other on the market due to the fact that they contain value. In these value interactions he is looking for *expressions* of value, i.e., relations which, since they flow from the values in the commodities, transmit information about these values. There is a hierarchy of such expressions from simple to elaborate. The principle which drives these expressions forward is: how well suited is the information contained in these relations for governing the decisions of the producers of the commodities, i.e., this is criterion (1).

When this is done, the riddle of money will disappear at the same time.

Damit verschwindet zugleich das Geldrätsel.

I translated *Geldrätsel* with “riddle” instead of “mystery.” Mystery, *Geheimnis*, is an

ontological category: things are intrinsically *geheimnisvoll*. A riddle, on the other hand, is

epistemological: someone does not know something, is perplexed by it, tries to resolve it.

↑ The “riddle of money” is the riddle why money can buy everything. It is not Marx’s only concern or even main concern. Marx’s main concern is the link between money and production. But bourgeois economics was preoccupied with the properties of money in circulation.

Exam Question 184 *Marx announces at the beginning of section 3 of chapter One that he is going to answer questions which were never even asked by bourgeois economists. Formulate these questions in your own words.*

Question 186 *What does Marx understand to be the riddle of money? And how does he solve this riddle in section 3?*

[From Commodity Interactions to the Form of Value]

Now Marx begins his analysis. Just before his two digressions, in 138:2/o, he said: since commodity value is something social, it can appear, manifest itself, only in the social interactions which commodities have with each other. Now what interactions do commodities have with each other as values? In the First edition, 38:1, reprinted here in the present Annotations, Marx wrote: their social interaction as commodities is simply that they count for each other as quantitatively different but qualitatively equal blobs of congealed abstract human labor. This is already quite simple, yet Marx looks for the *simplest* such interaction:

139:2 Obviously, the simplest value relation is that of one commodity to a single commodity of a different kind, whatever this other commodity may be.

62:4 Das einfachste Wertverhältnis ist offenbar das Wertverhältnis einer Ware zu einer einzigen verschiedenartigen Ware, gleichgültig welcher.

↑ This is the simplest value interaction because both commodities are ordinary commodities. Neither commodity is gold or some other use-value which predisposes it to function as money.

Question 188 *Why doesn’t Marx say that the simplest value relation is that between commodity and money?*

Question 189 *In a capitalist economy very few commodities are directly exchanged against each other. Almost all transactions involve money and a commodity. Why does Marx start his investigation with the exchange relation between two commodities, instead with the much more common relation between money and a commodity?*

The value relation between two commodities yields therefore the simplest expression of the value of a commodity.

Das Wertverhältnis zweier Waren liefert daher den einfachsten Wertausdruck für eine Ware.

Wertausdruck für eine Ware = Ausdruck für den Wert einer Ware = Ausdruck des Werts einer Ware.

↑ An “expression” of value is any relation or behavior that exists because commodities have value, and that emits information about this value. A *form* of value is a property of commodities allowing them to relate to each other as values. Forms of value are the roles which commodities play in an expression of value, see 32:1/o in the First edition.

The sentence above announces what Marx is investigating next. He will first show that the simplest value relation “yields” or contains an expression of value, and then in a long and abstract development he will analyze the roles of the two commodities in this expression of value. In the background are criteria (1) and (2): Marx will investigate to what extent these forms of value meet or do not meet the above criteria, and failure to fully meet these two criteria will also lead to more developed forms.

1.3.A. The Simple, Isolated, or Accidental Form of Value

Marx uses the attributes “ <i>einfach</i> ,” “ <i>einzel</i> ,” and “ <i>zufällig</i> .” He does not use “elementary.” Since there	is a conflict with the use of “elementary” in the very first paragraph of <i>Capital</i> , this word is	not used in this translation either.
--	---	--------------------------------------

Assume 20 yards of linen and 1 coat have the same value, i.e., (a) both are representations of abstract human labor, and (b) the socially necessary labor-time to produce them is equal. How do they interact with each other based on this relation, i.e., the social connection between them that they both represent the same amount of abstract human labor? The simplest such interaction is that one points to the other as its equal. (What Marx calls the simplest value relation I am calling here the simplest value interaction.) Marx picks the linen. His notation for the 20 yards of linen pointing to the coat as its equal is:

139:3–4 x commodity A = y commodity B or: x commodity A is worth y commodity B. (20 yards of linen = 1 coat or: 20 yards of linen are worth 1 coat.)	63:1 x Ware A = y Ware B oder: x Ware A ist y Ware B wert. (20 Ellen Leinwand = 1 Rock oder: 20 Ellen Leinwand sind 1 Rock wert.)
--	---

In Marx’s original text, both linen and coat are made by men, not women, but Marx playfully uses the fact that the German language gives (often rather arbitrary) male	and female genders to things. Linen is female and coat is male. In order to replicate this colorful stylistic play in the translation, I will pretend here that the coat was	made by a man and the linen by a woman (although usually weaving was men’s work; spinning was women’s work).
--	--	--

Since our intuition comes from an already monetized economy, the following remark may be useful at this point: “20 yards of linen are worth 1 coat” is a different and in fact a more elementary statement than: “20 yards of linen are worth as much as 1 coat.” The latter statement refers to the value of both coat and linen as a third thing different from both coat and linen. This is the point of view of the General equivalent, see 159:1. The statement “20

yards of linen are worth 1 coat,” by contrast, can be considered a price tag denominated in coats (instead of dollars). When we say “20 yards of linen are worth 100 dollars” we do not mean that the value of 20 yards of linen is equal to the *value* of 100 dollars, but we mean that 100 dollars *are* the value of 20 yards of linen. This is how the statement “20 yards of linen are worth 1 coat” should be read: it does not say that the *value* of the coat is equal to the value of the linen, but that the *coat itself* represents the value of the linen.

Since these Annotations are written for a general audience, I’d like to take this opportunity to also address a more basic misunderstanding sometimes happening to careless readers of the text. The form of value, which Marx discusses here, has no relation to the *use-values* involved. Unfortunately, Marx chose an example in which there *is* a relationship between the use-values: linen can be used to make coats (although Marx himself was thinking of woolen coats, see 145:2). This invariably leads to misunderstandings, such as, that the coat represents the value of the linen because it shows what kind of use-values can be made out of linen. Or, in the reverse relationship, the linen represents the value of the coat, since it takes this many yards of linen to make a coat. A careful reading of the text will show without doubt that *this is totally wrong!* The question whether one commodity is a raw material of which the other commodity can be made, or any other relationship of the *use-values*, has no bearing on the value form. It would have been better had Marx chosen the relationship

10 bags of potatoes = 1 coat

to make it clear that the value relation is *not* a relationship between the use-values. The linen weaver happens to need a coat and is willing to give 20 yards of linen in exchange for a coat. The *use-values* of linen and coat need not be related in any way to each other for such an exchange to take place.

As the placement of the formula “20 yards of linen is worth 1 coat” just below the title suggests, and as announced in 139:2, this interaction between linen and coat is an interaction in which the values of linen and coat come to be expressed. Marx is going to flesh this out now in the next four subsections. The subsection titled “The Two Poles of the Value Expression . . .” gives a fuller explanation of the simplest value interaction. Marx does not fail to mention that this simplest value interaction is an expression of value—because it is—but the first subsection does not yet pay much attention to what this expression says about value. The main result of this first subsection is that linen and coat play different and asymmetric roles in the value interaction “20 yards of linen is worth 1 coat.” Marx’s terminology for these different roles is that the linen is in the “relative form of value” and the coat in the “equivalent form of value.” The subsequent subsections “The Relative Form of Value” and “The Equivalent Form of Value” decipher what the relative and equivalent forms of value says about value. The concluding subsection “The Simple Form of Value Considered as a Whole” discusses the general relationship between value and exchange-value and shows that the exchange relationship between two commodities already contains the germ of money.

The Two Poles of the Value Expression: Relative Form of Value and Equivalent Form

139:5 The secret of all forms of value lies hidden in this Simple form of value.	63:2 Das Geheimnis aller Wertform steckt in dieser einfachen Wertform.
--	--

In this translation, Simple, Expanded, etc., are capitalized, but relative and equivalent are not.

↑ This Simple form contains the “secret” to all forms of value exactly because it is not yet developed. This lack of development allows the researcher to see connections which have been smoothened out and therefore are less easily visible in the more developed forms of value.

Its analysis, therefore, presents the key difficulty.	Ihre Analyse bietet daher die eigentliche Schwierigkeit.
---	--

Question 191 Does Marx contradict himself when he says the Simple form of value is difficult to analyze?

↑ In the preface to the First edition, p. 89:3/o, Marx says that chapter One is the most difficult part of *Capital*. Despite his attempts between the first and second edition to make the analysis of the form of value more accessible, the analysis of the form of value is probably the most difficult part of chapter One.

Since it is so difficult, let’s proceed carefully and methodically. ↓ Marx begins by clearing up a potentially confusing fact: although the equality of the values of linen and coat is a symmetric social relation between linen and coat, their interactions based on this equality need not be symmetric.

139:6 The two commodities of different kinds <i>A</i> and <i>B</i> (here linen and coat) obviously play two different roles.	63:3 Es spielen hier zwei verschiedenartige Waren <i>A</i> und <i>B</i> , in unsrem Beispiel Leinwand und Rock, offenbar zwei verschiedene Rollen.
--	--

The discussion in the present subsection (this and the next three paragraphs) seem more Hegelian than it is. It looks like an immersion into the meaning of the sentence “20 yards of linen are worth 1 coat.” But Marx has turned Hegel right side up. He merely explains in more detail the interaction between linen and coat which I summarized above as “the linen points to the coat as its equal” and which Marx denotes by the formula “20 yards of linen is worth one coat.”

But this is a very abstract argument requiring subtle thought processes. For instance one might wonder whether Marx argues here in a circle because first he formulates the value interaction in an asymmetric way, and then he makes a big deal about it that it is asymmetric. These doubts can be resolved if we make Marx’s abstract description of the value interaction more concrete and colorful by contemplating the situation and thought processes of the individuals engaged in an exchange. This makes things easier to understand

although it is logically not as clean as Marx, since it already interprets the value relations as exchange relations on the surface of the economy, while Marx is still in the process of describing how the relations in the production process project themselves onto the surface.

Going this route, asymmetry can be established as follows: If the social exchange proportion between linen and coat is “20 yards of linen for 1 coat,” then tailors and linen weavers must be on the market who are willing to make this exchange. This exchange is not a co-operative act in which both traders work together towards a common goal. On the contrary, the two traders have their separate reason for this exchange, which are often opposite to each other. In order to understand the individual activity which sustains this social exchange relation, one must therefore look at the point of view of each of the traders separately. By putting the linen on the left side of the equation, Marx has chosen the *linen weaver’s* point of view. If the linen weaver goes to the market and announces “20 yards of linen are worth 1 coat” (or puts up a sign next to her piece of linen to that effect), she expresses her willingness to exchange 20 yards of linen for 1 coat.

Exam Question 192 Why is the Simple value expression asymmetric between coat and linen?

↓ I will try to show that also the other things Marx says about the value interaction make sense if we read them as a description of the linen weaver’s situation and thought processes when she takes her linen to the market.

The linen expresses its value in the coat; the coat serves as the material in which that value is expressed.	Die Leinwand drückt ihren Wert aus im Rock, der Rock dient zum Material dieses Wertausdrucks.
--	---

↑ Although Marx states here that this interaction is an expression of the value of the linen—and the notation which Marx chose is not “I am willing to exchange 20 yards of linen for 1 coat” but it is the verbal value expression “20 yards of line is worth 1 coat”—Marx does not yet investigate in what way this is really a socially valid expression of the value of the linen. Of course, for the linen weaver herself, her willingness to accept 1 coat in exchange for 20 yards of linen is an expression of the value of the linen—in a sense closely related to the “revealed preferences” argument in modern economics: the linen weaver knows how much effort and expense was necessary to produce the linen, and she needs a coat. In light of this information she is willing to give away 20 yards of linen for a coat. In this sense, 20 yards of linen are, for her, worth 1 coat. The use-value of the coat is therefore for her the expression of the value of the linen. (Note that Marx’s own more general derivation, which does not explicitly introspect the thought processes of the linen weaver, only arrives at the statement that “the coat” is the material of the value expression without specifying that the *use-value* of the coat is this material.)

Modern neoclassical economics infers from this practical decision that in the linen weaver’s utility function, 20 yards of linen are ranked lower than 1 coat. Marx does not make this additional step. Instead, he insists that the linen weaver does not look at linen as use-value. She does not need linen, and she did not produce linen for her needs. But even if the linen weaver

was modeled to have a *Marxian* utility function, i.e., the linen enters her utility function not as a use-value, but as the disutility of her labor, this would still be an essentially different theory than Marx's own. Of course, the linen weaver knows how much labor is in the linen, and the amount of labor in the linen is necessarily one of the factors influencing her decision. But the reduction of all exchange-proportions to labor is an outcome generated by the interplay of the decisions of the producers and consumers, and not necessarily something of which the linen weaver is conscious or which is directly reflected in her motivations. Even a linen weaver who loves nothing more than to make linen must sell the linen at a price high enough to enable her to survive.

To say it again: Society is based on people's actions; what people think and intend is only relevant to the extent that it determines what they do. All we know, and all we need to know at this point, is that the linen weaver is offering to give her linen in exchange for the coat. This individual decision can be called an expression of the value of the linen in the coat not because the linen weaver is necessarily aware where the market value of her linen comes from. Of course, the linen weaver knows the labor content of the linen, and this knowledge enters her decisions, but so do many other things. Only the market interactions between many producers and consumers will filter out labor content as the factor deciding the center of gravity for the social exchange proportions. It must therefore be taken in a very broad sense that her practical actions are an expression of the labor content of the linen.

Here is more about it how the market filters out labor: She knows how much labor is in the linen. For her personally, this labor is not the only factor in her decision. On the market, she is interacting with many other commodity producers who also know the labor content of their own products, but who also have many other considerations when they agree to an exchange. What the individual agents not necessarily know, but Marx does know, is that labor is the only consideration which they share, all the other considerations are accidental and cancel each other out. This is why Marx can say that the linen weaver's decision to accept a coat for her linen is an expression of the *value* of the linen. Marx does not systematically pursue what the individual agents know and how the information flows from production to the market, although he sometimes remarks on it, see p. See also Engels's letter to J. Bloch on Sep 21, 1890:

... history is made in such a way that the final result always arises from conflicts between many individual wills, of which each in turn has been made what it is by a host of particular conditions of life. Thus there are innumerable intersecting forces, an infinite series of parallelograms of forces which give rise to resultant one the historical event. This may again itself be viewed as the product of a power which works as a whole unconsciously and without volition. For what each individual wills is obstructed by everyone else, and what emerges is something that no one willed. Thus history has proceeded hitherto in the manner of a natural process and is essentially subject to the same laws of motion. But from the fact that the wills of individuals—each of whom desires what he is impelled to by his physical constitution and external, in the last re-

sort economic, circumstances (either his own personal circumstances or those of society in general)—do not attain what they want, but are merged into an aggregate mean, a common resultant, it must not be concluded that they are equal to zero. On the contrary, each contributes to the resultant and is to this extent included in it.

Question 195 *The linen weaver's willingness to trade her linen for a coat cannot be an expression of the value of the linen, due to the principle that "bygones are bygones." The labor is a thing of the past, it no longer concerns the weaver; all that concerns her is what exists in the present, which is the linen. The decision to trade the linen must therefore be based on the linen itself and not on the labor used in the past to produce that linen. If the linen weaver trades coat for linen, she therefore reveals her preference of the use-value of the coat over that of the linen, and does not express the value of the linen. Is this a correct argument, and if not, where is the error?*

↓ The next step in Marx's analysis of the value interaction again borders on tautology: since this interaction was defined as the linen pointing to the coat as its equivalent, Marx doesn't seem to be saying anything new if he calls it active.

The first commodity plays an active role, the second a passive one.

Die erste Ware spielt eine aktive, die zweite eine passive Rolle.

↑ But if we put ourselves in the shoes of the linen weaver, the activity of the linen is no longer just a matter of grammar. The linen weaver just produced 20 yards of linen—although she does not need linen. Instead, she has many other needs. Her effort and expenses producing the linen will be wasted and her needs will remain unmet if she is unable to exchange the linen for the things she needs. Therefore she will not rest until the linen is off her shelf. This urgency gives the linen its active character.

Question 196 *In the Simple or Accidental form of value, which commodity plays an active role, and which a passive role? Explain what it means in this situation to be active or passive.*

↓ After showing that the two poles of the value interaction differ, Marx gives them different names:

The value of the first commodity is represented as relative value, in other words the commodity is in the relative form of value. The second commodity functions as equivalent, in other words it is in the equivalent form.

Der Wert der ersten Ware ist als relativer Wert dargestellt, oder sie befindet sich in relativer Wertform. Die zweite Ware funktioniert als Äquivalent oder befindet sich in Äquivalentform.

Question 197 *First Marx says that the equivalent form is passive, and then he uses the phrase "functions as equivalent" as synonymous to "being in equivalent form." Why does he use such an active word as "function" for a role which he just emphasized is passive?*

Viewed as a description of the situation of the individual commodity traders, a commodity is in the relative form of value if it is offered for exchange because its owner has invested labor into it and needs the fruits of this labor in a different use-value form. A commodity is in the equivalent form of value if it is in demand because its use-value fits the needs of someone who has a commodity to “pay” for it. Being in the equivalent form is also a form of value, i.e., the coat can only play the role of equivalent in the linen weaver’s offer because it is value as well. Why? Because the linen weaver would not be able to make her offer on the market if tailors would not also come to the market with coats driven by the need to turn the labor in their coats into something useful for them.

Exam Question 199 Explain the different parts played by coat and linen in the equation “20 yards of linen = 1 coat.”

The paragraph which we just read explained the *differences* between the roles played by linen and coat; the next paragraph goes one step further and stresses the *polar opposition* between these two poles:

139:7/o The relative form of value and the equivalent form are two moments which belong together, mutually condition each other, and cannot be separated; but, at the same time, they are mutually exclusive or opposite extremes. They are the two poles of the same expression of value, distributed over the different commodities which this expression of value brings in relation with each other.

63:4 Relative Wertform und Äquivalentform sind zueinander gehörige, sich wechselseitig bedingende, unzertrennliche Momente, aber zugleich einander ausschließende oder entgegengesetzte Extreme, d.h. Pole desselben Wertausdrucks; sie verteilen sich stets auf die verschiedenen Waren, die der Wertausdruck aufeinander bezieht.

Marx claims that linen and coat not only play different roles in this interaction but that they have a stronger asymmetric relationship which Marx calls here “opposition” (sometimes also translated with “antagonism”). In order to back up this claim Marx makes two specific observations: (a) Not only are the roles of the two commodities different, but the commodities which assume these roles must also have different use-values. (b) The interaction is of necessity one-sided, i.e., in the interaction in which the linen points to the coat as its equivalent, the coat does not simultaneously point to the linen as its equivalent. ↓ Marx first shows point (a), that the same use-value cannot occupy both poles of the Simple value expression:

I cannot, for example, express the value of linen in linen.

Ich kann z.B. den Wert der Leinwand nicht in Leinwand ausdrücken.

↓ This, too can be translated into the linen weaver’s thought process. If she were willing to exchange linen against linen (perhaps because she is exchanging linen of one color against identical linen of a different color, or linen today against linen tomorrow), then the criterion for such an exchange would be the equivalence of the use-values of the linen (because the linen weaver could be producing the other kind of linen herself). Such an exchange would

not say anything about the *value* of the linen, i.e., about the relationship between the linen weaver and the producers of the commodities the linen weaver needs for her own consumption. ↓ Marx’s own argument can be viewed as an abstract condensation of the interactions just described: the use-values must be different because if they are equal, the closer relation (equality of use-values) trumps the more distant relation (equality of values).

20 yards of linen = 20 yards of linen is not an expression of value. Instead, this equation says that 20 yards of linen are nothing but 20 yards of linen, a definite quantity of the useful object “linen.”

20 Ellen Leinwand = 20 Ellen Leinwand ist kein Wertausdruck. Die Gleichung sagt vielmehr umgekehrt: 20 Ellen Leinwand sind nichts anderes als 20 Ellen Leinwand, ein bestimmtes Quantum des Gebrauchsgegenstandes Leinwand.

↑ Of course a different but in all respects equal piece of linen has the same value as the original one. But pointing to this different piece does not say anything about the value of the original linen. ↓ From this Marx draws an important implication: Commodities can only then interact with each other *as values* if they have different use-values.

Question 201 Why doesn’t Marx simply say: one cannot express the value of linen in linen, because nobody would exchange 20 yards of linen for 20 yards of linen?

The value of the linen can therefore only be expressed relatively, i.e. in another commodity. The relative form of the value of linen therefore presupposes that some other commodity confronts it in the equivalent form.

Der Wert der Leinwand kann also nur relativ ausgedrückt werden, d.h. in anderer Ware. Die relative Wertform der Leinwand unterstellt daher, daß irgendeine andere Ware sich ihr gegenüber in der Äquivalentform befindet.

↑ The second commodity involved can be any use-value, but it must be a *different* use-value than the first. This concludes Marx’s first point, which I above called point (a). Although Marx used the word “expression of value” to make this point, my Annotations tried to paraphrase his argument without using the word “expression,” in order to show that at the moment we are still discussing the value interaction itself, not yet the expression of value contained in this interaction.

↓ (b) Now assume condition (a) is satisfied, i.e., two different use-values (linen and coat) occupy the two poles of the Simple form of value. Even then, the interaction could in theory still be symmetric, if the interaction between linen and coat in which the linen points to the coat as its equivalent, is at the same time an interaction in which the coat points to the linen as its equivalent. Marx denies that this is the case.

On the other hand, this other commodity, which figures as the equivalent, cannot simultaneously be in the relative form of value.

Andrerseits, diese andere Ware, die als Äquivalent figuriert, kann sich nicht gleichzeitig in relativer Wertform befinden.

↑ There is no symmetry between the two poles, the two different commodities indeed play different parts in their interaction.

It is not the latter commodity whose value is expressed. The latter commodity only provides the material in which the value of the first commodity is expressed.

↑ Again, for Marx this is simply a detailed explanation of what the interaction between linen and coat, which Marx labels by the formula “20 yards of linen are worth 1 coat,” looks like. If we put ourselves into the shoes of the linen weaver, this one-sidedness of the interaction is at the heart of her dilemma. She would love to turn her linen into a coat, but she cannot do this because she produces linen, not coats. Therefore she offers to turn the tailor’s coat into linen, in the hope the tailor will take her up on this and by this also turn her linen into a coat. But she is very aware that the fact that she thinks 20 yards of linen are worth 1 coat does not mean that the tailor will think 1 coat is worth 20 yards of linen.

↓ It follows from the thorough asymmetry of this interaction that the interaction which we just described is not the only possible interaction in which linen and coat interact as values. Since the interaction which we discussed is not symmetric in itself, there is also a second interaction, which is the mirror-image of the first.

140:1 Of course, the expression 20 yards of linen = 1 coat, or 20 yards of linen are worth 1 coat, also implies its reverse: 1 coat = 20 yards of linen, or 1 coat is worth 20 yards of linen.

↑ The linen weaver can exchange linen for coat only if the tailor agrees to this exchange—and the tailor’s agreement indicates that for him, the linen is an equivalent for his coat. ↓ But if the coat is in the relative form of value in the *tailor’s* expression of value that does not mean it is in the relative form of value in the *linen weaver’s* expression of value:

But in this case I must reverse the equation, in order to express the value of the coat relatively; and, if I do that, the linen becomes the equivalent instead of the coat.

In the First edition, 628:2, Marx describes how the linen weaver’s value expression interacts with the tailor’s value expression:

Denken wir uns Tauschhandel zwischen Leinwandproducent A und Rockproducent B. Bevor sie Handels einig werden, sagt A: 20 Ellen Leinwand sind 2 Röcke werth (20 Ellen Leinwand = 2 Röcke), B dagegen: 1 Rock ist 22 Ellen Leinwand werth (1 Rock = 22 Ellen Leinwand). Endlich, nachdem sie lang gemarktet, stimmen sie überein. A sagt: 20 Ellen Leinwand sind 1 Rock werth,

Nicht sie drückt ihren Wert aus. Sie liefert nur dem Wertausdruck andrer Ware das Material.

63:5 Allerdings schließt der Ausdruck: 20 Ellen Leinwand = 1 Rock oder 20 Ellen Leinwand sind 1 Rock wert, auch die Rückbeziehungen ein: 1 Rock = 20 Ellen Leinwand oder 1 Rock ist 20 Ellen Leinwand wert.

Aber so muß ich doch die Gleichung umkehren, um den Wert des Rocks relativ auszudrücken, und sobald ich das tue, wird die Leinwand Äquivalent statt des Rockes.

Imagine a barter transaction between linen weaver A and coat producer B. Before they agree on a trade, A says: 20 yards of linen are worth 2 coats (20 yards of linen = 2 coats), whereas B says: 1 coat is 22 yards of linen worth (1 coat = 22 yards of linen). Finally, after bargaining for a long time, they come to agreement. A says: 20 yards of linen are worth 1 coat, and B says: 1 coat is

und B sagt: 1 Rock ist 20 Ellen Leinwand werth. worth 20 yards of linen.

This shows that Marx had indeed the thought processes of linen weaver and tailor in mind. The later editions suppressed any references to them presumably because Marx considered it as an extraneous imagination and illustration which was not necessary in the abstract development he aspired to. This is not the only occasion where Marx is hiding or discarding the crutches which might make it easier to follow his thinking, presumably because he did not want to promote “picture-thinking” (*Vorstellungen*).

↑ This concludes Marx’s proof of what we called assertion (b):

The same commodity cannot, therefore, simultaneously appear in both forms in the same expression of value. These forms rather exclude each other as polar opposites.

Dieselbe Ware kann also in demselben Wertausdruck nicht gleichzeitig in beiden Formen auftreten. Diese schließen sich vielmehr polarisch aus.

↓ The possibility to reverse the interaction between linen and coat also has a different implication: every commodity that can be in the relative form of value can also be in the equivalent form of value.

140:2 Whether a commodity is in the relative form or in its opposite, the equivalent form, exclusively depends on the position it holds in the expression of value. That is, it depends on whether it is the commodity whose value is being expressed, or the commodity in which value is being expressed.

64:1 Ob eine Ware sich nun in relativer Wertform befindet oder in der entgegengesetzten Äquivalentform, hängt ausschließlich ab von ihrer jedesmaligen Stelle im Wertausdruck, d.h. davon, ob sie die Ware ist, deren Wert, oder aber die Ware, worin Wert ausgedrückt wird.

↑ This arbitrariness of the commodity in the equivalent form again describes the situation of the linen weaver. The linen weaver not only needs coats but also many other goods, and whenever she exchanges her linen for these other goods she expresses the value of her linen in these other goods.

Marx writes “exclusively” because the question whether a commodity is in the relative or equivalent form does not depend on anything *other* than its position in the expression of value. In particular, the equivalent form is not tied to any particular use-values. The Simple equivalent is still a general form of value in the sense that a commodity does not have to be gold in order to serve as equivalent. Any commodity can be equivalent, just as any commodity can be in the relative form. The value forms discussed here are transient forms. Just as an individual in capitalist society is sometimes buyer and sometimes seller, so a commodity is sometimes in the relative and sometimes in the equivalent form. Other relations are not transient: a given commodity is not sometimes money and sometimes an ordinary commodity, and the same individual is usually not sometimes a laborer and sometimes a capitalist.

Question 202 Assume 20 yards of linen and 1 coat have equal value, i.e., equal amounts of abstract social labor are necessary to produce them. In the subsection called “the two poles

of the value expression” Marx says the following about the value interaction “20 yards of linen are worth 1 coat” in which the linen points to the coat as its equivalent:

(a) Although the equality of the values of linen and coat is a symmetric social relation, this value interaction is asymmetric: linen and coat play different roles in it.

(b) The linen expresses its value in the coat.

(c) The linen is active, the coat is passive.

(d) It is not possible for linen to express its value in linen, rather, a commodity with a different use-value is needed for the expression of its value.

(e) If 20 yards of linen and 1 coat have equal values, their value relation also makes it possible to express the value of the coat in 20 yards of linen. But this is a different expression than the expression of the value of 20 yards of linen in 1 coat.

(f) Commodities other than coats can also be used for an expression of the value of 20 yards of linen.

These 6 statements as implications of the original statement “20 yards of linen are worth 1 coat.” They make the meaning of this original statement explicit. However, Hans argues in the Annotations that all 6 statements can also be viewed as a description of the thought processes of a linen weaver who needs a coat and who is willing to exchange 20 yards of linen for 1 coat—which is at the same time the exchange relationship in the market between linen and coat. Explain exactly how each point can be derived from this scenario.

The Relative Form of Value

Social relations can be and often are expressions of something. If Jane marries John she enters a specific social relationship with him. By entering this relation she at the same time expresses her love for John, and Jane’s love indirectly also reflects on John, it is an expression of his qualities as a husband. Many other examples can be given: whom I date is an expression of my popularity, salary is often used as expression of self-worth, etc. In the same way, the social interactions of commodities as values are expressions of the values of these commodities. Marx will show now in great detail how this is the case.

From the beginning, Marx has called the simplest value interaction an *expression* of value—and the formula “20 yards of linen is worth 1 coat” is indeed an expression, it expresses the value of the linen in the coat. In our interpretation of Marx’s discussion as the linen weaver’s willingness to exchange her 20 yards of linen for 1 coat, it is not only a verbal expression, but the linen weaver is ready to act on it, by accepting the coat in exchange for her linen. Nevertheless this is still a very private expression, which originates in the mind of the linen weaver, and which she has to communicate verbally—by the phrase “20 yards of linen is worth 1 coat” or by attaching a price tag to her linen—if she wants to exchange her linen. Next Marx will show how the actions of weaver and tailor generate an independent *representation* of the value not only of the linen but, in its more developed forms, of all value, which can be seen and acted upon by all producers and consumers of commodities.

1. The Commodity

In a further step, Marx will pay special attention to the private *producers* and see how they use the information contained in this representation.

One might say that until now the Simple form of value was discussed from the inside, i.e., from the point of view of the linen weaver herself. From now on it will be discussed from the outside, i.e., from the point of view of the market participants who observe the exchanges without knowing the thought processes of those who make these exchanges. In this new discussion, Marx first looks at relative and equivalent forms separately, and then at the relationship as a whole. The relative form has to be discussed first because it is active.

Content of the Relative Form of Value The derivation of the laws of commodity production and circulation in chapter One is made on the basis of simple commodity production (another instance of abstraction). The individuals meeting on the market are also those who produce and consume. Each knows exactly what is involved in producing that commodity which he or she brings to market, and the choices he or she makes on the market are informed by this knowledge. In the subsection which we are about to read, Marx is asking how the linen weaver, by agreeing to trade her 20 yards of linen for 1 coat, informs others about the part of the deep structure of the economy she is familiar with, i.e., the production of linen. This is what Marx calls the “content” of the relative form of value. Afterwards, starting with 141:3/o, Marx will broaden his field of vision and look at the joint impact of the exchange decisions of many individual traders. But first he looks at two traders only.

140:3/o In order to discover how the Simple expression of the value of a commodity is embedded in the value relation between two commodities, we must, for now, look at the value relation quite independently of its quantitative aspect.

64:2–3 Um herauszufinden, wie der einfache Wertaussdruck einer Ware im Wertverhältnis zweier Waren steckt, muß man letzteres zunächst ganz unabhängig von seiner quantitativen Seite betrachten.

[Why One Has to Begin with Quality and Not with Quantity]

The Moore-Aveling translation is: “In order to discover how the elementary expression of the value of a commodity lies hidden in the

value relation of two commodities.” Fowkes is very similar: “In order to find out how the simple expression of the value of a commodity lies hidden in the value relation between two commodities.” The formulation

“lies hidden” is wrong. An expression cannot be hidden. It may need deciphering, but there is a difference between something that is clearly visible on the surface but is not understood, and something that is hidden.

Question 204 Five times in Section 1.3 Marx uses the formulation that the value relation between two commodities “yields” or “contains” an expression of value, or that an expression of value “is embedded” in the value relation. Copy one of the five sentences where he says this (with page reference), and explain in your own words what he means by this formulation.

The word “expression of value” in the above sentence and in the whole development that follows now refers to a *public* expression of value, i.e., information about the value of the linen which others receive from the market activity of the linen weaver.

This is a little confusing because in the just preceding four paragraphs, the same word “expression of value” was used for the *private* expression of value, i.e., for the thoughts inside the linen weaver’s head which are not visible to others. But these thoughts lead to actions which do transmit information to others. These actions, and their competitive responses by other market participants, will be discussed here.

One might think that the most important piece of information transmitted by the linen weaver’s willingness to accept 1 coat in exchange for her 20 yards of linen is the quantity of linen which she offers in exchange for the coat. Marx’s above passage implies that this is a fallacy. This preoccupation with the quantities *prevents* us from recognizing how the value relation between two commodities is the expression of the values of the commodities involved. ↓ But Marx acknowledges that his critique of common sense is probably a surprise to the reader:

The usual procedure is the precise opposite of this: one sees in the value relation only the proportion in which specific quantities of two sorts of commodity count as equal to each other.

Man verfährt meist grade umgekehrt und sieht im Wertverhältnis nur die Proportion, worin bestimmte Quanta zweier Warensorten einander gleichgelten.

Question 206 *The exchange relationship between the commodities is a symmetric relationship: if 20 yards of linen can be exchanged for a coat, then a coat can also be exchanged for 20 yards of linen. Besides, Marx said in 126:2 that this relationship appears at first as the quantitative proportion in which commodities can be exchanged for each other. Despite this, Marx argues that the expression of value contained in this relationship is not symmetric and not primarily quantitative. Summarize in your own words, and in a way that your 10-year-old nephew can understand, the arguments used by Marx to support these two claims.*

↓ Although it is commonly done, the procedure of beginning with the quantities cannot be right, for methodological reasons alone: One overlooks that the magnitudes of different things become comparable in quantitative terms only after these things have been reduced to the same unit.

Man übersieht, daß die Größen verschiedner Dinge erst quantitativ vergleichbar werden nach ihrer Reduktion auf dieselbe Einheit.

In German, the beginning of the above sentence “*man übersieht*” is parallel to the beginning to the

previous sentence “*man ... sieht*.” This is why I used the translation “one overlooks” instead of “it is

apt to be forgotten.”

↑ Here is the word “reduction” again, which we first encountered in 127:2. ↓ Therefore it is appropriate to look at the quantity only after we know that the qualities are equal.

Although this remark is a logical implication of the previous sentence, is a little premature here because Marx has not yet shown that the qualities are equal. In the First edition 629:1, this and the preceding sentence were placed better, because they came after Marx’s assertion/proof that the qualities are equal.

It is only as expressions of such a common unit that they are of the same denomination, and are therefore commensurable magnitudes.¹⁷

Nur als Ausdrücke derselben Einheit sind sie gleichnamige, daher kommensurable Größen.¹⁷

Question 207 *What is the difference between “being of the same denomination” and “being commensurable magnitudes”?*

Fowkes:

“Only as expressions of the same unit do they have a common denominator, and are therefore commensurable magnitudes.”

This is an unfortunate translation. For Marx, “being of equal

denomination” is a statement about quality, and “being commensurable” a statement about quantity. Compare 159:1. This nuance is lost in Fowke’s translation because “having a common denominator” is already a quantitative statement. Moore-Aveling have it right:

“It is only as expressions of

such a unit that they are of the same denomination, and therefore commensurable magnitudes.”

This is one of the cases where Fowkes got it wrong, although the Moore-Aveling translation had it right.

Footnote 17 shows that the common-sense error of focusing on quantities and forgetting the qualities is repeated by the economists:

¹⁷ The few economists, such as S. Bailey, who have concerned themselves with the analysis of the form of value, were unsuccessful, firstly because they confuse the form of value with value itself, and secondly because, under the crude influence of the practical bourgeois, they give their attention from the outset, and exclusively, to the quantitative aspect of the question. ‘The command of quantity ... constitutes value’ [Bai37, p. 11]. Written by S. Bailey.

¹⁷ Die wenigen Ökonomen, die sich, wie S. Bailey, mit der Analyse der Wertform beschäftigt haben, konnten zu keinem Resultat kommen, einmal, weil sie Wertform und Wert verwechseln, zweitens, weil sie, unter dem rohen Einfluß des praktischen Bürgers, von vornherein ausschließlich die quantitative Bestimmtheit’ ins Auge fassen. “Die Verfügung über die Quantität ... macht den Wert.” [Bai37, p. 11]. Verfasser S. Bailey.

Samuel Bailey is an economist whom Marx takes seriously; Marx’s *Theories of Surplus-Value*, [mecw32]312–353, contain a detailed analysis of Bailey’s works.

[Message generated by the Linen Weaver’s Exchange Offer] After all these remarks about the wrong approach, Marx finally shows us how to do it right, and tells us what remains of the Simple form of value if we look at it independently of its quantitative aspect.

141:1 Whether 20 yards of linen = 1 coat or = 20 coats or = x coats, i.e. whether a given quantity of linen is worth few or many

64:3 Ob 20 Ellen Leinwand = 1 Rock oder = 20 oder x Röcke, d.h., ob ein gegebenes Quantum Leinwand viele oder we-

coats, each such proportion always implies that the linen and the coat, as magnitudes of value, are expressions of the same unit, things of the same nature. Linen = coat is the basis of the equation.

↑ Our curiosity whether the linen weaver is willing to give 20 or 25 or 18 yards of linen for the coat she needs should not detract us from a more basic noteworthy fact: her exchange offer tells everyone that in some respects, the two different commodity-kinds linen and coat are *equal* to each other.

Question 210 *If the linen weaver offers 20 yards of linen for 1 coat, then anyone who has a coat has the opportunity to convert it into linen. Should therefore the basis of the equation not be called “Coat = Linen” instead of, as Marx says in 141:1, “Linen = Coat”?*

↓ But Marx adds immediately that there is asymmetry in this equality. Although related, this asymmetry is not identical to the asymmetry discussed in 139:2. When we looked at the individual motivation of the linen weaver, the asymmetry consisted in the fact that the linen is a commodity which the linen weaver has produced, about which she has intimate knowledge regarding the labor time, skills, materials, and equipment necessary to produce it, but which she does not need. The coat is a use-value the linen weaver needs. Now, that we are looking at the social value relation sustained by this individual activity, the asymmetry consists in the fact that linen is offered on the market in exchange for coats, i.e., anybody who has a coat can convert it into linen. But the reverse does not hold. It is not sure whether anybody will take the linen weaver up on her offer. Of course the linen weaver wants to turn her linen into a coat, but she cannot do it herself. All she can do is turn coats into linen, therefore she offers to turn coats into linen, in the hope someone will take her up on this offer. Since the linen weaver publicly offers linen in exchange for coats, the tailor does not have to go through the trouble of publicly offering his coat in exchange for linen. All he has to do is privately approach the linen weaver with his coat.

141:2 But these two qualitatively equated commodities do not play the same role. Only the value of the *linen* is expressed, not that of the coat.

nige Röcke wert ist, jede solche Proportion schließt stets ein, daß Leinwand und Röcke als Wertgrößen Ausdrücke derselben Einheit, Dinge von derselben Natur sind. Leinwand = Rock ist die Grundlage der Gleichung.

64:4/o Aber die zwei qualitativ gleichgesetzten Waren spielen nicht dieselbe Rolle. Nur der Wert der Leinwand wird ausgedrückt.

Both translations say here: It is only the value of the linen that is expressed. This can be misunderstood to mean: only the value of the linen, not its use-value.

↑ This may seem surprising because elsewhere Marx says that both relative form of value and equivalent form are expressions of value. But Marx differentiates expression and representation. A representation of value is an expression of value, detached from the specific commodity whose value it expresses. In the equation “20 yards of linen is worth 1 coat,” the

linen is privileged because its value is represented in an independent thing outside the linen, in the coat. In the discussion that follows, Marx will show that the equivalent form develops from an independent representation of the value of the linen to an independent representation of value in general.

In our analysis of the linen weaver’s thought processes in 139:6 we had a similar asymmetry. The linen weaver’s offer of linen for coat is in her mind only an expression of the value of the linen, not an expression of the value of the coat. She is simply unable to express the value of the coat because she does not produce coats and therefore does not know the value of the coat. But now the situation is different. Earlier we looked at the *thoughts* of the linen weaver. Now we look at the social relations sustained by the linen weaver’s *actions*.

And how does the linen express its value? Und wie?

↑ This question signals that we are no longer just accepting what the linen weaver *says* about the value of the linen, but that we are looking what her actions reveal. How can someone witnessing the linen weaver’s offer of linen for a coat see this offer as a representation of the value of the linen but not of the coat?

By relating to the coat as its ‘equivalent’ or the ‘thing exchangeable’ for it.

Durch ihre Beziehung auf den Rock als ihr „Äquivalent“ oder mit ihr „Austauschbares“.

↑ This ability to exchange the coat for linen is a surface relationship, i.e., a social relation between commodities on the market and, through the detour over these commodities, also between the commodity owners. These commodity owners do not share the linen weaver’s need for a coat nor her knowledge about the cost of producing the linen. They only see that coats can, by exchange, be converted into linen.

↓ It is paradoxical that the linen weaver’s offer to exchange 20 yards of linen for 1 coat, which for the linen weaver is the expression of the value of the linen in the use-value of the coat, does *not* signal to other market participants that the linen is value. On the contrary, the linen weaver’s offer signals to them that the *coat* is value, since the coat has obtained the magical property of being exchangeable for linen.

On the one hand, the coat counts, in this relation, as the form of existence of value, as the material embodiment of value—for only as such is the coat the same as the linen.

In diesem Verhältnis gilt der Rock als Existenzform von Wert, als Wertding, denn nur als solches ist er dasselbe wie die Leinwand.

Only indirectly, through the detour over the coat, does the linen weaver’s offer also signal that the linen is value:

On the other hand, in this relation it is also revealed, or obtains an independent expression, that the linen itself is value—for only as value can the linen point to the coat as something equivalent with linen or exchangeable for linen.

Andrerseits kommt das eigne Wertsein der Leinwand zum Vorschein oder erhält einen selbständigen Ausdruck, denn nur als Wert ist sie auf den Rock als Gleichwertiges oder mit ihr Austauschbares bezüglich.

↑ The word “independent” means here: this expression of the value of linen is no longer

chained to the use-value of the linen and buried in the the brain of the linen weaver, but has its independent existence, for everyone to see and act upon. And although the expression of the value of the linen goes through a detour, Marx discusses it before discussing the expression of the value of the coat. The expression of the value of the coat will be discussed in the subsection about the Equivalent Form. It is much more dazzling than that of the linen, but it is limited in that only one commodity in society can play the role of being directly exchangeable against all other commodities. By contrast, not only the linen, but also all other commodities can express their values in a general equivalent.

Question 212 *What does the linen weaver's offer to exchange linen for coat, tell us about the coat? about the linen? Do not look at the quantities offered but look at it only as the qualitative equation "linen = coat."*

The qualitative equation "linen = coat" says therefore two things:

1. The coat is a thing composed of value or, in other words, an embodiment of value (*Wertding*)—it is nothing but value, it is the form in which value exists. It can be used to "buy" linen.
2. Linen is still linen, a physical object—but one which has value. This additional aspect of it has obtained an independent expression in the coat that can be exchanged for linen.

Both coat and linen are values, otherwise the coat could not be exchanged for linen. But only the value of the linen is *represented* (i.e., obtains an independent expression) in the linen weaver's offer to make the exchange, not that of the coat. One can say this enriches the linen and impoverishes the coat. Linen lives a full life, all her inner traits come to fruition. The coat on the other hand only serves as incarnation of value, as the value quasi-material having become actual matter, namely, a coat. It applauds the linen. The linen may be tickled by this applause, but the coat is little more than a claqueur.

Next Marx brings an unfortunate analogy.

In the same way, butyric acid is a different substance from propyl formate. Yet both are made up of the same chemical substances, carbon (C), hydrogen (H) and oxygen (O). Moreover, these substances are combined together in the same proportions in each case, namely $C_4H_8O_2$. If now butyric acid were to be equated with propyl formate, then, in the first place, propyl formate would count in this relation only as a form of existence of $C_4H_8O_2$; and in the second place, it would thereby be asserted that butyric acid

So ist die Buttersäure ein vom Propylformat verschiedner Körper. Beide bestehn jedoch aus denselben chemischen Substanzen—Kohlenstoff (C), Wasserstoff (H) und Sauerstoff (O), und zwar in gleicher prozentiger Zusammensetzung, nämlich $C_4H_8O_2$. Würde nun der Buttersäure das Propylformat gleichgesetzt, so gälte in diesem Verhältnis erstens das Propylformat bloß als Existenzform von $C_4H_8O_2$ und zweitens wäre gesagt, daß auch die Buttersäure aus $C_4H_8O_2$ besteht. Durch die Gleichsetzung

also consists of $C_4H_8O_2$. Thus by equating propyl formate with butyric acid one would be expressing their chemical composition as opposed to their bodily form.

This example is based on mistaken chemical concepts. Since butyric acid and propyl formate have an identical chemical formula $C_4H_8O_2$, Marx thought that their difference consisted in a "bodily" dimension not reducible to chemistry, while as chemical substances they were identical. Modern molecular chemistry can give a better explanation: although both molecules consist of the same atoms, the atoms are bound together in a different geometric arrangement. Therefore the difference is indeed a chemical one.

Question 215 *Marx gave here a mistaken example of emergence. Give examples where there is indeed emergence.*

[Characteristics of Value-Producing Labor] So far, Marx discussed the messages which the linen weaver sends out when she agrees to accept a coat for her linen. The recipients of these messages are not only the other commodity owners on the market, but also the producers of these commodities. Marx focuses now on the impact of the signals coming from the linen weaver's exchange offer on the *producers*. At the same time, he broadens his view and looks at the combined impact generated by *many* individual market offers, not just that of one linen weaver.

In order to describe this impact, Marx uses *speech* as a metaphor. This speech metaphor already lurked in the formulation "what does this equation say?" in 127:2, and in the formulation "this equation says" in 139:7/o. The commodities *say* something—not only to us but also to everybody else, including the private producers behind their closed doors labeled "no admittance." What are they saying? According to Marx, they say everything which he, as a writer, and we, as the readers, had to unearth through tedious scientific analysis at the beginning of *Capital*.

It is not an accident that the connection between value and labor is drawn only now. Until now, "value" was simply the quasi-physical ingredient of the commodities which made them exchangeable, but it was unclear where value came from. As long as we only look at the sphere of circulation, we can see that the commodities have value, but the relations in circulation alone do not allow us to infer where this value comes from. But if we go beyond the market, and look how the market information enters the production decisions of the private producers, then labor comes into the picture automatically—because ultimately, labor is the only decision variable for the private producers. The producers use the market information in order to decide how much labor to allocate to the production of which use-value. Although the entire subsection has the title "content of the relative form of value," we have only now arrived at the place where Marx discusses the *content* of the relative form of value.

⇓ Marx begins with the results of his own analysis of the commodity, and then compares it with what the commodities themselves tell us. This is a somewhat abrupt transition, but this

discontinuity should not surprise us, since an immanent transition to labor is not possible as long as one looks at the sphere of circulation alone.

141:3/o If we say that, as values, commodities are merely congealed masses of human labor, our analysis reduces them to the abstraction “value,” but does not give them a form of value distinct from their bodily forms.

↑ If one has followed the earlier analysis, one knows that commodities as values can be reduced to abstract labor, but one does not know the transmission belt through which the practical activity of the commodity owners on the surface of the economy is translated into an organization of production based on abstract labor. This transmission mechanism is implicit in the two aspects of the definition of “form of value” given in (1) and (2) earlier.

But if we listen to the commodities themselves, they not only tell *us* that they are congealations of abstract labor, but they also tell this to the private producers and in this way enable the producers to treat them as commodities.

It is otherwise in the value relation of one commodity to another.

↓ Marx introduces now the metaphor that, through their interactions on the market, the commodities tell us everything about the nature of value which we know from our scientific analysis.

The first commodity’s value character steps here forward through its own relationship with the second commodity.

↑ With the formulation that the commodity’s value character “steps forward” through its relationship with the other commodities, Marx had the Hegelian concept of *appearance* in mind. The definition of appearance is that *all* properties of the hidden essence (here of value) are reflected in the appearance. From a Critical Realist perspective the goal is more specific: the relationships and interactions on the surface must generate the information and incentives for the producers so that they can treat their products as values, i.e., as containers of abstract labor, and are motivated to do so. In other words, the surface interactions not only make the true character of the underlying relations recognizable to the researcher, but they also force the producers to adhere to these underlying relations of production if they want to compete successfully.

↓ In the next paragraph, Marx shows how it is indicated by the relations of the commodities that the labor which creates the value of the linen does not differ from the labor which creates the value of the coat, i.e., it is human labor in the abstract.

142:1 By setting the coat, for example, as a thing of value equal to the linen, the commodity owners also set the labor embedded in the coat equal to the labor embedded in

65:1 Sagen wir: als Werte sind die Waren bloße Gallerten menschlicher Arbeit, so reduziert unsre Analyse dieselben auf die Wertabstraktion, gibt ihnen aber keine von ihren Naturalformen verschiedene Wertform.

Anders im Wertverhältnis einer Ware zur andern.

Ihr Wertcharakter tritt hier hervor durch ihre eigne Beziehung zu der andern Ware.

65:2 Indem z.B. der Rock als Wertding der Leinwand gleichgesetzt wird, wird die in ihm steckende Arbeit der in ihr steckenden Arbeit gleichgesetzt.

the linen.

The “for example” means “for example the coat, but it could also be any other commodity.” The Moore-Aveling translation omits it, although it is important here: it indicates that we are no longer talking about the one linen weaver, but we are talking about the aggregate effect of many individual exchanges. Instead of “setting equal” the

Moore-Aveling translation has: “By making the coat the equivalent of the linen, we equate the labor embodied in the former to that in the latter.” Fowkes has: “By equating, for example, the coat as a thing of value to the linen, we equate the labor embedded in the coat with the labor embedded in the linen.” The “we” in both translations is

unfortunate: the reader must think the “we” is the researcher from the preceding paragraph which started with the words “if we say that.” But it is exactly not; rather, Marx is talking here about the actions of the commodity owners, and in German he does not use the word “we.”

Question 216 *If the linen weaver is willing to give 20 yards of linen for a coat, does she set linen equal to coat or coat equal to linen?*

↑ If the linen weaver offers linen in exchange for coats, then this is at first only of interest for the producers of *coats*. If they had ever contemplated switching to the production of linen, this is now no longer necessary. They can just continue producing coats and then trade their coats for linen. ↓ One might say, tailoring counts now at the same time as weaving labor, i.e., it counts as that which is common in both kinds of labor, as abstract human labor.

It is true, tailoring, which makes the coat, is concrete labor of a different sort than weaving, which makes the linen. But by equating tailoring with weaving, the commodity owners reduce tailoring in fact to what is really equal in the two kinds of labor, namely, that they are both human labor.

Nun ist zwar die Schneiderei, die den Rock macht, eine von der Weberei, die die Leinwand macht, verschiedenartige konkrete Arbeit. Aber die Gleichsetzung mit der Weberei reduziert die Schneiderei tatsächlich auf das in beiden Arbeiten wirklich Gleiche, auf ihren gemeinsamen Charakter menschlicher Arbeit.

↑ When Marx says that tailoring is “in fact” reduced to abstract human labor, he means this in contrast to reducing tailoring “in theory” to abstract human labor. In theory, the act of making coats can always be considered as an expenditure of human labor, just as the act of weaving linen. But only if the linen weaver is willing to exchange linen for coats does this abstraction gain practical relevance. Now the labor making coats counts “in fact” as the incarnation of abstract human labor which can, if the tailor so desires, take the form of linen.

↓ Once coats become the means to acquire linen, then also linen weaving counts as abstract labor because linen can be “sold” for coats.

Through this detour over tailoring they say that weaving too, in so far as it weaves value, has nothing to distinguish it from tailoring, and, consequently, is abstract human labor.

Auf diesem Umweg ist dann gesagt, daß auch die Weberei, sofern sie Wert webt, keine Unterscheidungsmerkmale von der Schneiderei besitzt, also abstrakt menschliche Arbeit ist.

↑ Note again the speech metaphor!

↓ The more indirect way in which linen counts as abstract labor has the advantage that it is generalizable to other commodities, since the coat's ability to purchase can be extended from only purchasing linen to purchasing other things as well. On the other hand, the coat's role is not generalizable; although every commodity owner wishes his or her own commodity would play the role of general equivalent, only one commodity overall can be in such a role. This is why Marx looks first at the linen-side of the equation. He will return to the coat-side in 142:2.

Only the expression of different sorts of commodities as equivalents makes the specific character of value-creating labor apparent, by in fact reducing the different kinds of labor embedded in the different kinds of commodities to their common quality of being human labor in general.^{17a}

↑ The above sentence contains another "in fact" because the market relations do those things in fact which our theoretical analysis had explored only theoretically: they reduce all labor to abstract human labor.

↓ The thoughts of Ben Franklin, one of the earliest economists exploring the nature of value, are a simple translation of these exchange relationships into words:

^{17a} Note to the 2nd edition: One of the first economists, after William Petty, to have deciphered the nature of value, is the famous Franklin: "Trade in general being nothing else but the exchange of labor for labor, the value of all things is ... most justly measured by labor" [Spa36, p. 267]. Franklin is not aware that by measuring the value of everything 'in labor' he makes abstraction from any difference in the kinds of labor exchanged—and thus reduces them all to equal human labor. Yet he states this without knowing it. He speaks first of the one 'labor', then of another 'labor', and finally of 'labor', without further qualification, as the substance of value of everything.

Nur der Äquivalenzausdruck verschiedenartiger Waren bringt den spezifischen Charakter der wertbildenden Arbeit zum Vorschein, indem er die in den verschiedenartigen Waren steckenden, verschiedenartigen Arbeiten tatsächlich auf ihr Gemeinsames reduziert, auf menschliche Arbeit überhaupt.^{17a}

^{17a} Note zur 2. Ausgabe. Einer der ersten Ökonomen, der nach William Petty die Natur des Werts durchschaut hat, der berühmte Franklin, sagt: „Da der Handel überhaupt nichts ist als der Austausch einer Arbeit gegen andre Arbeit, wird der Wert aller Dinge am richtigsten geschätzt in Arbeit“ [Spa36, p. 267]. Franklin ist sich nicht bewußt, daß, indem er den Wert aller Dinge „in Arbeit“ schätzt, er von der Verschiedenheit der ausgetauschten Arbeiten abstrahiert—und sie so auf gleiche menschliche Arbeit reduziert. Was er nicht weiß, sagt er jedoch. Er spricht erst von „der einen Arbeit“, dann „von der andren Arbeit“, schließlich von „Arbeit“ ohne weitere Bezeichnung als Substanz des Werts aller Dinge.

[Value is Congealed Labor, not Living Labor] ↓ We are not yet done showing how the value character of the linen steps forward through its relationship with the coat:

142:2 However, it is not sufficient to express the specific character of the labor which makes up the value of the linen.

Value is not identical to abstract labor itself but it is *congealed* abstract labor, i.e., although it is a social relation, it has the character of a material. This material character of value must

65:3/o Es genügt indes nicht, den spezifischen Charakter der Arbeit auszudrücken, woraus der Wert der Leinwand besteht.

also be expressed in the value relations. (The development which follows now is parallel to the earlier 128:3.)

Human labor-power in its fluid state, or human labor, creates value, but is not itself value. It becomes value in its coagulated state, in bodily form.

↑ The labor producing the linen could have been used to produce coats, and it could also have been used to produce anything else, but it must always be in a product, since storing the labor as labor is not an option.

In order to express the value of the linen as a congealed mass of human labor, it must be expressed as a "materiality," a thing, that is different than the linen itself and at the same time common to linen and all other commodities.

The quasi-material character of value must be expressed as well by the relations of the commodities with each other.

The task is already solved.

The reader can guess at this point how this is already solved: The quasi-material inside the linen, which makes up the value of the linen and which, as we know, does not intersect with the physical material making up the linen, is represented by an actual physical material which is different from the linen, namely, by the coat. Marx needs more than one paragraph to make this point, i.e., to support his claim that the task has already been solved.

142:3/o In the value relation of the linen, the coat counts as a thing qualitatively equal to the linen, as a thing of the same nature as linen, because it is a value.

↑ This we know already, but in the next ↓ needs a proof:

It counts therefore as a thing in which value manifests itself, or which, in its tangible bodily form, represents value.

Marx begins the demonstration of this claim by doubting how it can possibly be the case: Yet the coat itself, the body of the commodity "coat," is purely a use-value. A coat does not express value any more than does the first piece of linen we come across.

↑ In other words, this is again an impasse. ↓ Before resolving this impasse, Marx cannot resist a pun (uniforms are special kinds of coats), which emphasizes again that the coat gets this stature only from society—although once it has this stature, it seems as if it had it by its own nature:

Menschliche Arbeitskraft im flüssigen Zustand oder menschliche Arbeit bildet Wert, aber ist nicht Wert. Sie wird Wert in geronnenem Zustand, in gegenständlicher Form.

Um den Leinwandwert als Gallerte menschlicher Arbeit auszudrücken, muß er als eine „Gegenständlichkeit“ ausgedrückt werden, welche von der Leinwand selbst dinglich verschieden und ihr zugleich mit andrer Ware gemeinsam ist.

Die Aufgabe ist bereits gelöst.

66:1 Im Wertverhältnis der Leinwand gilt der Rock als ihr qualitativ Gleiches, als Ding von derselben Natur, weil er ein Wert ist.

↓ sentence Marx says something new, which

Er gilt hier daher als ein Ding, worin Wert erscheint oder welches in seiner handgreiflichen Naturalform Wert darstellt.

Nun ist zwar der Rock, der Körper der Rockware, ein bloßer Gebrauchswert. Ein Rock drückt ebensowenig Wert aus als das erste beste Stück Leinwand.

This proves only that the coat counts for more when inside the value relation with the linen than outside it, just as many a human counts for more when inside a gold-braided uniform than outside it.

↓ After this jocular interruption Marx asks what is the basis on which the coat can be a representation of the value of the linen?

143:1 In the production of the coat, human labor-power, in the shape of tailoring, was in actual fact expended.

↑ The tailor has done two things at the same time: On the one hand he has produced a coat, and on the other he has used up his own labor-power in order to do this. ↓ But the utilization of human labor-power is exactly the definition of abstract human labor.

Consequently, human labor is accumulated in the coat.

↑ In this last sentence, Marx does not speak about useful but about abstract labor. The useful labor producing the coat is not accumulated but objectified in the coat, i.e., it is a thing of the past, with its traces visible in the use-value of the coat. The abstract labor, by contrast, is accumulated or congealed. It continues to exist in the coat as labor. If one wishes, one can get this labor back out of the coat again: the linen weaver's offer is an opportunity for the tailor to retrieve his abstract labor in a form in which it may be more useful for him, namely in the form of linen instead of coats.

Question 217 Marx says that abstract labor has been accumulated in the coat. He would never say that concrete labor has been accumulated in the coat. Why not?

By virtue of this, the coat is a 'carrier of value', although this property does not show through anywhere, even where the coat is at its most threadbare.

↑ The coat can only be a representation of the value of the linen because the coat itself is value. But this value is invisible. Even the most threadbare coat, which allows one to see the person inside the coat, does not let us see the value inside the coat.

Question 218 Marx says that the human labor accumulated in the coat is not visible in the coat. Is this not obviously wrong? Everybody who sees a coat knows that it is a product of human labor; this coat would not exist without the human labor that produced it.

↓ Despite its invisibility, this value inside the coat is very powerful: it governs the linen's relationship with the coat.

Dies beweist nur, daß er innerhalb des Wertverhältnisses zur Leinwand mehr bedeutet als außerhalb desselben, wie so mancher Mensch innerhalb eines galonierten Rockes mehr bedeutet als außerhalb desselben.

66:2 In der Produktion des Rockes ist tatsächlich, unter der Form der Schneiderei, menschliche Arbeitskraft verausgabt worden.

Es ist also menschliche Arbeit in ihm aufgehäuft.

Nach dieser Seite hin ist der Rock „Träger von Wert“, obgleich diese seine Eigenschaft selbst durch seine größte Fadenscheinigkeit nicht durchblickt.

And in the value relation of the linen, the coat counts only under this aspect, counts therefore as embodied value, as incarnation of value.

↑ Marx refers here to the reducibility of the exchange relations to a quasi-material inside the things exchanged, first introduced in 127:2. Since the exchange relationship between coat and linen is reducible to some immaterial substance inside linen and coat, this immaterial substance (quasi-material) inside the coat is the *only* thing that governs the linen's relationship with the coat. I.e., not only does the linen *see* this invisible quasi-material in the coat, but this is indeed the *only* thing the linen sees in the coat. For the linen, therefore, the coat consists only of value. ↓ With this, the first half of the statement 142:3/o is proved. The next sentence celebrates this achievement.

Despite its buttoned-up appearance, the linen recognizes in the coat a splendid kindred soul, the soul of value.

↑ “*Stammverwandt*” is a kinship term which emphasizes that two people come from the same breed. Although the coat is made of wool, coat and linen are “cut from the same cloth,” namely, they are both the expenditure of abstract human labor.

↓ But Marx pushes on to make his next argument. By turning the coat into an expression of the linen's value, the linen turns at the same time the coat into an incarnation of *all* value, i.e., all value looks now like coats. Note that Marx uses now the word “represent” instead of the earlier “express.”

The coat, however, cannot represent value towards the linen unless value, for the latter, at the same time assumes the shape of a coat.

Und im Wertverhältnis der Leinwand gilt er nur nach dieser Seite, daher als verkörperter Wert, als Wertkörper.

Trotz seiner zugeknöpften Erscheinung hat die Leinwand in ihm die stammverwandte schöne Wertseele erkannt.

Der Rock kann ihr gegenüber jedoch nicht Wert darstellen, ohne daß für sie gleichzeitig der Wert die Form eines Rockes annimmt.

The “nevertheless” in the Fowkes translation is disastrous.

↑ After the linen has created, in the coat, a representation of its value which is *selbständig*, i.e., stands on its own feet, is no longer attached to the linen but detached, the coat tends to forget that it has obtained its value character from the linen but seems to have value in its own right. This tendency is already present in the Simple form of value but it is almost imperceptible. The tailor cannot go the shoemaker and say: “the linen weaver is willing to accept this coat and give me linen in exchange, therefore I want you to accept this coat and give me shoes in exchange.” In the Simple form of value it is too obvious that the coat has obtained its value character from the linen and has it only in relation with the linen. But in the further development, after society has proceeded from the Simple equivalent to the General equivalent, it is far less obvious that gold has obtained its value character only from the ordinary commodities, on the contrary, gold seems to be valuable by itself. ↓ The metaphor of a king applies much more strikingly to the general equivalent form than the Simple equivalent form. After all, a king does not become king because one of his subjects

treats him or her as king, but because all of his subjects do. This “generic” application of the metaphor of the king will be given a little later, in the section about the Fetish-like character of the commodity, in the footnote to 149:2/o. But let’s see what Marx says about kings already now:

An individual, *A*, for instance, cannot be ‘your majesty’ to another individual, *B*, unless majesty in *B*’s eyes assumes the physical shape of *A*, and, moreover, changes facial features, hair and many other things, with every new ‘father of his people’.

So kann sich das Individuum *A* nicht zum Individuum *B* als einer Majestät verhalten, ohne daß für *A* die Majestät zugleich die Leibesgestalt von *B* annimmt und daher Gesichtszüge, Haare und manches andre noch mit dem jedesmaligen Landesvater wechselt.

↑ If you are in a one-on-one relation with a king, don’t look for royal characteristics in his behavior. A king is just a normal human being. His “royalty” comes from the relations in which he is placed, not from his inner qualities. If you are still not convinced, assume the country gets a new king. Suddenly that what seem to be royal shifts from the characteristics of the former king to the characteristics of the new king.

To repeat, Marx uses this metaphor to make one point: the tendency to forget that the value form is a social relation and to consider it an inherent quality, a tendency which is very obvious with gold, this tendency is already present, although in a much more subtle way, with the coat. This tendency arises as soon as some commodity, here linen, has created a representation of its value in a use-value detached from the linen itself.

↑ The use-value of the coat is therefore not only an expression but also a representation of value. ↓ For the linen this means: it has obtained a value form which is different from (and independent of) its bodily form:

143:2 Hence, in the value relation in which the coat is the linen’s equivalent, the bodily shape of the coat counts as form of value. The value of the commodity linen is therefore expressed in the physical body of the commodity coat, the value of one in the use-value of the other. As a use-value, the linen is something palpably different from the coat; as value, it is equal to the coat and therefore looks like a coat. Thus the linen acquires a value form different from its bodily form.

66:3 Im Wertverhältnis, worin der Rock das Äquivalent der Leinwand bildet, gilt also die Rockform als Wertform. Der Wert der Ware Leinwand wird daher ausgedrückt im Körper der Ware Rock, der Wert einer Ware im Gebrauchswert der andren. Als Gebrauchswert ist die Leinwand ein vom Rock sinnlich verschiednes Ding, als Wert ist sie „Rockgleiches“ und sieht daher aus wie ein Rock. So erhält sie eine von ihrer Naturalform verschiedene Wertform.

↓ Marx punctuates this climax in the argument with a dose of shock therapy for his religious readers:

The value-character of linen is manifested in its equality with the coat, just as the sheep-like nature of christians is manifested in

Ihr Wertsein erscheint in ihrer Gleichheit mit dem Rock wie die Schafsnatur des Christen in seiner Gleichheit mit dem Lamm

their equality with the lamb of god.

| Gottes.

↑ This is the end of the detailed demonstration how the coat as a thing outside the linen represents the value quasi-material of the linen, i.e., of the explanation how the “task is already solved,” as Marx had said at the end of 142:2. The use of the word “appears” is significant here, because this is the Hegelian concept of appearance.

[Commodity Language and its Dialects] ↓ Now Marx concludes the thread about language started at 141:3/o, by saying once more very clearly that *everything* which our scientific analysis has unearthed about the commodity is reflected in the relations of the commodities themselves:

143:3/o We see, then, that everything our analysis of the value of commodities previously told us is repeated by the linen itself, as soon as it interacts with another commodity, the coat. Only it reveals its thoughts in the only language it is familiar with, the language of commodities.

66:4/o Man sieht, alles, was uns die Analyse des Warenwerts vorher sagte, sagt die Leinwand selbst, sobald sie in Umgang mit andrer Ware, dem Rock, tritt. Nur verrät sie ihre Gedanken in der ihr allein geläufigen Sprache, der Warensprache.

↓ Marx recapitulates the two highlights of the earlier derivation, in order to show how the commodity language differs from our own scientific analysis:

In order to say that its own value has been created by labor in its abstract quality of being human labor, the linen says that the coat, in so far as it counts as the linen’s equal, i.e. in so far as it is value, consists of the same labor as the linen does itself.

Um zu sagen, daß die Arbeit in der abstrakten Eigenschaft menschlicher Arbeit ihren eignen Wert bildet, sagt sie, daß der Rock, soweit er ihr gleichgilt, also Wert ist, aus derselben Arbeit besteht wie die Leinwand.

The first ↑ highlight was the character of value-producing labor, and the second ↓ the representation of congealed abstract labor as a thing.

In order to say that the sublime quasi-material which makes up its value differs from its stiff and starchy existence as a body, it says that value looks like a coat, and therefore that in so far as the linen itself is a value-thing, it and the coat are as alike as two peas.

Um zu sagen, daß ihre sublime Wertgegenständlichkeit von ihrem steifleinenen Körper verschieden ist, sagt sie, daß Wert aussieht wie ein Rock und daher sie selbst als Wertding dem Rock gleicht wie ein Ei dem andern.

↑ The commodity relations are therefore considered just as a different language in which to say certain things about value. They are no better or worse, only different than human languages.

Question 219 Take those things which we found out from the analysis of value, and describe how the linen itself tells them to us. Can the coat tell us a similar story?

↓ Even among the human languages some are better able to portray value than others.

Let us note, incidentally, that the language of commodities has, in addition to the Hebrew, also plenty of other more or less correct dialects. The German word ‘Wertsein’ (to be worth), for instance, brings out less strikingly than the Romance verb ‘valere’, ‘valer’, ‘valoir’ that the equating of commodity *B* with commodity *A* is commodity *A*’s own expression of value. Paris vaut bien une messe!

The analytical effort made in *Capital* to understand the commodity is equated here with a translation. The day-to-day languages of the agents are dialects of the commodity language, i.e., they speak this language but do not necessarily understand it.

Question 220 What does Marx mean by a “correct” dialect?

Question 222 Henry IV compares the trouble of going to mass with the use-value of being the ruler of Paris and hence France. Does this mean that the mass is in the relative form and Paris in the equivalent form? After all, he gives a mass in order to receive Paris, just as the linen weaver gives his linen (relative form) in order to receive a coat (equivalent form).

144:1 By means of the value relation, therefore, the bodily form of commodity *B* becomes the value form of commodity *A*, i.e., the physical body of commodity *B* becomes the mirror which reflects the value of commodity *A*.¹⁸

[Summary] This and the footnote sum up once more the main message of this section, that the value relation is an *expression* of value:

¹⁸ In a certain sense, every human being is in the same situation as a commodity. As he or she neither enters into the world with a mirror in their hand, nor as a Fichtean philosopher who can say ‘I am I’, a human first mirrors himself in a human. Peter only relates to himself as a human through his relation to another human, Paul, in whom he recognizes his likeness. With this, however, Paul also becomes from head to toe, in his physical form as Paul, the form of appearance of the human species for Peter.

↑ And if someone is still puzzled by this detour, that the expression of the value of the linen goes through turning the coat into an incarnation of value, one should remember that

Nebenbei bemerkt, hat auch die Warensprache, außer dem Hebräischen, noch viele andre mehr oder minder korrekte Mundarten. Das deutsche „Wertsein“ drückt z.B. minder schlagend aus als das romanische Zeitwort valere, valer, valoir, daß die Gleichsetzung der Ware *B* mit der Ware *A* der eigne Wertaussdruck der Ware *A* ist. Paris vaut bien une messe!

67:1 Vermittelst des Wertverhältnisses wird also die Naturalform der Ware *B* zur Wertform der Ware *A* oder der Körper der Ware *B* zum Wertspiegel der Ware *A*.¹⁸

¹⁸ In gewisser Art geht’s dem Menschen wie der Ware. Da er weder mit einem Spiegel auf die Welt kommt noch als Fichtescher Philosoph: Ich bin ich, bespiegelt sich der Mensch zuerst in einem andren Menschen. Erst durch die Beziehung auf den Menschen Paul als seinesgleichen bezieht sich der Mensch Peter auf sich selbst als Mensch. Damit gilt ihm aber auch der Paul mit Haut und Haaren, in seiner paulinischen Leiblichkeit, als Erscheinungsform des Genus Mensch.

also humans define their identity in their relations with others. By the way, the metaphor with Peter and Paul has its limits because Peter has no part in creating Paul, while the linen plays an active role in making the coat into the mirror of its value.

By entering into a relation with commodity *B* as the embodiment of value, as a materialization of human labor, commodity *A* turns the use-value *B* into the material through which its own value is expressed. The value of commodity *A*, thus expressed in the use-value of commodity *B*, has the form of relative value.

When we interpreted Marx’s preliminary reflections about the meaning of the sentence “20 yards of linen are worth 1 coat” as the linen weaver’s private deliberations, we already came to the result that for the linen weaver privately, the use-value of the coat is an expression of the value of the linen—because the weaver needs a coat and is willing to give linen in exchange for it. See the Annotations to 139:6. Now we have just derived that in the web of surface relations embracing the linen weaver when she makes her exchanges, the use-value of the coat is an expression of the value of the linen as well. Not because society likes coats, but because the activity of surface agents has created an expression of the value of the linen detached from use-value of the linen. This detached form forgets that it is the value of *linen* and becomes the incarnation of value pure and simple. The coat as a thing, its natural use-value form, doubles up as the material for the value forms of other commodities. The linen weaver’s private deliberation has therefore gained a social echo.

Question 224 How does the social scientist’s analysis of the substance of value differ from what the commodities themselves tell us about value?

Quantitative Determination of the Relative Form of Value Now let us return to the quantitative aspect, which had been disregarded earlier: to what extent is the relative form of value determined quantitatively?

144:2 Every commodity, whose value is to be expressed, is a given quantity of a useful object, for instance, 15 bushels of wheat, or 100 lb. of coffee.

↑ The phrase “whose value is to be expressed” takes us back to the situation at the very beginning of section 1.3, see 138:1: The linen weaver has produced linen although she personally does not need linen. She needs a form of value in the sense of criterion (2), a form which allows her to take advantage of the labor she has put into the linen.

This was discussed previously, but the earlier discussion is now amended in order to take in the quantitative dimension which had been set aside in 141:1. During the week, the linen weaver produced specific pieces of linen, ↑ each having a size, a color, etc., and ↓ each representing a specific quantity of labor.

Indem sich die Ware *A* auf die Ware *B* als Wertkörper bezieht, als Materialur menschlicher Arbeit, macht sie den Gebrauchswert *B* zum Material ihres eignen Wertausdrucks. Der Wert der Ware *A*, so ausgedrückt im Gebrauchswert der Ware *B*, besitzt die Form des relativen Werts.

67:2 Jede Ware, deren Wert ausgedrückt werden soll, ist ein Gebrauchsgegenstand von gegebenem Quantum, 15 Scheffel Weizen, 100 Pfd. Kaffee usw.

This commodity-quantity contains a specific quantity of human labor.

↑ The adjective “human” in “human labor” is relevant here. Marx is not talking about the linen weaver’s specific labor but about human labor in the abstract. ↓ If therefore the next sentence says that the value form of the commodity must give credit for each of these portions of her labor, big or small, we must remember that the linen weaver does not get social recognition for her actual labor, but for that labor that is socially necessary to produce the products she brings to market.

The form of value must therefore not only express value itself, but quantitatively determined value, i.e. the magnitude of value.

Dieses gegebne Warenquantum enthält ein bestimmtes Quantum menschlicher Arbeit.

Die Wertform hat also nicht nur Wert überhaupt, sondern quantitativ bestimmten Wert oder Wertgröße auszudrücken.

Question 225 Can you give an example in which something is the expression of another thing without being the expression of the quantity of that other thing?

↓ Marx might have said here “this task is already solved” because the surface relationship which is the starting point for the forms of value has a clear quantitative dimension.

In the value relation of commodity A to commodity B, of the linen to the coat, therefore, not only is the commodity-type coat, which counts here as the incarnation of value as such, equated in qualitative terms with the linen, but also a definite quantity of the value-object or equivalent, 1 coat for example, is equated with a definite quantity of linen, such as 20 yards.

Im Wertverhältnis der Ware A zur Ware B, der Leinwand zum Rocke, wird daher die Warenart Rock nicht nur als Wertkörper überhaupt der Leinwand qualitativ gleichgesetzt, sondern einem bestimmten Leinwandquantum, z.B. 20 Ellen Leinwand, ein bestimmtes Quantum des Wertkörpers oder Äquivalents, z.B. 1 Rock.

↑ It is a little unclear what the word “therefore” (*daher*) in this long sentence refers to. The argument cannot be that the value relations have a quantitative dimension because the linen weaver needs a quantitative expression of the value, therefore I assume the argument is: since value-producing labor is quantitatively determined, the value relations on the surface are quantitatively determined as well. It is possible to argue this way: If it didn’t matter to the producers how much work went into each product, then the market participants would not pay much attention either to the quantities exchanged on the market. Marx nowhere says this, therefore it is not clear whether this is what he meant. ↓ After talking about the value relations which contain the value expression, Marx talks now about this value expression itself:

144:2/o The equation 20 yards of linen = 1 coat, or 20 yards of linen are worth 1 coat, presupposes that 1 coat contains just as much of the substance of value as 20 yards of linen, i.e., that the quantities in which the two commodities are present have cost the

67:3/o Die Gleichung: „20 Ellen Leinwand = 1 Rock oder: 20 Ellen Leinwand sind 1 Rock wert“ setzt voraus, daß in 1 Rock gerade so viel Wertsubstanz steckt als in 20 Ellen Leinwand, daß beide Warenquanta also gleich viel Arbeit kosten oder

same amount of labor or the same quantity of labor-time.

gleich große Arbeitszeit.

Question 226 Is 144:2/o the first time Marx says that exchange proportions must be quantitatively proportional to labor-time, or has he said this already earlier?

↑ After having established in the previous paragraph that both the underlying labor process and the value relations are quantitatively determined, his last sentence makes a much stronger assertion: it postulates a quantitative correspondence between socially necessary labor in the production process and the exchange proportions on the surface. That he is making this strong assertion without any supporting arguments seems a little baffling. Perhaps he is guided by the consideration that a form change cannot add or subtract substance, therefore the quantities are preserved. But earlier, in 129:1, when he tried to transfer the quantity of labor into the quantity of value, he ran into the paradox of the lazy worker and had to correct himself. Also in the present situation, a similar correction is in store for him, since in a capitalist economy the exchange proportions are even in average not proportional to values but to prices of production. Perhaps he is so relaxed about this because he is making the tacit second-order argument that the surface relations can only then be coherent with the process going on in production, instead of interfering with it, if they are also quantitatively a reflection of the underlying quantity of labor.

Before we continue with the argument, just one brief remark about the wording. Marx writes here: “presupposes” because the equation “20 yards of linen = 1 coat” does not mean that the linen weaver decides how much she wants to give for a coat. The assumption is that “20 yards of linen = one coat” are the exchange proportions given by the market. If these are the prevailing market exchange proportions, then there must be linen weavers and tailors who are willing to make this exchange at these terms. Marx picked one of these linen weavers.

One might think here that Marx makes it too easy for himself. He claims quantitative correspondence between exchange proportions on the surface and labor content in production without giving much justification. ↓ However even if this correspondence between surface and underlying relations of production is achieved at one point, it is continually challenged by changes of productivity. Here Marx does his homework: He pays close attention to how such disturbances are reflected on the surface.

But the labor-time necessary for the production of 20 yards of linen or 1 coat varies with every change in the productive power of weaving or tailoring. The influence of such changes on the relative expression of the magnitude of value shall now be investigated in more detail.

Die zur Produktion von 20 Ellen Leinwand oder 1 Rock notwendige Arbeitszeit wechselt aber mit jedem Wechsel in der Produktivkraft der Weberei oder der Schneiderei. Der Einfluß solcher Wechsel auf den relativen Ausdruck der Wertgröße soll nun näher untersucht werden.

I did not translate it as: “change in the productivity of weaver or tailor” because this would have put an individualistic bent on it: I didn’t want it to sound as if the particular weaver or tailor was not working fast enough.

↑ Perhaps this emphasis on the disturbances comes from the insight that individual surface activity does not create the social relations, but it reproduces them.

The previous discussions of productivity (136:3–137:0) looked at one use-value only. Now (145:1–146:3) Marx discusses the influence of a change in productivity on the *relative* expression of the magnitude of value. He asks whether changes in exchange-value of a commodity reflect changes in productivity. The answer is: yes, but changes in productivity are not unambiguously reflected in relative value changes. The reason is simple: a fall in the productivity of making linen has the same effect on their relative values as a rise in the productivity of making coats. Therefore even in the best of all cases, in which exchange-values are precisely determined by relative value quantities, changes in productivity are not well reflected in the market relations.

The next two paragraphs describe two situations, both of which involve changes in productivity:

145:1 I. Let the value of the linen change¹⁹ while that of the coat remains constant. If the labor-time necessary for the production of linen be doubled, as a result of the increasing infertility of flax-growing soil for instance, its value will also be doubled. Instead of the equation 20 yards of linen = 1 coat, we will have 20 yards of linen = 2 coats, since 1 coat contains now only half as much labor-time as 20 yards of linen. If, on the other hand, the necessary labor-time be reduced by one half, as a result of improved looms for instance, the value of the linen will fall by one half. The equation will therefore now read 20 yards of linen = 1/2 coat. The relative value of commodity A, i.e. its value expressed in commodity B, rises and falls in direct relation to the value of A, if the value of B remains constant.

This is a paradoxical relationship: infertility means more value, improvement of the looms means less value. But it can be understood if we put ourselves into the shoes of the linen weaver: if she can produce more linen in the same time, she may be inclined to pay more linen in order to get a coat.

¹⁹ Here, as occasionally also on previous pages, we use the expression ‘value’ for quanti-

68:1 I. Der Wert der Leinwand wechsle,¹⁹ während der Rockwert konstant bleibt. Verdoppelt sich die zur Produktion der Leinwand notwendige Arbeitszeit, etwa infolge zunehmender Unfruchtbarkeit des flachstragenden Bodens, so verdoppelt sich ihr Wert. Statt 20 Ellen Leinwand = 1 Rock hätten wir 20 Ellen Leinwand = 2 Röcke, da 1 Rock jetzt nur halb so viel Arbeitszeit enthält als 20 Ellen Leinwand. Nimmt dagegen die zur Produktion der Leinwand notwendige Arbeitszeit um die Hälfte ab, etwa infolge verbesserter Webstühle, so sinkt der Leinwandwert um die Hälfte. Demgemäß jetzt: 20 Ellen Leinwand = 1/2 Rock. Der relative Wert der Ware A, d.h. ihr Wert ausgedrückt in der Ware B, steigt und fällt also direkt wie der Wert der Ware A, bei gleichbleibendem Wert der Ware B.

¹⁹ Der Ausdruck Wert wird hier, wie beiläufig schon früher stellenweis geschah, für quantitativ

tatively determined values, i.e. for the magnitude of value.

bestimmten Wert, also für Wertgröße gebraucht.

Question 227 Are there places earlier in chapter One where Marx wrote “value” where it would have been more precise to write “magnitude of value”?

If productivity changes on the other pole, there is an inverse quantitative relationship:

145:2 II. Let the value of the linen remain constant, while the value of the coat changes. If, under these circumstances, the labor-time necessary for the production of a coat is doubled, as a result, for instance, of a poor crop of wool, we should have, instead of 20 yards of linen = 1 coat, 20 yards of linen = 1/2 coat. If, on the other hand, the value of the coat sinks by one half, then 20 yards of linen = 2 coats. Hence, if the value of commodity A remains constant, its relative value, as expressed in commodity B, rises and falls in inverse relation to the change in the value of B.

↑ Unlike the effects of changes in the value of the linen, the effects of changes in the value of coats is no longer plausible from the individual point of view of the linen weaver. Since the coat still has the same use-value, and linen still takes her the same amount of labor to produce, why should she give now suddenly more linen to get a coat? This is one of the reasons (if I understand him right) why Marx later says that the equivalent form is not an expression of the quantity of the value of the coat. But right now Marx is not discussing this at all. He just assumes that the relative form of value is indeed also a quantitative expression of the value of the linen, but he shows that the value changes of the coat interfere with this expression. The first sign of this interference is that two completely different mechanisms yield the same outcome:

145:3/o If we compare the different cases examined under headings I and II, it emerges that the same change in the magnitude of relative value may arise from entirely opposed causes. Thus the equation 20 yards of linen = 1 coat becomes 20 yards of linen = 2 coats, either because the value of the linen has doubled or because the value of the coat has fallen by one half, and it becomes yards of linen = 1/2 coat, either because the value of the linen has fallen by one half, or be-

68:2 II. Der Wert der Leinwand bleibe konstant, während der Rockwert wechsle. Verdoppelt sich unter diesen Umständen die zur Produktion des Rockes notwendige Arbeitszeit, etwa infolge ungünstiger Wollschur, so haben wir statt 20 Ellen Leinwand = 1 Rock jetzt: 20 Ellen Leinwand = 1/2 Rock. Fällt dagegen der Wert des Rockes um die Hälfte, so 20 Ellen Leinwand = 2 Röcke. Bei gleichbleibendem Wert der Ware A fällt oder steigt daher ihr relativer, in der Ware B ausgedrückter Wert im umgekehrten Verhältnis zum Wertwechsel von B.

68:3 Vergleicht man die verschiedenen Fälle sub I und II, so ergibt sich, daß derselbe Größenwechsel des relativen Werts aus ganz entgegengesetzten Ursachen entspringen kann. So wird aus 20 Ellen Leinwand = 1 Rock: 1. die Gleichung 20 Ellen Leinwand = 2 Röcke, entweder weil der Wert der Leinwand sich verdoppelt oder der Wert der Röcke um die Hälfte fällt, und 2. die Gleichung 20 Ellen Leinwand = 1/2 Rock, entweder weil der Wert der Leinwand um

cause the value of the coat has doubled.

Since these different mechanisms yield the same outcome, it is also possible that they cancel each other out.

146:1 III. Let the quantities of labor necessary for the production of the linen and the coat vary simultaneously in the same direction and the same proportion. In this case, 20 yards of linen = 1 coat, as before, whatever change may have taken place in their respective values. Their change of value is revealed only when they are compared with a third commodity, whose value has remained constant. If the values of all commodities rose or fell simultaneously, and in the same proportion, their relative values would remain unaltered. The change in their real values would be manifested by an increase or decrease in the quantity of commodities produced within the same labor-time.

↑ Note Marx's use of the word "discover" (because we are talking about an expression).
↓ All other cases can be reduced to those already discussed:

146:2 IV. The labor-times necessary for the production respectively of linen and coat, and hence the values of linen and coat, may vary simultaneously in the same direction but to an unequal degree, or in opposite directions, and so on. The influence of all possible combinations of this kind on the relative value of a commodity can be worked out simply by applying cases I, II and III.

Summary: Value changes *are* an expression of changes in productivity, but Marx emphasizes how *incomplete* this expression is. It is neither unequivocal nor exhaustive.

146:3 Thus real changes in the magnitude of value are reflected neither unequivocally nor exhaustively in their relative expression, or, in other words, in the magnitude of the relative value. The relative value of a commodity may vary, although its value remains

die Hälfte sinkt oder der Wert des Rockes auf das Doppelte steigt.

68:4/o III. Die zur Produktion von Leinwand und Rock notwendigen Arbeitsquanta mögen gleichzeitig, in derselben Richtung und derselben Proportion wechseln. In diesem Falle nach wie vor 20 Ellen Leinwand = 1 Rock, wie immer ihre Werte verändert seien. Man entdeckt ihren Wertwechsel, sobald man sie mit einer dritten Ware vergleicht, deren Wert konstant blieb. Stiegen oder fielen die Werte aller Waren gleichzeitig und in derselben Proportion, so würden ihre relativen Werte unverändert bleiben. Ihren wirklichen Wertwechsel ersähe man daraus, daß in derselben Arbeitszeit nun allgemein ein größeres oder kleineres Warenquantum als vorher geliefert würde.

69:1 IV. Die zur Produktion von Leinwand und Rock resp. notwendigen Arbeitszeiten, und daher ihre Werte, mögen gleichzeitig in derselben Richtung wechseln, aber in ungleichem Grad, oder in entgegengesetzter Richtung usw. Der Einfluß aller möglichen derartigen Kombinationen auf den relativen Wert einer Ware ergibt sich einfach durch Anwendung der Fälle I, II und III.

69:2 Wirkliche Wechsel der Wertgröße spiegeln sich also weder unzweideutig noch erschöpfend wider in ihrem relativen Ausdruck oder in der Größe des relativen Werts. Der relative Wert einer Ware kann wechseln, obgleich ihr Wert konstant bleibt. Ihr relati-

constant. Its relative value may remain constant, although its value varies; and finally, simultaneous variations in the magnitude of its value and in the relative expression of that magnitude do not by any means have to correspond at all points.²⁰

Exam Question 228 Give examples illustrating Marx's remark that the relative form of value expresses the magnitude of value "neither unequivocally nor exhaustively."

Without calling them "defects," Marx is pointing out here some defects in the Simple form of value. It will be interesting to see to what extent the higher forms of value remedy these defects, and to what extent they preserve them.

Marx's simple if somewhat tedious exercise about how certain common changes in production are reflected on the surface can be seen part of an important leitmotif permeating Marx's discussion, namely, his critique of empiricism. Here, as on various other places, Marx shows how the empirical facts may give misleading information about what is really going on.

Question 229 Are there other undercurrents or leitmotifs in Marx's discussion other than his critique of empiricism?

On the other hand, these comparative increases in productivity are also a potentially important economic issue. Marx remarked in his early 1850–51 notebooks, written while he worked through Ricardo:

Were this [namely, a rise in productivity] to happen equally in all industries, then values would not change, and the spur for capitalism would fall away.

Presumably, Marx wrote this before he had worked out the concept of "relative surplus-value" which shows that capitalism does indeed benefit from generalized rises in productivity. The mature Marx makes related remarks in the section about crises in *Theories 2* [mecw32]161:1, that overproduction without disproportionality would not be overproduction.

The footnote gives a critique of the literature.

²⁰ This lack of congruence between the magnitude of value and its relative expression has been exploited by the vulgar economists with customary ingenuity. For example: "Once admit that A falls, because B, with which it is exchanged, rises, while no less labor is bestowed in the meantime on A, and your general principle of value falls to the ground ... If he [Ricardo] allowed that when A rises in value relatively to B,

ver Wert kann konstant bleiben, obgleich ihr Wert wechselt, und endlich brauchen gleichzeitige Wechsel in ihrer Wertgröße und im relativen Ausdruck dieser Wertgröße sich keineswegs zu decken.²⁰

²⁰ Note zur 2. Ausg. Diese Inkongruenz zwischen der Wertgröße und ihrem relativen Ausdruck ist von der Vulgärökonomie mit gewohntem Scharfsinn ausgebeutet worden. Z.B.: „Gebt einmal zu, daß A fällt, weil B, womit es ausgetauscht wird, steigt, obgleich unterdessen nicht weniger Arbeit auf A verausgabt wird, und euer allgemeines Wertprinzip fällt zu Boden ... Wenn zugegeben wird, daß, weil der Wert von A rela-

B falls in value relatively to *A*, he cut away the ground on which he rested his grand proposition, that the value of a commodity is ever determined by the labor embodied in it, for if a change in the cost of *A* alters not only its own value in relation to *B*, for which it is exchanged, but also the value of *B* relatively to that of *A*, though no change has taken place in the quantity of labor to produce *B*, then not only the doctrine falls to the ground which asserts that the quantity of labor bestowed on an article regulates its value, but also that which affirms the cost of an article to regulate its value' (J. Broadhurst, *Political Economy*, London, 1842, pp. 11 and 14).

Marx explains his use of the term "vulgar economists" in section 1.4 of this chapter, footnote 32 to paragraph 173:1/oo. The footnote continues:

^{20 ctd} Mr. Broadhurst might just as well say: consider the fractions 10/20, 10/50, 10/100 etc. The number 10 remains unchanged, and yet its proportional magnitude, its magnitude in relation to the numbers 20, 50, 100 continually diminishes. Therefore, the great principle that the magnitude of a whole number, such as 10, is 'regulated' by the number of times the number 1 is contained in it falls to the ground.

The Equivalent Form

As the forms of value evolve, the commodity in the relative form of value is able to express its value better and better. As if made visible through an X-ray camera, the hidden relations of production project themselves onto the surface and in this way guide individual activity. Marx used the metaphor that the commodities themselves tell us through their relations what we had to unearth tediously in our scientific investigation of the essence of value. As Hegel said, "essence must appear," and it does appear.

The commodity in the equivalent form, by contrast, is moving into the opposite direction. The linen weaver's offer gives the value of the coat a form as well. But instead of revealing the essence of value on the surface, this form of value disguises and mystifies the essence of the coat's value. This will be discussed now.

147:1 We have seen: if commodity *A* (the linen) expresses its value in the use-value of

tiv zu *B* steigt, der Wert von *B* relativ zu *A* fällt, ist der Grund unter den Füßen weggeschnitten, worauf Ricardo seinen großen Satz aufstellt, daß der Wert einer Ware stets bestimmt ist durch das Quantum der ihr einverleibten Arbeit; denn wenn ein Wechsel in den Kosten von *A* nicht nur seinen eignen Wert im Verhältnis zu *B*, womit es ausgetauscht wird, verändert, sondern auch den Wert von *B* relativ zu dem von *A*, obgleich kein Wechsel stattgefunden hat in dem zur Produktion von *B* erheischten Arbeitsquantum, dann fällt nicht nur die Doktrin zu Boden, die versichert, daß die auf einen Artikel verausgabte Quantität Arbeit seinen Wert reguliert, sondern auch die Doktrin, daß die Produktionskosten eines Artikels seinen Wert regulieren." (J. Broadhurst, „*Political Economy*“, London 1842, p. 11, 14.)

^{20 ctd} Herr Broadhurst könnte ebensogut sagen: Man sehe sich einmal die Zahlenverhältnisse 10/20, 10/50, 10/100 usw. an. Die Zahl 10 bleibt unverändert, und dennoch nimmt ihre proportionelle Größe, ihre Größe relativ zu den Nenner 20, 50, 100, beständig ab. Also fällt das große Prinzip zu Boden, daß die Größe einer ganzen Zahl wie 10 z.B. durch die Anzahl der in ihr enthaltenen Einer „reguliert“ ist.

70:1 Man hat gesehen: Indem eine Ware *A* (die Leinwand) ihren Wert im Gebrauchs-

a different commodity *B* (the coat), it impresses upon the latter a peculiar form of value of its own, namely that of the equivalent.

Fowkes's translation "impresses upon the latter a form of value peculiar to it" is unfortunate. It is a peculiar form of value, but not a

form of value peculiar to the coat. My "of its own" is an attempt to translate *selbst*: not only the linen has a form of value, but through

the activity of the linen the coat obtains its own form of value too.

wert einer verschiedenartigen Ware *B* (dem Rock) ausdrückt, drückt sie letzterer selbst eine eigentümliche Wertform auf, die des Äquivalents.

↑ Marx had already announced in 139:7/o that the expression of the value of the linen in the coat has two poles, the relative form of value and the equivalent form of value. Then in 141:2 Marx had characterized the equivalent form as follows: the linen weaver's offer turns the coat into a form of existence of value, an embodiment of value (*Wertding*). ↓ In the next sentence, Marx does not use the word "*Wertding*" but redescribes the action of the linen in such a way that the reader can infer from it what this means for the coat:

The commodity linen manifests its own value-being through the fact that the coat, without having to assume a form of value distinct from its own bodily form, counts as its equal.

Die Leinwandware bringt ihr eignes Wertsein dadurch zum Vorschein, daß ihr der Rock, ohne Annahme einer von seiner Körperform verschiedenen Wertform, gleichgilt.

↑ Being values, coat and linen have an equal substance—the value quasi-material. The linen *expresses* the invisible fact that it and the coat contain an equal substance by offering itself as an equal to the coat in its ordinary existence. (This is what Marx earlier had described as: the coat becomes an embodiment of value.) The important implication for the coat is that the coat does not need to assume a special form in order to be able to refer to the linen as value, but the coat can do this as a coat. The coat does not have to prove that it is socially needed, but it is in the privileged position of being accepted as is:

The linen therefore indeed expresses its own value-being by the direct exchangeability of the coat for linen.

Die Leinwand drückt also in der Tat ihr eignes Wertsein dadurch aus, daß der Rock unmittelbar mit ihr austauschbar ist.

↑ Marx says "indeed" (*in der Tat*) because the equivalent form, the privileged relation in which the coat finds itself, results from the surface activity (the deed) of the linen.

The equivalent form of a commodity is consequently the form of being directly exchangeable with some other commodity.

Die Äquivalentform einer Ware ist folglich die Form ihrer unmittelbaren Austauschbarkeit mit anderer Ware.

In other words, for the linen, coats are like money. Coats will always be accepted in the exchange against linen. If someone offers coats for linen, the linen weaver will not say: "sorry, I don't need a coat right now, I rather have a bathing suit."

This is a step towards solving the "riddle of money," i.e., towards explaining why money is accepted in exchange for everything. This miraculous property of money is a form of value. It does not come from a special value of money which other commodities lack. Rather, the

value of the equivalent (money) is of the same nature as the value of any other good. It merely has a different *form*. Money does not receive this form through its own power, but through the activity of all the ordinary commodities.

Question 230 *Why is a commodity in the equivalent form directly exchangeable with the commodity in the relative value form? (Also define what it means to be directly exchangeable.)*

[Equivalent Form has No Quantitative Determination] There is no need to discuss the *quality* of the equivalent form—it is the natural form of the commodity—therefore Marx immediately goes over to the *quantitative* aspect.

147:2 If one kind of commodity, such as coats, serves as the equivalent of another, such as linen, and coats therefore acquire the characteristic property of being in the form of direct exchangeability with linen, this does not mean that the proportion is given in which the two are exchangeable.

70:2 Wenn eine Warenart, wie Röcke, einer andren Warenart, wie Leinwand, zum Äquivalent dient, Röcke daher die charakteristische Eigenschaft erhalten, sich in unmittelbar austauschbarer Form mit Leinwand zu befinden, so ist damit in keiner Weise die Proportion gegeben, worin Röcke und Leinwand austauschbar sind.

Fowkes's "provides *us* with the proportion" (my emphasis) is another instance of a misplaced transposition of Marx's statement

about social facts themselves into a statement about how we are exploring these social facts here. I.e., although Marx did not

commit the epistemic fallacy, the translation builds it in afterwards.

↑ If the linen weaver offers to exchange 20 yards of linen for a coat, this places the coat into a privileged position. The coat can decide whether it wants to remain coat or whether it wants to turn itself into linen. But this privilege does not allow the coat to decide how much linen it will become.

↓ The linen weaver does not decide this either, but the exchange proportion between coat and linen are a social given ultimately determined by the socially necessary labor in coat and linen:

Since the magnitude of the value of the linen is given, this proportion depends on the magnitude of the value of the coat. Whether the coat is expressed as the equivalent and the linen as relative value, or, inversely, the linen is expressed as equivalent and the coat as relative value, the magnitude of the coat's value is determined, as ever, by the labor-time necessary for its production, therefore

Sie hängt, da die Wertgröße der Leinwand gegeben ist, von der Wertgröße der Röcke ab. Ob der Rock als Äquivalent und die Leinwand als relativer Wert oder umgekehrt die Leinwand als Äquivalent und der Rock als relativer Wert ausgedrückt sei, seine Wertgröße bleibt nach wie vor durch die zu seiner Produktion notwendige Arbeitszeit, also unabhängig von seiner Wertform

it is independent of the form of the coat's value. | bestimmt.

↑ This allows us to repeat a clarification which was made earlier in the Annotations (see our remarks about the word "presuppose" in 144:2/o and also earlier remarks), but which was not made explicit in Marx's text until here. The Simple form of value, 20 yards of linen is worth 1 coat, is not an expression of the value of the linen because the weaver decides how much linen to give for the coat. It is an expression of the value of the linen because the linen weaver, who knows that the socially determined exchange relation between coat and linen is 20 yards for one coat, is willing to carry out this exchange. What are her alternatives, if the coat is too expensive? She may leave her need or want unfulfilled, or she may try to meet it with other commodities (sweater instead of coat) or, if she can no longer satisfy her needs through the production of linen, she can switch to producing something different than linen. These changes in quantities demanded and supplied will then lead to price changes and ultimately adjust prices so that they become proportional to socially necessary labor times. But Marx assumes here that the individual producers and consumers can only make quantity decisions, they cannot set prices. Marx assumes here, as always in *Capital I*, that all these adjustments have been made and commodities are traded at their values.

Question 231 *In his discussion of the quantitative aspect of the equivalent form in 147:2, Marx considers the magnitude of the value of linen as given. Can this be justified, and if so, how?*

↓ But although the value of coats, together with the value of linen, determines this exchange relationship, the quantities which the coat in the equivalent form can fetch are not an *expression* of the value of the coat:

But when the coats assume the place of the equivalent in the value expression, the magnitude of their values fails to be expressed as magnitude of value. Rather, coats figure in the value equation merely as specific quantities of a certain thing.

Aber sobald die Warenart Rock im Wertausdruck die Stelle des Äquivalents einnimmt, erhält ihre Wertgröße keinen Ausdruck als Wertgröße. Sie figuriert in der Wertgleichung vielmehr nur als bestimmtes Quantum einer Sache.

The magnitude of the coat's value is not *expressed* in the equation "20 yards of linen are worth 1 coat" because the linen weaver does not compare the value of the linen with the *value* of the coat. Instead, she bases her trading decision on whether the *use-value* of the coat seems worth the effort she put into making the amount of linen which the market forces her to pay for the coat.

Question 232 *The relationship "20 yards of linen are worth 1 coat" says that 20 yards of linen have the same value as 1 coat, but it says nothing about the value of the coat itself. Right or wrong?*

Question 234 *Can it be called a defect of the equivalent form that the magnitude of value of the coat is not expressed when the coat is in the equivalent form, only when the coat is in the relative form?*

The claim that the exchange proportion depends on the value of the coat but is not an expression of the value of the coat needs more clarification. In the next paragraph, Marx deals with a possible objection. The equivalent form of value specifies the quantity of coats: 20 yards of linen are not worth 2 or 5 coats, they are worth 1 coat. And if the value of the coat would fall in half, then they would be worth 2 coats. Does this not mean that the quantity of coats is an expression of the quantity of the value of the coats? Marx gives a two-pronged but rather abstract argument to refute this:

↓ (1) Coats figure in this relationship only as quantities of a certain thing, not as quantities of value:

147:3/o For instance, 40 yards of linen are ‘worth’—what? 2 coats. Because coats play here the role of equivalent, i.e., the use-value “coat” counts as the embodiment of value vis-à-vis the linen, a certain number of coats is sufficient to express the value of a given quantity of linen.

↓ (2) The assumption that the quantity of coats in the equation “20 yards of linen is 1 coat” expresses the value of the coat amounts to the assumption, refuted earlier, that a commodity can express its value in its own use-value:

Two coats can therefore express the magnitude of value of 40 yards of linen, but they can never express the magnitude of their own value, the magnitude of the value of coats.

At the end, a very brief remark about the literature.

Because of their superficial reception of this fact—that in the equation of value the equivalent always has the form of a simple quantity of some article, of a use-value—Bailey and many of his predecessors and followers were misled into considering the expression of value as a merely quantitative relation. Rather, the equivalent form of a commodity does not contain any quantitative determination of value at all.

70:3 Z.B.: 40 Ellen Leinwand sind „wert“—was? 2 Röcke. Weil die Warenart Rock hier die Rolle des Äquivalents spielt, der Gebrauchswert Rock der Leinwand gegenüber als Wertkörper gilt, genügt auch ein bestimmtes Quantum Röcke, um ein bestimmtes Wertquantum Leinwand auszudrücken.

Zwei Röcke können daher die Wertgröße von 40 Ellen Leinwand, aber sie können nie ihre eigne Wertgröße, die Wertgröße von Röcken, ausdrücken.

Die oberflächliche Auffassung dieser Tatsache, daß das Äquivalent in der Wertgleichung stets nur die Form eines einfachen Quantums einer Sache, eines Gebrauchswertes, besitzt, hat Bailey, wie viele seiner Vorgänger und Nachfolger, verleitet, im Wertaussdruck ein nur quantitatives Verhältnis zu sehn. Die Äquivalentform einer Ware enthält vielmehr keine quantitative Wertbestimmung.

Fowkes translates *vielmehr* with “in fact” here; but Marx has a

secret meaning for “in fact” (*in der Tat*), see the comments to 147:1,

therefore the word “in fact” should be reserved for this meaning only.

The lack of a quantitative determination of value in the equivalent form will come up again when Marx discusses the difference between standard of prices and measure of value.

It can also become practically significant in the following situations:

When e.g. cattle was the general equivalent, the market determined the proportions of all other goods according to the needs of society, but the market did not signal whether or not there were too many cattle produced. This probably did not matter since these societies were such that one could always find uses for cattle.

But in *Grundrisse* Marx tells the story of a medieval village which ended up with not enough food because they found gold and everybody was digging for gold. Under the gold standard, the global scarcity of gold prevented such overproduction (but look at the gold rushes when new gold resources were discovered).

This lack of good market remedies when there is too much or too little money, gave banks such a strong competitive position (they were able to bring the whole economy to its knees just to make a few dollars profit) that they had to be regulated by the state. This regulation led to the gradual replacement of the gold standard by a standard set by monetary policy—something which would not have been possible had the equivalent form contained a quantitative determination of value.

Today we are also witnessing a situation in which Marx’s subtle insight becomes relevant: US economic policy is obviously debasing the US currency, but there is no inflation because the equivalent form of value does not contain a quantitative determination of the value of the dollar.

[Digression: Expression of Magnitude in Relative and Equivalent Form] Marx says that the exchange proportions are determined independent of the forms, that the relative form of value is an (albeit imperfect) *expression* of the magnitude of the value of the linen, and that the equivalent form of value is not an expression of the value of the coat at all. Perhaps it is easier to follow Marx’s argument at this point if we look at a change in the exchange proportion between coat and linen. Assume the value of the linen falls. The linen weaver is using a more efficient method and can produce more linen per hour. Then she should also be willing to offer more linen in exchange for the coat. This is why it is right to say that the exchange proportion is an expression of the magnitude of the value of the linen.

Now assume that for some reason the production of coats requires more labor, although the use-value remains the same. Since the use-value remains the same, the calculation of the linen weaver, who weighs this use-value against the time needed to produce linen, also remains unchanged. This is why it is right to say that the exchange proportion is not an expression of the magnitude of the value of the coat.

But something else happens if the coats require more labor. There will no longer be enough tailors who are willing to give coats away for 20 yards of linen, and therefore the

socially given exchange proportion between coats and linen will change: linen weavers everywhere will have to pay more linen for a coat. This price change is not due to the linen weaver in any way expressing the magnitude of the value of the coat. It is due to tailors expressing the magnitude of the values of their own products, and it is forced on the linen weaver by the market. Of course, fewer linen weavers will go along with the trade at this less favorable proportion; but the number of linen weavers agreeing to this trade is an expression of the magnitude of the value of linen, not of the magnitude of the value of the coat. This is an attempt to explain the seeming paradox that the exchange proportion agreed to by the linen weaver *depends* on the magnitude of the value of coats, but the linen weaver's agreement is not an *expression* of the magnitude of the value of coats.

[The First Peculiarity of the Equivalent Form] The remainder of the discussion of the equivalent form is structured around three peculiarities of the equivalent form. Marx introduces the first peculiarity without any transition or preparation of the reader:

148:1 The first peculiarity which strikes us when we consider the equivalent form is this, that use-value becomes the form of appearance of its opposite, value.

The first peculiarity is not the most basic, but the most obvious of the three.

148:2 The natural form of the commodity becomes form of value. But, note well, this reversal happens for commodity *B* (coat, or maize, or iron, etc.) only if some arbitrary other commodity *A* (linen etc.) enters into a value relation with it, and this reversal holds only within this relation.

↑ It is obvious that the coat acquires the magical ability to turn itself, by exchange, into linen only because the linen weaver has offered to exchange linen for coat. Marx stresses this obvious fact here (after already having taken the trouble, in 142:3/o, of mentioning it without emphasizing it), because in the more developed form of this same social relation on the surface of the economy, the dependence on the activity of the commodity in relative form is no longer obvious. Once the Simple equivalent has become General equivalent, and after the General equivalent has once and for all been amalgamated with one use-value, gold, gold has amazing social powers just because it is gold, because of its use-value. Gold has this social power because society has selected gold as the general equivalent. The ultimate origin of this power, the fact that any equivalent is equivalent only through the initiative of the commodities in the relative form of value, is no longer recognizable. Marx calls this the “solidification of a false semblance” (*Befestigung eines falschen Scheins*), see for instance in the First edition 34:0, where he says that in the Simple equivalent the false semblance has not yet been solidified. “False Semblances” is not an epistemological category, Marx is not talking about correct or incorrect theories, but one might say the surface relations

70:4 Die erste Eigentümlichkeit, die bei Betrachtung der Äquivalentform auffällt, ist diese: Gebrauchswert wird zur Erscheinungsform seines Gegenteils, des Werts.

71:1 Die Naturalform der Ware wird zur Wertform. Aber, nota bene, dies Quidproquo ereignet sich für eine Ware *B* (Rock oder Weizen oder Eisen usw.) nur innerhalb des Wertverhältnisses, worin eine beliebige andre Ware *A* (Leinwand etc.) zu ihr tritt, nur innerhalb dieser Beziehung.

themselves are lying about it where they come from. This is why the agents in a capitalist society cannot get insights into the true nature of their social relations through spontaneous learning. Science is necessary to penetrate these false appearances.

Since a commodity cannot relate to itself as equivalent, and therefore cannot make its own physical skin into the expression of its own value, it must relate to another commodity as equivalent, and therefore must make the physical skin of another commodity into its own value form.

↑ Instead of his usual metaphor body versus soul, Marx uses here the different metaphor skin versus muscles and bones. ↓ In the next paragraph, yet another metaphor will be introduced: expressing the value of linen in a coat is analogous to expressing the mass of a sugar-loaf in the iron weights which counterbalance it on a scale.

148:3/o Let us make this clear with the example of a measure which belongs to commodities as material objects, i.e. as use-values. A sugar-loaf, because it is a body, consists of heavy matter and therefore has a weight, but one can neither see this weight nor touch it.

[Analogy of the Sugar Loaf] Marx distinguishes here between “*Schwere*” (translated here with “heavy matter”) and “*Gewicht*” (translated with “weight”). “Heavy matter” is the underlying concept: it is what physicists call “mass.” Masses attract each other. The force with which a body of heavy matter is attracted by the earth is called its “weight.” This weight is a form of appearance of the heavy matter of a body. But in the passage under discussion, “weight” is not only used to denote this form of appearance, but also that what becomes measurable through this form of appearance, namely, the magnitude of the heavy matter of a given body. So far, modern physics agrees with Marx's intuitions.

We then take various pieces of iron, whose weight has been determined beforehand. The bodily form of the iron, considered for itself, is no more the form of appearance of heavy matter than is the bodily form of the sugarloaf.

↑ We can make sense of this last sentence and the argument to follow if we assume that Marx thinks heavy matter is some kind of chemical ingredient in every material body—similar to phlogiston, an ingredient which some physicists believed represented the heat in the body. Let's call the ingredient making the bodies heavy “massiton.” Massiton is invisible and cannot be felt from the texture of the body, but other bodies can sense it because they

Da keine Ware sich auf sich selbst als Äquivalent beziehn, also auch nicht ihre eigene Naturalhaut zum Ausdruck ihres eignen Werts machen kann, muß sie sich auf andre Ware als Äquivalent beziehn oder die Naturalhaut einer andren Ware zu ihrer eignen Wertform machen.

71:2 Dies veranschauliche uns das Beispiel eines Maßes, welches den Warenkörpern als Warenkörpern zukommt, d.h. als Gebrauchswerten. Ein Zuckerhut, weil Körper, ist schwer und hat daher Gewicht, aber man kann keinem Zuckerhut sein Gewicht ansehen oder anfühlen.

Wir nehmen nun verschiedene Stücke Eisen, deren Gewicht vorher bestimmt ist. Die Körperform des Eisens, für sich betrachtet, ist ebensowenig Erscheinungsform der Schwere als die des Zuckerhuts.

also contain massiton. Iron, regarded in isolation, is just as different from pure massiton as the sugarloaf, regarded in isolation. ↓ But if iron is placed in a weight relation with the sugar loaf, it counts as pure massiton representing the massiton in the sugar loaf. Instead of “pure massiton” Marx uses the phrase “heavy matter pure and simple” (*bloße Schwergestalt*).

↓ The next step in the argument is: If the need arises to “express” the massiton in the sugar-loaf, for instance because one wants to buy the sugar or use it in a recipe and therefore needs to know how much sugar it contains, one places the sugar loaf on a scale and looks how much iron is necessary to counterbalance it—despite the fact that iron, by itself, is no better incarnation of massiton than the sugar-loaf.

Nevertheless, in order to express the sugar-loaf as heavy matter, we place it into a weight relation with the iron. In this relation, the iron counts as a body representing nothing but heavy matter. Quantities of iron therefore serve to measure the weight of the sugar and represent, in relation to the sugar-loaf, heavy matter pure and simple, the incarnation of heavy matter.

For this to work, (1) both objects must contain massiton and (2) must enter a relation which allows the massiton in the sugar loaf to interact with the massiton in the iron. ↓ Marx reiterates these two conditions, first (2) then (1):

This part is played by the iron only within this relation, i.e. within the relation into which the sugar, or any other body whose weight is to be found, enters with the iron. If both objects lacked heavy matter, they could not enter into this relation, hence the one could not serve to express the heavy matter of the other.

↓ At the end is Marx’s proof that both objects contain massiton: this is shown by their equal quality when placed on a scale.

If we place both of them on the scales, we see in actuality that as heavy matter they are one and the same, and therefore that, taken in the appropriate proportions, they have the same weight.

↑ This is not a full proof. Had Marx been a physicist, he would also have looked for independent confirmation that massiton exists. He made this independent confirmation of the substance of value, when he showed that qua abstract labor all labor processes indeed have something in common. ↓ Next, Marx discusses the analogy between his weight example and the commodities:

Dennoch, um den Zuckerhut als Schwere auszudrücken, setzen wir ihn in ein Gewichtsverhältnis zum Eisen. In diesem Verhältnis gilt das Eisen als ein Körper, der nichts darstellt außer Schwere. Eisenquanta dienen daher zum Gewichtsmaß des Zuckers und repräsentieren dem Zuckerkörper gegenüber bloße Schwergestalt, Erscheinungsform von Schwere.

Diese Rolle spielt das Eisen nur innerhalb dieses Verhältnisses, worin der Zucker oder irgendein anderer Körper, dessen Gewicht gefunden werden soll, zu ihm tritt. Wären beide Dinge nicht schwer, so könnten sie nicht in dieses Verhältnis treten und das eine daher nicht zum Ausdruck der Schwere des andren dienen.

Werfen wir beide auf die Waagschale, so sehn wir in der Tat, daß sie als Schwere dasselbe, und daher in bestimmter Proportion auch von demselben Gewicht sind.

Just as the bodily form of the iron, as a measure of weight, represents nothing but heavy matter towards the sugar-loaf, so, in our expression of value, the bodily form of the coat represents nothing but value towards the linen.

↓ After the analogies, Marx also mentions the disanalogies:

149:1 Here, however, the analogy ceases. In the weight expression of the sugar-loaf, the iron represents a natural property common to both bodies, their heavy matter; but in the value expression of the linen, the coat represents a supra-natural property: their value, which is something purely social.

↑ The difference is that massiton is natural while the value quasi-material is social. Remember that “social” not merely means, involving an interaction between different people. The phrase “something purely social” does not mean: arising from the individual dispositions (preferences) of the economic agents, but it arises from the invisible production constraints which bind these people together in a society.

But both value and heavyness are, in Marx’s eyes, relative: Just as a coat cannot have value outside a social system which produces many commodities, Marx thinks that material bodies have masses only in relation with each other. The following paragraph from MEGA II/6, p. 32:1, interprets “Schwere” as something which is in truth relative, although it is assigned to the solitary body:

If I say for instance that the rock is heavy, I express heavyness as a property which can be attributed to the rock considered in isolation. In fact, however, its heavyness is a bodily property which it only possesses in relation to other bodies. The expression, while not saying anything about this relation, implies it.

Marx’s reasoning was, presumably, that something which has a relative expression (the famous instantaneous action at a distance represented by the Newtonian law of mass attraction), it must itself be relative. This contradicts classical mechanics which deals with autonomous mass points, but it is vindicated in the the general theory of relativity, which identifies heavy matter as curvature in space. (This latter theory also explains the other form of appearance of heavy matter overlooked by Marx: mass not only manifests itself in the force of gravity but also in its resistance to acceleration.) Marx’s mistake was therefore to interpret the communality of sugar loaf and iron weights as some chemical ingredient

Wie der Eisenkörper als Gewichtsmaß dem Zuckerhut gegenüber nur Schwere, so vertritt in unsrem Wertausdruck der Rockkörper der Leinwand gegenüber nur Wert.

71:3 Hier hört jedoch die Analogie auf. Das Eisen vertritt im Gewichts Ausdruck des Zuckerhuts eine beiden Körpern gemeinsame Natureigenschaft, ihre Schwere, während der Rock im Wertausdruck der Leinwand eine übernatürliche Eigenschaft beider Dinge vertritt: ihren Wert, etwas rein Gesellschaftliches.

Sage ich z.B. der Stein ist schwer, so drücke ich Schwere als eine Eigenschaft aus, die dem Stein isoliert für sich betrachtet, zukommt. In der That ist aber seine Schwere eine körperliche Eigenschaft, die er nur besitzt im Verhältniß zu andren Körpern. Der Ausdruck, obgleich er nichts von diesem Verhältniß sagt, schließt es ein.

instead of their joint embeddedness in higher-dimensional space-time. Bailey's counterexample with a distance, which Marx countered correctly, would have been a better analogy to the relation between sugar-loaf and iron weights than the value relation itself.

Question 238 *Was Marx's physics of the law of gravity wrong, and what does this say about his economics?*

There is another difference between this physics example and the economy, which Marx does not mention here: the law of gravity continues to function whether or not it expresses itself to the humans, while the law of value needs this expression in order to function.

Question 239 *What are the limits of the analogy with the sugar loaf? (Describe this analogy)*

[Social Origin of Equivalent Form Not Visible] ↓ The limits of the analogy with the sugar-loaf give a fitting transition to Marx's next topic: The equivalent form does *not* express that value is something social, the relative form *does* express it.

149:2/o The relative value form of a commodity, of the linen for example, expresses the value-being of the linen as something quite different from its body and bodily properties, namely, for example, as something which looks like a coat. This expression itself indicates that it conceals a social relation. Not so with the equivalent form, in which the body of the commodity itself, here the coat, just as it is in everyday life, expresses value—as if its value form were given to it by nature.

↑ When Marx writes here that the expression “conceals” a social relation, this is to be understood in the meaning: the expression is a visible surface relationship behind which an invisible deeper social relation is concealed. The German word “*verbergen*” connotes “contain” as much as “conceal.”

The relative form of value itself gives an indication that it is the expression of a *social* relation, because it relates the linen to a different commodity, coat. Not so the equivalent form. It seems to be a natural property of the coat to be able to “buy” linen. Now one might object and argue: the exchangeability with linen does not seem a natural property of the coat, since the coat has this property only when placed in the value relation with the linen. Against this, Marx has an interesting and sophisticated argument:

Admittedly, this holds good only within the value relation, in which the commodity linen is related to the commodity coat as its

71:4/o Indem die relative Wertform einer Ware, z.B. der Leinwand, ihr Wertsein als etwas von ihrem Körper und seinen Eigenschaften durchaus Unterschiedenes ausdrückt, z.B. als Rockgleiches, deutet dieser Ausdruck selbst an, daß er ein gesellschaftliches Verhältnis verbirgt. Umgekehrt mit der Äquivalentform. Sie besteht ja gerade darin, daß ein Warenkörper, wie der Rock, dies Ding wie es geht und steht, Wert ausdrückt, also von Natur Wertform besitzt.

Zwar gilt dies nur innerhalb des Wertverhältnisses, worin die Leinwandware auf die Rockware als Äquivalent bezogen ist.²¹ Da

equivalent.²¹ However, the properties of a thing do not arise from its relations to other things, they are, rather, merely activated by such relations. The coat, therefore, seems to have its equivalent form—its property of direct exchangeability—just as much from nature as its property of being heavy or its ability to keep us warm.

The fact that the coat does not *always* have its direct exchangeability, but only when it is placed in the value relation, is still compatible with the false interpretation that the coat has its direct exchangeability by *nature*: Even truly natural properties of things, not conferred on the things by society but located in the things themselves, are only then activated, or only then manifest themselves, when the thing is placed in certain relations to other things.

The equivalent form of value is what Marx calls a “determination of reflection.” Being king is also a determination of reflection, and it is surrounded with similar mystifications as the value form:

²¹ Such determinations of reflection are altogether very curious. For instance, one man is king only because other men stand in the relation of subjects to him. They, however, think they are the subjects because he is king.

aber Eigenschaften eines Dings nicht aus seinem Verhältnis zu andern Dingen entspringen, sich vielmehr in solchem Verhältnis nur betätigen, scheint auch der Rock seine Äquivalentform, seine Eigenschaft unmittelbarer Austauschbarkeit, ebenso sehr von Natur zu besitzen wie seine Eigenschaft, schwer zu sein oder warm zu halten.

²¹ Es ist mit solchen Reflexionsbestimmungen überhaupt ein eigenes Ding. Dieser Mensch ist z.B. nur König, weil sich andre Menschen als Untertanen zu ihm verhalten. Sie glauben umgekehrt Untertanen zu sein, weil er König ist.

[Bourgeois Economists about the First Peculiarity] The discussion of the first peculiarity concludes with a critique of bourgeois economists. Their argument is: gold is nothing special, because in earlier times much more profane commodities played the same role. Marx shows that this argument does not prove what it purports to prove, by taking it one step further: the special element is already present in the exchange relation between *any* two commodities.

Hence the mysteriousness of the equivalent form, which only impinges on the crude bourgeois vision of the political economist when it confronts him in its fully developed shape, that of money. He then seeks to explain away the mystical character of gold and silver by substituting less dazzling commodities for them and, with ever-renewed satisfaction, reeling off a catalogue of all the inferior commodities which have played the role of the equivalent at one time or another. He does not suspect that even the simplest expression of value, such as 20 yards

Daher das Rätselhafte der Äquivalentform, das den bürgerlich rohen Blick des politischen Ökonomen erst schlägt, sobald diese Form ihm fertig gegenübertritt im Geld. Dann sucht er den mystischen Charakter von Gold und Silber wegzuerklären, indem er ihnen minder blendende Waren unterschiebt und mit stets erneutem Vergnügen den Katalog all des Warenpöbels ableiert, der seinerzeit die Rolle des Warenäquivalents gespielt hat. Er ahnt nicht, daß schon der einfachste Wertausdruck, wie 20 Ellen Leinwand = 1 Rock, das Rätsel der Äquiva-

of linen = 1 coat, already presents us with the riddle of the equivalent form.

lentform zu lösen gibt.

[The Second Peculiarity of the Equivalent Form] The second peculiarity is that concrete labor is the expression of abstract labor.

150:1 The body of the commodity, which serves as the equivalent, always counts as the embodiment of abstract human labor, while it always is the product of some specific useful and concrete labor.

72:1 Der Körper der Ware, die zum Äquivalent dient, gilt stets als Verkörperung abstrakt menschlicher Arbeit und ist stets das Produkt einer bestimmten nützlichen, konkreten Arbeit.

Here Marx opposes “always counts” to “always is.” What does he mean by “counts”? There is a discrepancy between what the commodity is (physically) and what it counts as socially, between its physical existence and what it represents in the value relation. By “counts as the embodiment of abstract human labor,” Marx means: the tailor produces something which can not only be used as a garment, but which can also be exchanged. The tailoring labor makes more than just coats. The following sentence is the dialectical conclusion from the difference and unity of “counts” and “is” (becoming as the unity of being and not being): This concrete labor therefore becomes the expression of abstract human labor.

Diese konkrete Arbeit wird also zum Ausdruck abstrakt menschlicher Arbeit.

Next Marx points out the parallelism between commodities and the labor which produces them. Although we saw the peculiarity in the commodities first, this peculiarity of the commodities really stems from the peculiarity of the labors.

If the coat counts as realization of mere abstract human labor, the tailoring actually realized in it counts as the form in which mere abstract human labor realizes itself. In the expression of the value of the linen, the usefulness of tailoring consists, not in making clothes, and thus also people, but in making a physical object which we at once recognize as value, as a congealed quantity of labor, therefore, which is utterly indistinguishable from the labor objectified in the linen. In order to act as such a mirror of value, tailoring itself must reflect nothing other than its abstract quality of being human labor.

Gilt der Rock z.B. als bloße Verwirklichung, so die Schneiderei, die sich tatsächlich in ihm verwirklicht, als bloße Verwirklichungsform abstrakt menschlicher Arbeit. Im Wertausdruck der Leinwand besteht die Nützlichkeit der Schneiderei nicht darin, daß sie Kleider, also auch Leute, sondern daß sie einen Körper macht, dem man es ansieht, daß er Wert ist, also Gallerte von Arbeit, die sich durchaus nicht unterscheidet von der im Leinwandwert vergegenständlichten Arbeit. Um solch einen Wertspiegel zu machen, muß die Schneiderei selbst nichts widerspiegeln außer ihrer abstrakten Eigenschaft, menschliche Arbeit zu sein.

The next paragraph is an important anticipation of the section about the Fetish-like character of the commodity:

150:2 In tailoring, as well as in weaving, human labor-power is expended. Both,

72:2/o In der Form der Schneiderei wie in der Form der Weberei wird menschi-

therefore, possess the general property of being human labor, and there may be cases, such as the production of value, in which they must be considered only under this aspect.

che Arbeitskraft verausgabt. Beide besitzen daher die allgemeine Eigenschaft menschlicher Arbeit und mögen daher in bestimmten Fällen, z.B. bei der Wertproduktion, nur unter diesem Gesichtspunkt in Betracht kommen.

This translation was inspired by the French: “et dans certain cas ...

on ne doit les considérer qu’à ce point de vue.”

Marx calls this “not mysterious,” anticipating the question he will ask on p. 164:2 in the section about the fetish-like character of the commodity:

There is nothing mysterious in this.

All das ist nicht mysteriös.

But this unmysterious fact is expressed in an inverted fashion:

But in the value expression of the commodity the matter is stood on its head. In order to express the fact that weaving, for instance, creates the value of linen through its general property of being human labor rather than in its concrete form as weaving, the concrete labor which produces the equivalent of the linen, namely tailoring, is placed in relation to it as the tangible form in which abstract human labor is actualized.

Aber im Wertausdruck der Ware wird die Sache verdreht. Um z.B. auszudrücken, daß das Weben nicht in seiner konkreten Form als Weben, sondern in seiner allgemeinen Eigenschaft als menschliche Arbeit den Leinwandwert bildet, wird ihm die Schneiderei, die konkrete Arbeit, die das Leinwand-Äquivalent produziert, gegenübergestellt als die handgreifliche Verwirklichungsform abstrakt menschlicher Arbeit.

That under certain circumstances labor counts as abstract labor is *not* mysterious; but that concrete labor becomes the expression of abstract labor, this is mysterious! As in section 4, Marx contrasts that what the commodities say with how they say it:

150:3 The equivalent form therefore possesses a second peculiarity: in it, concrete labor becomes the form of manifestation of its opposite, abstract human labor.

73:1 Es ist also eine zweite Eigentümlichkeit der Äquivalentform, daß konkrete Arbeit zur Erscheinungsform ihres Gegenteils, abstrakt menschlicher Arbeit wird.

↑ Marx announces only now that the three paragraphs we just read were a discussion of the second peculiarity. ↓ And he immediately rushes on to the third peculiarity.

150:4/o Since, however, this concrete labor, tailoring, counts as merely the expression of homogeneous human labor, it takes the form of equality with other kinds of labor, such as the labor embodied in the linen. Although it is performed privately,

73:2 Indem aber diese konkrete Arbeit, die Schneiderei, als bloßer Ausdruck unterschiedsloser menschlicher Arbeit gilt, besitzt sie die Form der Gleichheit mit anderer Arbeit, der in der Leinwand steckenden Arbeit, und ist daher, obgleich Privatarbeit,

like all other commodity-producing labor, it is nevertheless labor in an immediately social form. This is why it represents itself in a product which is directly exchangeable with other commodities.

[The Third Peculiarity of the Equivalent Form] These two sentences have a convoluted grammatical structure. The argument presented is the following:

1. Concrete tailoring labor counts as the expression of abstract (Marx writes here “homogeneous” but this means the same) human labor (this is the second peculiarity).
2. As such abstract labor, tailoring is equal to all other labor and therefore also to the weaving labor.
3. Due to this equality, tailoring is labor in immediately social form, despite the fact that it is done privately. (This is what Marx is going to call the third peculiarity.)
4. (Marx is done with his derivation, but he makes one more step, anchoring a familiar empirical paradox in this third peculiarity:) Therefore the product of the private labor of tailoring, the coat, is directly exchangeable.

The next sentence identifies the third of these steps as the *third peculiarity* of the equivalent form: a privately produced commodity in equivalent form counts as its opposite, directly social labor. The manifestation of this paradox in the higher form of the general equivalent is a “riddle” familiar to everybody in a commodity society (assuming the gold standard): the private labor which produces gold has direct social powers, it is directly exchangeable for all other commodities. It is easy to see that this is peculiar.

Question 242 Write an essay carefully re-stating in your own words the different steps in the derivation of the third from the second peculiarity.

It is therefore a third peculiarity of the equivalent form that private labor becomes the form of its opposite, namely labor in immediately social form.

wie alle andre, Waren produzierende Arbeit, dennoch Arbeit in unmittelbar gesellschaftlicher Form. Ebendeshalb stellt sie sich dar in einem Produkt, das unmittelbar austauschbar mit anderer Ware ist.

Es ist also eine dritte Eigentümlichkeit der Äquivalentform, daß Privatarbeit zur Form ihres Gegenteils wird, zu Arbeit in unmittelbar gesellschaftlicher Form.

Question 243 Repeat in your own words the three peculiarities of the equivalent form.

[Aristotle's Analysis of the Form of Value] In order to clarify the second and third peculiarities, Marx discusses next how *Aristotle* analyzed the form of value:

151:1 The two peculiarities of the equivalent form just developed here will become easier to grasp if we go back to that great

73:3 Die beiden zuletzt entwickelten Eigentümlichkeiten der Äquivalentform werden noch faßbarer, wenn wir zu dem großen

researcher who was the first to analyse the value form, like so many other forms of thought, society and nature. I mean Aristotle.

Moore and Aveling translate

“Forscher” as “thinker,” Fowkes as “investigator.”

↓ Unlike Marx, Aristotle begins with a money relationship, i.e., using Marx’s example, a relationship of the form “20 yards of linen are worth 2 Pounds Sterling.” But Aristotle’s first observation is that this is essentially the same as “20 yards of linen are worth 1 coat.”

151:2 In the first place, Aristotle states quite clearly that the Money form of the commodity is only a further development of the Simple form of value, i.e. of the expression of the value of a commodity in some other arbitrarily chosen commodity, for he says:

“5 beds = 1 house”

(“Κλίναι πέντε ἀντὶ οἰκίας”)

“does not differ” from

“5 beds = a certain amount of money.”

(“Κλίναι πέντε ἀντὶ ...

ὅσου αἱ πέντε κλίναι”)

By the way, the Aristotle quotations in this paragraph can be found in [Ari26, Bk. V, Ch. 5, pp. 287–9]. ↓ In the next paragraph, Marx makes his usual distinction between the value expression, and the value relation in which this expression is contained. The value relation is a social relation, used by individuals to express the values of their goods.

151:3 He further sees that the value relation, in which this expression of value is embedded, requires that the house is qualitatively equated with the bed, and that these things, which are different physical objects, could not be related to each other as commensurable magnitudes if they were not equal in essence. ‘There can be no exchange,’ he says, ‘without equality, and no equality without commensurability’ (“οὐτ’ ἰσότης μὴ οὔσης συμμετρίας”).

↑ Aristotle’s last sentence can perhaps be understood better if one knows that the greek word for “equal” used here is at the same time the word for “fair.” Aristotle argued therefore: exchange requires fairness, and fairness can only be achieved if the exchanged goods are commensurable, i.e., can be measured with the same measure.

Forscher zurückgehn, der die Wertform, wie so viele Denkformen, Gesellschaftsformen und Naturformen zuerst analysiert hat. Es ist dies Aristoteles.

73:4 Zunächst spricht Aristoteles klar aus, daß die Geldform der Ware nur die weiter entwickelte Gestalt der einfachen Wertform ist, d.h. des Ausdrucks des Werts einer Ware in irgendeiner beliebigen anderen Ware, denn er sagt:

„5 Polster = 1 Haus“

(„Κλίναι πέντε ἀντὶ οἰκίας“)

„unterscheidet sich nicht“ von:

„5 Polster = soundso viel Geld“

(„Κλίναι πέντε ἀντὶ ...

ὅσου αἱ πέντε κλίναι“)

73:5 Er sieht ferner ein, daß das Wertverhältnis, worin dieser Wertausdruck steckt, seinerseits bedingt, daß das Haus dem Polster qualitativ gleichgesetzt wird und daß diese sinnlich verschiedenen Dinge ohne solche Wesensgleichheit nicht als kommensurable Größen aufeinander beziehbar wären. „Der Austausch“, sagt er, „kann nicht sein ohne die Gleichheit, die Gleichheit aber nicht ohne die Kommensurabilität“ („οὐτ’ ἰσότης μὴ οὔσης συμμετρίας“).

Question 245 *Didn't Aristotle get it wrong when he wrote: "There can be no exchange without equality, and no equality without commensurability"? This sounds as if things must first be commensurable in order to be equal. Isn't commensurability an implication of equality, instead of a condition for equality?*

Question 246 *Aristotle wrote: "There can be no exchange without equality, and no equality without commensurability." What does he mean by this? What is the difference between equality and commensurability?*

So far, Aristotle's analysis is amazingly close to Marx's. ↓ But Aristotle does not make the next step:

Here, however, he falters, and abandons the further analysis of the form of value. 'It is, however, in reality impossible ("τῇ μὲν οὖν ἀληθείᾳ ἀδύνατον"), that such unlike things are commensurable,' i.e. qualitatively equal. Their being set equal must be something foreign to the true nature of these things, a mere 'makeshift for practical purposes'.

Hier aber stutzt er und gibt die weitere Analyse der Wertform auf. „Es ist aber in Wahrheit unmöglich („τῇ μὲν οὖν ἀληθείᾳ ἀδύνατον“), daß so verschiedenartige Dinge kommensurabel“, d.h. qualitativ gleich sein. Diese Gleichsetzung kann nur etwas der wahren Natur der Dinge Fremdes sein, also nur „Notbehelf für das praktische Bedürfnis“.

By the way, Michael Eldred in <http://www.webcom.com/artefact/untp1tcl/exchv1js.html>, which is my source for the meaning of equality as fairness, translates Aristotle differently, and finds a utility theory of value in Aristotle. He translates the above sentence with "In truth, however, it is impossible that things so different could become commensurable, but with respect to use this is sufficiently possible." "with respect to use" means here: that what is equal in the commodities is that both are useful.

Question 247 *This question is for those who know Classic Greek: Is Eldred's translation of Aristotle correct, i.e., did Marx mis-translate Aristotle in 151:3?*

Question 248 *Which two steps in the analysis of value did Aristotle make correctly, and which step did he not make?*

Next, Marx uses Aristotle's answer itself to infer the reason why Aristotle did not make the third step:

151:4 Aristotle therefore himself tells us what prevented him from carrying his analysis to the end: the lack of a concept of value.

74:1 Aristoteles sagt uns also selbst, woran seine weitere Analyse scheitert, nämlich am Mangel des Wertbegriffs.

Marx's argument consists of two steps. (1) the only thing that can be equal in commodities is labor; (2a) if therefore Aristotle says commodities have nothing in common, (2b) he indicates that labor is not equal. I split the second step into two halves, because Marx first brings step (2a), then (1), then (2b). ↓ Here is (2a):

What is the equal something, i.e. the common substance, which the house represents for the bed in the expression of the value of the bed? Such a thing, 'in truth, cannot exist', says Aristotle. Why?

↓ In order to understand why Aristotle says this, Marx recapitulates now how we, ourselves, came to the opposite conclusion. This is step (1):

The house represents for the bed something equal, in so far as it represents what is indeed equal in both, in bed and house. And that is—human labor.

Was ist das Gleiche, d.h. die gemeinschaftliche Substanz, die das Haus für den Polster im Wertausdruck des Polsters vorstellt? So etwas kann „in Wahrheit nicht existieren“, sagt Aristoteles. Warum?

Das Haus stellt dem Polster gegenüber ein Gleiches vor, soweit es das in beiden, dem Polster und dem Haus, wirklich Gleiche vorstellt. Und das ist—menschliche Arbeit.

The three occurrences of "represent" in the above passage, is the translation of *vorstellt* and not the usual *darstellt*. Why does Marx use a different word here?

Because in Ancient Greece, the equality between bed and house on the market was *not* the surface representation of an underlying equality in production. Production

was not based on the equality of labor. The surface agents acted as if bed and house were equal without them being equal. It was an imagined equality.

↑ We are arguing from the vantage point of a society in which exchange relations are ubiquitous. Markets are not isolated or peripheral phenomena, but markets are central. In other words, the individual market agents equate their products all the time. They can only do this if there is in fact something equal in the different commodities, and when we looked for this equal thing we found something, namely, all commodities are products of the expenditure of human labor-power. ↓ Aristotle, on the other hand, could not make this inference, since at his time, labor was not equal (and, not coincidentally, markets played a much less central role in the economy than they do today).

Question 249 *Marx says: The house represents something equal to the bed, in so far as it represents what is really equal, both in the bed and the house. Isn't this a tautology?*

151:5/o However, Aristotle could not infer, from inspecting the form of value itself, that in the form of commodity-values, all labor is expressed as equal human labor and therefore as labor of equal validity—because Greek society was founded on the labor of slaves, hence had as its natural basis the inequality of men and of their labor-powers.

74:2 Daß aber in der Form der Warenwerte alle Arbeiten als gleiche menschliche Arbeit und daher als gleichgeltend ausgedrückt sind, konnte Aristoteles nicht aus der Wertform selbst herauslesen, weil die griechische Gesellschaft auf der Sklavenarbeit beruhte, daher die Ungleichheit der Menschen und ihrer Arbeitskräfte zur Naturbasis hatte.

Question 250 *Why does Marx use the strong formulation that Aristotle was unable to see that the social basis for the exchange of commodities lies in the fact that they all contain the common substance 'labor'? Perhaps this was difficult to see, but was it really impossible?*

Question 251 *Labor was not equal in Ancient Greece—how could the Greeks then exchange?*

Now Marx draws his lessons from this example—some sweeping conclusions:

The secret of the expression of value, namely the equality and equal validity of all kinds of labor because and in so far as they are human labor in general, could not be deciphered until the concept of human equality had already acquired the fixity of a commonly held prejudice. This however becomes possible only in a society where the commodity form is the universal form of the product of labor, hence the dominant social relation is the relation between men as possessors of commodities. Aristotle's genius is displayed precisely by his discovery of a relation of equality in the value-expression of commodities. Only the historical limitation inherent in the society in which he lived prevented him from finding out what 'in reality' this relation of equality consisted of.

Das Geheimnis des Wertausdrucks, die Gleichheit und gleiche Gültigkeit aller Arbeiten, weil und insofern sie menschliche Arbeit überhaupt sind, kann nur entziffert werden, sobald der Begriff der menschlichen Gleichheit bereits die Festigkeit eines Volksvorurteils besitzt. Das ist aber erst möglich in einer Gesellschaft, worin die Warenform die allgemeine Form des Arbeitsprodukts, also auch das Verhältnis der Menschen zueinander als Warenbesitzer das herrschende gesellschaftliche Verhältnis ist. Das Genie des Aristoteles glänzt gerade darin, daß er im Wertausdruck der Waren ein Gleichheitsverhältnis entdeckt. Nur die historische Schranke der Gesellschaft, worin er lebte, verhindert ihn herauszufinden, worin denn „in Wahrheit“ dies Gleichheitsverhältnis besteht.

Question 252 *Isn't it true that humans are equal? Why does Marx compare the concept of human equality with a "commonly held prejudice?"*

The Simple Form of Value Considered as a Whole

After having separated the Simple form of value into its two poles Relative and Equivalent form, and looked separately at their qualitative and quantitative aspects, Marx puts now all the pieces back together and looks at the deeper insights which this analytical exercise gave us about the whole.

152:1 The simple value form of a commodity is contained in its value relation with a commodity of a different kind, or in its exchange relation with the latter.

74:3/o Die einfache Wertform einer Ware ist enthalten in ihrem Wertverhältnis zu einer verschiedenartigen Ware oder im Austauschverhältnis mit derselben.

↑ It is new and significant that Marx says "value relation *or* exchange relation." The value relation comes from production: both commodities contain abstract human labor in equal amounts (i.e., equal socially necessary labor-time). The exchange relation is on the surface. It is the result of our tedious analysis that the value relation is mirrored and represented by an exchange relation. ↓ After naming this result (in such a way that it is even hard to see that it is a result), Marx develops this result in more detail:

1. The Commodity

The value of commodity A is qualitatively expressed by the direct exchangeability of commodity B with commodity A. It is quantitatively expressed by the exchangeability of a specific quantity of commodity B with the given quantity of commodity A.

Der Wert der Ware A wird qualitativ ausgedrückt durch die unmittelbare Austauschbarkeit der Ware B mit der Ware A. Er wird quantitativ ausgedrückt durch die Austauschbarkeit eines bestimmten Quantums der Ware B mit dem gegebenen Quantum der Ware A.

In the first edition at this point, 638:2/o, Marx also said something about the equivalent form: "Regarding ... the commodity functioning as *equivalent*, it counts for other commodity as the *embodiment of value*, as an article in *directly exchangeable form*—as *exchange-value*." Presumably, this mention of the equivalent form was inadvertently omitted in the rewriting and re-arranging between first and second editions.

↓ The common element which emerged in each of these particular investigations was therefore that the expression of value leads to a relation of exchangeability—exchange-value.

In other words, the value of a commodity is independently expressed through its representation as 'exchange-value'.

In andren Worten: Der Wert einer Ware ist selbständig ausgedrückt durch seine Darstellung als „Tauschwert“.

↑ "Independently" means here: independently of its own use-value. The power of commodity B to purchase A is an expression of the *value* of A which is independent of its use-value (the linen weaver's offer to give linen for coat has nothing to do with the use-value of linen). Note that Marx used here "representation" just as in 143:1.

Question 253 *I just wrote: "The power of commodity B to purchase A is an expression of the value of A." Shouldn't it rather be: "The power of commodity B to purchase A is an expression of the value of B"?*

↑ This seems a little anticlimactic because exchange-value is exactly where we started from. But this circular path was not in vain. We learned a lot from it. ↓ One thing we learned (or re-confirmed, Marx already said this already in 127:1,) is that the exchange value is not located inside the commodity, although the value is:

When at the beginning of this chapter we said, in common parlance, that a commodity is a use-value and an exchange-value, we were, strictly speaking, wrong. A commodity is a use-value or object of utility, and a "value." It represents itself as this twofold thing, that it is, as soon as its value assumes its own, from the bodily form of the commodity different form of appearance, that of exchange-value.

Wenn es im Eingang dieses Kapitels in der gang und gäben Manier hieß: Die Ware ist Gebrauchswert und Tauschwert, so war dies, genau gesprochen, falsch. Die Ware ist Gebrauchswert oder Gebrauchsgegenstand und „Wert“. Sie stellt sich dar als dies Doppelte, was sie ist, sobald ihr Wert eine eigne, von ihrer Naturalform verschiedene Erscheinungsform besitzt, die des Tauschwerts, ...

Marx discusses this also in his *Notes on Wagner*, [mecw24]544:6/o.

The main point Marx makes here is the following: instead of saying “the commodity is useful thing and exchange-value” one should rather say: “the commodity *is* useful thing and value, and in relation with other commodities it *has* exchange-value.” Marx distinguishes here clearly between that what is inside the commodity, (namely labor, which gives it its value) and what others carry to the commodity (the market participants are willing to accept the commodity in exchange, thus giving it exchange-value, because of the labor embodied in it).

The commodity never has this form when looked at in isolation, but only when it is in a value relation or exchange relation with a second commodity of a different kind.

I.e., the coat is in the equivalent form of value only if the linen weaver has just announced that she is willing to accept linen for a coat.

Once we know this, our manner of speaking does no harm; it serves, rather, as an abbreviation.

... und sie besitzt diese Form niemals isoliert betrachtet, sondern stets nur im Wert- oder Austauschverhältnis zu einer zweiten, verschiedenartigen Ware.

Weiß man das jedoch einmal, so tut jene Sprechweise keinen Harm, sondern dient zur Abkürzung.

Question 254 *Why is it wrong to say that the commodity is use-value and exchange-value?*

↓ Our arrival back at exchange-value when we were looking for the forms of value also tells us about the relationship between value and exchange-value. This is one of the central insight of the whole development of the Simple form of value:

152:2/o Our analysis proved that the value form or the expression of the value of the commodity springs from the nature of commodity value, instead of value and magnitude of value springing from their mode of expression as exchange-value.

75:1 Unsere Analyse bewies, daß die Wertform oder der Wertausdruck der Ware aus der Natur des Warenwerts entspringt, nicht umgekehrt Wert und Wertgröße aus ihrer Ausdrucksweise als Tauschwert.

In the First Edition, the transitional paragraph 43:4 between sections 1.3 and 1.4 reiterates that this is one of the central finding of this section.

Question 255 *Did Marx prove that exchange-value springs from the nature of commodity value, instead of value and magnitude of value deriving from exchange-value? If so, describe how this proof proceeded.*

Our arrival at the climax of subsection 1.3.A is celebrated by a fanfare consisting of three parts. First a humorous introduction taking up the remainder of paragraph 152:2/o, which makes fun of mainstream economics. Then follow two solemn paragraphs, one connecting the Simple form of value with the contradiction between use-value and value, and the other connecting it with the commodity form of the product. Both are insights into the big connections which we earned by our patient working through the minutiae of the Simple form of value.

First the theory-critical introduction:

This second view is the delusion shared by the Mercantilists (including Ferrier, Ganilh, and others,²² who have made a modern rehash of Mercantilism) with their antipodes, the modern traveling salesmen of Free Trade, such as Bastiat and his consorts. The Mercantilists place their main emphasis on the qualitative side of the expression of value, hence on the equivalent form of the commodity, which in its finished form is money. The modern pedlars of free trade, on the other hand, who must get rid of their commodities at any price, stress the quantitative side of the relative form of value. For them, accordingly, there exists neither value, nor magnitude of value, anywhere except in its expression by means of the exchange relation, that is, in the daily list of prices current on the Stock Exchange.

²² F. L. A. Ferrier (assistant customs-inspector), [Fer05], and Charles Ganilh, [Gan21].

The Scotsman Macleod, whose function it is to trick out the confused ideas of Lombard Street in the most learned finery, is a successful cross between the superstitious Mercantilists and the enlightened pedlars of free trade.

Mercantilists (quality, superstition) and free traders (quantity, enlightenment), as well as Macleod, a recent unhappy cross of the two, share the error that value originates from its form, while Marx just showed the opposite. Marx uses the word “free trade pedlars” (*Freihandelshausierburschen*) also in footnote 48 to paragraph 349:2–350:1 of chapter Ten. In *Contribution*, 389/o, Marx uses similar metaphors, equating the Monetarists with catholics and the Mercantilists with protestants.

Question 256 *How can one equate mercantilism with superstition and free trade with Enlightenment? (See also Contribution, p. 389/o.)*

Contribution, footnote * to 301:3 has a brief remark about Macleod’s book *Theory of Exchange*, London 1858, and footnote * to 375:1/o a longer discussion of his *Theory and*

Dies ist jedoch der Wahn sowohl der Mercantilisten und ihrer modernen Aufwärmer, wie Ferrier, Ganilh usw.,²² als auch ihrer Antipoden, der modernen Freihandels-Commis-Voyageurs, wie Bastiat und Konsorten. Die Mercantilisten legen das Hauptgewicht auf die qualitative Seite des Wertausdrucks, daher auf die Äquivalentform der Ware, die im Geld ihre fertige Gestalt besitzt—die modernen Freihandelshausierer dagegen, die ihre Ware um jeden Preis losschlagen müssen, auf die quantitative Seite der relativen Wertform. Für sie existiert folglich weder Wert noch Wertgröße der Ware außer in dem Ausdruck durch das Austauschverhältnis, daher nur im Zettel des täglichen Preiskurants.

²² Note zur 2. Ausg. F. L. A. Ferrier (sous-inspecteur des douanes), [Fer05], and Charles Ganilh, [Gan21].

Der Schotte Macleod, in seiner Funktion, die kreuzverwirrten Vorstellungen von Lombardstreet möglichst gelehrt herauszuputzen, bildet die gelungene Synthese zwischen den abergläubigen Mercantilisten und den aufgeklärten Freihandelshausierern.

Practice of Banking etc., 1855. Footnote 12 in chapter Four of *Capital I*, 255:1, also makes a short mention of that latter book. Henry Dunning Macleod lived from 1821–1902.

The next two paragraphs underline the importance of the central result of this subsection. First Marx shows that this is how society processes its internal contradictions:

153:1 Our closer scrutiny of the expression of the value of commodity *A* contained in the value relation of *A* to *B* has shown that within that relation the natural form of commodity *A* counts only as a thing of use-value, while the natural form of *B* figures only as form of value, or a thing of value. The internal opposition between use-value and value, hidden within the commodity, is therefore presented by an external opposition, i.e. by a relation between two commodities such that the one commodity, that whose value is to be expressed, counts immediately only as a use-value, whereas the other commodity, in which that value is expressed, counts immediately only as exchange-value. Hence the Simple form of value of a commodity is the simple form of appearance of the opposition between use-value and value contained within the commodity.

↑ The *development* of this opposition in the more developed forms of value is the subject of 160:4.

Question 257 In 153:1, Marx says that the commodity whose value is to be expressed, counts immediately only as a use-value, and the commodity in which that value is expressed, counts immediately only as exchange-value. Isn't it just the opposite? The linen, whose value is to be expressed, counts for the linen weaver as exchange-value, and the coat, in which the value of the linen is expressed, counts for the linen weaver as use-value.

The next paragraph places this central result in world history:

153:2/o The product of labor is an object of utility in all states of society; but only during a historically specific epoch of development, in which the labor expended in the production of a useful article is represented as a 'bodily' property of that article, namely,

75:2/o Die nähere Betrachtung des im Wertverhältnis zur Ware *B* enthaltenen Wertausdrucks der Ware *A* hat gezeigt, daß innerhalb desselben die Naturalform der Ware *A* nur als Gestalt von Gebrauchswert, die Naturalform der Ware *B* nur als Wertform oder Wertgestalt gilt. Der in der Ware eingehüllte innere Gegensatz von Gebrauchswert und Wert wird also dargestellt durch einen äußeren Gegensatz, d.h. durch das Verhältnis zweier Waren, worin die eine Ware, deren Wert ausgedrückt werden soll, unmittelbar nur als Gebrauchswert, die andre Ware hingegen, worin Wert ausgedrückt wird, unmittelbar nur als Tauschwert gilt. Die einfache Wertform einer Ware ist also die einfache Erscheinungsform des in ihr enthaltenen Gegensatzes von Gebrauchswert und Wert.

76:1 Das Arbeitsprodukt ist in allen gesellschaftlichen Zuständen Gebrauchsgegenstand, aber nur eine historisch bestimmte Entwicklungsperiode, welche die in der Produktion eines Gebrauchsdinges verausgabte Arbeit als seine „gegenständliche“ Eigen-

its value, is the product of labor turned into a commodity.

In this long sentence, Marx says (without putting sufficient emphasis on it) that the historical conversion of the product of labor into a commodity is driven by the exchange. First, people exchange their goods, and then they modify their production relations in order to produce for the exchange. I.e., those relations on the surface, which the whole section 3 has identified as the form of value, historically precede and stimulate the creation of that of which they are the form. Marx says something related also in 166:2/o. From this follows Marx's next conclusion:

It therefore follows that the Simple value form of the commodity is at the same time the simple commodity form of the product of labor, and also that the development of the commodity form coincides with the development of the value form.

schaft darstellt, d.h. als seinen Wert, verwandelt das Arbeitsprodukt in Ware.

Es folgt daher, daß die einfache Wertform der Ware zugleich die einfache Warenform des Arbeitsprodukts ist, daß also auch die Entwicklung der Warenform mit der Entwicklung der Wertform zusammenfällt.

Fowkes writes here: "It therefore follows that the simple form of value of the commodity is at the same time the simple form of

value of the product of labour;" ... This seems to be a simple typo, presumably Fowkes meant to write: "It therefore follows that the

simple form of value of the commodity is at the same time the simple commodity form of the product of labour."

The Moore-Aveling translation is very good here; it is clearer than the German and seems inspired by the French edition: "It therefore follows that the elementary value form is also the primitive form under which a product of labor appears historically as a commodity, and that the gradual transformation of such products into commodities proceeds *pari passu* with the development of the value form."

Question 259 Why does the development of the commodity form of the product coincide historically with development of the form of value? I.e., why did history not proceed in such a way that the products of labor first developed into commodities and then, after some time lag, the form of value of these commodities went through its own development?

Question 260 In a number of places in *Capital* Marx refers to the commodity form of the product and the value form of the commodity almost as if they were one and the same thing. Find those places.

Question 261 Derek Sayer, in [Say79, p. 19/20], writes: "Commodity form and value-form are in fact not synonymous, though Marx frequently elides the two terms. The value-form is, strictly speaking, only one aspect of the commodity form, the other being use-value. But the elision is quite comprehensible because the problem of explaining the commodity form ultimately resolves itself into one of explaining the value form. Use-value, as an attribute of the product of labor under all conditions, cannot be used to explain that which differentiates the commodity form, whereas exchange-value expresses exactly this differentia specifica." Comment.

After this pause and celebration, Marx rushes on in the argument. After recognizing, in 152:2/o, that the exchange relations of commodities are an expression of their value (and thus rightly deserve the name “forms of value”) we are also able to see the insufficiencies, defects, of this expression in satisfying criterion (1).

154:1 One sees right away the insufficiency of the Simple form of value, of this embryonic form which must undergo a series of metamorphoses before ripening into the price form.

↑ Right after announcing a discussion of the insufficiencies or defects of the Simple form of value, Marx remarks about the ripening of these forms—because the defects will be remedied in the “riper” forms.

↓ Marx does not simply say that the expression as a whole is defective, but he finds a defect in the relative form of value, and then shows its companion defect in the equivalent form of value.

154:2 The expression of the value of commodity *A* in terms of some arbitrary other commodity *B* merely distinguishes the value of *A* from the use-value of *A*, and therefore also only places *A* in an exchange relation with one particular different kind of commodity, instead of representing *A*’s qualitative equality with all other commodities and its quantitative proportionality to them.

↑ By expressing the value of a commodity in the use-value of a different commodity, the Simple form of value represents value as something that is different from its use-value, but not as something that is qualitatively equal for all commodities. This is a serious defect. The decisions of the linen weaver to accept coats, of the butcher to accept bread, etc., do not resonate with each other.

↓ On the side of the equivalent, this same defect shows itself in the fact that the coat is directly exchangeable only with the linen, not with other commodities. I.e., the coat is a poor incarnation of value.

To the Simple relative form of value of a commodity there corresponds the Isolated equivalent form of another commodity. Thus, in the relative expression of value of the linen, the coat possesses the form of equivalent, the form of direct exchangeability, only in relation to this one kind of commodity, the linen.

76:2 Der erste Blick zeigt das Unzulängliche der einfachen Wertform, dieser Keimform, die erst durch eine Reihe von Metamorphosen zur Preisform heranreift.

76:3 Der Ausdruck in irgendwelcher Ware *B* unterscheidet den Wert der Ware *A* nur von ihrem eignen Gebrauchswert und setzt sie daher auch nur in ein Austauschverhältnis zu irgendeiner einzelnen von ihr selbst verschiedenen Warenart, statt ihre qualitative Gleichheit und quantitative Proportionalität mit allen andren Waren darzustellen.

Der einfachen relativen Wertform einer Ware entspricht die einzelne Äquivalentform einer andren Ware. So besitzt der Rock, im relativen Wertausdruck der Leinwand, nur Äquivalentform oder Form unmittelbarer Austauschbarkeit mit Bezug auf diese einzelne Warenart Leinwand.

Question 262 When Marx talks about the “defects” of the Simple form of value, in what respect are they defects?

↓ Although the transition from Simple to Expanded form of value remedies the just-mentioned defect, this defect is not the driving force behind the transition. Rather, the transition occurs spontaneously, “by itself.” We will see shortly that the transitions from the Expanded to the General form of value, or from the General form of value to the Money form, are no longer spontaneous but require deliberate social acts.

154:3 However, the Simple form of value passes by itself into a more complete form.

76:4 Indes geht die einzelne Wertform von selbst in eine vollständigere Form über.

↑ Although Marx says here that the Expanded form of value is *more* complete than the Simple form, he will say in 156:2/o that the Expanded form, too, is incomplete.

↓ The *possibility* of a remedy can be teased out of the defect of the Simple form of value in the following way: It is a defect that value is expressed in only one arbitrary commodity. This arbitrariness contains the key to transcending this defect. It does not matter which kind the second commodity is, therefore many expressions of the value of each commodity are possible.

Although this Simple form expresses the value of a commodity *A* in only one commodity of another kind, it is a matter of complete indifference what this second commodity is, whether it is a coat, iron, corn, etc.

Vermittelt derselben wird der Wert einer Ware *A* zwar in nur einer Ware von andrer Art ausgedrückt. Welcher Art aber diese zweite Ware, ob Rock, ob Eisen, ob Weizen usw., ist durchaus gleichgültig.

↓ In the next sentence, Marx states that the theoretical possibility of multiple equivalents becomes a reality, without giving reasons why this must be so. But such a reason can be supplied easily, and 157:3 can serve as a hint: although each commodity producer specializes on producing a limited range of use-values, he or she needs many different use-values. Each linen weaver on the market is therefore likely to have a shopping list: she not only needs a coat but a number of different things as well.

Different Simple expressions of the value of one and the same commodity arise therefore according to whether this commodity enters into a value relation with this or that other kind of commodity.^{22a}

Je nachdem sie also zu dieser oder jener andren Warenart in ein Wertverhältnis tritt, entstehn verschiedne einfache Wertausdrücke einer und derselben Ware.^{22a}

^{22a} Note to the 2nd edition. For instance in Homer, the value of a thing is expressed in a series of different things.

^{22a} Note zur 2. Aufl. Z.B. bei Homer wird der Wert eines Dings in einer Reihe verschiedner Dinge ausgedrückt.

↓ And if one looks at all linen weavers together, then almost any use-value is likely to be exchangeable for linen somewhere.

The number of such possible expressions is limited only by the number of the different

Die Anzahl ihrer möglichen Wertausdrücke ist nur beschränkt durch die Anzahl von ihr

kinds of commodities distinct from A. The isolated expression of A's value transforms itself therefore into the indefinitely expandable series of different Simple expressions of that value.

verschiedner Warenarten. Ihr vereinzelter Wertausdruck verwandelt sich daher in die stets verlängerbare Reihe ihrer verschiedenen einfachen Wertausdrücke.

Question 264 Describe the “defects” of the Simple form of value, and explain how these defects generate their own remedy.

1.3.B. The Total or Expanded Form of Value

The Expanded form of value is a transitional phase (“Durchgangsphase” in the first edition, 43:4) between the Simple and the General forms of value. This subsection is written in a terse, telegraphic style.

154:4 z commodity A = u commodity B or = v commodity C or = w commodity D or = x commodity E or = etc.

155:1 (20 yards of linen = 1 coat or = 10 lb. tea or = 40 lb. coffee or = 1 quarter of wheat or = 2 ounces of gold or = 1/2 ton of iron or = etc.)

If one combines all the things linen weavers are willing to accept in exchange for 20 yards of linen, one gets the Expanded form of value of linen. In the absence of money, the Expanded form can be a generally accepted social form of value only if one unique dominant commodity, such as cattle, is used to acquire all other commodities. See 158:3, 160:6, and *Contribution*, 286:3/ooo where Marx says that the Expanded form of value is only theoretical. In developed commodity production, the Expanded form exists only as the specific form in which the General equivalent expresses its value.

The Expanded Relative Form of Value

155:2 The value of a commodity, of the linen for example, is now expressed in countless other members of the world of commodities.

↑ Starting from the exchange relationship between linen and coats, we had inferred, previously, that there must be weavers who trade linen for coats. Now we are broadening our view and also look at those weavers who trade their linen for other commodities. We get a multitude of expressions which does not stem from any multiplicity of the value of linen, but simply from the fact that linen weavers, like everybody else, have many needs. ↓ But

77:1 z Ware A = u Ware B oder = v Ware C oder = w Ware D oder x Ware E oder = etc.
77:2 (20 Ellen Leinwand = 1 Rock oder = 10 Pfd. Tee oder = 40 Pfd. Kaffee oder = 1 Quarter Weizen oder = 2 Unzen Gold oder = 1/2 Tonne Eisen oder = etc.)

for those looking at this relation from the outside, the simple fact that linen is a value is now diffracted into a bewildering multitude of different expressions:

The body of every other commodity now becomes a mirror of the linen's value.²³

Jeder andre Warenkörper wird zum Spiegel des Leinwandwerts.²³

It seems contradictory to mirror the same thing in many different mirrors. Footnote 23 discusses how this contradiction was noted in the literature:

²³ For this reason one speaks of the coat-value of the linen when its value is represented in coats, or of its corn-value when expressed in corn, and so on. Every such expression says that it is the linen's value which appears in the use-values coat, corn etc.

²³ Man spricht deshalb vom Rockwert der Leinwand, wenn man ihren Wert in Röcken, von ihrem Kornwert, wenn man ihn in Korn darstellt etc. Jeder solche Ausdruck besagt, daß es ihr Wert ist, der in den Gebrauchswerten Rock, Korn usw. erscheint.

↑ This last sentence is an echo of the argument made in 127:1: these various exchange relations are the expressions of something that has to do with the linen alone, namely of the value of the linen. ↓ Bailey interprets them differently. He thinks these exchange relations indicate that linen has more than one value:

‘The value of any commodity denoting its relation in exchange, we may speak of it as ... corn-value, cloth-value, according to the commodity with which it is compared, and hence there are a thousand different kinds of value, as many kinds of value as there are commodities in existence, and all are equally real and equally nominal’ [Bai25, p. 39].

„Da der Wert jeder Ware ihr Verhältnis im Austausch bezeichnet, können wir ihn bezeichnen als ... Kornwert, Tuchwert, je nach der Ware, mit der sie verglichen wird; und daher gibt es tausend verschiedene Arten von Werten, so viele, wie Waren vorhanden sind, und alle sind gleich real und gleich nominell.“ [Bai25, p. 39].

S. Bailey, the author of this anonymous work, which in its day created a considerable stir in England, was under the delusion that by pointing to the multiplicity of the relative expressions of the same commodity-value he had demolished any possibility of a conceptual determination of value.

S. Bailey, der Verfasser dieser anonymen Schrift, die ihrer Zeit viel Lärm in England machte, wähnt durch diesen Hinweis auf die kunterbunten relativen Ausdrücke desselben Warenwerts alle Begriffsbestimmung des Werts vernichtet zu haben.

↑ Of course Bailey has not demolished the concept of value. The fact that the same value can have multiple expressions does not mean that value is not a well-defined concept.

↓ The footnote concludes with a brief evaluation of Bailey's contribution. Bailey attacked the labor theory of value, but also exposed many of the weaknesses of Ricardo's version of this theory. Marx discusses Bailey at great detail in *Theories of Surplus-Value*.

Still, despite the narrowness of his own outlook, he was able to put his finger on some serious defects in the Ricardian theory, as is demonstrated by the animosity with which he was attacked by Ricardo's followers, in the Westminster Review for example.

Daß er übrigens, trotz eigner Borniertheit, wunde Flecken der Ricardoschen Theorie sondiert hatte, bewies die Gereiztheit, womit die Ricardosche Schule ihn angriff, z.B. in der „Westminster Review“.

↑ So far footnote 23. ↓ In the main text, Marx strikes a more positive note. Far from

refuting the concept of value, the proliferation of equivalents is an accurate reflection of the underlying reality that as value-creating labor, weaving counts as equal to the labors producing coats or wheat or iron or gold:

It is only thus that this value truly appears as a congealed quantity of undifferentiated human labor. For the labor which creates it is now explicitly represented as labor which counts as the equal of every other sort of human labor, whatever natural form it may possess, i.e., whether it be objectified in a coat, in corn, in iron, or in gold.

↑ In connection with what I said earlier, I understand this sentence to mean: the surface relations do not reveal that the commonality inside the commodities is human labor in the abstract, but once we know this, it becomes clear that many aspects of this labor are accurately reflected on the surface. This is indeed all that is necessary for the surface relations to guide production, since the private producers “know” very well about labor—after all, the reallocation of their labor is ultimately the only response to the market signals which they are able to make. ↓ Among others, the surface relations accurately reflect the fact that human labor in the abstract is more than a physiological fact valid for every labor process individually, but that the labor processes are placed in a relation to each other as equals, i.e., they are compared with each other:

The linen, by virtue of its form of value, no longer stands in a social relation with merely one other kind of commodity, but with the whole world of commodities. As a commodity it is citizen of this world.

↓ The next sentence brings another dimension in which this form of value expresses the truth about value:

At the same time, it is contained in this endless series of value expressions that the value of the commodity itself has nothing to do with the particular use-values in which it appears.

↑ The multitude of expressions indicates that these are only expressions and cannot be the real thing. If the 20 yards of linen are in one instance exchanged against 1 coat, and in another against 10 lbs. tea, etc., this makes it implausible that these come from the relationships between the owner of linen and the owners of each of these other commodities. It is much more plausible to assume that all these other commodities, by their willingness to exchange themselves for linen, express the same thing about the commodity “linen.” Marx had made a very similar argument at the very beginning of the chapter, in 127:1.

So erscheint dieser Wert selbst erst wahrhaft als Gallerte unterschiedsloser menschlicher Arbeit. Denn die ihn bildende Arbeit ist nun ausdrücklich als Arbeit dargestellt, der jede andre menschliche Arbeit gleichgilt, welche Naturalform sie immer besitze und ob sie sich daher in Rock oder Weizen oder Eisen oder Gold usw. vergegenständliche.

Durch ihre Wertform steht die Leinwand daher jetzt auch in gesellschaftlichem Verhältnis nicht mehr zu nur einer einzelnen andren Warenart, sondern zur Warenwelt. Als Ware ist sie Bürger dieser Welt.

Zugleich liegt in der endlosen Reihe seiner Ausdrücke, daß der Warenwert gleichgültig ist gegen die besondere Form des Gebrauchswerts, worin er erscheint.

Fowkes has: “the endless series of value expressions implies that, from the point of view of the value of the commodity, the particular use-value in which it appears is a matter of indifference.” This is a unfortunate formulation because the particular use-value in which the commodity-value appears is a matter of indifference not only from the point of view of the

commodity-value but in general, from every point of view. The phrase “*der Warenwert ist gleichgültig*” evokes a figurative “feeling” of indifference on part of the commodity-value (it doesn’t care in which use-value it is expressed). Fowkes draws from this the wrong conclusion that it is something subjective, only valid from the point of view of the

value. In my reading of this sentence, this “feeling” reflects a deep-seated ontological indifference (the inner substance of value has nothing to do with use-values). Marx wrote this sentence to point out that this deep-seated indifference finds its expression on the surface in the endless series of equivalents.

↓ On the quantitative side, the Expanded form cushions the quantity of value from accidental individual circumstances:

155:3/o In the first form, 20 yards of linen = 1 coat, it might well be a pure accident that these two commodities are exchangeable in a specific quantitative relation. In the second form, by contrast, a background of this accidental appearance immediately shines through, which is essentially different from it yet determines it. The value of the linen remains unaltered in magnitude, whether represented in coats, coffee, or iron, or in innumerable different commodities, belonging to the most diverse owners. The accidental relation between two individual commodity-owners falls away. It becomes plain that it is not the exchange of commodities which regulates the magnitude of their values, but rather the reverse, it is the magnitude of the value of commodities which regulates the proportion in which they are exchanged.

↑ As long as we know that linen has only one value, not many values depending on the circumstances of the exchanges, we know that this value is not generated by the exchange but is generated elsewhere.

78:1 In der ersten Form: 20 Ellen Leinwand = 1 Rock kann es zufällige Tatsache sein, daß diese zwei Waren in einem bestimmten quantitativen Verhältnisse austauschbar sind. In der zweiten Form leuchtet dagegen sofort ein von der zufälligen Erscheinung wesentlich unterschiedener und sie bestimmender Hintergrund durch. Der Wert der Leinwand bleibt gleich groß, ob in Rock oder Kaffee oder Eisen etc. dargestellt, in zahllos verschiedenen Waren, den verschiedensten Besitzern angehörig. Das zufällige Verhältnis zweier individueller Warenbesitzer fällt fort. Es wird offenbar, daß nicht der Austausch die Wertgröße der Ware, sondern umgekehrt die Wertgröße der Ware ihre Austauschverhältnisse reguliert.

Question 266 *How does it become plain here that it is not the exchange of commodities which regulates the magnitude of their values, but rather the reverse, it is the magnitude of the value of commodities which regulates the proportion in which they are exchanged?*

The Particular Equivalent Form

156:1 Every commodity, such as coat, tea, iron, etc., counts, in the expression of value of the linen, as an equivalent and therefore a physical incarnation of value.

Fowkes translates *Wertkörper* with “physical object possessing value.” It would have been more accurate

to say “physical object representing value.” Moore-Aveling are here better

78:2 Jede Ware, Rock, Tee, Weizen, Eisen usw., gilt im Wertausdruck der Leinwand als Äquivalent und daher als Wertkörper.

than Fowkes, they write “thing that is value.”

Does this mean that regardless of what kind of commodity one has, it is always exchangeable against linen, that one can always find a linen weaver who needs this commodity? This is not possible. Linen weavers would be flooded with use-values nobody wants. ↓ Marx makes this argument on a much more abstract level, by pointing out the defects of the equivalent form coming with the Expanded relative form of value.

The specific bodily form of each of these commodities is now a Particular equivalent form alongside many others. In the same way, the many specific, concrete, and useful kinds of labor contained in the physical commodities count now as just as many particular forms of realization or manifestation of human labor in general.

Die bestimmte Naturalform jeder dieser Waren ist jetzt eine besondere Äquivalentform neben vielen andren. Ebenso gelten die mannigfaltigen in den verschiedenen Warenkörpern enthaltenen bestimmten, konkreten, nützlichen Arbeitsarten jetzt als ebenso viele besondere Verwirklichungs- oder Erscheinungsformen menschlicher Arbeit schlechthin.

↑ This is already a defect. Human labor as such is undifferentiated, yet it has many different incarnations. Marx does not remark on this specifically, but begins here a systematic discussion of all the defects of the Expanded form of value.

Defects of the Total or Expanded Form of Value

In a hurried style, Marx enumerates the “defects” of the Total or Expanded form, and its “improvements” over the Simple form. In a nutshell, the defects are: The Expanded form is not unique (i.e., the equivalent of the same commodity is not the same everywhere and at all times), it is not simple (i.e., more than one use-value is involved in this form, but in real life one will only deal with one of these use-values at a time), and it is not uniform (i.e., the expanded equivalent of linen is qualitatively different from that of boots). One aspect which is not a defect is that it is representative, i.e., the unending series of equivalents covers the whole breadth of what abstract labor can do.

As earlier in 154:2, Marx does not simply say that the Expanded form of value as a whole is defective, but he allocates the defects to the two poles of the expression. First he enumerates three defects of the Expanded *relative* form of value.

↓ Incompleteness: Whereas value itself is something fixed and given, this representation of value is unfinished and continually subject to extensions:

156:2/o Firstly, the relative expression of value of the commodity is incomplete, because the series of its representations never comes to an end. The chain, of which each equation of value is a link, is liable at any moment to be lengthened by any newly created commodity, providing the material for a fresh expression of value.

“Relative expression of value” is here short for “relative Expanded

form of value as an expression of value.”

↑ It is not just a theoretical possibility that new use-values may enter the market. Often, new use-values are introduced exactly for the purpose of achieving a more favorable exchange proportion than would be possible with the established ones. But the Expanded relative form of value would be unfinished even in a world without technical change. If the linen weaver offers her linen for an assortment of various other goods, then this assortment can always only be a sample, only a subset of all the goods on the market. The linen weaver may well be willing to exchange the linen also for a good which is not in this original subset.

↓ Lack of simplicity: Whereas abstract value-creating labor is simple, its origin is the same human labor-power used in various different production processes, its representation is not simple but composed of many different components which have nothing in common with each other. Marx calls it a “motley mosaic”:

Secondly, it is a motley mosaic of disparate and unconnected expressions of value.

Zweitens bildet sie eine bunte Mosaik aus einanderfallender und verschiedenartiger Wertausdrücke.

↓ Lack of uniformity: Whereas value of linen is qualitatively equal to the value of boots, namely, they both are congealed abstract labor, the relative form of value of linen is different from that of every other commodity.

And lastly, if, as must be the case, the relative value of each commodity is expressed in this expanded form, it follows that the relative form of value of each commodity is an endless series of expressions of value which is different than the relative form of value of every other commodity.

Wird endlich, wie dies geschehn muß, der relative Wert jeder Ware in dieser entfalteten Form ausgedrückt, so ist die relative Wertform jeder Ware eine von der relativen Wertform jeder andren Ware verschiedene endlose Reihe von Wertausdrücken.

↑ “Different” means here “qualitatively different.” One needs an expression of value which is qualitatively the same for all commodities and only quantitatively different. The lists of equivalents are originally not proportional to each other, i.e., they are qualitatively different from each other.

After the defects of the Expanded relative form, Marx discusses those of the Expanded *equivalent* form:

The defects of the Expanded relative form of value are reflected in the corresponding equivalent form.

↓ That iron, wheat, gold, etc. are included in the Expanded relative value form of linen does not mean that they suddenly show up on the market as a group. In their *existence*, these use-values are as unrelated as ever. This is why Marx begins his discussion of the defects of the Expanded equivalent form not with the whole array of commodities listed as equivalents, but with the individual commodities included in this array, which he calls “Particular” equivalents:

Since the bodily form of each individual kind of commodity is here one Particular equivalent form amongst innumerable other Particular equivalent forms, the only equivalent forms in existence are limited equivalent forms, each of which excludes any of the others.

↑ Marx (a) calls these Particular equivalents limited, and (b) says that each excludes the other. Since Marx will elaborate on (a) in his next sentence, let’s first discuss (b). If linen has coat as one Particular equivalent, this does not mean that the linen weaver whom the tailor approaches in order to exchange his coat is one who needs a coat; instead, his Particular equivalent may exclude coats. Although the Expanded form of value covers all commodity owners offering linen, there is not one Particular equivalent which is accepted by every commodity-owner offering linen. This is a different exclusivity than that between the Expanded equivalent forms of two different commodities discussed in 158:3.

Similarly, the specific, concrete, useful kind of labor contained in each Particular commodity-equivalent is only a Particular and therefore not an exhaustive form of appearance of human labor.

If you look at the actualizations of this unlimited series, which by necessity consist of only one piece of the mosaic at a time, then you also lose the representativeness. To stay with our example, the labor contained in the coat is not an exhaustive form of appearance of human labor, it is simply the kind of human labor that produces coats.

Lack of uniqueness, which was the first defect on the relative side, is the third defect of the Expanded equivalent form of value:

It is true that human labor possesses a complete or total form of appearance in the aggregation of its particular forms of appearance. But in that case it has no single, unified form of appearance.

—Die Mängel der entfalteten relativen Wertform spiegeln sich wider in der ihr entsprechenden Äquivalentform.

Da die Naturalform jeder einzelnen Warenart hier eine besondere Äquivalentform neben unzähligen andren besondern Äquivalentformen ist, existieren überhaupt nur beschränkte Äquivalentformen, von denen jede die andre ausschließt.

Ebenso ist die in jedem besondern Warenäquivalent enthaltene bestimmte, konkrete, nützliche Arbeitsart nur besondere, also nicht erschöpfende Erscheinungsform der menschlichen Arbeit.

Diese besitzt ihre vollständige oder totale Erscheinungsform zwar in dem Gesamtumkreis jener besondern Erscheinungsformen. Aber so besitzt sie keine einheitliche Erscheinungsform.

Question 268 Which characteristics of value are expressed better in the Expanded form of value than in the Simple form, and what are the defects of the Expanded form?

As in 154:3, the remedy to these defects is already implicit in the problem:

157:1 The Expanded relative form of value is, however, nothing but the sum of the simple relative expressions or equations of the first form, such as:

20 yards of linen = 1 coat

20 yards of linen = 10 lb. of tea, etc.

157:2 Each of these equations implies the identical equation in reverse:

1 coat = 20 yards of linen

10 lb. of tea = 20 yards of linen, etc.

157:3 In fact, when a person exchanges his linen for many other commodities, and thus expresses its value in a series of other commodities, it necessarily follows that the other owners of commodities exchange them for the linen, and therefore express the values of their various commodities in one and the same third commodity, the linen.—

↓ Right now Marx assumes that this potential becomes actualized, without saying why and how:

If, then, we reverse the series 20 yards of linen = 1 coat, or = 10 lb. of tea, etc., i.e. if we formulate the converse relation already implied in the series, we get:

79:1 Die entfaltete relative Wertform besteht jedoch nur aus einer Summe einfacher relativer Wertausdrücke oder Gleichungen der ersten Form, wie:

20 Ellen Leinwand = 1 Rock

20 Ellen Leinwand = 10 Pfd. Tee usw.

79:2 Jede dieser Gleichungen enthält aber

rückbezüglich auch die identische Gleichung:

1 Rock = 20 Ellen Leinwand

10 Pfd. Tee = 20 Ellen Leinwand usw.

79:3 In der Tat: Wenn ein Mann seine Leinwand mit vielen andren Waren austauscht und daher ihren Wert in einer Reihe von andren Waren ausdrückt, so müssen notwendig auch die vielen andren Warenbesitzer ihre Waren mit Leinwand austauschen und daher die Werte ihrer verschiedenen Waren in derselben dritten Ware ausdrücken, in Leinwand.—

Kehren wir also die Reihe: 20 Ellen Leinwand = 1 Rock oder = 10 Pfd. Tee oder = usw. um, d.h., drücken wir die der Sache nach schon in der Reihe enthaltene Rückbeziehung aus, so erhalten wir:

Question 269 Why doesn’t Marx go from the Simple form of value directly to the General form of value by letting everyone express their values in the same commodity?

Question 270 Imagine a world in which humans only need one use-value to survive (e.g., some humans survive on carrots alone, others on boots alone, others again on shampoo

alone, etc.), but production is such that each production process yields many different use-values (i.e., the production process which produces milk also produces shoe polish, record players, sausages, cooking oil, roller blades, coats, sunglasses, and tooth brushes, and many other things, as byproducts.) Argue that in such a fictitious world, the expression of value would go directly from the accidental form of value to the general form of value, bypassing the expanded form of value.

1.3.C. General Form of Value

157:4				79:4			
1	coat	=	} 20 yards of linen	1	Rock	=	} 20 Ellen Leinwand
10	lb. of tea	=		10	Pfd. Tee	=	
40	lb. of coffee	=		40	Pfd. Kaffee	=	
1	qtr. of wheat	=		1	Qtrr. Weizen	=	
2	ounces of gold	=		2	Unzen Gold	=	
1/2	ton of iron	=		1/2	Tonne Eisen	=	
x	commodity A	=		x	Ware A	=	
				usw.	Ware	=	

The Changed Character of the Value Form

In the first edition, 643:2, Marx remarks that this form is quite different. ↓ The first paragraph explains the name “General” form of value:

157:5 The commodities now express their values (1) in a simple form, because in a single commodity, and (2) in a unified form, because each commodity expresses its value in the same commodity. Their form of value is simple and common to all, hence general.

79:5 Die Waren stellen ihre Werte jetzt 1. einfach dar, weil in einer einzigen Ware und 2. einheitlich, weil in derselben Ware. Ihre Wertform ist einfach und gemeinschaftlich, daher allgemein.

Fowkes has “The commodities now present their values to us, . . .” The “to us” is not in the Moore-Aveling translation, and it is out of place. The expression or representation of value is a social necessity, and it has nothing to do with the readers of this book. In the core of the economy, i.e., at a systemic level, there is a bond between all labors in society

because they all are the usually interchangeable applications of the same homogeneous finite mass of human labor-power. But this intrinsic connection can only affect human activity when it enters the realm of human interactions. The interpersonal relations which induce the economic agents to take the intrinsic constraints of this limited

pool of social labor-power into considerations are called, by Marx, the forms, expressions, representations of value. Since the agents do not react to value itself but to these expressions of value, it is important that these expressions are faithful expressions of the intrinsic properties of value.

The German word for “general” is “*allgemein*” (i.e., *allen gemein*, common to all).

While discussing the difference between the General form and the previous forms (Simple and Expanded forms of value), Marx also reviews the characteristics of these previous forms.

He recapitulates their shortcomings and shows how the present form overcomes them.

158:1 The two previous forms (let us call them *A* and *B*) only got as far as expressing the value of a commodity as something distinct from its own use-value or physical body.

80:1 Die Formen I und II kamen beide nur dazu, den Wert einer Ware als etwas von ihrem eignen Gebrauchswert oder ihrem Warenkörper Unterschiedenes auszudrücken.

But by emphasizing the distinction between value and use-value of the same commodity, the previous forms lost the homogeneity of value itself. This will be explained in the next two paragraphs. As a belated elaboration of an obscure hint in 153:2/o, Marx also sketches out under what circumstances these previous value forms occurred in practice:

158:2 The first form, A, produced equations like this: 1 coat = 20 yards of linen, 10 lb. of tea = 1/2 ton of iron. The value of the coat is expressed as something which is like linen, that of the tea as something which is like iron. These expressions of the value of coat and tea are therefore as different as linen is from iron. This form, it is plain, appears in practice only in the early stages, when the products of labor are converted into commodities by accidental occasional exchanges.

80:2 Die erste Form ergab Wertgleichungen wie: 1 Rock = 20 Ellen Leinwand, 10 Pfd. Tee = 1/2 Tonne Eisen usw. Der Rockwert wird als Leinwandgleiches, der Tee- wert als Eisengleiches usw. ausgedrückt, aber Leinwandgleiches und Eisengleiches, diese Wertausdrücke von Rock und Tee, sind ebenso verschieden wie Leinwand und Eisen. Diese Form kommt offenbar praktisch nur vor in den ersten Anfängen, wo Arbeitsprodukte durch zufälligen und gelegentlichen Austausch in Waren verwandelt werden.

158:3 The second form, *B*, distinguishes the value of a commodity more completely from its own use-value, for the value of the coat now contrasts its bodily form by assuming all possible shapes, that of linen, iron, tea, etc., every shape but that of a coat.

80:3 Die zweite Form unterscheidet vollständiger als die erste den Wert einer Ware von ihrem eignen Gebrauchswert, denn der Wert des Rocks z.B. tritt jetzt seiner Naturalform in allen möglichen Formen gegenüber, als Leinwandgleiches, Eisengleiches, Teegleiches usw., alles andre, nur nicht Rockgleiches.

This is a more thoroughly negative expression of value: by expressing the value of a commodity in the shape of *all* other commodities one says that value is not equal to *any* use-value. But this thorough negativity makes homogeneity impossible:

On the other hand, this immediately excludes any expression of value common to all commodities; for, in the expression of value of each commodity, all other commodities only appear in the form of equivalents.

Andrerseits ist hier jeder gemeinsame Wertausdruck der Waren direkt ausgeschlossen, denn im Wertausdruck je einer Ware erscheinen jetzt alle andren Waren nur in der Form von Äquivalenten.

For a joint expression of value, two commodities would have to be in the relative form of

value at the same time, with some joint equivalent. Both commodities would have to be in the active position. This is impossible with the Expanded equivalent form, since the second commodity is included as an equivalent of the first, and therefore cannot be in the relative value form at the same time. Marx writes “only” as an equivalent, because the equivalent form is passive and not very expressive; for instance, it does not express the quantity of the value of the equivalent commodity, see 147:2. Again, Marx mentions the historical conditions under which this form of value occurred first:

The Expanded form of value comes into actual existence for the first time when a particular product of labor, such as cattle, is no longer exceptionally, but habitually, exchanged for various other commodities.

Homogeneity is regained in the General form of value:

158:4 The new form we have just obtained expresses the values of the world of commodities in one single kind of commodity set apart from the rest, in linen for example, and thus represents the values of all commodities through their equality with linen. The equation with linen differentiates the value of every commodity not only from its own use-value, but from all use-values. Hence the value is expressed as that which this commodity has in common with all commodities.

The differentiation between value and use-value proceeded in three steps. The Simple form of value shows that the value of linen is something different from the use-value of linen (since this value is represented in the use-value of the coat). The Expanded form of value shows the irrelevance of the use-value representing the value, compare 155:2, it might be coats, but it might also be different things. Only the General form of value shows that value is separate from any use-value—because the linen in the General form of value is not acquired because it is linen, but because it is the General equivalent.

↑ This last sentence is interesting. In the Simple and also the Expanded form of value, Marx emphasizes that the commodities express their values in the *use-value* of the Equivalent commodities. With the General form of value this is no longer true. Once one commodity has been singled out as the general equivalent, it is no longer the use-value of the commodity serving as equivalent that matters, but the fact that every other commodity expresses its value in that same equivalent commodity. This value expression of all other commodities makes the equivalent commodity *directly exchangeable*, in other words, the equivalent commodity can be used to buy all other commodities.

This expression in one and the same commodity makes the General form of value the first

Die entfaltete Wertform kommt zuerst tatsächlich vor, sobald ein Arbeitsprodukt, Vieh z.B., nicht mehr ausnahmsweise, sondern schon gewohnheitsmäßig mit verschiedenen andren Waren ausgetauscht wird.

80:4 Die neugewonnene Form drückt die Werte der Warenwelt in einer und derselben von ihr abgesonderten Warenart aus, z.B. in Leinwand, und stellt so die Werte aller Waren dar durch ihre Gleichheit mit Leinwand. Als Leinwandgleiches ist der Wert jeder Ware jetzt nicht nur von ihrem eignen Gebrauchswert unterschieden, sondern von allem Gebrauchswert, und ebendadurch als das ihr mit allen Waren Gemeinsame ausgedrückt.

form of value which leads to it that in the production process the commodities are related to each other as values, i.e., as blobs of abstract human labor:

Only this form, therefore, has the effect of relating the commodities with each other as values, or enables them to appear to each other as exchange-values.

Erst diese Form bezieht daher wirklich die Waren aufeinander als Werte oder läßt sie einander als Tauschwerte erscheinen.

The General form of value is not only an expression of value, but an expression of value by a social relation involving all commodities. In this way it can become the social relation on the surface sustaining production on the core level of the economy (here we are talking about channel (2)).

Question 272 In 158:4, Marx writes the following about the general form of value: “Only this form, therefore, has the effect of relating the commodities with each other as values, or enables them to appear to each other as exchange-values.” Why didn’t he write: “or enables them to appear to each other as values”?

↓ Discussion of the General relative form of value. An important difference now is that this is no longer an “interpersonal” interaction between the commodity and its trading partners, but a relation spanning all of society.

158:5/o The two earlier forms express the value of a given commodity either in terms of a single commodity of a different kind, or in a series of many commodities which differ from the given commodity. In both cases it is the private task, so to speak, of the individual commodity to give itself a form of value, and it accomplishes this task without the aid of the others, which play towards it the merely passive role of equivalents.

80:5/o Die beiden früheren Formen drücken den Wert je einer Ware, sei es in einer einzigen verschiedenartigen Ware, sei es in einer Reihe vieler von ihr verschiedenen Waren aus. Beidemale ist es sozusagen das Privatgeschäft der einzelnen Ware, sich eine Wertform zu gehen, und sie vollbringt es ohne Zutun der andren Waren. Diese spielen ihr gegenüber die bloß passive Rolle des Äquivalents.

The General form of value is not quite as passive:

The general form of value, on the other hand, can only arise as a joint work of the whole world of commodities. A commodity gains a general expression of its value only when, at the same time, all other commodities express their values in the same equivalent; and every newly emergent commodity must follow suit. It thus becomes evident that because the objectivity of commodities as values is the purely ‘social existence’ of these things, it can only be expressed through an all-sided social relation;

Die allgemeine Wertform entsteht dagegen nur als gemeinsames Werk der Warenwelt. Eine Ware gewinnt nur allgemeinen Wertausdruck, weil gleichzeitig alle andren Waren ihren Wert in demselben Äquivalent ausdrücken, und jede neu auftretende Warenart muß das nachmachen. Es kommt damit zum Vorschein, daß die Wertgegenständlichkeit der Waren, weil sie das bloß „gesellschaftliche Dasein“ dieser Dinge ist, auch nur durch ihre allseitige gesellschaftliche Beziehung ausgedrückt werden kann,

consequently the form of their values must be a socially valid form.

ihre Wertform daher gesellschaftlich gültige Form sein muß.

Question 273 Describe the joint work of all commodities which is necessary to appropriately express the value of one commodity.

Clearly, this “joint work of the whole world of commodities” must be supervised by the state. This is one of the several places in *Capital* where Marx describes, without explicitly saying so, tasks of the capitalist state.

Now the quantitative aspect:

159:1 In this form, which sets all commodities equal to the linen, the commodities appear not only as qualitatively equal, as values in general, but also as values whose quantities can be compared.

81:1 In der Form von Leinwandgleichen erscheinen jetzt alle Waren nicht nur als qualitativ Gleiche, Werte überhaupt, sondern zugleich als quantitativ vergleichbare Wertgrößen.

The rest of the paragraph elaborates how they can be compared:

Because the magnitudes of their values are expressed in one and the same material, the linen, these magnitudes are now reflected in each other. For instance, 10 lbs. of tea = 20 yards of linen, and 40 lbs. of coffee = 20 yards of linen. Therefore 10 lbs. of tea = 40 lbs. of coffee. In other words, 1 lb. of coffee contains only a quarter as much of the substance of value, that is, labor, as 1 lb. of tea.

Weil sie ihre Wertgrößen in einem und demselben Material, in Leinwand bespiegeln, spiegeln sich diese Wertgrößen wechselseitig wider. Z.B. 10 Pfd. Tee = 20 Ellen Leinwand, und 40 Pfd. Kaffee = 20 Ellen Leinwand. Also 10 Pfd. Tee = 40 Pfd. Kaffee. Oder in 1 Pfd. Kaffee steckt nur 1/4 soviel Wertschubstanz, Arbeit, als in 1 Pfd. Tee.

It is therefore a very good form of value. Every commodity has this form of value with one exception:

159:2/o The General relative form of value of the world of commodities excludes only one commodity, the linen, on which it imposes the character of General equivalent.

81:2 Die allgemeine relative Wertform der Warenwelt drückt der von ihr ausgeschlossenen Äquivalentware, der Leinwand, den Charakter des allgemeinen Äquivalents auf.

Next Marx asks how the value of this excluded equivalent commodity is expressed:

The bodily form of the linen is the common form taken by the value of all commodities. Linen is therefore directly exchangeable with all other commodities.

Ihre eigne Naturalform ist die gemeinsame Wertgestalt dieser Welt, die Leinwand daher mit allen andren Waren unmittelbar austauschbar.

This is an important observation: since all commodities express their values in the General equivalent, this General equivalent commodity is directly exchangeable with all commodities. What does “directly exchangeable” mean? If you take an ordinary commodity to

market, two questions must be resolved for an exchange to go through: (1) does your trading partner need your commodity, and (2) how much of his own commodity is he going to give you for your commodity. Your commodity is called “directly exchangeable” if question (1) is always answered in the affirmative. Nobody will turn the trade down with you because they don’t need your commodity (if your commodity is the General equivalent). Only question (2) matters, the exchange proportion between their commodity and the General equivalent. I.e., the General equivalent can be used to *buy* other commodities. This power to buy everything is a direct and positive expression of the value of the equivalent commodity: The bodily form of the linen counts as the visible incarnation, the general social chrysalis state, of all human labor. Weaving, the private labor which produces linen, is at the same time labor in general social form, the form of equality with all other kinds of labor. The innumerable equations of which the general form of value is composed equate the labor realized in the linen with the labor contained in every other commodity. They thus convert weaving into the general form of appearance of undifferentiated human labor. In this manner the labor objectified in the values of commodities is not just represented negatively, as labor in which abstraction is made from all the concrete forms and useful properties of actual work. Rather its own positive nature is explicitly brought out. It is the reduction of all kinds of actual labor to their common character of being human labor in general, of being the expenditure of human labor-power.

Ihre Körperform gilt als die sichtbare Inkarnation, die allgemeine gesellschaftliche Verpuppung aller menschlichen Arbeit. Die Weberei, die Privatarbeit, welche Leinwand produziert, befindet sich zugleich in allgemein gesellschaftlicher Form, der Form der Gleichheit mit allen andren Arbeiten. Die zahllosen Gleichungen, woraus die allgemeine Wertform besteht, setzen der Reihe nach die in der Leinwand verwirklichte Arbeit jeder in andrer Ware enthaltenen Arbeit gleich und machen dadurch die Weberei zur allgemeinen Erscheinungsform menschlicher Arbeit überhaupt. So ist die im Warenwert vergegenständlichte Arbeit nicht nur negativ dargestellt als Arbeit, worin von allen konkreten Formen und nützlichen Eigenschaften der wirklichen Arbeiten abstrahiert wird. Ihre eigne positive Natur tritt ausdrücklich hervor. Sie ist die Reduktion aller wirklichen Arbeiten auf den ihnen gemeinsamen Charakter menschlicher Arbeit, auf die Verausgabung menschlicher Arbeitskraft.

Question 275 How does the General Equivalent form of value express the labor represented in value not only negatively but also positively?

Now the whole of the General form of value:

160:1 The General form of value, in which all products of labor are presented as mere congealed quantities of undifferentiated human labor, shows by this general coverage alone that it is the social expres-

81:3 Die allgemeine Wertform, welche die Arbeitsprodukte als bloße Gallerten unterschiedsloser menschlicher Arbeit darstellt, zeigt durch ihr eignes Gerüste, daß sie der gesellschaftliche Ausdruck der Waren-

sion of the world of commodities. Thus it makes it plain that within this world the general human character of labor forms its specific social character.

Interdependence of the Development of Relative Form of Value and Equivalent Form

The main objective of section 1.3 is an understanding of the “genesis” of money, see 139:1. Money is a commodity which is always in the general equivalent form. The equivalent, however, is passive. In the present brief subsection Marx shows that also the *development* of the equivalent form is passive; it is driven by the development of the relative form.

160:2 The degree of development of the equivalent form corresponds to that of the relative form of value. However it should be noted that the development of the equivalent form is only the expression and result of the development of the relative form.

↓ More specifically, the equivalents in the Simple, Expanded, and General forms of value are generated through the actions of the commodities in the corresponding relative forms of value.

160:3 The Simple or Isolated relative form of value of one commodity converts some other commodity into a Simple equivalent. The Expanded form of relative value, that expression of the value of one commodity in terms of all other commodities, imprints on those other commodities the form of various Particular equivalents. Finally, a particular kind of commodity obtains the form of General equivalent, because all other commodities make it the material embodiment of their unified and general form of value.

The equivalents go through the progression individual—particular—general.

Despite the correspondence in the development paths of the two poles, these paths themselves do not converge but, on the contrary, the “antagonism” between the two poles becomes stronger. (This antagonism will then be used, in chapter Two, 181:2, to explain the practical implementation of the forms of money along with the development of commodity production itself.) We use “antagonism” as translation for the German word *Gegensatz*. In the First edition, 645:2, it is called a “polar antagonism,” which is explained to be an “inseparable

welt ist. So offenbart sie, daß innerhalb dieser Welt der allgemein menschliche Charakter der Arbeit ihren spezifisch gesellschaftlichen Charakter bildet.

81:4 Dem Entwicklungsgrad der relativen Wertform entspricht der Entwicklungsgrad der Äquivalentform. Aber, und dies ist wohl zu merken, die Entwicklung der Äquivalentform ist nur Ausdruck und Resultat der Entwicklung der relativen Wertform.

82:1 Die einfache oder vereinzelte relative Wertform einer Ware macht eine andre Ware zum einzelnen Äquivalent. Die entfaltete Form des relativen Werts, dieser Ausdruck des Werts einer Ware in allen andren Waren, prägt ihnen die Form verschiedenartiger besonderer Äquivalente auf. Endlich erhält eine besondere Warenart die allgemeine Äquivalentform, weil alle andren Waren sie zum Material ihrer einheitlichen, allgemeinen Wertform machen.

connectedness and at the same time continual exclusion.”

160:4 Concomitantly with the development of the value form itself, however, develops also the antagonism between the relative form of value and the equivalent form, the two poles of the value form.

This antagonism is already present in the Simple form of value, although both sides consist of arbitrary commodities:

160:5 The first form, 20 yards of linen = 1 coat, already contains this antagonism, but does not attach it.

The antagonism is not “attached” or “fixed” to the commodities because one cannot say, for instance, that the linen is in the relative and the coat in the equivalent form. One can only say that for the weaver, the linen is in the relative and the coat in the equivalent form, but for the tailor just the reverse holds: for him, the linen is in the equivalent and the coat in the relative form.

According to whether we read the same equation forwards or backwards, each of the two commodity poles (such as linen and coat) is found in the relative form on one occasion, and in the equivalent form on the other.

↓ This indeterminateness makes it difficult to see that there even is an antagonism.

Here it is still difficult to keep hold of the polar antagonism.

↓ The Expanded form of value is no longer symmetric, but its reversal leads to a new form of value, the General form of value.

160:6 In form *B*, only one commodity at a time can expand its relative value into a totality, and it only possesses this Expanded relative form of value because, and in so far as, all other commodities are with respect to it, equivalents. Here we can no longer reverse the equation—such as 20 yards of linen = 1 coat or = 10 lb. of tea or = 1 quarter of wheat etc.—without altering its whole character, and converting it from the Expanded form into the general form of value.

↑ Form *B*: interchange of the sides no longer possible in the same equation. Such an interchange transforms *B* into *C*.

82:2 In demselben Grad aber, worin sich die Wertform überhaupt entwickelt, entwickelt sich auch der Gegensatz zwischen ihren beiden Polen, der relativen Wertform und Äquivalentform.

82:3 Schon die erste Form—20 Ellen Leinwand = 1 Rock—enthält diesen Gegensatz, fixiert ihn aber nicht.

Je nachdem dieselbe Gleichung vorwärts oder rückwärts gelesen wird, befindet sich jedes der beiden Warenextreme, wie Leinwand und Rock, gleichmäßig bald in der relativen Wertform, bald in der Äquivalentform.

Es kostet hier noch Mühe, den polarischen Gegensatz festzuhalten.

82:4 In der Form II kann immer nur je eine Warenart ihren relativen Wert total entfalten oder besitzt sie selbst nur entfaltete relative Wertform, weil und sofern alle andren Waren sich ihr gegenüber in der Äquivalentform befinden. Hier kann man nicht mehr die zwei Seiten der Wertgleichung—wie 20 Ellen Leinwand = 1 Rock oder = 10 Pfd. Tee oder = 1 Qrtr. Weizen etc.—umsetzen, ohne ihren Gesamtcharakter zu verändern und sie aus der totalen in die allgemeine Wertform zu verwandeln.

⇓ In form C, the antagonism develops into a contradiction: one commodity is general equivalent *because* all others are not.

161:1 Finally, the last form, C, gives to the world of commodities a general social relative form of value, because, and in so far as, all commodities except one are thereby excluded from the equivalent form. A single commodity, the linen, therefore has the form of direct exchangeability with all other commodities, in other words it has a immediately social form because, and in so far as, no other commodity is in this situation.²⁴

↑ This also means: as soon as a general equivalent exists, direct barter is marginalized. This is even enforced by modern anti-trust laws. “Reciprocity agreements,” i.e., agreements of the sort: I buy this from you if you buy that from me, are illegal. Two firms are not allowed to co-operate so as to protect themselves from the market at large.

⇓ Footnote 24 says two things: (A) it explains that this antagonism is by no means obvious, and (B) from there it leads to Proudhon’s petty bourgeois ideology, which denies that there are antagonisms.

²⁴ It is by no means self-evident that the form of direct and universal exchangeability is an antagonistic form, as inseparable from its opposite, the form of non-direct exchangeability, as the positivity of one pole of a magnet is from the negativity of the other pole. This has allowed the illusion to arise that all commodities can simultaneously be imprinted with the stamp of direct exchangeability, in the same way that it might be imagined that all Catholics simultaneously can be popes. It would, of course, be highly desirable in the eyes of the petty bourgeois, who views the production of commodities as the absolute summit of human freedom and individual independence, if the inconveniences connected with this form, notably also the impossibility of direct exchangeability of commodities, could be removed. This philistine utopia is depicted in the socialism of Proudhon, which, as I have shown elsewhere, does not even possess the merit of originality, but was in fact developed far more successfully long before Proudhon by Gray, Bray and others. Even so, wisdom of this kind is still rife in

82:5 Die letztere Form, Form III, endlich gibt der Warenwelt allgemein-gesellschaftliche relative Wertform, weil und sofern, mit einer einzigen Ausnahme, alle ihr angehörigen Waren von der allgemeinen Äquivalentform ausgeschlossen sind. Eine Ware, die Leinwand, befindet sich daher in der Form unmittelbarer Austauschbarkeit mit allen andren Waren oder in unmittelbar gesellschaftlicher Form, weil und sofern alle andren Waren sich nicht darin befinden.²⁴

²⁴ Man sieht es der Form allgemeiner unmittelbarer Austauschbarkeit in der Tat keineswegs an, daß sie eine gegensätzliche Warenform ist, von der Form nicht unmittelbarer Austauschbarkeit ebenso unzertrennlich wie die Positivität eines Magnetpols von der Negativität des andren. Man mag sich daher einbilden, man könne allen Waren zugleich den Stempel unmittelbarer Austauschbarkeit aufdrücken, wie man sich einbilden mag, man könne alle Katholiken zu Päpsten machen. Für den Kleinbürger, der in der Warenproduktion das nec plus ultra menschlicher Freiheit und individueller Unabhängigkeit erblickt, wäre es natürlich sehr wünschenswert, der mit dieser Form verbundenen Mißstände überhoben zu sein, namentlich auch der nicht unmittelbaren Austauschbarkeit der Waren. Die Ausmalung dieser Philisterutopie bildet Proudhons Sozialismus, der, wie ich anderswo gezeigt, nicht einmal das Verdienst der Originalität besitzt, vielmehr lange vor ihm von Gray, Bray und andern weit besser entwickelt wurde. Dies verhindert solche Weisheit nicht, heutzutage, in gewissen Kreisen,

certain circles under the name of ‘science’. No school of thought has thrown around the word ‘science’ more haphazardly than that of Proudhon, for “Where thoughts are absent, words are brought in as convenient replacements.”

↑ Marx refers here to his 1847 polemic against Proudhon, *The Poverty of Philosophy*, chapter One. The quotation at the end of the footnote is a slightly altered quotation from Goethe, *Faust*, Part I, Scene 4, *Faust’s Study*. Related is also footnote 40 to paragraph 181:2 in chapter Two.

William J. Blake wrote in [Bla39, pp. 625–27]: “Proudhonism has dogged the footsteps of Marxism from 1847 to the present day. Its type of thinking is the standard ‘radical’ approach to the world. It is common to currency reformers and fascists (in theory), and its isolation of the banker as the source of all evil is extremely popular. But it lacks any understanding of the totality of production relations, and is gaseous.”

Question 276 *Why is it not possible that all Catholics are simultaneously popes?*

After this digression in the footnote let us go back to the main text, in which the argument was: all commodities share a joint relative form of value because all commodities except one are excluded from the general equivalent form. Since people accept the general equivalent for their own commodities because they know they can use the general equivalent to purchase the things they need, the question is relevant now the value of this excluded commodity is expressed.

161:2 The commodity that plays the role of General equivalent is on the other hand excluded from the uniform and therefore General relative form of value. If the linen, or any other commodity serving as General equivalent, were, at the same time, to share in the relative form of value, it would have to serve as its own equivalent. We should then have: 20 yards of linen = 20 yards of linen, a tautology in which neither value nor its magnitude is expressed.

Marx calls “20 yards of linen = 20 yards of linen” here a “tautology,” while his formulation in 139:7/o suggested that this equation does have a meaning although it is no longer an expression of value. This is one of the places where Marx is a little inconsistent in his argument.

In order to express the relative value of the General equivalent, we must rather reverse form C. This equivalent has no relative form

unter dem Namen der „science“ zu grassieren. Nie hat eine Schule mehr als die Proudhonsche mit dem Wort „science“ um sich geworfen, denn „wo Begriffe fehlen, da stellt zur rechten Zeit ein Wort sich ein.“

83:1 Umgekehrt ist die Ware, die als allgemeines Äquivalent figuriert, von der einheitlichen und daher allgemeinen relativen Wertform der Warenwelt ausgeschlossen. Sollte die Leinwand, d.h. irgendeine in allgemeiner Äquivalentform befindliche Ware, auch zugleich an der allgemeinen relativen Wertform teilnehmen, so müßte sie sich selbst zum Äquivalent dienen. Wir erhielten dann: 20 Ellen Leinwand = 20 Ellen Leinwand, eine Tautologie, worin weder Wert noch Wertgröße ausgedrückt ist.

Um den relativen Wert des allgemeinen Äquivalents auszudrücken, müssen wir vielmehr die Form III umkehren. Es besitzt kei-

of value in common with other commodities; its value is, rather, expressed relatively in the infinite series of all other physical commodities. Thus the Expanded relative form of value, or form *B*, now appears as the specific relative form of value of the equivalent commodity.

This expression of the value of money is relevant because the seller no longer compares the value of his commodity with the use-value of the equivalent, but with the bundle of use-values which a given sum of money can buy.

Transition from the General Form of Value to the Money Form

162:1 The General equivalent form is one of the forms of value. Any commodity can therefore be the General equivalent. However whatever commodity it is, it is only in General equivalent form (form *C*) because and in so far as all other commodities exclude it from their ranks and treat it as the equivalent. And it is not until this exclusion has once and for all confined itself to one specific kind of commodity, that the uniform relative form of value of the whole world of commodities has gained objective fixity and general social validity.

The transition from forms *A* to *B* to *C* was driven by the defects of these forms, their insufficiencies in expressing value. The transition from *C* to *D*, by contrast, is driven by an inner tension in form *C* itself. The General equivalent form is a form of value which can be assumed by every commodity, but this form has a very exclusive character: if one commodity is in this form, all other commodities are excluded from it. This tension between arbitrariness and uniqueness can only be resolved by a social act which fixes one commodity as General equivalent.

162:2 As for the specific kind of commodity, with whose natural form the equivalent form socially grows together, it becomes the money commodity, or assumes money functions.

ne mit den andren Waren gemeinschaftliche relative Wertform, sondern sein Wert drückt sich relativ aus in der endlosen Reihe aller andren Warenkörper. So erscheint jetzt die entfaltete relative Wertform oder Form II als die spezifische relative Wertform der Äquivalentware.

83:2 Die allgemeine Äquivalentform ist eine Form des Werts überhaupt. Sie kann also jeder Ware zukommen. Andererseits befindet sich eine Ware nur in allgemeiner Äquivalentform (Form III), weil und sofern sie durch alle andren Waren als Äquivalent ausgeschlossen wird. Und erst vom Augenblick, wo diese Ausschließung sich endgültig auf eine spezifische Warenart beschränkt, hat die einheitliche relative Wertform der Warenwelt objektive Festigkeit und allgemein gesellschaftliche Gültigkeit gewonnen.

83:3/o Die spezifische Warenart nun, mit deren Naturalform die Äquivalentform gesellschaftlich verwächst, wird zur Geldware oder funktioniert als Geld.

1. The Commodity

I avoided the formulation “functions as money” although this is what Marx wrote, because in chapter Three, the function of money as money is distinguished from its function as measure of value or means of circulation. In other words, here the translation tries to use a more consistent terminology than Marx himself.

Fowkes translates this passage as: “The specific kind of commodity with whose natural form the equivalent form is socially interwoven now becomes the money commodity, or serves as money.” The social coalescence Marx talks about here does not have the character of an interweaving. Interweaving

implies the harmonious merger of two things that fit together. Marx writes “*verwächst*,” not “*zusammenwächst*,” which connotes the growing together of two things which have nothing in common, like a tree growing together with a rock that is in its way.

↑ Note that Marx writes here “become.” The fixing of the role of general equivalent on one specific kind of commodity (gold) is only the beginning of money. In chapter Three, section 3, Marx says that a second social act, namely the adoption of the same commodity as means of circulation, will be necessary before the money-commodity becomes full-fledged money.

Playing the part of General equivalent within the world of commodities becomes its specific social function and consequently its social monopoly. In form *B*, the commodities figure as Particular equivalents of linen, and in form *C* they jointly express their relative values in linen; now there is one particular commodity which has historically conquered this favored position: gold. If, then, in form *C*, we replace the linen with gold, we get:

Es wird ihre spezifisch gesellschaftliche Funktion, und daher ihr gesellschaftliches Monopol, innerhalb der Warenwelt die Rolle des allgemeinen Äquivalents zu spielen. Diesen bevorzugten Platz hat unter den Waren, welche in Form II als besondere Äquivalente der Leinwand figurieren und in Form III ihren relativen Wert gemeinsam in Leinwand ausdrücken eine bestimmte Ware historisch erobert, das Gold. Setzen wir daher in Form III die Ware Gold an die Stelle der Ware Leinwand, so erhalten wir:

1.3.D. Money Form

162:3

20	yards of linen	=	} 2 ounces of gold
1	coat	=	
10	lb. tea	=	
40	lb. coffee	=	
1	quarter of corn	=	
$\frac{1}{2}$	ton of iron	=	
<i>x</i>	commodity A	=	

etc.

162:4 Fundamental changes have taken place in the course of the transition from

84:1

20	Ellen Leinwand	=	} 2 Unzen Gold
1	Rock	=	
10	Pfd. Tee	=	
40	Pfd. Kaffee	=	
1	Qrtr. Weizen	=	
$\frac{1}{2}$	Tonne Eisen	=	
<i>x</i>	Ware A	=	

84:2 Es finden wesentliche Veränderungen statt beim Übergang von Form I zu

form *A* to form *B* and from form *B* to form *C*.

↑ By implication, the difference between *C* and *D* is *not* fundamental. As against this, there is no difference between forms *C* and *D*, except that gold instead of linen has now assumed the General equivalent form. Gold is in form *D* what linen was in form *C*: the General equivalent. The advance consists only in that the form of direct and general exchangeability, in other words the General equivalent form, has now by social custom irrevocably become entwined with the specific bodily form of the commodity gold.

Not the form as such differs, only the use-value this form is attached to. “Gold” and “linen” in this passage must be understood metaphorically. Gold stands for a specific commodity which is by social custom always in the General equivalent form, while “linen” stands for a General equivalent which is decided case by case, perhaps because it is most convenient for the situation at hand. This seems to be only a subtle difference, but it has important implications. The welding together of a particular use-value with a particular form of value generates a true novelty, and the functions of money in chapter Three show how fertile this combination is.

In the German original, the word “spezifisch” was used once in 162:1, twice in 162:2, and once in 162:4. This term is also used

elsewhere, e.g., in 188:2, see my annotations there, and in *Contribution*, 303:4/o. Despite the apparent significance of this term,

the Moore-Aveling translation does not use the word “specific” here.

This particular use-value was gold because this use-value conforms best with the properties of a General equivalent (see chapter Two, 183:2/o about that). The next paragraph shortly sketches how gold started out as an ordinary commodity and gradually conquered the position of being recognized everywhere as the General equivalent. Only after this has been accomplished has there been a difference between the General form of value with gold as the equivalent, and the Money form of value.

162:5/o Gold confronts the other commodities as money only because it previously confronted them as a commodity. Like all other commodities, one of its functions was that of an equivalent, either a Simple equivalent in isolated exchanges, or a Particular equivalent alongside other commodity-equivalents. Gradually it began

Form II, von Form II zu Form III.

Dagegen unterscheidet Form IV sich durch

nichts von Form III, außer daß jetzt statt Leinwand Gold die allgemeine Äquivalentform besitzt. Gold bleibt in Form IV, was die Leinwand in Form III war—allgemeines Äquivalent. Der Fortschritt besteht nur darin, daß die Form unmittelbarer allgemeiner Austauschbarkeit oder die allgemeine Äquivalentform jetzt durch gesellschaftliche Gewohnheit endgültig mit der spezifischen Naturalform der Ware Gold verwachsen ist.

84:3 Gold tritt den andren Waren nur als Geld gegenüber, weil es ihnen bereits zuvor als Ware gegenüberstand. Gleich allen andren Waren funktionierte es auch als Äquivalent, sei es als einzelnes Äquivalent in vereinzeltten Austauschakten, sei es als besondres Äquivalent neben andren Warenäquivalenten. Nach und nach funktio-

to serve as General equivalent in narrower or wider circles. As soon as it has won the monopoly of this position in the value expression of the world of commodities, does it become the money commodity. And only from the moment that it has already become the money commodity, does form *D* differentiate itself from form *C*, i.e., does the General form of value transform itself into the Money form.

This answers the question, posed in 139:1, of the genesis of the Money form, but it does not show in what respects the Money form differs from the General form of value. What Marx calls here the Money form is not a new form of value but the coalescence of the General equivalent with a specific use-value. This creates something new, which will be explored in chapter Three.

Exam Question 278 *The difference between the Money form (under the gold standard) and the General equivalent form is small; nevertheless it has important implications. Elaborate.*

Question 279 *Compare Marx’s derivation of money with the derivations of money in modern Economics*

Next Marx mentions briefly what becomes of the relative form of value when the equivalent form turns into the Money form.

163:1 The Simple relative expression of the value of some commodity, such as linen, in the commodity which already functions as the money commodity, such as gold, is the price form. The ‘price form’ of the linen is therefore: 20 yards of linen = 2 ounces of gold, or, if 2 ounces of gold when coined give £ 2, 20 yards of linen = £ 2.

This discussion will be continued in much more detail in chapter Three, see 189:1. In the last paragraph of section 1.3, Marx returns from *D* back to *A* and thus concludes the circle.

163:2 The only difficulty in the comprehension of the Money form is that of grasping the General equivalent form or, more broadly, of the General form of value, form *C*. Form *C* can be reduced by working backwards to form *B*, the Expanded form of value, and its constitutive element is form *A*: 20 yards of linen = 1 coat or *x* commodity

nierte es in engeren oder weiteren Kreisen als allgemeines Äquivalent. Sobald es das Monopol dieser Stelle im Wertaussdruck der Warenwelt erobert hat, wird es Geldware, und erst von dem Augenblick, wo es bereits Geldware geworden ist, unterscheidet sich Form IV von Form III, oder ist die allgemeine Wertform verwandelt in die Geldform.

84:4 Der einfache relative Wertaussdruck einer Ware, z.B. der Leinwand, in der bereits als Geldware funktionierenden Ware, z.B. dem Gold, ist Preisform. Die „Preisform“ der Leinwand daher: 20 Ellen Leinwand = 2 Unzen Gold oder, wenn 2 Pfd.St. der Münzname von 2 Unzen Gold, 20 Ellen Leinwand = 2 Pfd.St.

85:1 Die Schwierigkeit im Begriff der Geldform beschränkt sich auf das Begreifen der allgemeinen Äquivalentform, also der allgemeinen Wertform überhaupt, der Form III. Form III löst sich rückbezüglich auf in Form II, die entfaltete Wertform, und ihr konstituierendes Element ist Form I: 20 Ellen Leinwand = 1 Rock oder *x* Ware $A = y$

$A = y$ commodity B . The Simple commodity form is therefore the germ of the Money form.

The first edition, 43:4, brings a transitional paragraph here which reiterates what Marx considered the most important finding of this section:

As one sees, the analysis of the commodity yields all *essential* determinations of the *form of value*. It yields the form of value itself, in its opposite moments, the *General relative form of value*, the *General equivalent form*, finally the never-ending *series of Simple relative value expressions*, which first constitute a transitional phase in the development of the form of value, in order to eventually turn into the *specific relative form of value of the General equivalent*.

Marx distinguishes here between *general* value forms, which can be assumed by any commodity, and *specific* value forms, which cannot.

However the analysis of the commodity yielded these forms as *forms of the commodity* in general, which can therefore be taken on by every commodity—although in a polar manner, so that when commodity A finds itself in *one* form determination, then commodities B , C , etc. assume the *other* in relation to it.

↓ The last sentence is especially significant.

It was however of decisive importance to discover the inner necessary connection between *form of value*, *substance of value*, and *magnitude of value*, i.e., expressed ideally, to prove that the *form of value* springs from the *concept of value*.

The German word is “ideell” and not “ideal”; i.e., this is not a wrong

(idealistic) expression, but it is the reflection of this reality in theory.

One might translate it as: “expressed epistemically.”

Marx did not begin with the concept of value to derive from it the form of value, but he began with the analysis of a concrete object of practical activity, namely, the commodity. Then at the end he can step back and summarize his findings with the words: the form of value springs from the concept of value. This is a reversal of Hegel, the necessity of which is best seen if one translated it into the core-surface paradigm: Marx tried to show in this

Ware B . Die einfache Warenform ist daher der Keim der Geldform.

Man sieht: die Analyse der Ware ergibt alle *wesentlichen* Bestimmungen der *Wertform* und die *Wertform* selbst in ihren gegensätzlichen Momenten, die *allgemeine relative Wertform*, die *allgemeine Äquivalentform*, endlich die nie abschließende *Reihe einfacher relativer Wertausdrücke*, welche erst eine Durchgangsphase in der Entwicklung der *Wertform* bildet, um schließlich in die *spezifisch relative Wertform des allgemeinen Äquivalents* umzuschlagen.

Aber die Analyse der Ware ergab diese Formen als *Warenformen* überhaupt, die also auch jeder Ware zukommen, nur *gegensätzlich*, so daß wenn die Ware A sich in der *einen* Formbestimmung befindet, die Waren B , C , usw. ihr gegenüber die *andre* annehmen.

Das entscheidend Wichtige aber war den inneren notwendigen Zusammenhang zwischen *Wertform*, *Wertschranke* und *Wertgröße* zu entdecken, d.h. ideell ausgedrückt, zu beweisen, daß die *Wertform* aus dem *Wertbegriff* entspringt.

derivation that monetized market relations are the appropriate surface relations which induce the economic agents, who interact in this way on the surface, to produce value in the core of the economy.

Question 282 Compare the discussion of section 1.3 in these Annotations here with the discussion of section 1.3 in [Sek97, vol. 1, pp. 34 ff.].

1.4. The Fetish-Like Character of the Commodity and its Secret

In the first German edition of *Capital*, chapter One ended with a seven-page passage about the fetish-like character of the commodity, starting at 44:1. For the second German edition, Marx profoundly revised this passage and almost doubled its length. But even the second edition must be considered incomplete. Marx discusses here a set of questions which are extremely important for understanding capitalism and the possibilities to overcome it.

Although Marx does not divide section 1.4 into subsections, these Annotations divide it into five parts. The whole section is an analysis of the sources and implications of what Marx calls the mysterious character of the commodity. Marx first gives a characterization of what the mysterious character of the commodity *consists in* (subsection 1.4.a) and then asks where it *comes from* (1.4.b). Since social relations take the form of mysterious objective phenomena, scientific efforts are necessary to understand these phenomena enough so that “successful” action within this framework is possible. This is the origin of “bourgeois economics,” which is discussed in subsection 1.4.c. Subsection 1.4.d gives four examples of societies in which social relations do not take a mystified form, followed by a short sketch of the correspondence between religion and the relations of production. Subsection 1.4.e is related to 1.4.c; it points out the theoretical errors, the “fetishism,” of bourgeois political economy. The subtitles for these subsections are given in square brackets because they do not come from Marx.

Before our detailed commentary of section 1.4 can begin, we must look at its title, which reads, in German, “*Der Fetischcharakter der Ware und sein Geheimnis*.” Usually, “*Fetischcharakter der Ware*” is translated with “commodity fetishism.” However, a more accurate translation would be “fetish-like character of the commodity.” Marx distinguishes between “fetishism,” which is a false “story” guiding practical activity, and “fetish-like character,” which is a property in fact possessed by social relations. Commodities have a *fetish-like character*, while members of capitalist society often display *fetishism* (systematized in “bourgeois economics”). Fetishism and bourgeois economics will be discussed in subsections 1.4.c and 1.4.e. A brief allusion to fetishism is already given at the end of 1.4.a, but the early parts of this section focus on the *fetish-like character* of the commodity.

In the Moore-Aveling translation, the title is: “The Fetishism of Commodities and the Secret

Thereof.” Fowkes translated it as “The Fetishism of the Commodity and its Secret.” Both are wrong.

The French edition says correctly: “Le caractère fétiche de la marchandise et son secret.”

Exam Question 283 *What is the difference between commodity fetishism and the fetish-like character of commodities?*

1.4.a. [Exactly Which Aspects of the Commodity are Mysterious?]

Marx begins his discussion with the statement that commodities are “mysterious.” By this he means that the social relations encapsulated in the commodities are not visible to or controlled by the commodity owners. Then he asks where exactly in the commodity is this mystery located. He rules out the use-value (163:3/o) and the *content* of the value determinations (164:1), in order to arrive at the *commodity form* of the product (164:2). To illustrate the mysterious character of the commodity form, Marx brings analogies of the eye and religion (164:3/o). Afterwards, in what we call subsection 1.4.b, Marx will go on to investigate *the origin*, in the relations of the producers in the production process, of this mysterious character of their products on the surface of the economy.

163:3/o At first glance, a *commodity* | 85:2 Eine *Ware* scheint auf den ersten seems to be something obvious and trivial. | Blick ein selbstverständliches, triviales Ding.

↑ A commodity seems to be something “obvious and trivial”—namely, a useful object with simple properties that are easily examined and understood. ↓ In the next sentence, Marx says that the scientific analysis of this seemingly simple object shows that it is really something complicated. One would expect that scientific analysis begins with something complex and reduces it to something more simple. If one already starts with something simple, how can research make it more complex? Because the simple surface properties turned out to be *contradictory*. In order to resolve these contradiction, Marx had to dig deeper and uncovered so-to-say a busy inner life beneath the commodities’ bland appearances:

But its analysis brings out that it is quite intricate, abounding in metaphysical hairsplitting and theological niceties. | Ihre Analyse ergibt, daß sie ein sehr vertracktes Ding ist, voll metaphysischer Spitzfindigkeit und theologischer Mucken.

↑ Each word in the above sentence refers to one of the results of the earlier analysis:

- The commodity is “intricate”—because it has many determinations, it has not only use-value but also value, which manifests itself in various forms—from the simple exchangeability of two commodities to the power of money to buy everything.
- It engages in “metaphysical hairsplitting”—because in the commodity itself, these multiple determinations are undeveloped, so that one needs the powers of abstraction to grasp them. (See First edition, 28:6/o).
- It abounds in theological niceties—because money can be compared to the god of commodities, as Marx did in the First edition, 37:1.

These references to the First edition were necessary because the sentence under discussion was already present in the First edition, while two of the specific places this sentence seems to refer to did not make it into the later editions.

The commodity has properties which do not come from its physical body, and which reveal their origin only in distorted ways. This comes out most strikingly in the three peculiarities of the equivalent form, 148:1: use-value becomes the form in which value manifests itself; concrete labor the form in which abstract labor, and private labor the form in which social labor manifests itself. Indeed, in *Contribution*, the commodity fetishism section consisted of one long paragraph 275:1/o taking the place of the *fourth peculiarity*. Also in *Capital*, one can find the fetish-like character enumerated in parallel with these peculiarities, see chapter Three, p. 208:2/o.

Question 284 *Which evidence prompts Marx to say, at the beginning of the Commodity Fetishism section, that the commodity is “intricate” or “mysterious”?*

Question 285 *In Capital 163:3/o Marx says that the commodity is “intricate” or “mysterious,” while in his Notes on Wagner, [mecw24]544:6/o he says it is simple. What gives?*

Marx calls the commodity “intricate” or, in the next sentence, “mysterious,” immediately after giving a theory which fully explains the commodity. The mysterious character is therefore not a reflection of our ignorance about the commodity. The commodity is mysterious because the simple social relations which our analysis revealed in the commodity are not expressed in the commodity in a straightforward manner but lead to contradictory and contorted surface expressions. Marx asks now: what is it about those underlying simple relations which prevents them from being expressed in a simple way? He proceeds here in two steps. First, following his earlier analysis, he cuts the commodity into several (conceptual) pieces and asks which of these pieces is mysterious (i.e., leads to contradictory expressions). In his own words, this is the question where the mysterious character of the commodity is located. And after having identified those elements and ruled out others, his next question is: what is it in those elements that causes their expressions to be contradictory? This is the question about the source of the mysterious character.

Question 286 *If the commodity, empirically, is not mysterious, but its scientific analysis reveals that it has a mysterious character, doesn’t this mean that the scientific analysis is wrong?*

Question 289 *Comment on the following statement: “After a long and tedious explanation of the commodity, Marx surprises his reader at the end of chapter One with the assertion that the commodity is mysterious. This is Marx’s last-ditch effort to drag commodity production into the dirt, after his own analysis could not turn up much that is wrong with it. Ironically, Marx admits here that his explanation of the commodity is less than satisfactory, since it mystifies something that is really plain and simple.”*

↓ First therefore, Marx looks where the mysterious character of the commodity is located.

Many economic phenomena in capitalism have an *outwardly* “magical” character. The power of money to purchase everything, or the power of capital to grow quasi on its own accord, sudden financial crises and breakdowns of economic growth, inflation, unemployment, stock market booms and busts, salaries which have nothing to do with the skills or experience of the recipient, the tendency of wealth to concentrate rather than dissipate, even modern consumerism, i.e., people’s over-attachment to things, and the social status conveyed by the clothes one wears or the car one drives—in all these phenomena the economy seems to have a separate “life.” Although the economy is the product of the economic agents, it seems to be independent of them.

Modern economics does not admit that the economy is beyond the control of the economic agents. The theory of *rational expectations* is a good example for an explanation according to which the mysterious phenomena of modern capitalism are the outgrowth of nothing other than pure human rationality in the absence of full information. At most, modern economics finds irrationality at the level of individual behavior (Keynes), but never in the social structure as such.

Far from denying the mysterious character of the commodity, Marx considers it so important that he interrupts his analysis of the social forms themselves, in order to understand why they are mysterious. But instead of picking out some of the many *outwardly* mysterious phenomena, he tries to find the root of this magic by investigating the mysterious character of the *commodity*, of the “elementary” social form, see 125:1. The commodity already contains in an undeveloped form many of the determinations of money and capital, and Marx asserts that also the outwardly magical and self-acting characters of money and capital have their root in the more subtle mysteries of the commodity.

Exam Question 293 *Why does Marx explore the mysterious character of the commodity, which is bland and abstract, instead of picking up one of the many striking outwardly mysterious phenomena of capitalism?*

Question 294 *Whether the commodity is “mysterious” or not is a value judgment which can neither be proved nor disproved. Do you agree? What would Marx say about this?*

In the next few paragraphs, Marx asks: exactly which aspect of the commodity is mysterious? Since Marx is looking for an absence here, the absence of clarity and control, he uses an elimination argument: he rules out all those cases where clarity is *present*.

As the first step in this elimination, Marx rules out the commodity’s use-value.

So far as it is a *use-value*, there is nothing mysterious about the commodity, whether we consider it from the point of view that, by its properties, it satisfies human needs, or that it first obtains these properties as the *product* of human labor.

Soweit sie *Gebrauchswert*, ist nichts Mysteriöses an ihr, ob ich sie nun unter dem Gesichtspunkt betrachte, daß sie durch ihre Eigenschaften menschliche Bedürfnisse befriedigt oder diese Eigenschaften erst als *Produkt* menschlicher Arbeit erhält.

The next passage focuses on the second alternative, the production process:

The activity by which man changes the forms of the materials of nature in a manner useful to him is entirely accessible to the senses. The form of the wood, for instance, is altered when a table is made out of it. Nevertheless the table is still a piece of wood, an ordinary thing which can be seen and touched.

↑ The production process is entirely accessible to the senses, a more literal translation would be: it is clear to the senses that mankind changes the forms of the natural materials. This is a process which one can fully experience with one’s senses, as opposed to the social processes investigated in this book, which are not part of the empirical experience.

Question 295 *Isn’t it reductionism to say that the table is wood, as Marx says in 163:3/o? And what about tables made from other materials?*

Doesn’t Marx set up a straw man here? Would anyone seriously think that the use-value of commodities, or the process producing this use-value, is mysterious? Marx’s denial of the mysterious character of use-value is worded very carefully. Marx chose formulations emphasizing the *transformational* character of production. (This transformational character was already addressed earlier in 133:2/o and its footnote 13.) Marx’s secret message here is that anyone who does not hold this transformational view believes in miracles. In other words, Marx is using the first, trivial step in his elimination to promote a transformational view of material production, instead of a view in which production creates something out of nothing.

Material production changes the form of things in a useful manner. This process is based on science, not magic; therefore it does not lead to the loss of social control. But things look different when the social context of production is considered, i.e., when the article is no longer seen as a mere use-value but as a commodity:

But, as soon as the table steps forth *as a commodity*, it changes into something that has extrasensory features attached to its sensuous existence. It not only stands with its feet on the ground, but in relation to all other commodities it turns itself on its head, and evolves out if its wooden brain grotesque ideas, far spleenier than if it suddenly were to begin dancing.²⁵

Es ist sinnenklar, daß der Mensch durch seine Tätigkeit die Formen der Naturstoffe in einer ihm nützlichen Weise verändert. Die Form des Holzes z.B. wird verändert, wenn man aus ihm einen Tisch macht. Nichtsdestoweniger bleibt der Tisch Holz, ein ordinäres sinnliches Ding.

Aber sobald er *als Ware* auftritt, verwandelt er sich in ein sinnlich übersinnliches Ding. Er steht nicht nur mit seinen Füßen auf dem Boden, sondern er stellt sich allen andren Waren gegenüber auf den Kopf und entwickelt aus seinem Holzkopf Grillen, viel wunderlicher, als wenn er aus freien Stücken zu tanzen begänne.²⁵

“Aus freien Stücken”: Fowkes’s translation “of its own free will” has connotations to “will” which do not belong here. Perhaps one

could say “of its own whim, accord.” The translation here uses “suddenly” because this implies spontaneity and self-activity. It is

also inspired by the French “que si elle se mettait à danser.”

↑ Marx brings again several colorful metaphors referring to similar aspects of the commodity as his formulations in the second sentence of 163:3/o. Whereas the former metaphors emphasized that the commodity contained forces which are not obvious to those handling the commodities, the present metaphors indicate that the commodity acts on its own accord:

- As a commodity, a table is sensuous *and* extrasensory—because it is not only the product of useful labor but at the same time the accumulation of abstract labor. In 164:3/o Marx will use the formulation “sensuous-extrasensory or social.”
- In relation to all other commodities, the table stands on its head.—This is a reference to the three peculiarities of the equivalent form, in which the form itself is the exact opposite of that what this form represents and regulates.
- The table evolves out of its wooden brain grotesque ideas.—Since value manifests itself in the relation between commodities, the commodities seem to be animated beings with their own intentions and social relations.

The metaphor in this last item shows that Marx considers economic laws to be *tendencial*. The results of the analysis of the commodity earlier in chapter One are compared here to a “spleen” in the commodity’s head, i.e., as a *tendency* to act in a certain way, not necessarily any particular action itself. Only the higher forms of capitalist wealth (money and especially capital) depend on it, for their existence, that these tendencies are enacted.

Footnote 25 brings an example where the tables literally begin to dance:

²⁵ One remembers that China and the tables started to dance when all the rest of the world seemed to stand still—in order to encourage the others.

²⁵ Man erinnert sich, daß China und die Tische zu tanzen anfangen, als alle übrige Welt stillzustehn schien—pour encourager les autres.

↑ Spiritistic table-shifting had become fashionable during the reactionary aftermath of the 1848 revolution in Germany. Marx saw the irony: while social progress was frozen, tables began to move. “China” is a pun. It refers at the same time to the porcelain dishes on the moving tables and to the Taiping-revolution in China, which, Marx hoped, would encourage others to follow suit.

Commodities are the unity of use-value and value. Since use-value has been ruled out, Marx looks now whether the mysterious character of the commodity can have something to do with value.

164:1 The mystical character of the commodity does not arise, therefore, from its use-value.

85:3/o Der mystische Charakter der Ware entspringt also nicht aus ihrem Gebrauchswert.

↑ This summarizes the results of the previous paragraph.

No more does it spring from the content of the determinations of *value*.

Er entspringt ebensowenig aus dem Inhalt der Wertbestimmungen.

Moore and Aveling translated “*Inhalt*” with “nature.” But in the modern usage of the word

“nature,” not only *Inhalt* but also *Form* would be considered part of the commodity’s nature. Marx is

trying to say something much narrower here.

↑ This formulation may create the impression that we will also come up empty-handed if we look at value. But this impression is false. Marx does not say that the mysterious character does not come from value. He says that it does not come from the *content* of the value determinations, i.e., from the (social) stuff value is made of. The “content” (*Inhalt*) of the value determinations must be distinguished here from the social *form* which this content takes in a commodity society. The first edition, 44:2/o, formulates the same idea a little differently:

No more does it spring from the determinations of *value*, considered for themselves

Er entspringt ebensowenig aus den Wertbestimmungen, für sich selbst betrachtet.

“Considered for themselves” means: considered not as determinations of value but in their own right. Stepping out of the Hegelian form-content paradigm, one might say: the mysterious character does not come from those aspects of the social production process which are regulated by the value relations between the commodities. (If formulated this way, Marx’s next step in 164:2 follows immediately: it must come from the commodity form, i.e., from the objectified surface relations which regulate these aspects of social production. But let us discuss things in order.)

From various earlier places (most clearly expressed in the two transitional passages in the first edition of *Capital*, 21:2 and 42:4) we know that Marx distinguishes between three *determinations of value*: (α) its substance, (β) its quantity, and (γ) its form. The *content* of these determinations, i.e., the stuff which these aspects of value are made out of, are (α) human labor in the abstract (i.e., the expenditure of labor-power), (β) socially necessary labor-time, and (γ) a social relation on the surface of the economy (the form of value is exchange-value, which is a social relation).

In order to prove that the mysterious character does not spring from the content of the value determinations, Marx argues that these three kinds of stuff themselves are not mysterious, and/or that they are not peculiar to commodity-producing societies but can also be found in societies which are not mysterious. Regarding (α) the argument is:

For in the first place, however varied the useful labors or productive activities might be, it is a *physiological* truth that they are functions of the *human* organism, and that each such function, whatever may be its nature or its form, is essentially the *expenditure of human* brain, nerves, muscles, sense

Denn erstens, wie verschieden die nützlichen Arbeiten oder produktiven Tätigkeiten sein mögen, es ist eine *physiologische* Wahrheit, daß sie Funktionen des *menschlichen* Organismus sind und daß jede solche Funktion, welches immer ihr Inhalt und ihre Form, wesentlich *Verausgabung* von

organs, etc.

menschlichem Hirn, Nerv, Muskel, Sinnesorgan usw. ist.

The word “essentially” here indicates that it is not possible to eliminate all effort out of the production process. Although production uses natural forces, it is not the spontaneous outcome of these natural forces. Nature has to be directed by humans to have the effect that humans desire. This “directing” the natural forces, rather than giving in to them, is an activity which requires effort. Physicists know that energy is needed to keep a system in a state of low entropy. This here is an analogous situation.

The “physiological truth” that all production is the expenditure of human labor-power makes it *possible*, but by no means necessary, that all labor-powers be treated by society as parts of the same homogeneous mass. This is exactly what Marx says in 150:2. The examples of the other societies, which will be given later in this section, starting with 169:2/o, show that not all societies treat their labor-powers as one homogeneous mass.

Question 296 *What is an “essential” property of something? What can be said in support of Marx’s claim that labor is “essentially” expenditure of human brain, nerves, muscles, sense organs, etc.?*

Question 297 *Do you know production processes in which humans participate without having to spend any effort?*

Question 298 *Skip forward to subsection 1.4.d, pp. 169:2/o – 171:2/o, and describe the social role played by the fact that all labor is the expenditure of human labor-power in the Robinson example and the other examples of non-capitalist societies given there.*

Point (β), the quantity of value, is discussed as follows:

Secondly, regarding that which underlies the determination of the magnitude of value, namely, the *duration* of that expenditure or the *quantity* of labor, this *quantity* is even palpably distinguishable from the *quality* of labor.

Was zweitens der Bestimmung der Wertgröße zugrunde liegt, die *Zeitdauer* jener Verausgabung oder die *Quantität* der Arbeit, so ist die *Quantität* sogar sinnfällig von der *Qualität* der Arbeit unterscheidbar.

Question 299 *What does Marx mean with the “palpable difference between quality and quantity of labor;” and why is this adduced as evidence that the contents of the value determination are not mysterious?*

One can only conjecture what Marx might have meant with the “palpable difference” between quantity and quality of labor. Perhaps Marx refers to the fact that the quantity of value is not given by the actual labor-time but by the socially necessary labor-time—a difference which can be deadly. But even if one ignores this remark, the argument given in the next sentence rules out labor-time as a mysterious element in commodity production:

In all states of society, the labor *time* it costs to produce the means of subsistence must necessarily concern mankind, although not to the same degree at different stages of development.²⁶

Since this is valid *generally*, the mystery cannot come from labor-time. Even a society that is not mystified must take labor-time into consideration.

²⁶ Note to the 2nd edition. The old Germans counted the area of an acre of land according to a day’s labor, and therefore the acre was also called Tagwerk (also Tagwanne) (jurnale or jurnal, terra jurnal, jornal or diurnal), Mannwerk, Mannskraft, Mannsmaad, Mannshauet etc. Compare Georg Ludwig von Maurer, “Einleitung zur Geschichte der Mark-, Hof-, usw. Verfassung,” München 1854, p. 129 sq.

In allen Zuständen mußte die *Arbeitszeit*, welche die Produktion der Lebensmittel kostet, den Menschen interessieren, obgleich nicht gleichmäßig auf verschiedenen Entwicklungsstufen.²⁶

²⁶ Note zur 2. Ausg. Bei den alten Germanen wurde die Größe eines Morgens Land nach der Arbeit eines Tages berechnet und daher der Morgen Tagwerk (auch Tagwanne) (jurnale oder jurnal, terra jurnal, jornal oder diurnal), Mannwerk, Mannskraft, Mannsmaad, Mannshauet usf. benannt. Sieh Georg Ludwig von Maurer, „Einleitung zur Geschichte der Mark-, Hof-, usw. Verfassung“, München 1854, p. 129 sq.

Question 300 *Compare the one function of labor-time in the Robinson example, p. 169:2/o, with the two functions of labor-time in the example of an “association of free men,” i.e., of a communist society given on p. 171:2/o in subsection 1.4.d.*

Now point (γ), the *form* of value:

And finally, whenever men work for each other in any way, their labor also assumes a *social* form.

Endlich, sobald die Menschen in irgendeiner Weise füreinander arbeiten, erhält ihre Arbeit auch eine *gesellschaftliche* Form.

This sentence is closely related to 138:2/o, and can be paraphrased as: whenever people are not independent self-sufficient producers, but production is part of the social web in which they find themselves, there must be interpersonal interactions between the producers. There is no mystery involved in this either.

Question 301 *The armchair socialist (Kathedersozialist) Adolf Wagner wrote that Marx “finds the common social substance of exchange-value ... in labour.” Marx, in his Notes about Wagner, [mecw24]534:1, strenuously objects. What, if anything, is wrong with Wagner’s formulation?*

Question 302 *Since use-value is not mysterious, the commodity’s mysterious character must come from value.*

a. *Is a commodity mysterious because it takes labor, i.e., the expenditure of human brain, nerves, muscles, etc., to produce it?*

b. *Is a commodity mysterious because the question how much time it takes to produce it is relevant for society at large?*

c. Is a commodity mysterious because the labors performed in a commodity-producing society are part of an overall social labor process?

d. Is there another aspect of the value of the commodity which was overlooked here that might be mysterious?

The First edition brings now the Robinson example and the example of a communist society, which is in the later editions moved to 169:2/o and 171:2/o. These example societies are scrutinized for the roles played by those characteristics of social labor which under commodity production make up the three determinations of value. In these example societies, these roles are *not* mystified. This provides further evidence that the content of the value determinations is not mysterious. By pointing out the different roles they play in different societies, Marx also clarifies his distinction between the *content* of the value determinations taken by themselves, and the context in which they are awarded social significance: In commodity-producing society, they are attached to the use-values of the products as their *values*.

164:2 From where, then, arises the mysterious character of the product of labor, as soon as it assumes the *form of a commodity*? Obviously from this form itself.

86:1 Woher entspringt also der rätselhafter Charakter des Arbeitsprodukts, sobald es *Warenform* annimmt? Offenbar aus dieser Form selbst.

Marx formulates here the results of the elimination argument in such a way that the answer lies directly in the question, so that it seems almost trivial. However Marx achieves this effect only by switching without warning from the form of value to the commodity-form of the product. (Such a “warning” was present in the first edition, where Marx gave his examples of non-commodity societies which were not mysterious. After moving these examples to a different place, the transition has become a little abrupt.) By commodity-form of the product Marx means the fact that in a market society, those three underlying social necessities which Marx calls the contents of the value determinations are regulated by the interactions of the commodities on the surface of the economy as values.

Marx looks now in detail at these market interactions, to verify whether they are indeed mysterious. And he finds a huge *discrepancy, incongruity*, between the character of those market interactions themselves and that what they regulate. Proceeding methodically, Marx contrasts the content of (α) – (γ) with the forms this content takes in commodity-producing society. Regarding (α) , Marx writes:

The equality of all human labors obtains the bodily form of the equal value quasi-materiality of all products of labor, ...

Die Gleichheit der menschlichen Arbeiten erhält die sachliche Form der gleichen Wertgegenständlichkeit der Arbeitsprodukte, ...

An attribute of labor in the production process is represented on the surface as an attribute of things. And what is a physiological truth with respect to labor, becomes, once it is attached to the finished product, a social abstraction with no basis in the natural world. “So far no chemist has ever discovered exchange-value either in a pearl or a diamond.” (177:3–4). Only the attributes of *concrete* labor are engraved in the use-value of the product, but this use-value does not reveal how much labor-time was used to produce it, and how much of

this labor-time stands up under the test of being “socially necessary.” Nevertheless, in a commodity society, the abstract labor used to produce the products is treated as if it was an additional natural property of the product itself. Now (β) :

... the measure of labor by time takes the form of the quantity of the value of the commodities, ...

... das Maß der Verausgabung menschlicher Arbeitskraft durch ihre Zeitdauer erhält die Form der Wertgröße der Arbeitsprodukte, ...

↑ Society’s allocation of labor is not based on the actual labor-time spent, but on the results of haggling on the market place, on the success or failure of marketing campaigns. Finally (γ) :

... and finally the relations between the producers, in which those social determinations of their labors assert themselves and are sustained, take the form of a social relation between the products of labor.

... endlich die Verhältnisse der Produzenten, worin jene gesellschaftlichen Bestimmungen ihrer Arbeit betätigt werden, erhalten die Form eines gesellschaftlichen Verhältnisses der Arbeitsprodukte.

My translation of this last passage needs an explanation. As I said earlier, one of the important differences between Marxist and neoclassical economics is that Marxism does not reduce the social relations to the individual. The social connection, in which individuals are embedded, pre-exists the individuals and cannot be explained by looking at the individuals themselves. If one looks at the relations of production in a commodity economy, the hiatus between social and individual sphere is even wider, since individual producers and consumers interact in the market, i.e., on the surface of the economy, which is dislocated from production. The mysterious self-activity of the commodity, i.e., the fact that the economy has its own dynamics and follows its own laws, has to do with this irreducibility and dislocation.

The relationship between individual agency and the social context by which it is enabled and constrained is therefore a very special one. On the one hand, nothing happens in a society without individuals carrying it out. On the other hand, and that will only be developed fully in the present section, individual conscious activity becomes the motor through which the blind necessities of the economic structure assert themselves. The ramifications of this are discussed in more detail in [Bha89, pp. 66–77]. Marx used a special word for this intricate relationship: the social relations “*betätigen sich*” (become active) or “*werden betätigt*” (are acted out) in the practical activity of the individuals. It is an unusual use of this word, even in German, and in translations, its meaning is often completely obliterated. In the present passage I translated it with the phrase “assert themselves and are sustained” in order to capture the two channels that must exist in this relationship: “assert themselves” refers to channel (1), while “are sustained” refers to channel (2).

Whereas Marx stressed before that it is not mysterious *that* people stand in contact with each other, the paragraph under discussion addresses the form of this contact, which is indeed mysterious: it is a contact between the *products*.

Question 303 Compare the three discrepancies (α)–(γ) between form and content of the value determinations with the three peculiarities of the equivalent form.

The next long sentence summarizes the three points of the last paragraph, without using the framework of “form” versus “content” of the “value-determinations,” but explaining in simple terms what this means:

164:3/o What is mysterious about the commodity form is therefore simply that the social characteristics of men’s own labor are reflected back to them as objective characteristics inherent in the products of their labor, as quasi-physical properties of these things,

86:2/o Das Geheimnisvolle der Warenform besteht also einfach darin, daß sie den Menschen die gesellschaftlichen Charaktere ihrer eigenen Arbeit als gegenständliche Charaktere der Arbeitsprodukte selbst, als gesellschaftliche Natureigenschaften dieser Dinge zurückspiegelt,

By “social characteristics of labor” in commodity-producing society Marx means the fact that all labor counts as a homogeneous fraction of society’s pool of labor-power, and its quantity is the socially necessary labor-time needed to produce the products. See e.g. 166:1. I.e., these are points (α) and (β) above. Two things are happening: (1) all labor is reduced to abstract human labor, and (2) this reduction is not achieved by a direct interaction between the producers during the production process, but through the confrontation of the finished products on the market. For the individual producer this means that her labor is integrated into social aggregate labor by the exchange relations which her *product* has with other products. This is point (γ) above, which Marx summarize next. Marx uses the phrase “social aggregate labor” (*Gesamtarbeit*) to designate the social labor in a commodity producing society, which consists of many labors performed privately. Presumably Marx chose this somewhat awkward formulation in order to avoid the connotation that it is collective labor: and that therefore also the social relation of the producers to the aggregate labor is reflected as a social relation of objects, a relation which exists apart from and outside the producers.

daher also auch das gesellschaftliche Verhältnis der Produzenten zur Gesamtarbeit als ein außer ihnen existierendes gesellschaftliches Verhältnis von Dingen.

In the draft to the revisions of the first German edition, which were published only recently in [Mar87a, p. 38:5], Marx says explicitly that the reduction of concrete labor to human labor in the abstract is the specific way how commodity producers relate their private labor to socially aggregate labor:

The reduction of the different useful labors, which produce just as many different useful things, to *human labor that counts as equal*, as well as the joint measurement of this labor by its necessary length of time, are obviously nothing other than a specific manner how the producers relate to their aggregate labor, a social relation, which the producers

Die Reduktion der verschiedenen Arbeiten, welche ebenso viele verschiedene nützliche Dinge produciren, auf *gleichgeltende menschliche Arbeit*, wie das gemeinsame Messen dieser Arbeit durch ihre nothwendige Zeitdauer, ist offenbar nichts als ein bestimmtes Verhalten der Produzenten zu ihrer Gesamtarbeit, ein gesellschaftliches

enter within production and with respect to production.

Verhältniß, welches Personen innerhalb der Produktion und mit Bezug auf dieselbe eingehen.

The social relations regulating material production in a society are called “relations of production,” and some modern Marxists have adopted the useful distinction between relations *in* production and relations *of* production. In the last sentence ↑, Marx himself makes this distinction when he distinguishes between relations “within” production and relations “with respect to” production.

Question 304 Explain how value denotes a specific relation of production and not just the general relationship between a producer and his product.

Now let us return to Marx’s text in *Capital*.

Through this *quid pro quo*, the products of labor become commodities, sensuous things which are at the same time extrasensory or social.

Durch dieses Quidproquo werden die Arbeitsprodukte Waren, sinnlich übersinnliche oder gesellschaftliche Dinge.

In order to treat their products as commodities, the economic agents have to engage in this “*quid pro quo*” (interchange, substitution between social relations of people and material relations of things), i.e., they have to act as if these products had their social properties by nature.

Next, Marx gives two analogies, first the eye and then religion, in order to emphasize the importance and wide-ranging ramifications of this substitution.

In the same way, the impact of light, emanating from some exterior object, on the optic nerve, is perceived not as a subjective stimulation of that nerve, but as the physical shape of the exterior object.

So stellt sich der Lichteindruck eines Dings auf den Sehnerv nicht als subjektiver Reiz des Sehnervs selbst, sondern als gegenständliche Form eines Dings außerhalb des Auges dar.

Does this mean that the mystification of the commodity relation is no greater than the mystification of seeing through one’s eyes? Is the market simply society’s retina through which it looks at its sphere of production? On the one hand one can say this, yet there is an important difference. The light giving rise to the nervous impulses comes from physical objects, which emit or reflect light according to their physical properties. The visual representation of these objects, which the brain constructs from the nervous impulses in the eye, gives information about these physical properties and thus helps humans, who are physical beings, to move about in the physical world and interact with it. This interaction uses the same laws of physics which would prevail in the outside world also without this interaction. By contrast, the properties which the commodities display on the market are *socially* generated, i.e., they are generated by the activity of the same human beings who are handling these objects. I.e., when the economic agents try to take advantage, in their activity, of the social properties of those objects, they change by their activity the very social properties

they are trying to exploit. The summary of the analogy of the eye in Table 1.1 tries to draw attention to this.

Question 306 *What corresponds to what in the example with the eye? Give a list of correspondences, like: retina—capitalist class (this one is of course a joke), etc. To what extent is this an appropriate example, and where does the analogy have its limits?*

Here is Marx's own explanation of the limitations of the analogy of the eye:

In the act of seeing, however, light is in fact transmitted from one thing, the exterior object, to another thing, the eye. It is a physical relation between physical things. As against this, the commodity form of the products of labor, and the value relation in which it represents itself, have absolutely nothing to do with the physical nature of the products or with any relations they have as physical objects.

Aber beim Sehen wird wirklich Licht von einem Ding, dem äußeren Gegenstand, auf ein andres Ding, das Auge, geworfen. Es ist ein physisches Verhältnis zwischen physischen Dingen. Dagegen hat die Warenform und das Wertverhältnis der Arbeitsprodukte, worin sie sich darstellt, mit ihrer physischen Natur und den daraus entspringenden dinglichen Beziehungen absolut nichts zu schaffen.

Why is it so problematic that a social relation presents itself as a quasi-physical property of the products? Because physical properties are exogenous to human activity, while the social relations are endogenous:

It is the specific social relation of the people themselves which assumes for them, as in an optical illusion, the form of a relation of things.

Es ist nur das bestimmte gesellschaftliche Verhältnis der Menschen selbst, welches hier für sie die phantasmagorische Form eines Verhältnisses von Dingen annimmt.

"Phantasmagoria" is, according to the *Oxford English Dictionary*, "a name invented for an exhibition of optical illusions chiefly by means of the magic lantern, first

exhibited in London in 1802. This word will be used again in the French translation of 166:2/o. Moore-Aveling has: "assumes, in their eyes, the fantastic form," Paul

and Paul have: "which, in their eyes, has here assumed the semblance of a relation between things," and Fowkes has: "assumes for them the fantastic form."

Marx says (in a more literal translation than the one given above) that social relations take a "phantasmagorical" form, using a word that was coined for an exhibition of *optical illusions* in London 1802. In an optical illusion, you think that you are seeing something outside the eye which is really generated inside the eye. This is a good metaphor for the circularity of the commodity relation.

Question 307 *In 164:3/o, Marx uses the eye as an analogy but also points out the limitations of this analogy. Earlier, in section 3, p. 148:3/o, Marx had used the weighing of a sugar-loaf as an analogy, and had described the limitations of this earlier analogy in similar words. Compare these two analogies and their limitations.*

The stimulation of my optical nerve by light coming from a thing outside is experienced in my brain as the shape (i.e. a physical property) of a thing outside me.	The relation of my labor to social aggregate labor is experienced in my practical activity as the exchange-value (i.e. a quasi-physical property) of my product.
But in the act of seeing, the light stimulating my optical nerve comes from a physical thing outside the eye;	whereas in commodity production, that what I experience as quasi-physical properties of the things I am handling is the result of my own activity.

Table 1.1.: Correspondence Table for Analogy of Eye

The *circularity* implied in the representation of *social* relations as quasi-physical properties of *things* is also suggested by Marx's formulations at the beginning of the present paragraph 164:3/o "are reflected *back* to them," and in the last sentence just discussed: "the specific social relation of the people *themselves* . . . assumes *for them*" (my emphasis all three times). The laws of nature are the prerequisites of human activity, while social relations are its product. The quid pro quo which turns the product of labor into a commodity implies therefore that people treat the *outcome* of their own activity as it was its nature-given objective *prerequisite*. But without a clear separation of observer and the thing observed, science is not possible. This is why it is so difficult to overcome the mystification of the commodity.

In its dealings with nature, mankind has learned to subordinate the laws of nature to individual purposes. Nature not only imposes constraints and necessities but is also an enabling and liberating force. Material production tames nature by subordinating its forces to human will. In a commodity-producing society, in which things are endowed with social powers, individuals attempt to use the *social* properties of things for their personal benefit in a similar way as material production takes advantage of the natural properties of things. They try to instrumentalize these social properties, but instead of tapping into the natural resources and thus expanding the powers of humanity they unwittingly end up drawing on the energies of others in society. This may be advantageous for a minority but cannot work for everyone. It does not truly work for anybody, because, instead of being able to direct the social forces to their benefit, individuals become the blind executors of social laws which they do not control.

Modern attempts at individual emancipation from *society* imitate the successful emancipation from *nature*. And although Marx is all in favor of subjective emancipation, the

method which is used here, this imitation, dooms them to failure. It remains a chase after optical illusions, or an effort to build a perpetuum mobile, or an attempt to strengthen oneself by drinking one's own blood. By trying to pursue *their* goals, while at the same time heeding the seemingly objective constraints which "the market" imposes on them, and which they do not recognize as being of their own making, individuals become the mere executors of the inner tendencies of the commodity.

As long as individuals follow this route, they will not be able to duplicate the successes which they had in dealing with the physical world. This route will not allow individuals to transform their social relations into a benign and beneficial backdrop for their individual purposes. Instead, these attempts lead to the subjugation and instrumentalization of one part of society by another—and to the subordination of everyone, whether they are on the "giving" or the "receiving" end of this exploitative relationship, to the blind laws of capital accumulation.

In capitalist society, the individuals' subordination to social laws is the result of a failed attempt to emancipate themselves from them. This contrasts sharply with the more "direct" integration of the individual into social relations prevailing in earlier historical periods, which usually amounted to a forced subjection of individual motives to an overriding social purpose. In *Grundrisse*, 83:2/o, Marx emphasizes this difference:

Only in the eighteenth century, in 'civil society', do the various forms of the social connection confront the individual as nothing more than a means, subordinated to his private purposes, as an extraneous necessity.

Erst in dem 18. Jahrhundert, in der „bürgerlichen Gesellschaft“, treten die verschiedenen Formen des gesellschaftlichen Zusammenhangs dem Einzelnen als bloßes Mittel für seine Privatzwecke entgegen, als äußerliche Notwendigkeit.

I translated this sentence in such a way that the interpretation which I consider the correct one comes out clearly. Since Marx did not say "merely a means for his private purposes" (*bloß als ein Mittel für*) but "a mere means" (*als bloßes Mittel*) I assume he did not intend

to say that the purposes were merely private (as opposed to the "higher" social purposes), but he wanted to emphasize that the social connection was not something commanding respect in its own right but was degraded to nothing more than a means. The

word "äußerlich" (extraneous) connotes a degradation as well: the social connection is not seen as the culmination of private interests, but as a constraint and obstacle coming in from the outside.

Here is another *Grundrisse* quote, from , where Marx says the same thing at greater length: That the social connection resulting from the collision of independent individuals appears with respect to them simultaneously both as objective necessity and as external bond, represents *exactly their independence*, for which *social being, though a necessity*, is no more than a *means*, and therefore *appears to the individuals themselves as some-*

Daß der gesellschaftliche Zusammenhang, der durch den Zusammenstoß der unabhängigen Individuen entsteht, zugleich als sachliche Notwendigkeit, und zugleich als ein äußerliches Band gegenüber ihnen erscheint, stellt *eben ihre Unabhängigkeit* dar, für die das gesellschaftliche Dasein zwar *Notwendigkeit*, aber nur *Mittel* ist, also den Indi-

thing external, and in money, even as a tangible thing. They produce in and for society, as social individuals, but at the same time this appears as a mere means to objectify their individuality.

viduen selbst als ein Äußerliches erscheint, im Geld sogar als ein handgreifliches Ding. Sie produzieren in und für die Gesellschaft, als gesellschaftliche, aber zugleich erscheint dies als bloßes Mittel ihre Individualität zu vergegenständlichen.

In capitalism, the individual tries to instrumentalize the social connections for his or her individual purposes, and fails. It is even worse than a failure, because the social connection ends up using the individual's self-directed activity as the motor for its own blind purposes of capital accumulation.

Although Marx hints at this circularity in various ways, he never addresses it explicitly. His most explicit mention of this circularity is the analogy of *religion*, which comes next. Marx describes the social reality of religion by how individuals perceive it, i.e., he tacitly switches over to a new subject: instead of the *fetish-like character* of the commodity he discusses now the *fetishism* of the commodity producers.

In order, therefore, to find an analogy we must take flight into the misty realm of religion. There the products of the human brain seem to be independent beings endowed with a life of their own, which enter into relations with each other and with the human race. So it is in the realm of commodities with the products of people's hands.

Um daher eine Analogie zu finden, müssen wir in die Nebelregion der religiösen Welt flüchten. Hier scheinen die Produkte des menschlichen Kopfes mit eigenem Leben begabte, untereinander und mit den Menschen im Verhältnis stehende selbständige Gestalten. So in der Warenwelt die Produkte der menschlichen Hand.

The religious analogy is catchy, but it should not cause the reader to think that the fetish-like character of the commodity is merely a matter of an illusion. Whether or not people are aware of the social origin of the quasi-physical properties of the commodity—in their daily dealings in a commodity society, they are forced to *act* as if the commodities were things which had these social properties just as firmly attached to them as their physical properties. For someone who is forced to act in this way, it is *easy* to slip into thinking that these social properties of the commodities really come from their physical makeup. And society relies on these "slips": capitalistic social relations can only maintain themselves if most of the people most of the time "forget," in their practical actions, that the powers of the things which they are trying to take advantage of originate in their own activity. But it is far from impossible to pierce that veil, and nobody individually is *forced* to see the commodity this way. Marx calls this false consciousness "fetishism."

This I call the fetishism, which sticks to the products of labor as soon as they are produced as commodities, and which is therefore inseparable from the production of commodities.

Dies nenne ich den Fetischismus, der den Arbeitsprodukten anklebt, sobald sie als Waren produziert werden, und der daher von der Warenproduktion unzertrennlich ist.

Moore and Aveling translate it as “fetishism inherent in commodities,” although “*ankleband*” is the direct opposite of “inherent.”

This is the first time that Marx uses the word “fetishism” rather than “fetish-like character.” The formulations “inseparable” and “sticks to” indicate that fetishism is not a property of the commodities themselves, but something which can be avoided only with great effort by those who handle commodities. Just as it is very difficult to avoid getting tar on oneself if one handles things covered with tar.

Here are some more examples of Marx’s usage of the word “fetishism.” In 176:1, Marx again uses the term “fetishism attached to” in the context of an illusion (*Schein*). In *Results*, last sentence of 982:1/o, Marx writes: “This constitutes a basis for the fetishism of political economists.” Although fetishism *sticks* to the commodity, it is the fetishism “*of*” whoever is deceived by the fetish-like character. *Capital II*, 303:2, has a formulation which can be taken as a good definition of “fetishism”:

Furthermore this brings to completion the fetishism peculiar to bourgeois political economy, the fetishism which mistakes the social, economic character, which is impressed on things in the social process of production, for a natural character stemming from the material nature of these things.

Ferner vollendet sich damit der der bürgerlichen Ökonomie eigentümliche Fetischismus, der den gesellschaftlichen, ökonomischen Charakter, welchen Dinge im gesellschaftlichen Produktionsprozeß aufgeprägt erhalten, in einen natürlichen, aus der stofflichen Natur dieser Dinge entspringenden Charakter verwandelt.

Question 309 *How does Marx’s use of the term “fetishism” compare with its modern dictionary definition?*

Readers in the modern U.S.A. often interpret the term “commodity fetishism” to mean an excessive devotion to material goods. I have no evidence that Marx ever used it in this way. And today’s often-heard admonition that one should not “overemphasize” material goods is most of the time merely an attempt to console oneself about one’s poverty by thinking poverty is desirable. For the minority who are affluent enough that this is an issue, however, this overemphasis derives from the fetish-like character of commodities. Material possessions become too important because they are the individual’s only link to society: conspicuous consumption compensates for the paucity of *direct* social relations. People feel how much power things have, and they want to retrieve some of this power for themselves by owning these things.

Question 310 *Modern advertising specialists know that consumers often buy a certain product not because they need this particular article, but because they are trying to compensate for other unmet needs. These compensatory demands are important for the economy because they are insatiable. Advertising addresses them whenever it suggests that social recognition, happiness, etc. are connected with the possession of a certain object.*

Is this what Marx meant by the “fetish-like character of the commodity,” or does it contradict it, or would Marx’s theory give rise to amendments of this theory?

Question 311 *Mark Blaug writes in [Bla85, p. 268:2]: “Commodity ‘fetishism’ refers to the tendency to reify commodities, to treat what are in fact social relations between men as if they were relations between things.” Right or wrong?*

1.4.b. [The Secret of the Fetish-Like Character]

The metaphor which compares people’s *fetishism* with religious superstition jumps ahead a little bit, since the development so far had focused on the *fetish-like character* of the commodity, but it is a fitting transition Marx’s next question. The argument in section 1.4.a shows clearly that Marx does not consider the mysterious character of the commodity to be a reflection of lack of knowledge or false consciousness by the individuals handling the commodities, but a property of the commodity itself. Now Marx looks at the core of the economy, where the commodity is produced, in order to see whether there is something in the core which is responsible for the mysterious character of the commodity. In other words, he is trying to decipher the “secret” of the fetish-like character of the commodity.

Textual evidence that Marx considered this so-called “secret” as a separate question is given in [mecw]. That Marx found the question worth asking is also clear from footnote 77a in chapter Twenty-Five, paragraph 771:1/o.

In the preceding subsection 1.4.a we have learned: the commodities’ mysterious fetish-like character lies in the incongruity, dissonance, between the commodity form of the product on the surface and the underlying social relations in the core which these surface forms regulate. People’s *social* relations appear to them as *material* properties of their products, the *outcome* of their activity appears to them as its *prerequisite*. The surface appearances are not only misrepresentations, giving a distorted view of the social relations (as we will get to know in chapter Nineteen), but the entire causality is reversed. The surface agents are not only thrown into an environment in which their social relations are hidden from them, but they are also prevented to learn from their experiences, because these experiences are the reflection of their own actions.

Marx devotes the present subsection 1.4.b to the question whether we can find something in production that is responsible for the mysterious character of the commodities on the surface. I.e., Marx asks: is there something in the way people relate to each other in production, i.e., not on the market surface but in the core of the economy itself, which already predisposes them to lose control over their social relations?

Question 313 *Make a thought experiment comparing market production, in which an artisan produces something for sale, to community production, in which the same artisan knows the people who will use the things he is producing, and these are the same people who are producing the things the artisan is consuming. If you were this artisan, would you act*

differently in the market situation than in the community situation? Would, over time, the use-value of your product and the technology of your labor evolve differently in these two situations?

At the beginning of this investigation, Marx surprises us with the claim that we already know the answer:

165:1 As the foregoing analysis has already demonstrated, this fetish-like character of the world of commodities has its origin in the peculiar social character of the labor which produces them.

“Fetischcharakter der Warenwelt” is, in both English editions, translated incorrectly with “fetishism.”

In a draft version of this passage, Marx is a little more explicit:

[mew] If we ask the further question where this fetish-like character of the commodity stems from, this *secret* has already been resolved by the preceding analysis. It springs from *the special social character of labor* which produces commodities, and the corresponding *peculiar social relation of the commodity producers*.

The foregoing analysis has indeed shown that the forms which give the commodity its fetish-like character are expressions of the inner nature of value. See for instance First Edition, 43:4. And the most important aspect in this inner nature of value, its “pivot” 131:2/o, is the double character of labor. If the double character of labor leads to mysterious expressions on the surface, it is important to know how this double character of labor is experienced by the producers themselves:

165:2/o Objects of utility become commodities only because they are *the products of private labors conducted independently of each other*. All these private labors together constitute the aggregate social labor. Since the producers do not come into social contact until they exchange the products of their labors, the specific social characteristics of their private labors appear only within this exchange.

87:1 Dieser Fetischcharakter der Warenwelt entspringt, wie die vorhergehende Analyse bereits gezeigt hat, aus dem eigentümlichen gesellschaftlichen Charakter der Arbeit, welche Waren produziert.

[megaII/6]39:5 Fragen wir nun weiter, woher dieser Fetischcharakter der Waare, so ist dieß *Geheimniß* bereits gelöst durch die vorhergehende Analyse. Er entspringt aus *dem besondern gesellschaftlichen Charakter der Arbeit*, welche Waaren producirt, und dem entsprechenden *eigenthümlich gesellschaftlichen Verhältniß der Warenproduzenten*.

87:2 Gebrauchsgegenstände werden überhaupt nur Waren, weil sie *Produkte voneinander unabhängig betriebener Privatarbeiten* sind. Der Komplex dieser Privatarbeiten bildet die gesellschaftliche Gesamtarbeit. Da die Produzenten erst in gesellschaftlichen Kontakt treten durch den Austausch ihrer Arbeitsprodukte, erscheinen auch die spezifisch gesellschaftlichen Charaktere ihrer Privatarbeiten erst innerhalb dieses Austausches.

“Überhaupt” means: articles of utility not only owe their fetish-like character but more

generally their entire being commodities to the double character of labor. I left it out in the translation.

“Appear” means here not only that the social relations are unknown before the exchange. These relations already exist before the exchange, on the one hand because of the real interdependence in society, and on the other because of what the economic agents expect to be the case. But these relations are only *actualized*, put to the practical test and either validated or refuted after production itself is already finished. Only when it is already too late do the economic agents enter a framework in which they can interact and act on their relations:

In other words, the private labors take effect, through their activity, as elements of the social aggregate labor only through the connections which the act of exchange establishes between the products and, through the products’ mediation, between the producers.

Oder die Privatarbeiten betätigen sich in der Tat erst als Glieder der gesellschaftlichen Gesamtarbeit durch die Beziehungen, worin der Austausch die Arbeitsprodukte und vermittelst derselben die Produzenten versetzt.

What does this mean for the practical activity of the producers in the production process itself? This is an investigation of the *direct interactions between the producers of commodities*, which are sometimes called the relations *in production* or the *mode of production in the narrow sense*. Commodities are produced privately, i.e., the producers do not have direct contact with each other while they are producing. But these private labors can keep the producers alive only as social labor [Mar87a, p. 38:1], only to the extent to which they can prove themselves as social labor. The validation of their private labors as social labor, the reality test, and any practical activity necessary to reconcile this after-the-fact reality with the already finished production, happens retroactively through the success which the products have on the market.

Marx draws two implications from this. On the one hand, the producers themselves are not deceived: they see the inversion, which was at the heart of the fetish-like character of the commodity at the market, as what it is:

To the producers therefore, the social relations between their private labors *appear* as what they *are*, i.e., not as direct social relations of persons during their labor processes themselves, but rather as *material relations* of persons and *social relations of things*.

Den letzteren *erscheinen* daher die gesellschaftlichen Beziehungen ihrer Privatarbeiten als das, was sie *sind*, d.h. nicht als unmittelbar gesellschaftliche Verhältnisse von Personen in ihren Arbeiten selbst, sondern vielmehr als *sachliche Verhältnisse* der Personen und *gesellschaftliche Verhältnisse der Sachen*.

Question 314 *One of Marx’s basic critiques of capitalism is that the surface appearances are false, they hide what is going on underneath. But in the section about the fetish-like character Marx seems to deny this critique since he says that the relations of their private labors appear to the producers as what they are. Can this be reconciled?*

In the first edition p. 47:2, the formulation is less dramatic:

The social relations of their labors *are* and *appear* therefore not as immediately social ...

Die gesellschaftlichen Beziehungen ihrer Arbeiten *sind* und *erscheinen* daher nicht als unmittelbar gesellschaftliche ...

The parallel use of “are” and “appear” leads here to a grammatical inconsistency, because “appear” requires “as” while “are” cannot be used together with “as.” Perhaps Marx re-worded the sentence in the second edition only in order to straighten out the grammar, although after this change, this sentence sounded much deeper and more mysterious. On the other hand, this is not the only place where Marx uses this more mysterious formulation. *Contribution*, 321:5 says that commodities can only relate to one another as what they are, and in a different context, Marx says in *Capital II*, 137:3, that the capitalist production process appears in the circulation process as what it is.

Question 315 Give an example of social relations between persons that take the form of “material relations of persons,” and an example of social relations between persons that take the form of “social relations of things.”

On the other hand, the fact that they see this inversion does not undo this inversion, they are still stuck in it:

166:1 It is only during the exchange that the products of labor acquire a uniform social objectivity as values, which is distinct from their varied sensuous objectivities as use-values.

87:3/o Erst innerhalb ihres Austauschs erhalten die Arbeitsprodukte eine von ihrer sinnlich verschiedenen Gebrauchsgegenständlichkeit getrennte, gesellschaftlich gleiche Wertgegenständlichkeit.

Does this mean that their labors are not yet equal, because the exchange which sets the products equal happens after the production process is finished? Of course not. The producers anticipate the market during production and react to the market when they continue production. Therefore they shape the direct production process according to the requirements of the market:

This division of the product of labor into a useful thing and an embodiment of value is only then carried out in practice when exchange has become sufficiently extensive and important to allow useful things to be produced for the exchange, so that their character as values is already taken into account during production. From this moment on, the labor of the private producer in fact acquires a twofold social character.

Diese Spaltung des Arbeitsprodukts in nützliches Ding und Wertding betätigt sich nur praktisch, sobald der Austausch bereits hinreichende Ausdehnung und Wichtigkeit gewonnen hat, damit nützliche Dinge für den Austausch produziert werden, der Wertcharakter der Sachen also schon bei ihrer Produktion selbst in Betracht kommt. Von diesem Augenblick erhalten die Privatarbeiten der Produzenten tatsächlich einen doppelten gesellschaftlichen Charakter.

How do the producers take heed of the market outcomes during the production process? The market sanction which everybody tries to guard against is of course that the goods

cannot be sold at a profitable price. However this inability to fetch an appropriate price can be due to two quite different reasons: either the good is not needed, or the production methods for this good are not efficient enough. Marx distinguishes these two mechanisms in the next passage:

On the one hand it must, as a specific useful kind of labor, satisfy a specific social need, and thus prove itself as an element of the aggregate labor, as a branch of the spontaneously developed social division of labor. On the other hand, it can satisfy the manifold needs of its own producer only in so far as each particular useful private labor can be exchanged with, i.e., counts as the equal of, every other kind of useful private labor.

Sie müssen einerseits als bestimmte nützliche Arbeiten ein bestimmtes gesellschaftliches Bedürfnis befriedigen und sich so als Glieder der Gesamtarbeit, des naturwüchsigen Systems der gesellschaftlichen Teilung der Arbeit, bewähren. Sie befriedigen andererseits nur die mannigfachen Bedürfnisse ihrer eignen Produzenten, sofern jede besondere nützliche Privatarbeit mit jeder anderen nützlichen Art Privatarbeit austauschbar ist, also ihr gleichgilt.

This is the double character of labor. Labor must fit into the division of labor as concrete labor, and all labor must be equal as abstract labor.

Question 319 What is the connection between the fetish-like character of the commodity and the double character of labor?

The economic agents, who observe these market sanctions, see that the market equalizes their products, but they do not experience their labors themselves as equal—although their labors *must* be equal for the products to be equal, as Marx emphatically reiterates in the next passage:

Equality of entirely *different kinds of labor* can be arrived at only by an *abstraction from their real inequality*, by a reduction to the characteristic they have in common, that of being the *expenditure of human labor-power*, being *human labor* in the abstract.

Die Gleichheit *toto coelo* verschiedener Arbeiten kann nur in einer Abstraktion von ihrer wirklichen Ungleichheit bestehen, in der Reduktion auf den gemeinsamen Charakter, den sie als *Verausgabung menschlicher Arbeitskraft*, abstrakt *menschliche Arbeit*, besitzen.

Toto coelo means “entirely,” and it refers to verschieden, not to Gleichheit! The French translation

p. 54:2/o makes this clear: “equality of the labors which *toto coelo* differ from each other.” Also

the Moore-Aveling translation has it right, but Fowkes got it wrong.

In the French edition, p. 54:2/o, an additional sentence follows now, which is missing in the German or the English editions, although one can find it in the draft manuscript for the second German edition, [Mar87a, p. 41]. This additional sentence emphasizes that the exchange forces the producers to equalize their labors; they do not equalize them because their democratic convictions that everyone is equal.

Only the exchange accomplishes this reduction by bringing into mutual presence on an equal footing the products of the most diverse labors.

Instead of accepting the equality of their labors as a deliberate unifying principle of society, the producers draw their view of their place in society from the practical activity necessary to protect themselves from the detrimental sanctions of the market:

The private producer's brain reflects this twofold social character of his private labor only in the forms in which it manifests itself in his practical interactions, the exchange of products.

The producer considers the social character of his labor only (the German "*nur*" has almost the meaning of *merely*) under the perspective of the practical exigencies of the exchange. Is it significant that Marx uses a very passive formulation for this kind of thinking ("his brain reflects"). It is a spontaneous act quite different from the mental efforts that would be necessary to penetrate through the fetishized appearances of commodities. The producer orients himself *merely* by the surface reactions, instead of directly addressing the core connections of which he is a part. (This displacement of his attention from core to surface will be summarized once more explicitly at the beginning of the next paragraph 166:2/o.)

The next passage give more detail how the two sides of the double character of labor represent themselves to the direct producer:

The socially useful character of his private labor presents itself to the producer in the form that the product of labor has to be useful, not to him but to others, and the social character of equality of the various kinds of labor presents itself in the form of a common value-character possessed by these materially different things, the products of labor.

↑ Although the formulation "the private producer's brain reflects" may sound as if this reflection was an illusion generated by false surface appearances, this is not the case here. That the product has to be useful for others, and that it has to contain as much as possible of whatever makes them exchangeable (value), are not false surface appearances. But the producers' attention on the market is again an inversion between cause and effect. The next three paragraphs contrast what the producers are doing in their inverted reactions to the market to what would be the case in a more rational system.

The next three long paragraphs form a unit which is broken out here as section 1.4.c. However the first of these paragraphs begins with a three-sentence summary of the results of section 1.4.b, therefore it will be discussed already here. It emphasizes what the social

... et c'est l'échange seul qui opère cette réduction en mettant en présence les uns des autres sur un pied d'égalité les produits des travaux les plus divers.

Das Gehirn der Privatproduzenten spiegelt diesen doppelten gesellschaftlichen Charakter ihrer Privatarbeiten nur wider in den Formen, welche im praktischen Verkehr, im Produktaustausch erscheinen—

—den gesellschaftlich nützlichen Charakter ihrer Privatarbeiten also in der Form, daß das Arbeitsprodukt nützlich sein muß, und zwar für andre—den gesellschaftlichen Charakter der Gleichheit der verschiedenartigen Arbeiten in der Form des gemeinsamen Wertcharakters dieser materiell verschiedenen Dinge, der Arbeitsprodukte.

relations of commodity production are *for* the individuals in those relations:

166:2/o People do not therefore bring the products of their labor in relation to each other as *values* because they regard these objects as *the mere material shells* of homogeneous human labor. They proceed in the reverse order: by equating, in the exchange, the different *products to each other as values*, they equate their own different labors as human labor. They do this without knowing it.²⁷

88:1 Die Menschen beziehen also ihre Arbeitsprodukte nicht aufeinander als *Werte*, weil diese Sachen ihnen als *bloß sachliche Hüllen* gleichartig menschlicher Arbeit gelten. Umgekehrt. Indem sie ihre verschiedenartigen *Produkte einander* im Austausch als *Werte* gleichsetzen, setzen sie ihre verschiedenen Arbeiten als menschliche Arbeit gleich. Sie wissen das nicht, aber sie tun es.²⁷

Not even the producers know the character of the social ties which organize production. They do not view the exchange as an arrangement arising from known social conditions, or serving certain agreed-on social purposes which go beyond exchange itself, but as a given environment in which they have to prove *themselves*. This drives them to atomistic competition. They do not see the role their own labor plays in their social relations. This is why they are unable to take control of their social relations.

Some of Marx's formulations here raise the question whether he thought the producers should be criticized for their failure to go beyond the surface. At the very end of chapter Two, in 187:1, Marx blames the fetish-like character of the commodity on the atomistic behavior of the individual producers. However, in the French edition, which is the last edition edited by Marx himself, this criticism of the individual producers was cut out again. There are two more omissions in the French edition. The passage which we discussed last, in 166:1 is omitted, and also paragraph 165:1 is omitted, which announces that the origin of the fetish-like character must be found in the production process.

Footnote 27 addresses the same thematic from a different angle:

²⁷ Therefore, when Galiani said: Value is a relation between persons ('La Ricchezza è una ragione tra due persone') he ought to have added: a relation concealed beneath a material shell. Galiani [Gal03, t. 3, p. 221]

²⁷ Wenn daher Galiani sagt: Der Wert ist ein Verhältnis zwischen Personen—"La Ricchezza è una ragione tra due persone"—, so hätte er hinzusetzen müssen: unter dinglicher Hülle verstecktes Verhältnis. Galiani [Gal03, vol. 3, p. 221]

This footnote has the following points of contact with the argument in the main text:

- The footnote shows that, far from viewing their market activities as the expression of the social context in which they stand, the agents even need to be reminded that value is a *social relation*.
- But to call value a social relation, without indicating how *unconsciously* it is being entered, is misleading. This is why Galiani "ought" to have added some clarification.
- This clarification should have pointed out that the relation is "*concealed*"—because those engaged in this relation do not know what their relationship does, e.g., they do

not know that everything they do on the market is based on the social equality of their labors.

- How can it be that they relate to each other without being aware of the content of their relationship? Because their relations to each other are constituted by their reactions to the quasi-physical properties of the products they are handling. Hence the formulation that their relations are concealed “*beneath a material shell*.”

Marx’s gentle correction of Galiani’s omission foreshadows a critique of classical political economy which will be made more explicit in the course of the present subsection and in subsection 1.4.e. Classical economists are trying to decipher the forms, unveil their hidden content, but the fact *that* the social relationship is hidden does not seem noteworthy to them—and even less, of course, are they concerned with the reasons *why* it is hidden.

Both footnote and main text emphasize the importance of people’s awareness of their social relations.

Marx emphasizes here the importance of people’s awareness of their social relations. In every other respect, his counterfactual summary statement at the beginning of 166:2/o is remarkably *limited*. Marx does not contrast commodity production, the reign of abstract labor, with a society in which the producers enter into a more differentiated relation with each other. Rather, he adduces as hypothetical counterpart a society in which individual labors relate to each other through the same principle of abstract labor, but this time established deliberately and with the full awareness of the producers, rather than as the unconscious and unintended result of efforts whose superficial goal is not at all interested in the social organization of production but circles around individual market success.

The principle by which producers coordinate their labors is therefore not the main factor distinguishing commodity society from a free associations of individuals. More important is the question how consciously the agents engage in this coordination. The main difference which Marx emphasizes is whether their social arrangements can be clearly seen and are commonly understood, or whether they arise behind the backs of individuals directing their purposes elsewhere.

The following passage from *Capital III*, 958/o, shows once more how important it is for Marx whether or not people make their social decisions *consciously*. Marx argues here that the realm of necessities, the portion of the day which men have to “wrestle with nature” in order to satisfy their needs, will never dwindle to insignificance—because needs expand as productivity expands. Although “true freedom” starts outside this realm of necessity, here is what Marx says about freedom in the realm of necessary labor itself:

958/o Freedom in this field can only consist in socialized man, the associated producers, rationally regulating their metabolism with nature, bringing it under their common control, instead of being ruled by it as by a blind power; and carrying out this

828:0 Die Freiheit in diesem Gebiet kann nur darin bestehn, daß der vergesellschaftete Mensch, die assoziierten Produzenten, diesen Stoffwechsel mit der Natur rationell regeln, unter ihre gemeinschaftliche Kontrolle bringen, statt von ihm als von einer blinden

metabolism with the least expenditure of energy and under conditions most favorable to, and worthy of, their human nature.

den Macht beherrscht zu werden; ihn mit dem geringsten Kraftaufwand und unter den ihrer menschlichen Natur würdigsten und adäquatesten Bedingungen vollziehn.

The requirement that production will go on “with the least expenditure of energy and under conditions most favorable to, and worthy of, their human nature” is listed here only second. The first requirement is that people must bring their metabolism with nature “under their common control, instead of being ruled by it as by a blind power.” This shows again how important social awareness is to Marx.

1.4.c. [The Necessity of Bourgeois Political Economy]

Individuals have plenty of evidence that the process they are engaged in is not going in the direction they want it to go. However they usually do not take this as a signal that a myopic manipulation of socially empowered objects cannot give them the control over their social relations which they aspire to. Rather they see it as a chain of riddles to be solved and a series of practical problems to be overcome.

The following sentence from the first edition 46:2/o aptly defines the subject of section 1.4.c:

First, their relationship exists practically. Secondly, however, since they are humans, *their relationship exists as a relationship for them*.

Erst ist ihr Verhältnis praktisch da. Zweitens aber, weil sie Menschen sind, ist *ihr Verhältnis als Verhältnis für sie da*.

The word “Dasein” hidden in these two sentences. One should

not translate it as “exists,” but I haven’t thought of a good way to capture this.

The next three paragraphs look at the explanations which the agents come up with in their efforts to solve the riddles they encounter in their practical activity. Marx considers the mainstream economics of his time (which he calls “bourgeois political economy”) to be a systematic compilation of such explanations. In these three paragraphs, the three determinations of value are taken up again in order.

The first paragraph discusses (α) the *substance of value*. We already discussed its introductory passage 166:2/o, which summed up once more how the commodity’s fetish-like character originates. After pointing out that even those engaged in direct production are ignorant of the basic character of their own economic relations, Marx continues:

Value, therefore, does not have it written on its forehead *what it is*.

Es steht daher dem Wert nicht auf der Stirn geschrieben, *was er ist*.

Question 324 Explain Marx’s metaphor that “value does not have it written on its forehead what it is.” Later in the commodity fetishism section, Marx uses the same metaphor “written

on the forehead” again in a slightly different context. Compare what he says that second time with what he says here.

Since it is not obvious what value is, value becomes the object of scientific analysis:

Value transforms every product of labor into a social hieroglyphic. Later on, people try to decipher the hieroglyphic, to get behind the secret of their own social product. (The determination of the useful articles as *values* is *their* social product as much as language is.)

Der Wert verwandelt vielmehr jedes Arbeitsprodukt in eine gesellschaftliche Hieroglyphe. Später suchen die Menschen den Sinn dieser Hieroglyphe zu entziffern, hinter das Geheimnis ihres eigenen gesellschaftlichen Produkts zu kommen, denn die Bestimmung der Gebrauchsgegenstände *als Werte* ist *ihr* gesellschaftliches Produkt so gut wie die Sprache.

Instead of “the secret of their own social product,” the French edition says “the secrets of the social product to which they contribute” (les secrets de l’oeuvre sociale à laquelle ils contribuent). This is a more transformational outlook.

A market which follows laws beyond the control of producers and traders is as contradictory as a text which cannot be read by its own writer. But this contradiction is not addressed by bourgeois economists. They simply use scientific tools to decipher these hieroglyphics, and they eventually succeed. But their special situation, namely, that the objects of their scientific research are the result of their own activity, demands that they should do more: not just deciphering their own relations after the fact, but take control over their social relations so that they won’t take the form of hieroglyphics in the first place. This they do not do, and this is why Marx says their fetishism persists even after they have found out that value comes from labor.

The belated scientific discovery that the products of labor, in so far as they are values, are merely the objectified expressions of the human labor expended to produce them, marks an epoch in the history of mankind’s development, but by no means banishes the illusion that the social characteristics of labor seem to be physical characteristics of the products. Something which is only valid for this particular form of production (production of commodities), namely, that the specific social character of the independent private labors consists in their equality as human labor and assumes the form of the value-character of the product,

Die späte wissenschaftliche Entdeckung, daß die Arbeitsprodukte, soweit sie Werte, bloß sachliche Ausdrücke der in ihrer Produktion verausgabten menschlichen Arbeit sind, macht Epoche in der Entwicklungsgeschichte der Menschheit, aber verscheucht keineswegs den gegenständlichen Schein der gesellschaftlichen Charaktere der Arbeit. Was nur für diese besondere Produktionsform, die Warenproduktion, gültig ist, daß nämlich der spezifisch gesellschaftliche Charakter der voneinander unabhängigen Privatarbeiten in ihrer Gleichheit als menschliche Arbeit besteht und die Form des Wertcharakters der Arbeitspro-

appears to those entrapped in the relations of commodity production as a natural fact that cannot be changed. Even after the above-mentioned scientific discovery, the value-character of the product seems an immutable given to them, just as the scientific dissection of the air into its component parts leaves the atmosphere itself unaltered in its physical configuration.

As on some other places, I went out on a limb with this translation, but some of it can be justified by the French edition. In French, “*verscheucht keineswegs den gegenständlichen Schein der*

gesellschaftlichen Charaktere der Arbeit” is translated with “ne dissipe point la fantasmagorie qui fait apparaître le caractère social du travail comme un caractère des choses, des produits eux-mêmes.”

dukte annimmt, erscheint, vor wie nach jener Entdeckung, den in den Verhältnissen der Warenproduktion Befangenen ebenso endgültig als daß die wissenschaftliche Zersetzung der Luft in ihre Elemente die Luftform als eine physikalische Körperform bestehen läßt.

(The word *phantasmagorisch* was also used in 164:3/o.) And “*ebenso endgültig*” is elaborated in French as: “tout aussi invariable et d’un ordre tout aussi naturel.”

The discovery that air is a mixture of certain other gases will of course leave the chemical makeup of the air unchanged. However if a basic discovery in the social sciences has no impact on the (now better understood) social relations, then this is remarkable. In section 1.4.b, Marx had argued that the secret, the root cause, of the fetish-like character of the commodity lies in the fact that the producers do not experience their labors as equal. The most basic principle governing market relations is therefore not part of the common consciousness. If this piece of knowledge is so important, why did the scientific discovery of the classical economists that value is based on labor not remove this fetish-like character? Marx’s answer is interesting: because social sciences were too “naturalistic,” they were viewed, like the natural sciences, as the description of immutable laws that are not affected by it whether humans understand them or not.

How dangerous this insight was for capitalism can also be judged from the fact that, after Marx, the labor theory of value was abandoned by the mainstream. Its place was taken by a theory which anchored capitalist relations in human psychology, i.e., the immutability of capitalism was written into the theory itself.

After the discovery that value comes from labor, people’s fetishism can obviously no longer consist in the belief that value comes from the physical properties of things. Now people think that the law of value, and all the bad things which a society based on value and money has in store, are unalterable facts which one cannot change. The disadvantages of capitalism are believed to be anchored in human nature, instead of people recognizing that they are brought about by a very special social form of organizing production.

Exam Question 326 *If someone understands that value comes from society and not from nature, how can that person still have a fetishistic view of social relations under capitalism?*

Question 327 Marx criticizes in 166:2/o that even after the discovery of labor as the substance of value, this was generally considered an “immutable fact.” What else should people have thought and done?

Of course, even if people understand the laws of their society, they still cannot immediately abolish these laws. It requires hard work and struggles, and it will be a long process before social relations have attained a more desirable form. In the preface to the first edition, 91:3/o, Marx writes:

Even when a society has got upon the right track for the discovery of the natural laws of its movement . . . , it can neither clear by bold leaps, nor remove by decree, the successive phases of its natural development. But it can shorten and lessen the birth-pangs.

The next paragraph, whose secret organizing principle is (β) the *magnitude of value*, describes how the producers’ practical activities generate the need to resolve certain *limited* theoretical questions.

167:1/o The first thing the producers need to know in practice when they exchange their products is, how much of the other products will they get for their own—in which proportions can the products be exchanged?

89:1 Was die Produktentauscher zunächst praktisch interessiert, ist die Frage, wieviel fremde Produkte sie für das eigne Produkt erhalten, in welchen Proportionen sich also die Produkte austauschen.

Again I can justify my translation by pointing to the French, where

“*die Frage*” is translated with “*de savoir*,” i.e., this first sentence

indeed discusses the *knowledge* they are interested in.

Marx referred to the needs of the practical commodity traders to know the quantitative proportions already in footnote 17 to paragraph 140:3/o in section 1.3.A: “The few economists, . . . who have concerned themselves with the analysis of the form of value, were unsuccessful, . . . because, under the crude influence of the practical bourgeois, they give their attention from the outset, and exclusively, to the quantitative aspect of the question.”

As soon as these proportions have attained a certain customary fixity, they seem to spring from the nature of the products. That one ton of iron and two ounces of gold have equal value is considered a similar fact as that a pound of gold and a pound of iron are equal in weight, despite their different physical and chemical properties.

Sobald diese Proportionen zu einer gewissen gewohnheitsmäßigen Festigkeit herangereift sind, scheinen sie aus der Natur der Arbeitsprodukte zu entspringen, so daß z.B. eine Tonne Eisen und 2 Unzen Gold gleichwertig, wie ein Pfund Gold und ein Pfund Eisen trotz ihrer verschiedenen physikalischen und chemischen Eigenschaften gleich schwer sind.

The fixity of the exchange proportions allows the producers to forget that value relations are social. However this fixity can only be achieved through continual fluctuations:

Indeed, the value character of the products of labor affirms itself only through their play as magnitudes of value.

In der Tat befestigt sich der Wertcharakter der Arbeitsprodukte erst durch ihre Betätigung als Wertgrößen.

This “play” of the quantities of value is caused by people’s attempts to take advantage of the value proportions. Although the commodity producers, in their practical actions, only pay attention to the quantity of value and not its quality, Marx says here, in a very abbreviated fashion, that this one-sided interest in quantity leads them to act in such a way that they give their labor the qualitative character of equal human labor, i.e., of value-creating labor. This is a dialectical conversion of quantity into quality.

Here is an attempt, which goes beyond Marx’s text, to describe in more detail how the products’ play as magnitudes of value affirms their value character. Since the exchange proportions seem to come from the nature of the product, and not from the labor process, the producers try to escape the quantitative link between labor and value by producing that use-value and employing that production method which gives them the most favorable exchange for the effort they put in. They use two main strategies to achieve this:

- On the one hand, they channel their labors into those branches of production which the market rewards best in relation to their effort.
- On the other hand, in every given branch of this division, they systematically explore the range of what can be done differently in order to gain an advantage over those with whom they compete.

These conscious actions have the following unintended consequences:

- The calculation regarding the market demand integrates their labor, according to its particularities, into the social division of labor.
- The active pursuit of the best production process causes them to end up with very similar labor processes, since everyone does that in parallel and since they also learn from each other.

The first edition, 46:2/o, has the following poignant formulation, which is consistent with the above interpretation: “In order to relate their products as commodities, men are *forced* to equate their different labors to abstract human labor” (my emphasis).

Question 329 Commodity producers do not exchange their products because they consider the labor in these products to be equal and therefore believe the fruits of the labor should be distributed on an equal basis. Marx claims that, on the contrary, the market interactions induce them to unknowingly equalize their labors. Describe the process by which they equalize their labors, and the goals which they pursue in this process.

Question 330 *Someone says: The law of value cannot hold. We are free people, we do what we want. We are not forced to price our commodities by their labor content. Explain to this person, along the lines of the argument Marx uses here, that this myopic attempt to assert one's freedom leads to unfreedom.*

One can sum it up as follows: Although their considerations only center around a quantitative advantage, the producers are forced to make important qualitative changes in the production process if they want to stay competitive in the market, while their efforts to get ahead of the market can only have temporary success. In the long run, the market will catch up with them again.

This is the circularity (p. 192 above) in action. Producers encounter social constraints (the quantitative exchange relations of the goods on the market) and try to turn them to their advantage, using similar methods as those with which they have successfully conquered nature. But this time, their efforts to get ahead fail; even worse, in these efforts they are unwittingly carrying out the “orders” dictated by the law of value. In *Results*, 1037:2/o, Marx says explicitly that the capitalists, in their efforts to outwit the law of value, implement it.

Which difference between the laws of nature and the laws of the market is responsible for the fact that humans, who have been very successful in becoming the masters of *natural* forces, remain the servants of their own social relations when they try to take advantage of the *social* properties of the objects they are handling? Answer: the laws of nature remain unchanged regardless of what people do. By contrast, the producers' reactions to the prices cause these prices to change. To use Bhaskar's terminology, transitive and intransitive dimensions are not clearly separated here. This is why it is not the social forces which are instrumentalized, but people's efforts to instrumentalize the social forces:

These magnitudes vary continually, independently of the will, foreknowledge and actions of the exchangers. Their own social movement has for them the form of a movement of things—things which, far from being under their control, in fact control them.

This last sentence indicates that perhaps Marx was thinking along the lines which I am developing in my commentary here. People think they control the social powers of things (just as they do control their natural powers), but this is an illusion.

The production of commodities must be fully developed before the scientific insight emerges, from experience itself, that all the different kinds of private labor (which are carried on independently of each other, and yet, as *spontaneously developed branches of the social division of labor*, are all-round dependent on each other) are continually be-

Die letzteren wechseln beständig, unabhängig vom Willen, Vorwissen und Tun der Austauschenden. Ihre eigne gesellschaftliche Bewegung besitzt für sie die Form einer Bewegung von Sachen, unter deren Kontrolle sie stehen, statt sie zu kontrollieren.

Es bedarf vollständig entwickelter Warenproduktion, bevor aus der Erfahrung selbst die wissenschaftliche Einsicht herauswächst, daß die unabhängig voneinander betriebenen, aber als *naturwüchsige Glieder der gesellschaftlichen Teilung der Arbeit* allseitig voneinander abhängigen Privatarbeiten fortwährend auf ihr gesellschaftlich

ing reduced to the measure in which they are socially necessary.

notwendiges Maß reduziert werden, ...

Question 331 *Isn't there an inconsistency in Marx's text? At the beginning of paragraph 167:1/o, the fixity of commodity prices is stressed, while towards the end of the same paragraph 167:1/o, Marx emphasizes that they fluctuate continually.*

The unpredictable *changes* of the exchange proportions interfere with the efforts of the agents to use these proportions to their advantage. This causes them to wonder how the magnitude of value is determined, and leads to the scientific discovery of socially necessary labor-time as the underlying principle.

However the reader should be aware that this scientific effort is only a very superficial resolution of the dilemma faced by the market participants. Although they systematically try to instrumentalize for individual advantage the powerful social forces exhibited by the market, they find that they remain at the mercy of blind objective laws, under the control of things. Instead of wondering *how they came into this predicament*, so that they can wrest control away from these things, they use science to understand *how the things move that control them*, in the hope that in this way they can “outwit” them or at least arrange themselves better with them. This is called a “TINA compromise.” (TINA = There Is No Alternative.)

In the accidental and ever-fluctuating *exchange proportions between the products*, the labor-time socially necessary to produce them asserts itself violently as a regulative *law of nature*. This law asserts itself like the law of gravity asserts itself when a person's house collapses on top of him.²⁸

... weil sich in den zufälligen und stets schwankenden *Austauschverhältnissen ihrer Produkte* die zu deren Produktion gesellschaftlich notwendige Arbeitszeit als regelndes *Naturgesetz* gewaltsam durchsetzt, wie etwa das Gesetz der Schwere, wenn einem das Haus über dem Kopf zusammenpurzelt.²⁸

If the house collapses, the law of gravity asserts itself *despite* the attempts of the builder to control it. Now we all know that it is possible to build houses that do not collapse. The collapse of the house reveals a flaw in engineering. The footnote brings a quote from the young Engels emphasizing that also the working of the capitalist economy reveals a basic flaw:

²⁸ ‘What are we to think of a law which can only assert itself through periodic crises? Well, it is a *natural law that is based on the lack of awareness of the people who are subjected to it*’. [mecw3]433/34.

²⁸ “Was soll man von einem Gesetz denken, das sich nur durch periodische Revolutionen durchsetzen kann? Es ist eben ein *Naturgesetz, das auf der Bewußtlosigkeit der Beteiligten beruht*.” Friedrich Engels, [mecw3]433/34.

The formulation “law based on the lack of awareness of the people who are subjected to it” (my emphasis) implies that people act in a certain way *because* they are unaware. This does not mean that consciousness determines their social being, but that the mechanisms by

which the blind social forces take precedence over individual goals are based on (i.e., cannot be effective without) a lack of consciousness on the part of the individuals.

The determination of the magnitude of value by labor-time is therefore a secret hidden under the apparent movements of the relative magnitudes of commodity values. By uncovering this secret, the semblance of a merely accidental determination of the magnitude of value of the products of labor is removed, but the objectified form in which this determination takes place is by no means abolished.

Die Bestimmung der Wertgröße durch die Arbeitszeit ist daher ein unter den erscheinenden Bewegungen der relativen Warenwerte verstecktes Geheimnis. Seine Entdeckung hebt den Schein der bloß zufälligen Bestimmung der Wertgrößen der Arbeitsprodukte auf, aber keinesfalls ihre sachliche Form.

The scientific efforts described in the preceding two long paragraphs are in both cases strangely impotent. Although necessitated by the fetish-like character of the commodity, they do not help overcome it. The next paragraph explains this impotence. It centers about point (γ), *the form of value*.

168:1/o Man's thought about the forms of social life, and therefore also his scientific analysis of these forms, takes a course directly opposite to the actual development of these forms. He begins 'after the feast' with the completed results of the development process.

89:2/o Das Nachdenken über die Formen des menschlichen Lebens, also auch ihre wissenschaftliche Analyse, schlägt überhaupt einen der wirklichen Entwicklung entgegengesetzten Weg ein. Es beginnt post festum und daher mit den fertigen Resultaten des Entwicklungsprozesses.

This translation benefited from the Eden and Cedar Paul translation. In Fowkes's translation, reflection

begins "after the feast, and therefore with the results of the process of development ready to

hand." This wrongly pulls the word "*fertig*" from the ontological into the epistemological sphere.

The purposeful activity of individuals differs in an important way from the dynamics of their social relations. *Individual* human activity is characterized by its intentionality:

... what distinguishes the worst of architects from the best of bees is that the architect builds the cell in his mind before he constructs it in wax. 283:2/o.

In *social* life however, people first act and then think:

In their difficulties our commodity-owners think like Faust: 'In the beginning was the deed'. They have therefore already acted before thinking. The natural laws of the commodity manifest themselves (*betätigen sich*) in the natural instincts of the commodity owners. 180:3–181:1.

Among the mechanisms that cause the suspension of human intentionality on the social level, Marx singles out here the passivity of everyday thinking. The word "*Nachdenken*,"

here translated as "reflection," has, in German, a quite passive connotation. It evokes someone sitting on a couch, smoking his pipe, relaxing, and "thinking." A similar passivity characterizes the forms of thinking described in the previous two paragraphs.

- Under point (α), 166:2/o, people's everyday thinking stumbled upon a glaring contradiction, the fact that people's own social product is not transparent to them. They try to (and finally succeed in) solving the riddles their own activity poses, without ever raising the critical question how it happens that their own activity presents riddles in the first place.
- Under point (β), 167:1/o, theoretical activity was kindled by their efforts to succeed in the market place. This again lacked any motivation to ask the more fundamental critical questions—on the contrary, the agents were interested in an affirmation of what they were doing.
- Point (γ), which we are discussing at present, brings a third cognitive obstacle to an effective scientific analysis: The forms of social life, which are the *result* of the relations individuals enter in production and daily life, are at the same time the *starting point* for their reflection (*Nachdenken*) about it.

In sum, practical life not only furnishes the motivation for science, but also presents many obstacles. Science, by its nature, cannot be a passive or automatic process. Just as production is necessarily "work" (the formulation in 164:1 that labor is *essentially* the expenditure of human labor-power), science is "work" as well.

The social forms which stamp products as commodities, which they therefore must possess before they can circulate as commodities, have already acquired the fixity of natural forms of social life, before man seeks to give an account, not of the historical character of these forms—for in his eyes they have already become immutable—but of their content.

Die Formen, welche Arbeitsprodukte zu Waren stempeln und daher der Warenzirkulation vorausgesetzt sind, besitzen bereits die Festigkeit von Naturformen des gesellschaftlichen Lebens, bevor die Menschen sich Rechenschaft zu geben suchen nicht über den historischen Charakter dieser Formen, die ihnen vielmehr bereits als unwandlungsfähig gelten, sondern über deren Gehalt.

Bourgeois economics has an additional incentive to persist in the mistake of starting its analysis with the finished forms, which are too mystified to reveal the true underlying relations: since bourgeois economics cannot admit that capitalism is a historically conditioned and historically limited mode of production, it cannot look at it as a historical process.

In the remainder of the paragraph, Marx gives a concrete example of a finished form that obfuscates rather than reveals:

It was only the analysis of the prices of commodities which led to the determination of the magnitude of value, and only the common expression of all commodities

So war es nur die Analyse der Warenpreise, die zur Bestimmung der Wertgröße, nur der gemeinschaftliche Geldausdruck der Waren, der zur Fixierung ihres Wertcharakters führ-

in money which led to the fixation of their character as values.

I.e., research started when some striking empirical phenomena had arisen which needed an explanation. But this is already too late:

It is however precisely this finished form of the world of commodities—the money form—which conceals the social character of private labor and therefore the social relations between the private producers behind quasi-physical properties of things, instead of revealing these relations plainly.

In support of the claim that the money form conceals, Marx describes next what “plainly revealing” would have meant in this situation:

If I say that coats or boots relate to linen as the general incarnation of abstract human labor, it is plain how bizarre an expression this is. The producers of coats and boots, however, when they relate their commodities to linen (or to gold and silver, which does not change the matter in the least) as the General equivalent, experience and express the relation of their own private labor to the aggregate labor of society in exactly this bizarre form.

te.

Es ist aber ebendiese fertige Form—die Geldform—der Warenwelt, welche den gesellschaftlichen Charakter der Privatarbeiten und daher die gesellschaftlichen Verhältnisse der Privatarbeiter sachlich verschleiert, statt sie zu offenbaren.

Wenn ich sage, Rock, Stiefel, usw. beziehen sich auf Leinwand als die allgemeine Verkörperung abstrakter menschlicher Arbeit, so springt die Verrücktheit dieses Ausdrucks ins Auge. Aber wenn die Produzenten von Rock, Stiefel, usw. diese Waren auf Leinwand—oder auf Gold und Silber, was nichts an der Sache ändert—als allgemeines Äquivalent beziehen, erscheint ihnen die Beziehung ihrer Privatarbeiten zu der gesellschaftlichen Gesamtarbeit genau in dieser verrückten Form.

These two sentences deserve a close reading. Let us first look at the first sentence.

If it were possible to see the invisible content behind the form—if one could, so-to-say, take an X-ray look at the relations of production underlying the exchange—one would see with amazement that the producers relate their concrete labors to the labor producing gold as the incarnation of human labor in the abstract, although the labor producing gold is just as concrete as any other labor. Everybody would be aware that this is a bizarre and deficient method of establishing a connection between the many interdependent labor processes. In the first edition, 37:1, in what was to become section 3 of chapter One, Marx brings an interesting metaphor to show how bizarre this is:

37:1 It is as if, besides lions, tigers, hares, and all other real animals, ... also *the animal* existed, the individual incarnation of the whole animal kingdom.

37:1 Es ist als ob neben und außer Löwen, Tigern, Hasen, und allen andern wirklichen Tieren ... auch noch *das Tier* existierte, die individuelle Inkarnation des ganzen Tierreichs.

It would not only be bizarre, but it would also be easy to see that it is bizarre.

Before we go to the second sentence, which presents the difficulty. let's look at the differ-

ence between first and second sentences. The first sentence uses the words “general incarnation of abstract human labor,” which is a core category, while the second sentence speaks of the “General equivalent,” which is a surface category. Also, the first sentence states that it is an obviously bizarre relation, but Marx does not use the word “form.” He does use the word “expression,” but by this he means his verbal representation of the core relations (“if I say”).

In the second sentence, Marx turns off the X-ray machine of his scientific analysis and looks at the form in which these bizarre relations present themselves to the practical surface activity. The fact that coat, boots, etc. are placed in relation to gold as the General equivalent is no longer obviously bizarre, on the contrary, it is a sensible procedure growing out of the necessities of exchange. But these sensible practical activities engage the economic agents in bizarre relations of production in the core. The forms themselves only become bizarre if one sees this content in them, i.e., if one recognizes that they mediate the relationship of the producers's private labor to the social aggregate labor.

Marx has chosen here a very nice example showing how the finished forms conceal. The surface forms are “finished” in a fashion which gives them practical applicability. But the practical usefulness of these forms on the surface veils the bizarre character of the core relations mediated by them.

Question 332 Why can empiricism, the starting with and clinging to empirical facts, only come to conclusions that affirm existing social relations?

Question 333 Where else should one start science if not with data? How did Marx himself come to his findings?

After this serious critique of bourgeois economics, Marx, surprisingly, nevertheless attributes “social validity” to it:

169:1 It is precisely forms of this kind which yield the *categories* for bourgeois economics.

90:1 Derartige Formen bilden eben die *Kategorien* der bürgerlichen Ökonomie.

“Forms of this kind” refers to the finished surface forms, the bizarre (*verrückten*), false social forms, which veil the underlying relations. A “category” is a fundamental classification, something that can serve as starting point for an explanation but which itself cannot be explained. Bourgeois economics does not start with the fundamental underlying relations but with their bizarre surface reflections. Marx will remark on this again on p. 677:2, when he discusses capitalism's false form par excellence, namely, the wage form, There as well as here Marx makes the argument that the erroneous view of the world generated by these surface categories cannot just be dismissed as a collection of subjective errors, but it has objective significance since it guides human actions:

These categories are socially accepted, and therefore objective, forms of thought for

Es sind gesellschaftlich gültige, also objektive Gedankenformen für die Produktions-

the relations of production of *this historically determined* social mode of production, namely, commodity production.

verhältnisse *dieser historisch bestimmten* gesellschaftlichen Produktionsweise, der Warenproduktion.

This translation assumes that the “*es sind*” (it is) at the beginning of this sentence refers to “categories,” or, more precisely, to those theories which are taken as

categories by bourgeois economy, not to “forms.” Grammatically this might easily be the case, especially since Marx wrote “*es sind*” instead of “*sie sind*,” and

also from the meaning I find it unlikely that Marx equates social forms with forms of thought.

Question 335 In 169:1, Marx calls the superficial understanding of the agents in capitalist society, their forms of thought, “socially accepted” or, in a more literal translation, “socially valid” and “objective.” Shouldn’t he have called them “false” instead of “valid” and “subjective” instead of “objective”?

Although bourgeois economics clings to the surface, it *is* valid: not because it reveals the inner structure of the commodity economy, but because it formulates its *forms of thought*, i.e., the spontaneous thinking which these relations of production induce in the practical agents. Marx calls these forms “valid” and “objective” without further elaboration. However his derivation of bourgeois economics as the scientific extension of the consciousness of the practical agents in the market implies that the validity and objectivity of these false appearances consists in the fact that they direct the activities of the economic agents on the surface of the economy.

The validity of these categories, whether they help us understand the inverted forms of appearance on the surface or the deep structure of the relations of production, must be qualified as indicated by the italicized phrase in the passage we just read: these categories are valid only historically. This gives the transition to section 1.4.d, the discussion of other societies. The whole mystery of commodities, all the magic and necromancy that surrounds the products of labor on the basis of commodity production, vanishes therefore as soon as we take refuge in other forms of production.

Aller Mystizismus der Warenwelt, all der Zauber und Spuk, welcher Arbeitsprodukte auf Grundlage der Warenproduktion umnebelt, verschwindet daher sofort, sobald wir zu andren Produktionsformen flüchten.

1.4.d. [Examples of Non-Commodity Societies and the Role of Religion]

In 169:2–172:0, Marx gives examples of societies in which commodity production is *not* predominant, i.e., in which labor is not, as in commodity production, private labor which at the same time keeps its provider alive only as social labor (translated from 38:1).

Betrachten wir andre Formen der Produktion, worin die Arbeit nicht wie in der Warenproduktion Privatarbeit ist, die zugleich nur als gesellschaftliche Arbeit ihren Verrihter am Leben erhält.

“All essential determinations of value” can nevertheless be found. They are (α) the equality of all human labor insofar as it is expenditure of human labor-power, (β) the social significance of labor-time, and (γ) the existence of interactions between the producers through which their labors are integrated into the social labor process. The forms which (α), (β), and (γ) take may involve coercion and exploitation, but they are not mysterious. When discussing medieval society, Marx makes an important connection: if social relations are this transparent, exploitation is only possible through the direct exercise of force. He does not explicitly state the implication of this for capitalism: it can do away with the continual use of direct force only at the expense of being mystified.

At the end of this subsection, Marx looks at the character of religion in different societies. He claims that religion reflects the quality and transparency of social relations.

But now let us start with the detailed discussion:

169:2/o As political economists are fond of Robinson Crusoe stories,²⁹ let us first look at Robinson on his island. Undemanding though he is by nature, he still has needs to satisfy, and must therefore perform *useful labors of various kinds*: he must make tools, knock together furniture, tame llamas, fish, hunt, and so on. Of his prayers and the like we take no account here, since our friend takes pleasure in them and sees them as recreation. Despite the diversity of his productive functions, he knows that they are only different forms of activity of one and the same Robinson, hence only different modes of *human* labor. Necessity itself compels him to divide his *time* with precision between his different functions. Whether one function occupies a greater space in his total activity than another depends on the magnitude of the difficulties to be overcome in attaining the useful effect aimed at. Our friend Robinson Crusoe learns this by experience, and having saved a watch, ledger, ink and pen from the shipwreck, he soon begins like a good Englishman to keep a set of books. His stock-book contains a catalogue of the useful objects he possesses, of the *different* operations necessary for their production, and finally of the

90:2/o Da die politische Ökonomie Robinsonaden liebt,²⁹ erscheine zuerst Robinson auf seiner Insel. Bescheiden, wie er von Haus aus ist, hat er doch verschiedenartige Bedürfnisse zu befriedigen und muß daher *nützliche Arbeiten verschiedner Art* verrichten, Werkzeuge machen, Möbel fabricieren, Lama zähmen, fischen, jagen usw. Vom Beten u. dgl. sprechen wir hier nicht, da unser Robinson daran sein Vergnügen findet und derartige Tätigkeit als Erholung betrachtet. Trotz der Verschiedenheit seiner produktiven Funktionen weiß er, daß sie nur verschiedene Betätigungsformen desselben Robinson, also nur verschiedene Weisen *menschlicher* Arbeit sind. Die Not selbst zwingt ihn, seine *Zeit* genau zwischen seinen verschiedenen Funktionen zu verteilen. Ob die eine mehr, die andre weniger Raum in seiner Gesamttätigkeit einnimmt, hängt ab von der größeren oder geringeren Schwierigkeit, die zur Erzielung des bezweckten Nutzeffektes zu überwinden ist. Die Erfahrung lehrt ihn das, und unser Robinson, der Uhr, Hauptbuch, Tinte und Feder aus dem Schiffbruch gerettet, beginnt als guter Engländer bald Buch über sich selbst zu führen. Sein Inventarium enthält ein Verzeichnis der Gebrauchsgegenstände, die er

labor-time that specific quantities of these products have on average cost him. All the relations between Robinson and these objects that form his self-created wealth are here so simple and transparent that even Mr. Sedley Taylor could understand them. And yet those relations contain all the essential determinations of *value*.

besitzt, der *verschiednen* Verrichtungen, die zu ihrer Produktion erheischt sind, endlich der *Arbeitszeit*, die ihm bestimmte Quantität dieser verschiedenen Produkte im Durchschnitt kosten. Alle Beziehungen zwischen Robinson und den Dingen, die seinen selbstgeschaffnen Reichtum bilden, sind hier so einfach und durchsichtig, daß selbst Herr M. Wirth sie ohne besondere Geistesanstrengung verstehn dürfte. Und dennoch sind darin alle wesentlichen Bestimmungen des *Werts* enthalten.

The word “different” in “different operations” is underlined in the first edition, p. 45:1, to emphasize

that considered as useful labor, labors are not equal. The Fowkes-translation “various”

misses this, and the Moore-Aveling translation omits this attribute altogether.

Sedley Taylor is a fellow of Trinity College in Cambridge who had tried to slander Marx’s work, as described by Engels in the preface to the fourth German edition, p. 117:2/o.

Of course, it is not an accident that Robinson leads this gallery of examples. Many economics books at Marx’s time start with one-man economies. Every epoch touts its socially created form of the individual as the outgrowth of human nature. See *Grundrisse* 83:1–85:0 and 87:1 about this.

It is almost surprising that Marx did not say more about it here. The atomistic attitude by which everyone considers himself a Robinson is exactly what Marx suspected to be the origin of the fetish-like character of the commodity. Footnote 29 (new in the second edition, although Marx merely quotes himself from his earlier *Contribution*) is, in a veiled form, such a critique:

²⁹ Even Ricardo has his Robinson Crusoe story. ‘Ricardo makes his primitive fisherman and primitive hunter right away exchange their fish and game as owners of commodities, in proportion to the labor-time materialized in these exchange-values. On this occasion he slips into the anachronism of allowing the primitive fisherman and hunter to value their implements in accordance with the annuity tables used on the London Stock exchange in 1817.’

²⁹ Auch Ricardo ist nicht ohne seine Robinsonade. „Den Urfischer und Urjäger läßt er sofort als Warenbesitzer Fisch und Wild austauschen, im Verhältnis der in diesen Tauschwerten vergegenständlichten Arbeitszeit. Bei dieser Gelegenheit fällt er in den Anachronismus, daß Urfischer und Urjäger bei Berechnung ihrer Arbeitsinstrumente die 1817 auf der Londoner Börse gangbaren Annuitätentabellen zu Rate ziehen.“

The annuity tables are not the only anachronism. Exchange itself is already an anachronism. Members of primitive tribes are not isolated individuals who consider their products their private property and have nothing else in common with their fellow tribesmen than the equality of their labors. The dissolution of the social unity into many individuals which we experience in modern capitalism is *not* the natural state; it is the result of a long historical

process. Marx just made fun of the methodological individualism of mainstream economists by saying that they “are fond of Robinson Crusoe Stories” (first sentence in 169:2/o), and here he says that not even Ricardo escapes this.

Question 336 Why does Marx call Ricardo’s exchange between primitive fisherman and primitive hunter a “Robinson Crusoe story”?

In the conclusion of the footnote, Marx makes fun of Ricardo’s lack of any conception about non-capitalist societies:

^{29 ctd} ‘It seems that the “parallelograms of Mr. Owen” were the only form of society other than the bourgeois one which Ricardo was acquainted with.’ (Karl Marx, “A Contribution etc.,” pp. 38, 39.)

^{29 ctd} „Die ‚Parallelogramme des Herrn Owen‘ scheinen die einzige Gesellschaftsform, die er außer der bürgerlichen kannte.“ (Karl Marx, „Zur Kritik etc.“, p. 38, 39.)

‘Parallelograms’ were, according to the utopian socialist Robert Owen, the best layout for the streets in a worker’s settlement, so that everyone has to walk the same distance to the central assembly hall [Owe13]. Ricardo refers to this in [Ric22, p. 21].

After the footnote let us look at the main text. The essential determinations of value play an important role in Robinson’s one-man-society, although they are not expressed in relations between the products. Rather, they are reflected in the uses which Robinson makes of some of the things salvaged from the shipwreck, things which he found ready-made for him because they play important roles also in the society from which his ship came:

- (α) Despite their differences, all labors are performed by the same individual, Robinson.
- (β) Robinson uses his *watch* to keep track of how much labor-time is taken up by his various activities.
- (γ) The decision how to allocate his time efficiently, which is critical for his survival, does not involve a coordination of the actions of different producers, but a coordination between what Robinson does today and what he does tomorrow. Robinson’s logbook helps with these decisions.

Question 337 Which “social” forms do the three determinations of value take in Robinson’s one-man-society?

Since Robinson is alone, no direct coercion is involved. In this respect, Robinson is just the opposite of the example Marx brings next:

170:1 Let us now transport ourselves from Robinson’s island, bathed in light, to medieval Europe, shrouded in darkness. Here, instead of one independent man, we find everyone dependent—serfs and lords, vassals and suzerains, laymen and clerics.

91:1/o Versetzen wir uns nun von Robinsons lichter Insel in das finstre europäische Mittelalter. Statt des unabhängigen Mannes finden wir hier jedermann abhängig—Leibeigene und Grundherrschaften, Vasallen und Lehensgeber, Laien und Pfaffen. Persönli-

Personal dependence characterizes the social relations of material production as much as it does the other spheres of life based on that production. But precisely because relations of personal dependence form the given foundation, there is no need for labor and its products to assume a fantastic form different from their reality. They enter the social structure as services in kind and payments in kind. The natural form of labor, its particularity—and not, as in a society based on commodity production, its universality—is here its immediate social form. The *corvée* is as much measured by time as is the labor which produces commodities, but every serf knows that while serving his lord he expends a specific quantity of his own personal labor-power. The tithe owed to the priest is more clearly apparent than the priest's blessing. Whatever we may think, then, of the different character masks in which men confront each other in such a society, the social relations which individuals enter in the labor process do appear here as their own personal relations, and are not disguised as social relations between things, between the products of labor.

In medieval Europe, the three determinants of value play the following roles:

- (α) Not the generality but the particularity of the labor is its immediate social form. A tithe was usually paid in kind, and society even established standards regarding work procedures and use-values.
- (β) *Corvée* measured by time. Also the word “tithe” (one-tenth) designates a given proportion of the peasant family's *labor-time* regardless of how big the output turns out to be.
- (γ) Social relations take the form of personal relationships, not of relations between things. Nevertheless, the individuals are not the authors of these relations; the relations are mere character masks (see 178:1/o) forced on them by society. King by the grace of

che Abhängigkeit charakterisiert ebenso sehr die gesellschaftlichen Verhältnisse der materiellen Produktion als die auf ihr aufgebauten Lebenssphären. Aber eben weil persönliche Abhängigkeitsverhältnisse die gegebne gesellschaftliche Grundlage bilden, brauchen Arbeiten und Produkte nicht eine von ihrer Realität verschiedene phantastische Gestalt anzunehmen. Sie gehn als Naturaldienste und Naturalleistungen in das gesellschaftliche Getriebe ein. Die Naturalform der Arbeit, ihre Besonderheit, und nicht, wie auf Grundlage der Warenproduktion, ihre Allgemeinheit, ist hier ihre unmittelbar gesellschaftliche Form. Die Fronarbeit ist ebensogut durch die Zeit gemessen wie die Waren produzierende Arbeit, aber jeder Leibeigne weiß, daß es ein bestimmtes Quantum seiner persönlichen Arbeitskraft ist, die er im Dienst seines Herrn verausgabte. Der dem Pfaffen zu leistende Zehnten ist klarer als der Segen des Pfaffen. Wie man daher immer die Charaktermasken beurteilen mag, worin sich die Menschen hier gegenüber treten, die gesellschaftlichen Verhältnisse der Personen in ihren Arbeiten erscheinen jedenfalls als ihre eignen persönlichen Verhältnisse und sind nicht verkleidet in gesellschaftliche Verhältnisse der Sachen, der Arbeitsprodukte.

God, peasant or artisan by birth, etc. Also in medieval Europe, society did *not* consist of individuals.

Question 339 Which social forms do the three determinations of value take in Marx's example of medieval society?

The sentence: “Precisely because relations of personal dependence form the given foundation, there is no need for labor and its products to assume a fantastic form different from their reality” indirectly also says something about capitalism: After the dissolution of the feudal direct dependencies, exploitative relations could only reemerge as long as they were hidden under a mystified form. It will become clear also from things said later that Marx views it a necessary ingredient of capitalist exploitation that it be *hidden*.

Question 341 Explain Marx's statement in 170:1 that labor in medieval society did not take a social form different from its natural form.

171:1 For an example of labor in common, i.e., directly associated labor, there is no need to go back to the spontaneously developed form which we find at the threshold of the history of all civilized peoples.³⁰ We have one nearer to hand in the patriarchal rural industry of a peasant family which produces corn, cattle, yarn, linen and clothing for its own use. These things confront the family as so many products of its collective labor, but they do not confront each other as commodities. The different kinds of labor which create these products—such as tilling the fields, tending the cattle, spinning, weaving and making clothes—are already in their natural form social functions; for they are functions of the family, which, just as much as a society based on commodity production, possesses its own spontaneously developed division of labor. The distribution of labor within the family and the labor-time expended by the individual members of the family are regulated by differences of gender and age as well as by seasonal variations in the natural conditions of labor.

92:1 Für die Betrachtung gemeinsamer, d.h. unmittelbar vergesellschafteter Arbeit brauchen wir nicht zurückzugehen zu der naturwüchsigen Form derselben, welche uns an der Geschichtsschwelle aller Kulturvölker begegnet.³⁰ Ein näher liegendes Beispiel bildet die ländlich patriarchalische Industrie einer Bauernfamilie, die für den eignen Bedarf Korn, Vieh, Garn, Leinwand, Kleidungsstücke usw. produziert. Diese verschiedenen Dinge treten der Familie als verschiedene Produkte ihrer Familienarbeit gegenüber, aber nicht sich selbst wechselseitig als Waren. Die verschiedenen Arbeiten, welche diese Produkte erzeugen, Ackerbau, Viehzucht, Spinnen, Weben, Schneiderei usw. sind in ihrer Naturalform gesellschaftliche Funktionen, weil Funktionen der Familie, die ihre eigne, naturwüchsige Teilung der Arbeit besitzt so gut wie die Warenproduktion. Geschlechts- und Altersunterschiede wie die mit dem Wechsel der Jahreszeit wechselnden Naturbedingungen der Arbeit regeln ihre Verteilung unter die Familie und die Arbeitszeit der einzelnen Familienglieder.

⇓ These labors therefore do not have to be reduced to abstract labor in order to be integrated into the social context:

The time-measured expenditure of the individual labor-powers takes here from the outset the form of an social attribute of these labors themselves, since the individual labor-powers act, from the outset, only as organs of the family's joint labor-power.

Die durch die Zeitdauer gemeßne Verausgabung der individuellen Arbeitskräfte erscheint hier aber von Haus aus als gesellschaftliche Bestimmung der Arbeiten selbst, weil die individuellen Arbeitskräfte von Haus aus nur als Organe der gemeinsamen Arbeitskraft der Familie wirken.

↑ Marx speaks here about expenditure of labor-power in the context of a patriarchal peasant family. Does this mean this labor counts as abstract labor? No. The rules in this mini-society of a family are: certain jobs have to be done; chicken have to be fed, the fields have to be tilled. Feeding the chickens is children's labor, cooking is women's labor, and tilling is men's labor.

Primitive societies, but also rural patriarchal industry serve as examples of joint labor:

- (α) The physiological truth that all labors are *equal* has no social significance. The question who does what is determined exactly by the *differences* of age and gender. This division of labor is "spontaneously developed" (*naturwüchsig*), i.e., it is based on tradition instead of the free decision and consent of the participants.
- (β) Labor-time is assigned along with the tasks in (α); the work load varies seasonally (i.e., in certain months they have to work a lot, and in others they may have lots of free time).
- (γ) All work is performed in direct coordination, workers are "organs" of the whole family. No special social forms are needed except perhaps traditional ways of doing things and of division of labor.

The different determinations are not separated here. Mental abstraction is necessary to extract them from the direct co-operation of the family members.

Question 342 Which social forms do the three determinations of value take in Marx's example of a self-sufficient peasant family?

Question 343 In 171:1, Marx says about the patriarchal self-sufficient peasant household: "The time-measured expenditure of the individual labor-powers takes here from the outset the form of a social attribute of these labors themselves ..." Does this mean that in this household labor is social labor as abstract labor, as argued in [Kur87]?

Footnote 30, new in the second edition (but, like Footnote 29, a quote from the earlier *Contribution*), argues that the original state of society was indeed communal property:

³⁰ 'A ridiculous notion has spread recently that communal property in its natural, sponta-

³⁰ „Es ist ein lächerliches Vorurteil in neuester Zeit verbreitet, daß die Form des naturwüchsi-

neous form is specifically Slav, indeed exclusively Russian. In fact, it is the primitive form that we can prove to have existed among Romans, Teutons and Celts, and which indeed still exists to this day in India, in a whole range of diverse patterns, albeit sometimes only as remnants. A more exact study of the Asiatic, and specifically of the Indian form of communal property would show how different forms of spontaneous, primitive communal property lead to different forms of its dissolution. Thus the different original types of Roman and Germanic private property can be deduced from the different forms of Indian communal property'. (Karl Marx, *Zur Kritik etc.*, p. 10.)

Marx's last example is a mode of production which does not yet exist, socialism:

171:2/o Let us finally imagine, for a change, an association of free individuals, working with the means of production held in common, in which the labor-power of all the different individuals is consciously applied as the combined labor-power of the community.

"Imagining" (*vorstellen*) is a pre-scientific form of thinking. Concerning future modes of production, Marx claims that not much else is possible. This "imagination" also quietly rebuts the notion that the capitalist economy is the only imaginable one.

gen Gemeineigentums spezifisch slawische, sogar ausschließlich russische Form sei. Sie ist die Urform, die wir bei Römern, Germanen, Kelten nachweisen können, von der aber eine ganze Musterkarte mit mannigfachen Proben sich noch immer, wenn auch zum Teil ruinenweise, bei den Indiern vorfindet. Ein genaueres Studium der asiatischen, speziell der indischen Gemeineigentumsformen würde nachweisen, wie aus den verschiedenen Formen des naturwüchsi-gen Gemeineigentums sich verschiedene Formen seiner Auflösung ergeben. So lassen sich z.B. die verschiedenen Originaltypen von römischem und germanischem Privateigentum aus verschiedenen Formen des indischen Gemeineigentums ableiten." (Karl Marx, „Zur Kritik etc.“, p. 10.)

92:2/o Stellen wir uns endlich, zur Abwechslung, einen Verein freier Menschen vor, die mit gemeinschaftlichen Produktionsmitteln arbeiten und ihre vielen individuellen Arbeitskräfte selbstbewußt als *eine* gesellschaftliche Arbeitskraft verausgaben.

My translation of the second half of the sentence leans on the Moore-Aveling translation which is free but excellent. Moore-Aveling write:

Let us now picture to ourselves, by way of change, a community of free individuals, carrying on their work with the means of production in common, in which the labor-power of all the different individuals is

consciously applied as the combined labor-power of the community.

Fowkes translates the second half as:

expending their many different forms of labour-power in full self-awareness as one single social labour force.

This is closer to the German but far less clear. Fowkes's efforts to make the text run smoothly introduce unwanted connotations

and obscure the meaning. His translation suggests that the organization is by *kind* of labor (the form of the labor-power) rather than by *individual* circumstances, and by translating "Arbeitskraft" the first time with "labor-power" and the second time with "labor force" the message is lost that in socialism each individual labor-power is treated as equal part of the social labor-power. Marx wrote "selbstbewußt" because the individuals are conscious about how they *themselves* are linked into the social connection; Fowkes's "self-awareness" does not capture this at all.

In socialism, each individual labor-power is treated as part of the social labor-power. In this respect socialism resembles commodity production, but this time the pooling of the individual labor-powers is done *consciously* rather than as the unintended byproduct of market competition.

All the characteristics of Robinson's labor are repeated here, but with the difference that they are *social* instead of *individual*. All of Robinson's products were exclusively the result of his own personal labor and they were therefore directly objects of utility for him personally. The total product of our imagined association is a *social* product. One part of this product serves as fresh means of production and remains social. But another part is consumed by the members of the association as means of subsistence. This part must therefore be *divided* amongst them. The way this division is made will vary with the particular kind of social organization of production and the corresponding level of social development attained by the producers. We shall assume, but only for the sake of a parallel with the production of commodities, that the share of each individual producer in the means of subsistence is determined by his *labor-time*. Labor-time would in that case play a double part. Its apportionment in accordance with a definite social plan maintains the correct proportion between the different functions of labor and the various needs of the associations. On the other hand, labor-time also serves as a measure of the contribution of each individual to the common labor, and of his share in the part of the total product destined for individual consumption. The social relations of the individual producers, both towards their labor and the products of their labor, are here transparent in their simplicity, in production as well as in distribution.

Alle Bestimmungen von Robinsons Arbeit wiederholen sich hier, nur *gesellschaftlich* statt *individuell*. Alle Produkte Robinsons waren sein ausschließlich persönliches Produkt und daher unmittelbar Gebrauchsgegenstände *für* ihn. Das Gesamtprodukt des Vereins ist ein *gesellschaftliches* Produkt. Ein Teil dieses Produkts dient wieder als Produktionsmittel. Er bleibt gesellschaftlich. Aber ein anderer Teil wird als Lebensmittel von den Vereinsgliedern verzehrt. Er muß daher unter sie *verteilt* werden. Die Art dieser Verteilung wird wechseln mit der besondern Art des gesellschaftlichen Produktionsorganismus selbst und der entsprechenden geschichtlichen Entwicklungshöhe der Produzenten. Nur zur Parallele mit der Warenproduktion setzen wir voraus, der Anteil jedes Produzenten an den Lebensmitteln sei bestimmt durch seine *Arbeitszeit*. Die Arbeitszeit würde also eine doppelte Rolle spielen. Ihre gesellschaftlich planmäßige Verteilung regelt die richtige Proportion der verschiedenen Arbeitsfunktionen zu den verschiedenen Bedürfnissen. Andererseits dient die Arbeitszeit zugleich als Maß des individuellen Anteils des Produzenten an der Gemeinschaftsarbeit und daher auch an dem individuell verzehrbaren Teil des Gemeinschaftsprodukts. Die gesellschaftlichen Beziehungen der Menschen zu ihren Arbeiten und ihren Arbeitsprodukten bleiben hier durchsichtig einfach in der Produktion als auch in der Distribution.

All determinations of Robinson's labor are repeated, but this time socially instead of individually.

- (α) People consciously treat everyone's labor-power as one social labor-power. Instead of the market automatism, which forces the participants to equalize their labors, Marx envisages conscious decisions about who should do what, reconciling social necessities with individual skills and preferences.
- (β) Labor-time is not only a relevant factor in the production decision, but here it is also assumed to be the criterion for distribution. Thus labor-time has *two* roles. It has this same dual role in commodity production, although the mechanism is quite different.
- (γ) Social relations (association of free individuals) are transparent.

Question 344 Which social forms do the three determinations of value take in Marx's example of a socialist society?

In this example of a socialist society, a transformational view as we found it in 163:3/o is not evident. It rather evokes a Rousseau-type scenario of "free," i.e., independent, individuals coming together to arrange their production. On the other hand, Marx is aware that this isolation of the individuals is not their natural state but the result of a long social process.

Religion is not only a metaphor for commodity fetishism, it is a social phenomenon which needs its own explanation. The next two paragraphs discuss the connection between the mystifications of social relations and religion. They also give important information about how Marx viewed the relationship between productive powers (technology), relations of production, and "superstructural" phenomena such as religion.

172:1/o For a society of commodity producers, whose general social relation of production consists in the fact that they treat their products as *commodities*, hence as *values*, and in this objectified form bring their private labors into relation with each other as *homogeneous human labor*, *Christianity* with its religious cult of the abstract human, especially in its bourgeois development, i.e., in Protestantism, Deism, etc., is the most fitting *form of religion*.

93:1/o Für eine Gesellschaft von Warenproduzenten, deren allgemein gesellschaftliches Produktionsverhältnis darin besteht, sich zu ihren Produkten als *Waren*, also als *Werten* zu verhalten, und in dieser sachlichen Form ihre Privatarbeiten aufeinander zu beziehen als *gleiche menschliche Arbeit*, ist das *Christentum*, mit seinem Kultus des abstrakten Menschen, namentlich in seiner bürgerlichen Entwicklung, dem Protestantismus, Deismus usw., die entsprechendste *Religionsform*.

Just as the value relation abstracts from the concrete usefulness of labor and from the individual circumstances of production, so Christianity also makes an abstraction: namely, from some of the more "bodily" aspects of humans. Just as the labor process must rise above its local and traditional character to withstand the test of the market, so humans must strip off

their bodily encumbrances to become pure souls. But this correspondence between religion and commodity relations only holds for modern religions in modern time. Religion is a very old phenomenon, and the question arises how the old religions related to the socio-economic conditions of their time. This will be discussed next.

Question 345 *In what ways can Christianity and the commodity relation be considered similar?*

In the ancient Asiatic, classical-antique, and other such modes of production, the transformation of the product into a commodity, and therefore individuals in the capacity of commodity producers, play a subordinate role—although this role increases in importance as these communities approach nearer and nearer to the stage of their dissolution. Trading nations, properly so called, exist only in the interstices of the ancient world, like the gods of Epicurus in the intermundia, or Jews in the pores of Polish society.

Since the commodity relation was subordinate in the ancient modes of production, it must be ruled out as the material basis for the ancient religions. Next, Marx also rules out any other complexity or obscurity of social relations, and then gives his explanation of the religions of those times:

Those ancient social production-organisms are a lot simpler and more transparent than those of bourgeois society. But they are based either on the immaturity of humans as individuals, who have not yet torn themselves loose from the umbilical cord of their natural species-connection with other humans, or on direct relations of dominance and servitude. They are conditioned by a low stage of development of the productive powers of labor, and by correspondingly limited relations of men within the process of creating and reproducing their material life, hence also between each other and between man and nature. These real limitations are reflected in the ancient worship of

In den altasiatischen, antiken usw. Produktionsweisen spielt die Verwandlung des Produkts in Ware, und daher das Dasein des Menschen als Warenproduzenten, eine untergeordnete Rolle, die jedoch um so bedeutender wird, je mehr die Gemeinwesen in das Stadium ihres Untergangs treten. Eigentliche Handelsvölker existieren nur in den Intermundien der alten Welt, wie Epikurs Götter, oder wie Juden in den Poren der polnischen Gesellschaft.

Jene alten gesellschaftlichen Produktionsorganismen sind außerordentlich viel einfacher und durchsichtiger als der bürgerliche, aber sie beruhen entweder auf der Unreife des individuellen Menschen, der sich von der Nabelschnur des natürlichen Gattungszusammenhangs mit andren noch nicht losgerissen hat, oder auf unmittelbaren Herrschafts- und Knechtschaftsverhältnissen. Sie sind bedingt durch die niedrige Entwicklungsstufe der Produktivkräfte der Arbeit und entsprechend befangene Verhältnisse der Menschen innerhalb ihres materiellen Lebenserzeugungsprozesses, daher zueinander und zur Natur. Diese wirkliche Befangenheit spiegelt sich ideell wider in

nature, and in other elements of tribal religions.

Marx gives two reasons for the early religions: immaturity of the individual and direct relations of dominance and subordination. Both are conditioned by the low development of productivity, which allows only limited relations within the production process, therefore also in society at large (compare also footnote 89 to paragraph 492:3/o in the machinery chapter and a brief remark in 927:3/o in the chapter about the historical tendency). Religions which are worship of nature are evidently based in the low level of productive forces, and tribal religions in the immaturity of individuals who have not yet cut their umbilical chord to the tribe.

It seems that this “immaturity” of the individual is not considered here to be generated by the social relations. Apparently, Marx sees an independent historical development also on the level of interpersonal relations, which is conditioned by, but not reducible to, and presumably slower than, the succession of social modes of production. Relevant here is also Marx’s remark in 775:1/o that “the soil of commodity production can bring forth production on a large-scale only in capitalist form.”

Question 346 *In the sentence: “[The ancient social production-organisms] are conditioned by a low stage of development of the productive powers of labor, and by correspondingly limited relations of men within the process of creating and reproducing their material life, hence also between each other and between man and nature,” Marx describes the relationship between the following three: productive forces (i.e., technology), the relations^[2] in the production process, and social relations^[1] at large. Rephrase this relationship in your own words.*

Marx concludes his discussion of religion with a statement about the conditions under which religion can “fade away.” For this, he returns to the modern conditions, in which religion cannot be explained by the immaturity or the direct subordination of the individual, but by the mystification of the social relations:

The echo of the real world in religions of any kind can fade away only when the relations of everyday practical activity present themselves to the individuals all the time as transparently rational interactions with each other and with nature. The mystical veil will not be lifted from the countenance of the social life-process, i.e., of the process of material production, until it becomes the product of freely associated men, and stands under their conscious and planned control.

den alten Natur- und Volksreligionen.

Der religiöse Widerschein der wirklichen Welt kann überhaupt nur verschwinden, sobald die Verhältnisse des praktischen Werktagslebens den Menschen tagtäglich durchsichtig vernünftige Beziehungen zueinander und zur Natur darstellen. Die Gestalt des gesellschaftlichen Lebensprozesses, d.h. des materiellen Produktionsprozesses, streift nur ihren mystischen Nebelschleier ab, sobald sie als Produkt frei vergesellschafteter Menschen unter deren bewußter planmäßiger Kontrolle steht.

Mankind's ability to seize this social control is the result of developments which are beyond its control:

This, however, requires that society possess a material foundation, or a number of material conditions of existence, which in their turn are the natural and spontaneous product of a long and painful historical development.

Dazu ist jedoch eine materielle Grundlage der Gesellschaft erheischt oder eine Reihe materieller Existenzbedingungen, welche selbst wieder das naturwüchsige Produkt einer langen und qualvollen Entwicklungsschichte sind.

1.4.e. [The Fetishism of Bourgeois Political Economy]

The mystification of the commodity relation not only makes people religious, it also breeds the science of "bourgeois economics." Subsection 1.4.c derived the necessity of such a scientific enterprise from the spontaneous theoretical needs of those participating in a fetish-like economy. The emancipatory potential, which this science has like any science, is overshadowed by its social function. Its passivity, and the hopeless starting point with the finished surface categories emphasized in 1.4.c, are the legacies imprinted on this science by the social need that spawned it. But the ability of bourgeois economics to satisfy its social role—instead of leading to emancipatory action—depends not only on its method but also on the theories it provides. Subsection 1.4.e concentrates on the basic theoretical errors of bourgeois economics. These errors show that bourgeois economics is the institutionalization of commodity fetishism.

173:1/oo Political economy has indeed, however incompletely,³¹ analyzed value and its magnitude, and has uncovered the content concealed within these forms. But it has never once asked why this content takes that form, that is to say, why labor is expressed *in value*, and why the measure of labor by its duration is expressed in the *magnitude of the value* of the product.³² These forms, which have it written on their foreheads that they belong to a social formation in which the production process has the mastery over men, and man does not yet master the production process, are considered by the political economists' bourgeois consciousness to be self-evident and nature-imposed necessities, just as necessary as productive labor itself.

94:1/oo Die politische Ökonomie hat nun zwar, wenn auch unvollkommen,³¹ Wert und Wertgröße analysiert und den in diesen Formen versteckten Inhalt entdeckt. Sie hat niemals auch nur die Frage gestellt, warum dieser Inhalt jene Form annimmt, warum sich also die Arbeit *im Wert* und das Maß der Arbeit durch ihre Zeitdauer in der *Wertgröße* des Arbeitsprodukts darstellt?³² Formen, denen es auf der Stirn geschrieben steht, daß sie einer Gesellschaftsformation angehören, worin der Produktionsprozeß die Menschen, der Mensch noch nicht den Produktionsprozeß bemeistert, gelten ihrem bürgerlichen Bewußtsein für ebenso selbstverständliche Naturnotwendigkeit als die produktive Arbeit selbst.

Question 348 *Can labor be measured in other ways than in time?*

1. The Commodity

In German, the third sentence above reads: "*Formeln, denen es auf der Stirn geschrieben steht . . .*" This seems to be a typographical error in the second and later German editions. I assume it

should be "*Formen*" instead of "*Formeln*." Apparently this error was never corrected except in the French translation. (It says "*Formen*" in the First edition and "*formes*" in the French edition.)

By the way, the enlightening phrase "why this content takes that form" was, inexplicably to me, omitted in the Moore-Aveling translation!

"Forms which have it written on their foreheads": Marx's first criticism of bourgeois political economy is *not* its inability to accurately decipher these forms, but its failure to ask those questions which led him to write section 1.4, compare page 181 above. Although the immanent theoretical development cries out for a scrutiny of the historical character of these forms and the conditions under which they can endure, bourgeois economists do not ask this question. This shows that they suffer under the higher forms of fetishism discussed earlier in 166:2/o.

In footnote 89 to paragraph 492:3/o at the beginning of the Machinery chapter, Marx reiterates the importance of not just deciphering the forms, but also understanding how they arose.

Besides its silence on the most crucial question it should have asked, bourgeois economics also made errors in answering those questions which it did ask. The long footnotes 31 and 32 detail the immanent shortcomings of political economy. The first footnote concentrates on the substance of value (after deferring the discussion of the quantity of value to later), and the second on the form of value.

³¹ The insufficiency of Ricardo's analysis of the magnitude of value—and his analysis is by far the best—will become apparent from the third and fourth books of this work.

By this Marx means *Capital III* and *Theories of Surplus Value*. The quantity of value will therefore not be discussed here. But its quality will:

^{31 ctd} As regards value itself, classical political economy nowhere distinguishes explicitly and with full awareness between the labor represented in the value of a product and the same labor manifest in its use-value.

³¹ Das Unzulängliche in Ricardo's Analyse der Wertgröße—und es ist die beste—wird man aus dem dritten und vierten Buch dieser Schrift ersehen.

^{31 ctd} Was aber den Wert überhaupt betrifft, so unterscheidet die klassische politische Ökonomie nirgendwo ausdrücklich und mit klarem Bewußtsein die Arbeit, die sich im Wert, von derselben Arbeit, die sich im Gebrauchswert ihres Produkts darstellt.

Question 350 *Marx writes that "classical political economy nowhere makes the explicit and consciously clear distinction between the labor represented in the value of a product and the same labor manifest in its use-value." If it is the same labor, how can one distinguish it?*

Although classical economists do not make this distinction *explicitly* and with *full awareness*, the subject of their science, the economy, induces them to make this distinction *implicitly* and *without knowing it*:

^{31 ctd} Of course the classical economists do, in actual fact, make this distinction, for they treat labor sometimes from its quantitative aspect, and at other times qualitatively. It does not occur to them that a purely quantitative difference between different kinds of labor presupposes their qualitative unity or equality, and therefore their reduction to abstract human labor.

These general remarks are backed up by a very specific “smoking-gun” proof that Ricardo was not aware of the distinction between concrete and abstract labor.

^{31 ctd} For instance, Ricardo declares himself in agreement with Destutt de Tracy when the latter says: ‘As it is certain that our physical and moral faculties are alone our original riches, the employment of those faculties, labor of some kind, is our original treasure, and it is always from this employment that all those things are created which we call riches ... It is certain, too, that all those things only represent the labor which has created them, and if they have a value, or even two distinct values, they can only derive them from that’ (the value) ‘of the labor from which they emanate’ (Ricardo, *The Principles of Political Economy*, 3rd Edn, London, 1821, p. 334).

With the two distinct values of a commodity Destutt means use-value and exchange-value. If Ricardo agrees with Destutt that both of these come from labor, instead of correcting Destutt that use-value comes from concrete and exchange-value from abstract labor, then this is incontrovertible evidence that Ricardo is *not* aware of the difference between the two aspects of labor.

Marx is conscientious enough to point out an additional wrinkle in his example, which is however less relevant for the subject under discussion: the passage quoted from Destutt also contains a blatant contradiction, and Ricardo only picks up one of the two contradictory messages—namely the correct one:

^{31 ctd} I shall content myself here with pointing out that Ricardo puts his own more profound interpretation upon the words of Destutt. The Frenchman does, in fact, say on the one hand that all things which constitute wealth ‘represent the labor which has created them,’ but he also says, on the other hand, that they acquire their ‘two different values’ (use-value and exchange-value) from ‘the value of labor.’ He thus lapses into the shallowness of the vulgar economist, who pre-

^{31 ctd} Sie macht natürlich den Unterschied tatsächlich, da sie die Arbeit das einmal quantitativ, das andermal qualitativ betrachtet. Aber es fällt ihr nicht ein, daß bloß quantitativer Unterschied der Arbeiten ihre qualitative Einheit oder Gleichheit voraussetzt, also ihre Reduktion auf abstrakt menschliche Arbeit.

^{31 ctd} Ricardo z.B. erklärt sich einverstanden mit Destutt de Tracy, wenn dieser sagt: „Da es sicher ist, daß unsere körperlichen und geistigen Fähigkeiten allein unser ursprünglicher Reichtum sind, ist der Gebrauch dieser Fähigkeiten, eine gewisse Art Arbeit, unser ursprünglicher Schatz; es ist immer dieser Gebrauch, welcher alle jene Dinge schafft, die wir Reichtum nennen ... Zudem ist es gewiß, daß alle jene Dinge nur die Arbeit darstellen, die sie geschaffen hat, und wenn sie einen Wert haben, oder sogar zwei unterschiedliche Werte, so können sie dies doch nur haben aus dem“ (dem Wert) „der Arbeit, dem sie entspringen.“ (Ricardo, „The Principles of Political Economy“, 3. ed., Lond. 1821, p. 334.)

^{31 ctd} Wir deuten nur an, daß Ricardo dem Destutt seinen eigenen tieferen Sinn unterschiebt. Destutt sagt in der Tat zwar einerseits, daß alle Dinge, die den Reichtum bilden, „die Arbeit repräsentieren, die sie geschaffen hat,“ aber andererseits, daß sie ihre „zwei verschiednen Werte“ (Gebrauchswert und Tauschwert) vom „Wert der Arbeit“ erhalten. Er fällt damit in die Flachheit der Vulgärökonomie, die den Wert einer Ware (hier der Arbeit) voraussetzt, um dadurch hinter-

supposes the value of one commodity (labor, in this case) so that he can then determine the values of the other commodities. But Ricardo reads him as if he had said that labor (not the value of labor) is represented both in use-value and in exchange-value.

The point that value comes from labor itself, not from the value of labor, will be made in great detail in chapter Nineteen.

Question 351 *Are there any errors in the following passage by Destutt the Tracy? If so, what are they?*

As it is certain that our physical and moral faculties are alone our original riches, the employment of those faculties, labor of some kind, is our original treasure, and it is always from this employment that all those things are created which we call riches ... It is certain, too, that all those things only represent the labor which has created them, and if they have a value, or even two distinct values, they can only derive them from that of the labor from which they emanate.

The rest of the footnote is more to the point again. Ricardo’s failure to distinguish between the two aspects of labor makes it difficult for him to rebut Say’s trivialities. In Marx’s view, Ricardo had the right instincts, but had difficulties arguing his point because he did not distinguish between concrete and abstract labor.

^{31 ctd} Nevertheless, Ricardo himself pays so little attention to the twofold character of labor behind its twofold expression, that his whole chapter ‘Value and Riches, their Distinctive Properties’ is largely devoted to laborious refutation of the trivialities of a J. B. Say.

Finally, footnote 31 concludes with another reference to Destutt:

^{31 ctd} And at the end he is therefore quite astonished to find that while Destutt agrees with him that labor is the source of value, Destutt nevertheless also agrees with Say about the concept of value.

All this is simultaneously subtle and condensed, and only someone with an intimate knowledge of Ricardo will be able to fully appreciate this argument.

The second footnote, number 32, clarifies an additional detail which the main text brings only implicitly. It emphasizes that political economy investigated value and the magnitude of value, but it never even discovered the form of value—because this would have led to questions it wanted to avoid.

her den Wert der andren Waren zu bestimmen. Ricardo liest ihn so, daß sowohl im Gebrauchswert als Tauschwert sich Arbeit (nicht Wert der Arbeit) darstellt.

^{31 ctd} Er selbst aber scheidet so wenig den zwieschlächtigen Charakter der Arbeit, die doppelt dargestellt ist, daß der in dem ganzen Kapitel: „Values and Riches, their Distinctive Properties“ sich mühselig mit den Trivialitäten eines J. B. Say herumschlagen muß.

^{31 ctd} Am Ende ist er daher auch ganz erstaunt, daß Destutt zwar mit ihm selbst über Arbeit als Wertquelle und dennoch andererseits mit Say über den Wertbegriff harmoniere.

³² It is one of the chief failings of classical political economy that it has never pursued the analysis of commodities and more specifically of commodity value to the point where it yields the form of value, i.e., that what turns value into exchange-value. Even its best representatives, Adam Smith and Ricardo, treat the form of value as something quite indifferent or extraneous to the nature of the commodity itself.

It is not only important to know what value is and how its magnitude is determined, but also to relate the form which value takes on the surface of the economy, i.e., the exchange relation of commodities, to its quality and quantity. The reason why this aspect is so often ignored is twofold. On the one hand, the practical activity on the market does not throw up this question, but first and foremost requires an explanation of the magnitude of value. On the other hand, even the best representatives of bourgeois political economy consider the capitalist form of production as the eternally given one. This causes them to overlook the specificity of the value form.

^{32 ctd} The reason for this is not solely that their attention is entirely absorbed by the analysis of the magnitude of value. It lies deeper. The value form of the product of labor is the most abstract, but also the most general form of the bourgeois mode of production. It characterizes this mode of production as a particular species of social production, and therewith as one of a historical and transitory character. If one considers it to be the eternal natural form of social production, one necessarily overlooks the specificity of the value form as well—and consequently that of the commodity form, together with its further developments, the money form, the capital form, etc.

Again, this general claim is backed by specific examples. Marx brings two arguments why economists who understand that value comes from labor nevertheless do not understand money: (1) the theories they come up with contradict each other, and (2) these errors become especially apparent when they theorize the higher forms of money, such as the banking system. The fear to unmask the capitalist system interferes more with the explanation of the more developed forms than that of the most basic and abstract ones:

^{32 ctd} That is why certain economists who are entirely agreed that labor-time is the measure of the magnitude of value, have the strangest and most contradictory notions concerning money, the universal equivalent in its finished form. This emerges sharply when they deal with banking, where the commonplace definitions of money

³² Es ist einer der Grundmängel der klassischen politischen Ökonomie, daß es ihr nie gelang, aus der Analyse der Ware und spezieller des Warenwerts die Form des Werts, die ihn eben zum Tauschwert macht, herauszufinden. Gerade in ihren besten Repräsentanten, wie A. Smith und Ricardo, behandelt sie die Wertform als etwas ganz Gleichgültiges oder der Natur der Ware selbst äußerliches.

^{32 ctd} Der Grund ist nicht allein, daß die Analyse der Wertgröße ihre Aufmerksamkeit ganz absorbiert. Er liegt tiefer. Die Wertform des Arbeitsprodukts ist die abstrakteste, aber auch allgemeinste Form der bürgerlichen Produktionsweise, die hierdurch als eine besondere Art gesellschaftlicher Produktion und damit zugleich historisch charakterisiert wird. Versieht man sie daher für die ewige Naturform gesellschaftlicher Produktion, so übersieht man notwendig auch das Spezifische der Wertform, also der Warenform, weiter entwickelt in der Geldform, Kapitalform usw.

^{32 ctd} Man findet daher bei Ökonomen, welche über das Maß der Wertgröße durch Arbeitszeit durchaus übereinstimmen, die kunterbuntesten und widersprechendsten Vorstellungen von Geld, d.h. der fertigen Gestalt des allgemeinen Äquivalents. Dies tritt schlagend hervor z.B. bei der Behandlung des Bankwesens, wo mit den

will no longer do. Hence there has arisen in opposition to the classical economists a restored Mercantilist System (Ganilh etc.), which sees in value only the social form, or rather the insubstantial ghost of that form.—

↑ The error Marx is alluding to here is that of considering money to be only a social agreement and forget its substance. Marx will say more about this in chapter Two, 184:3/oo.

Question 352 *How are the errors which bourgeois economics makes in those questions which it tries to answer related to the question which it did not want to ask?*

Question 353 *What did and what didn't the classical economists find out?*

A detailed sociology-of-science explanation of the role of political economy is given in the afterword to the second edition, see e.g. 96:3/o. Here only the following remark:

^{32 ctd} Let me point out once and for all that by classical political economy I mean all the economists who, since the time of W. Petty, have investigated the real inner structure of bourgeois relations of production, as opposed to the vulgar economists who only flounder around within the apparent structure of those relations, ceaselessly ruminate on the materials long since provided by scientific political economy, in order to lend plausibility to the crudest phenomena for bourgeois daily food. Apart from this, the vulgar economists confine themselves to systematizing in a pedantic way, and proclaiming for everlasting truths, the banal and complacent notions held by the bourgeois agents of production about their own world, which is to them the best possible one.

Question 354 *What is Marx's difference between bourgeois economists and vulgar economists?*

Let us now return from the footnotes to the main text, which was not so much concerned with the factual theoretical errors of political economy but with its uncritical avoidance of certain questions. Since mainstream political economy accepts the historically specific forms as nature-given necessities, it has no better way out, when confronted with historically different economic formations, than a religion that is confronted with other religions: Hence the pre-bourgeois forms of the social organization of production are treated by political economy in much the same way

gemeinplätzlichen Definitionen des Geldes nicht mehr ausgereicht wird. Im Gegensatz entsprang daher ein restauriertes Merkantilssystem (Ganilh usw.), welches im Wert nur die gesellschaftliche Form sieht oder vielmehr nur ihren substanzlosen Schein.—

^{32 ctd} Um es ein für allemal zu bemerken, verstehe ich unter klassischer politischer Ökonomie alle Ökonomie seit W. Petty, die den innern Zusammenhang der bürgerlichen Produktionsverhältnisse erforscht im Gegensatz zur Vulgärökonomie, die sich nur innerhalb des scheinbaren Zusammenhangs herumtreibt, für eine plausible Verständlichmachung der sozusagen grössten Phänomene und den bürgerlichen Hausbedarf das von der wissenschaftlichen Ökonomie längst gelieferte Material stets von neuem wiederkauft, im übrigen aber sich darauf beschränkt, die banalen und selbstgefälligen Vorstellungen der bürgerlichen Produktionsagenten von ihrer eigenen besten Welt zu systematisieren, pedantisieren und als ewige Wahrheiten zu proklamieren.

Vorbürgerliche Formen des gesellschaftlichen Produktionsorganismus werden daher von ihr behandelt wie etwa von den Kir-

as pre-Christian religions were treated by the Fathers of the Church.³³

With this, Marx dives into another long footnote. It elaborates on the inadequate treatment of pre-bourgeois modes of production by political economy, stemming from their failure to recognize the historical specificity of their own mode of production, and then says something about modes of production in general. It starts with a quote from *Misery of Philosophy*:

³³ “The economists have a singular way of proceeding. For them, there are only two kinds of institutions, artificial and natural. The institutions of feudalism are artificial institutions, those of the bourgeoisie are natural institutions. In this they resemble the theologians, who likewise establish two kinds of religion. Every religion which is not theirs is an invention of men, while their own is an emanation of God . . . Thus there has been history, but there is no longer any.” (Karl Marx, *Misère de la philosophie. Réponse à la philosophie de la misère de M. Proudhon*, 1847, p. 113).

The example of a blatant mis-representation of earlier economies by a bourgeois economist illustrates this general statement:

^{33 ctd} Truly comical is M. Bastiat, who imagines that the ancient Greeks and Romans lived by plunder alone. For if people live by plunder for centuries there must, after all, always be something there to plunder; in other words, the objects of plunder must be continually reproduced. It seems, therefore, that even the Greeks and the Romans had a process of production, hence an economy, which constituted the material basis of their world as much as the bourgeois economy constitutes that of the present-day world. Or perhaps Bastiat means that a mode of production based on the labor of slaves is based on a system of plunder? In that case he is on dangerous ground. If a giant thinker like Aristotle could err in his assessment of slave labor, why should a dwarf economist like Bastiat be right in his assessment of wage labor?

If Bastiat means by plunder the plundering of the defeated provinces, then the argument is that the things plundered must also be produced. If Bastiat means that slave labor is plunder, then one has to wonder whether wage labor should be called plunder too.

chenvätern vorchristliche Religionen.³³

³³ „Die Ökonomen verfahren auf eine sonderbare Art. Es gibt für sie nur zwei Arten von Institutionen, künstliche und natürliche. Die Institutionen des Feudalismus sind künstliche Institutionen, die der Bourgeoisie natürliche. Sie gleichen darin den Theologen, die auch zwei Arten von Religionen unterscheiden. Jede Religion, die nicht die ihre ist, ist eine Erfindung der Menschen, während ihre eigene Religion eine Offenbarung Gottes ist.—Somit hat es eine Geschichte gegeben, aber es gibt keine mehr.“ (Karl Marx, *Misère de la philosophie. Réponse à la philosophie de la misère de M. Proudhon*, 1847, p. 113.)

^{33 ctd} Wahrhaft drollig ist Herr Bastiat, der sich einbildet, die alten Griechen und Römer hätten nur von Raub gelebt. Wenn man aber viele Jahrhunderte durch von Raub lebt, muß doch beständig etwas zu rauben da sein oder der Gegenstand des Raubes sich fortwährend reproduzieren. Es scheint daher, daß auch Griechen und Römer einen Produktionsprozeß hatten, also eine Ökonomie, welche ganz so die materielle Grundlage ihrer Welt bildete wie die bürgerliche Ökonomie die der heutigen Welt. Oder meint Bastiat etwa, daß eine Produktionsweise, die auf der Sklavenarbeit beruht, auf einem Raubsystem ruht? Er stellt sich dann auf gefährlichen Boden. Wenn ein Denkiere wie Aristoteles in seiner Würdigung der Sklavenarbeit irrte, warum sollte ein Zwergökonom, wie Bastiat, in seiner Würdigung der Lohnarbeit richtig gehn?

Footnote 33 concludes with a highly interesting additional remark, in which Marx refers back to his famous passage in the preface to the *Contribution to the Critique of Political Economy*. The importance of this remark was pointed out by Balibar in [AB70, p. 217].

^{33 ctd} I seize this opportunity of briefly refuting an objection made by a German-American publication to my work *A Contribution to the Critique of Political Economy*, 1859. My view is that each particular mode of production, and the relations of production corresponding to it at every given moment, in short ‘the economic structure of society’, is ‘the real foundation, on which arises a legal and political superstructure and to which correspond definite forms of social consciousness’, and that ‘the mode in which material life is produced conditions the general process of social, political and intellectual life’. In the opinion of the German-American publication this is all very true for our own times, in which material interests are preponderant, but not for the Middle Ages, dominated by Catholicism, nor for Athens and Rome, dominated by politics.

Before responding to the argument, Marx indicates that this is not a new interpretation of Middle Ages and the ancient world. By implication: if there is something to it, he, Marx, would have considered it. And indeed, Marx shows again and again, especially in his *Theories of Surplus-Value*, that he is very familiar with the literature. Although he is very critical of the writings of his contemporaries, it is second nature to him to consider it carefully—not only because of the insights it may contain but also because they are “socially valid . . . forms of thought” (169:1) generated by the capitalist relations of production.

^{33 ctd} In the first place, it strikes us as odd that anyone should suppose that these well-worn phrases about the Middle Ages and the ancient world were unknown to anyone else.

In his substantive response, Marx reaffirms an explanation which seems to say that production is the ultimate determinant because nothing can happen in a society before people are clothed and fed.

^{33 ctd} One thing is clear: the Middle Ages could not live on Catholicism, nor could the ancient world on politics. On the contrary, it is the manner in which they gained their livelihood which explains why in one case politics, in the other case Catholicism, played the main role. Regarding the Roman Republic, for instance, one needs no more than a slight acquaintance with its

^{33 ctd} Ich ergreife diese Gelegenheit, um einen Einwand, der mir beim Erscheinen meiner Schrift “Zur Kritik der Pol. Oekonomie”, 1859, von einem deutsch-amerikanischen Blatte gemacht wurde, kurz abzuweisen. Es sagte, meine Ansicht, daß die bestimmte Produktionsweise und die ihr jedesmal entsprechenden Produktionsverhältnisse, kurz “die ökonomische Struktur der Gesellschaft die reale Basis sei, worauf sich ein juristischer und politische Überbau erhebe und welcher bestimmte gesellschaftliche Bewußtseinsformen entsprächen”, daß “die Produktionsweise des materiellen Lebens den sozialen, politischen und geistigen Lebensprozeß überhaupt bedinge”,—alles dies sei zwar richtig für die heutige Welt, wo die materiellen Interessen, aber weder für das Mittelalter, wo der Katholizismus, noch für Athen und Rom, wo die Politik herrschte.

^{33 ctd} Zunächst ist es befremdlich, daß jemand voraussetzen beliebt, diese weltbekannten Redensarten über Mittelalter und antike Welt seien irgend jemand unbekannt geblieben.

^{33 ctd} Soviel ist klar, daß das Mittelalter nicht vom Katholizismus und die antike Welt nicht von der Politik leben konnte. Die Art und Weise, wie sie ihr Leben gewannen, erklärt umgekehrt, warum dort die Politik, hier der Katholizismus die Hauptrolle spielt. Es gehört übrigens wenig Bekanntschaft z.B. mit der Geschichte der römischen Republik dazu, um zu wissen, daß die

history to be aware that its secret history is the history of landed property. On the other hand, already Don Quixote had to pay for the mistake of believing that knight errantry was equally compatible with all economic forms of society.

This argument for the centrality of the mode of production seems at first sight (a) quite unrelated to the topic under discussion, and (b) false, a non sequitur. (a) One might wonder what it has to do with commodity fetishism, and (b) it has also been often remarked that the fact that the economy provides the basic necessities for the survival of society does not necessarily imply that the economic sphere *directs* society.

In order to answer these two objections, one has to see them in their relationship. If one understands why this topic is discussed here, in the commodity fetishism section, one also understands how economics is so dominant. The missing link is people's lack of consciousness. Balibar [AB70, p. 216] noticed some of this when he pointed out that the preponderance of the economic sphere was most direct when fetishism was most thorough.

Now back to the main text:

176:1 How utterly some economists are deceived by the fetishism attached to the world of commodities, or by the *objective* appearance of the *social* characteristics of labor, is shown, among other things, by the dull and tedious dispute over the *part played by nature* in the formation of exchange-value. Since exchange-value is a specific social manner of expressing the labor bestowed on a thing, it can have no more natural content than do, for example, international *currency exchange rates*.

This may seem a silly dispute, since it seems so simple to look through the fetish-like character of the *commodity*. Things look different as soon as more developed forms are considered.

176:2 As the *commodity-form* is the most general and the least developed form of bourgeois production, it makes its appearance at an early date, though not in the same predominant and therefore characteristic manner as nowadays. Hence its fetish character seems still relatively easy to penetrate. But when we come to more concrete forms, not even the appearance of simplicity remains. Where did the illusions of the

Geschichte des Grundeigentums ihre Geheimgeschichte bildet. Andererseits hat schon Don Quixote den Irrtum gebüßt, daß er die fahrende Ritterschaft mit allen ökonomischen Formen der Gesellschaft gleich verträglich wählte.

97:1 Wie sehr ein Teil der Ökonomen von dem der Warenwelt anklebenden Fetischismus oder dem *gegenständlichen* Schein der *gesellschaftlichen* Arbeitsbestimmungen getäuscht wird, beweist u.a. der langweilig abgeschmackte Zank über die *Rolle der Natur* in der Bildung des Tauscherts. Da Tauschwert eine bestimmte gesellschaftliche Manier ist, die auf ein Ding verwandte Arbeit auszudrücken, kann er nicht mehr Naturstoff enthalten wie etwa der *Wechselkurs*.

97:2 Da die *Warenform* die allgemeinste und unentwickeltste Form der bürgerlichen Produktion ist, weswegen sie früh auftritt, obgleich nicht in derselben herrschenden, also charakteristischen Weise wie heutzutage, scheint ihr Fetischcharakter noch relativ leicht zu durchschauen. Bei konkreteren Formen verschwindet selbst dieser Schein der Einfachheit. Woher die Illusionen des Monetarsystems? Es sah dem Gold und Sil-

Monetary System come from? The adherents of the Monetary System did not see that gold and silver, as money, represent a social relation of production, albeit in the form of natural objects with peculiar social properties. And what of modern political economy, which looks down so disdainfully on the Monetary System? Does not its fetishism become quite palpable as soon as it deals with *capital*? How long is it since the disappearance of the Physiocratic illusion that ground rent grows out of the soil not out of society?

Both the Moore-Aveling and the Ben Fowkes translations say it "is" still relatively easy to see through, instead of "seems." However the first edition and also Contribution,

275:1/o, both say: it *is* relatively easy (although right afterwards Contribution says: "verschwindet dieser Schein der Einfachheit." And Marx did make the change

from "is" to "seems" during the revisions of this chapter for the second edition, emphasizing that the mystification is not really simple; is only seems so.

When Marx says that the fetish-like character of the commodity *seems* relatively easy to penetrate, the implication is that it *is* not really easy. The error which one is likely to commit here is discussed in chapter Two, 184:3/oo, and also footnotes 27 and 32 here: it is equally wrong to consider commodities merely as social symbols without appreciating the importance of the objectified form of social relations.

In Contribution 275:1/o, Marx gives the following poignant formulation:

All the illusions of the monetary system arise from the failure to perceive that money, although a physical object with distinct properties, represents a social relation of production. As soon as the modern economists, who sneer at the illusions of the monetary system, deal with the more complex economic categories, such as capital, they display the same illusions. This emerges clearly in their confession of naive astonishment when the phenomenon that they have just ponderously described as a thing reappears as a social relation and, a moment later, having been defined as a social relation, teases them once more as a thing.

Marx ends the chapter with some comical remarks:

176:3/o But, to avoid anticipating, we will content ourselves here with one more example concerning the commodity-form itself. If commodities could speak, they would say this: our use-value may inter-

ber nicht an, daß sie als Geld ein gesellschaftliches Produktionsverhältnis darstellen, aber in der Form von Naturdingen mit sonderbar gesellschaftlichen Eigenschaften. Und die moderne Ökonomie, die vornehm auf das Monetarsystem herabgrinst, wird ihr Fetischismus nicht handgreiflich, sobald sie das *Kapital* behandelt? Seit wie lange ist die physiokratische Illusion verschwunden, daß die Grundrente aus der Erde wächst, nicht aus der Gesellschaft?

97:3 Um jedoch nicht vorzugreifen, genüge hier noch ein Beispiel bezüglich der Warenform selbst. Könnten die Waren sprechen, so würden sie sagen, unser Gebrauchswert mag den Menschen interessieren. Er kommt

est humans, but it does not belong to us as objects. What does belong to us *as objects*, however, is our value. Our own interactions as commodity objects prove it. We relate to each other only as exchange-values.

Question 356 *How does Marx know what commodities would say if they could speak?*

The speaking commodities exemplify a symmetric counterpart of commodity fetishism. While people act as if they were thinking that the social properties of commodities come from nature, commodities relate to each other as if they were thinking that the natural properties of commodities come from the humans. The following quotes show that this nonsense is echoed by published economists:

Now listen how the economist makes himself the mouthpiece of the commodities:

177:1 ‘Value (i.e. exchange-value) is a property of things, riches (i.e. use-value) of man. Value, in this sense, necessarily implies exchanges, riches do not.’³⁴

³⁴ (*Observations on Some Verbal Disputes in Pol. Econ., particularly relating to value, and to supply and demand*, Lond. 1821, p. 16.)

Marx brings a second quote, which is almost identical although it comes from a different source: These sources are, according to footnotes 34 and 35, [Ano21, p. 16] and [Bai25, p. 165 seq.].

177:2 ‘Riches (use-value) are the attribute of man, value is the attribute of commodities. A man or a community is rich, a pearl or a diamond is *valuable* ... A pearl or a diamond has value as pearl or diamond.’³⁵

³⁵ S. Bailey, l.c., p. 165 sq.

The first of these two quotes is discussed by Marx at some length in *Theories of Surplus-Value* [mecw32]316:7:

RICHES in this context are use-values. It is true, use-values are wealth only in relation to humans. But it is by its *own* PROPERTY that something is a use-value

uns nicht als Dingen zu. Was uns aber *dinglich* zukommt, ist unser Wert. Unser eigener Verkehr als Warendeingeweise beweist das. Wir beziehn uns nur als Tauschwerte aufeinander.

Man höre nun, wie der Ökonom aus der Warenseele heraus spricht:

“Wert” (Tauschwert) “ist Eigenschaft der Dinge, Reichtum” (Gebrauchswert) “des Menschen. Wert in diesem Sinn schließt notwendig Austausch ein, Reichtum nicht.”³⁴

³⁴ „Value is a property of things, riches of man. Value, in this sense, necessarily implies exchanges, riches do not.“ (*Observations on Some Verbal Disputes in Pol. Econ., particularly relating to value, and to supply and demand*“, Lond. 1821, p. 16.)

„Reichtum“ (Gebrauchswert) „ist ein Attribut des Menschen, Wert ein Attribut der Waren. Ein Mensch oder ein Gemeinwesen ist *reich*; eine Perle oder Diamant ist *wertvoll* ... Eine Perle oder Diamant hat Wert als Perle oder Diamant.“³⁵

³⁵ „Riches are the attribute of man, value is the attribute of commodities. A man or a community is rich, a pearl or a diamond is valuable ... A pearl or a diamond is valuable as a pearl or diamond.“ (S. Bailey, l.c., p. 165 sq.)

and therefore an element of wealth for humans. Take away from the grape the properties which make it a grape, and the use-value which it has as a grape for humans disappears; and it ceases to be, as a grape, an element of wealth. Riches as identically with use-value are *properties of things* THAT ARE MADE USE OF BY MEN AND WHICH EXPRESS A RELATION TO THEIR WANTS. As against this, “value” is supposed to be the “PROPERTY OF THINGS”!

In *Capital*, Marx expresses similar thoughts as follows:

177:3–4 So far no chemist has ever discovered exchange-value in pearl or diamond. The economists who claim to have discovered this chemical substance with their special critical acumen, come to the conclusion that the use-value of material objects belongs to these objects independently of their material properties, while their value, on the other hand, forms a part of them as objects. What confirms them in this view is the curious fact that the use-value of a thing is realized for the humans *without exchange*, i.e., in the direct relation between thing and person, while, inversely, its value is realized only in exchange, i.e., in a *social* process.

98:1–2 Bisher hat noch kein Chemiker Tauschwert in Perle oder Diamant entdeckt. Die ökonomischen Entdecker dieser chemischen Substanz, die besondern Anspruch auf kritische Tiefe machen, finden aber, daß der Gebrauchswert der Sachen unabhängig von ihren sachlichen Eigenschaften, dagegen ihr Wert ihnen als Sachen zukommt. Was sie hierin bestätigt, ist der sonderbare Umstand, daß der Gebrauchswert der Dinge sich für den Menschen *ohne Austausch* realisiert, also im unmittelbaren Verhältnis zwischen Ding und Mensch, ihr Wert umgekehrt nur im *Austausch*, d.h. in einem *gesellschaftlichen* Prozeß.

“ökonomischen Entdecker dieser chemischen Substanz” (literally: economic discoverer of this

chemical substance) refers again to the incongruity between economic form and physical content. The

translation misses that! In the first edition it was simply “our authors” (unsere Verfasser).

The bourgeois economists thought they were “confirmed” in their absurd views by the following arguments

1. Use-value is realized in the relation between object and man, therefore the economists think it comes from man, not the object. This is also how the speaking commodities themselves in 176:3/o conclude that their use-values cannot be attributed to them as objects.
2. Value is realized only in the exchange. Exchange is seen as a relation between things, therefore value seems to belong to the things. Again this is exactly what the speaking commodities themselves said.

By his appositions “without exchange” to 1. and “i.e., in a *social* process” to 2., Marx shows the absurdity of this reasoning.

This inversion of the natural and social is reminiscent of the following passage from Shakespeare's *Much Ado About Nothing*:
Who would not be reminded at this point of the advice given by the good Dogberry to the night-watchman Seacoal?

"To be a well-favored man is the gift of fortune; but reading and writing comes by nature."³⁶

A "well-favored man" is here a good-looking man, unambiguously in Marx's German translation.

Question 357 *How is it a manifestation of fetishism to speak of "rich" people and "valuable" things?*

Footnote 36 takes up once more the theme of footnote 32 to paragraph 173:1/oo.

³⁶ Both the author of *Observations etc.* and S. Bailey accuse Ricardo of converting exchange-value from something merely relative into something absolute. He did exactly the reverse. He reduced the seeming relativity, which these things (diamond, pearls, etc.) possess as exchange-values to the true relation hidden behind this semblance, namely their relativity as mere expressions of human labor. If the followers of Ricardo answer Bailey rudely, but not convincingly, this is because they are unable to find in Ricardo's own works any elucidation of the inner connection between value and the form of value (exchange-value).

Question 358 *Why does Marx say in footnote 36 to paragraph 177:3–4 that the commodities diamond, pearl, etc., only seem to possess relativity as exchange-values? Are exchange-values not relative by definition?*

Wer erinnert sich hier nicht des guten Dogberry, der den Nachtwächter Seacoal belehrt:

"Ein gut aussehender Mann zu sein ist eine Gabe der *Umstände*, aber lesen und schreiben zu können kommt von *Natur*."³⁶

³⁶ Der Verfasser der „Observations“ und S. Bailey beschuldigen Ricardo, er habe den Tauschwert aus einem nur Relativen in etwas Absolutes verwandelt. Umgekehrt. Er hat die Scheinrelativität, die diese Dinge, Diamant und Perlen z.B., als Tauschwerte besitzen, auf das hinter dem Schein verborgene wahre Verhältnis reduziert, auf ihre Relativität als bloße Ausdrücke menschlicher Arbeit. Wenn die Ricardianer dem Bailey grob, aber nicht schlagend antworten, so nur, weil sie bei Ricardo selbst keinen Aufschluß über den inneren Zusammenhang zwischen Wert und Wertform oder Tauschwert fanden.

2. The Exchange Process

Chapter One showed that production, under capitalism, is organized around the allocation of society's labor-power (which is treated as one homogeneous mass with only quantitative differences) to the different branches of production. Since the actual co-ordination of the different production processes according to these principles takes place outside of the production process itself, in the market, section 1.3 pursued the process through which the inner measure of all commodities, abstract labor, finds a fitting surface representation, namely, money. Chapter Two looks at the *individual* actions and relations on the *surface* of the economy, i.e., the market. It explores how individuals depend on and reproduce the structural relations of production discussed in chapter One.

The relation between society and individual can be compared with that between two animals in symbiosis. Society does not determine what the individuals do, nor does it *guarantee* the individuals their survival. Rather, individuals must use the social relations and institutions in order to pursue their own goals. The social structures come to life because the need to survive forces people to accept the "character masks" provided for them by the social relations. On the other hand, this social framework can only persist if it enables individuals to survive and reproduce, otherwise individuals would have no choice but to act outside the social framework.

Chapter Two shows that individuals are indeed motivated to use the social framework developed in chapter One. Commodity owners can best achieve their goals in the commodity exchange if they implement in practice those social forms, derived in section 1.3 of chapter One, by which commodities express their values. The technical difficulties of the exchange are resolved by social forms which were derived not as instruments to facilitate the exchange, but as the forms in which value appropriately expresses itself.

It is not surprising that the forms which are most appropriate expressions of the inner structure of the commodity also facilitate the surface interactions between commodities. But it is also not a tautology, and the fit between structural expression and practical usefulness is not perfect. Chapters Four, Five, and Six will show that money not only facilitates exchange, but that money fosters behaviors that go beyond the economic necessities of simple commodity production. (In these Annotations here this will be called the "curse" of money).

Question 361 *Why a separate chapter about the exchange process? Has the exchange not already been discussed in chapter One?*

Marx did not subdivide chapter Two, but for the purpose of this commentary it is divided into four sections.

The first section, *Social Prerequisites of Commodity Production*, consists of one paragraph only, 178:1/o, which gives a brief overview of the social relations that are *necessary* for production to take the form of commodity production. People must recognize each other as private owners, i.e., treat each other as disconnected strangers.

In the second section, *Dilemmas Inherent in the Commodity Exchange* 179:1–181:1, Marx asks the opposite question: how do commodity relations affect individual actions and interactions. Marx describes the dilemmas which a commodity owner encounters who is trying to make exchanges in such a way that his or her personal interests are met.

Marx argues that these dilemmas are unsolvable on an individual level, but that the *social* act of separating money from the ordinary commodities creates the framework for its resolution. The next section, *Historical Development of the Commodity Form* 181:2–184:2, shows how this social act came to be performed in history.

The final section, *Ideologies of Money and its Fetish-Like Character* 184:3–187, discusses the false consciousness generated by the practical market interactions: money as a symbol, the quantitative expression of the value of the money commodity, and the magic of money.

2.1. [Social Prerequisites of Commodity Production]

178:1/o Commodities cannot go to market by themselves in order to exchange themselves.

In chapter One, the commodity was depicted as something active. Chapter Two begins with the sobering observation that commodities, by themselves, cannot even walk to the market. We must therefore look what their keepers are doing, the commodity owners.

Although chapter Two is a discussion of volitional individual agency, this formulation shows that center stage is still occupied by the commodity, not its owner. The exchange process is introduced as something which the *commodities* need to do, not their owners. The word “keeper” or “guardian” (*Hüter*) indicates that the main actor is not the owner but the commodity. The owners of the commodities get our attention only because nothing in society happens unless some individual carries it out—but this does not mean that the individual is in charge. In our mental image we should not visualize owners carrying their commodities to the market, but commodities dragging their owners along with them to the market.

The keeper of the commodity is its private owner, i.e., Marx introduces here the concept of private property. The first thing to know about private property is that it is not a relation between thing and person but a *social* relation—because something is yours only if others in society respect your property. Just as value is a social relation that looks like an attribute of things, so is private property a social relation that looks like a bond between people and things.

99:1/o Die Waren können nicht selbst zu Märkte gehen und sich nicht selbst austauschen.

Wir müssen uns also nach ihren Hütern umsehen, den Warenbesitzern.

Commodities are things, and can therefore not put up resistance against man. If they do not comply with his will, he can use force—in other words, he can take them.³⁷

Die Waren sind Dinge und daher widerstandslos gegen den Menschen. Wenn sie nicht willig, kann er Gewalt brauchen, in andren Worten, sie nehmen.³⁷

“Take possession” is a too formal translation of the German word

“*nehmen*,” which denotes a simple practical act disregarding social rules.

↑ Marx not only says that private property is a social relation, but he puts his own spin on this: he describes the commodity as having its own will. The commodity belongs to *P* and therefore only wants to be used by *P*. It would like to see its will respected by the humans—but the commodity itself has no recourse if the non-owner *Q* ignores the social relations crystallized in the commodity and treats it as a thing which he can simply *take* (see *Grundrisse*, 94:1).

Footnote 37 brings a juicy illustration in which commodities literally have their own wills—they are human beings—and where the “taking” consists in sexual and other violations:

³⁷ In the twelfth century, so renowned for its piety, very delicate things often appear among these commodities. Thus a French poet of the period enumerates among the commodities to be found in the fair of Lendit, alongside clothing, shoes, leather, implements of cultivation, skins, etc., also ‘women crazy of their bodies’.

³⁷ Im 12., durch seine Frömmigkeit so berühmten Jahrhundert, kommen unter diesen Waren oft sehr zarte Dinge vor. So zählt ein französischer Dichter jener Zeit unter den Waren, die sich auf dem Markt von Landit einfanden, neben Kleidungsstoffen, Schuhen, Leder, Ackergeräten, Häuten usw. auch „femmes folles de leur corps“ auf.

The medieval French poet is Guillot de Paris. Lendit is a town near Paris where a great fair had been held annually from the 12. to the 19. centuries. The quote is taken from the satirical poem “Dit du Lendit.”

Commodities, as things, are just as powerless as these women selling their sexual favors. Just as these women have very little protection if their buyers do not treat them humanely, so are the commodities powerless if the members of society do not respect their commodity relations.

Therefore, a social relation between the commodity *owners* is necessary. It is society, not the commodity itself, which prevents *Q* from taking the commodity unless its owner *P* agrees to it.

In order to relate these objects to one another as commodities, their keepers must relate to each other as persons, whose wills reside in these objects.

Um diese Dinge als Waren aufeinander zu beziehen, müssen die Warenhüter sich zueinander als Personen verhalten, deren Willen in jenen Dingen haust, ...

The persons whose “wills reside in these objects” are the private owners of these objects. If *P* steals *Q*’s commodity, he automatically violates the will of *Q*, whether or not *Q* witnesses the theft or actually needs the commodity that is stolen from him. Whoever wants to

use something that is the property of *Q* must have the permission of *Q*. *Q*'s will refers not only to his or her body, but to a circle of things around it. If you *use* a hammer, your will does not reside in the hammer; having one's will reside in an object is a different relationship than that of using the object. People's wills reside no longer in their persons, activities, interpersonal relations, but in things.

Question 365 Explain in your own words Marx's phrase that the commodity owners' will "resides" in the objects which are his property.

Is this a good thing or not? Where does it have its limits in our society? Are there things for which it is desirable that people's wills reside in them?

Usually *Q* will only then get *P*'s permission to use *P*'s commodity if he can give one of his own commodities in exchange. This leads us back to the topic of this chapter, the exchange process:

In order to appropriate the commodity of the other, and alienate his own, each owner has to consent with the other, i.e., it is an act of will common to both parties.

... so daß der eine nur mit dem Willen des andren, also jeder nur vermittelt eines, beiden gemeinsamen Willensaktes sich die fremde Ware aneignet, indem er die eigne veräußert.

With personal property (toothbrush, clothes, home, car) you have the right to exclude others from using these things because they are part of your person. Commodity exchange gives a different reason for denying others the use of the things which are your property: others cannot have your things unless they give you some of theirs. Private property becomes the means to access others' property.

Although both parties freely agree to the exchange, the parties do not share a common goal. In certain acts of exchange, these goals diverge so much that the transaction is best considered an act of coercion, but it is accompanied by a ritual which makes it look like a voluntary act. This "voluntary" nature of property transfers is one of the means by which private property hooks its owners. Property is not assigned and/or denied to you by some authority, which can become the target of your hatred, but you acquire everything you have by an act of your own will. The worker receiving a minimum wage must tell herself that she consented to her employment relation and that she can always quit her job.

The producers are separated in production and connected in the exchange. The legal relation reflects this separation by the concept of private property, and the connection by the contract [Cat89, p. 25]. These two aspects are very contradictory to each other.

This agreement between commodity owners necessary to transfer ownership is only one of many examples of a pervasive "split will" on the part of private owners, about which Marx comments elsewhere. On the one hand, the property owners have complete control over their privately owned objects. On the other hand, they must subordinate their wills to a legal framework which forces them to put the respect of private property above everything else, even above their own lives. The private owner's will is therefore split. To be private owner of a commodity means, on the one hand, that one is very selfish, since one can dispose

over one's private property without being responsible to anyone. On the other hand, private property can only then be a generally respected principle if the laws of private property take precedence over any human needs. The laws of private property, therefore, turn you into an absolute despot on the one hand, and into a piece of dust on the other. This is a pervasive contradiction for everyone living in a capitalist society. It is especially obvious in situations where ownership of a thing is transferred from one person to another, but this is by far not the only situation where this contradiction comes to the surface.

The keepers must therefore recognize each other as the private owners of their commodities.

Sie müssen sich daher wechselseitig als Privateigentümer anerkennen.

↑ This is the first time Marx uses the word "private owner." Commodity exchange is only possible if the individuals treat each other as the private owners of their respective commodities. ↓ But this does not mean that the commodity owners first have to enter a legal relation before they can exchange commodities. Rather, by exchanging commodities they implicitly recognize each other as private owners and enter a contract with each other.

This juridical relation, whose form is the contract, whether as part of a developed legal system or not, is a relation between wills in which the economic relation reflects itself.

Dies Rechtsverhältnis, dessen Form der Vertrag ist, ob nun legal entwickelt oder nicht, ist ein Willensverhältnis, worin sich das ökonomische Verhältnis widerspiegelt.

↑ The laws do not create this relation but they only make it explicit. This is argued much more clearly in *Notes on Wagner*, p. [mecw24]553:4–554:1.

By the way, Marx does not say that the juridical relation is a mirror-image of the economic relation, but the juridical relation is like a mirror in which one can see the reflection of the economic relation. This formulation allows the interpretation that the juridical relation has its own autonomy, a modern term for this is "relative autonomy," it is not a mere derivative of the economic relation.

↓ Although this legal relation is a relation of wills, its content is not created by the individuals but by the economic relations.

The content of this juridical relation or relation of wills is given by the economic relation itself.³⁸

Der Inhalt dieses Rechts- oder Willensverhältnisses ist durch das ökonomische Verhältnis selbst gegeben.³⁸

In this relationship of wills, individuals consider the laws of private property more important than the next person. Individuals remain strangers to each other and only enter into mutual "scratch your back" relations, as described in *Grundrisse* 243₃₄–244₁₂. Marx's assertion that the content of this relation is given by the economy is reason for hope: people relate to each other in this way not because of human nature, but people are forced to relate this way because of the structure of the society they find themselves in.

Question 369 Which social relations must exist between producers so that they exchange (or buy and sell) their products as commodities? Describe groups or societies which have

social relations that preclude exchange between individual members.

The emphasis that this relation of wills obtains its content from the economy is again an implicit criticism of Hegel, for whom the state is the incarnation of the will of the people. Marx says, yes, they have to enter a relation of wills, but its content is not theirs but is given to them by the economy. If they want something that is not prescribed to them by the economy, they face bankruptcy, money pump, loss of job, etc.

Footnote 38 illustrates what it means that the content of the legal relation is given by the economy. Proudhon's ideals of justice are only desirable in the context of commodity production, yet he considers them "eternal" principles:

³⁸ Proudhon draws the inspiration for his ideal of justice, of 'eternal justice', from the juridical relations which the production of commodities has made necessary. This, by the way, also furnishes proof, to the consolation of all would-be capitalists, that the commodity form of the product is as eternal as justice.

↑ It must be comforting for the capitalists and their dupes to read that commodity relations conform with the principles of justice. They infer from this that such a just system must last forever. ↓ This erroneous subordination of the actual commodity relations to an ideal of eternal justice leads to the desire to modify the actual relations wherever they do not conform with this ideal:

^{38 ctd} Then Proudhon turns round and seeks to reform the actual production of commodities, and the corresponding legal system, in accordance with this ideal. What would one think of a chemist who, instead of studying the laws governing actual molecular interactions, and on that basis solving specific problems, claimed that those interactions must be modified in order to conform to the 'eternal ideas' of 'naturalness' and 'affinity'? When we say 'usury' contradicts 'eternal justice', 'eternal equity', 'eternal mutuality', and other 'eternal truths', we do not know any more about it than the fathers of the church did when they said usury was incompatible with 'eternal grace', 'eternal faith', and 'God's everlasting will'.

³⁸ Proudhon schöpft erst sein Ideal der Gerechtigkeit, der justice éternelle, aus den der Warenproduktion entsprechenden Rechtsverhältnissen, wodurch, nebenbei bemerkt, auch der für alle Spießbürger so tröstliche Beweis geliefert wird, daß die Form der Warenproduktion ebenso ewig ist wie die Gerechtigkeit.

^{38 ctd} Dann umgekehrt will er die wirkliche Warenproduktion und das ihr entsprechende wirkliche Recht diesem Ideal gemäß ummodellern. Was würde man von einem Chemiker denken, der, statt die wirklichen Gesetze des Stoffwechsels zu studieren und auf Basis derselben bestimmte Aufgaben zu lösen, den Stoffwechsel durch die „ewigen Ideen“ der „naturalité“ und der „affinité“ ummodellern wollte? Weiß man etwa mehr über den „Wucher“, wenn man sagt, er widerspreche der „justice éternelle“ und der „équité éternelle“ und der „mutualité éternelle“ und anderen „vérités éternelles“, als die Kirchenväter wußten, wenn sie sagten, er widerspreche der „grâce éternelle“, der „foi éternelle“, der „volonté éternelle de dieu“?

Question 371 *If Proudhon draws his ideals of justice from commodity production, why does real commodity production then contradict these ideals?*

Also the main text argues that (at least at this level of abstraction) the economic relations determine what people want. Commodities act through people:

The persons exist here for one another only as representatives of commodities, therefore as commodity owners.

Die Personen existieren hier nur füreinander als Repräsentanten von Ware und daher als Warenbesitzer.

Marx's remark that individuals exist "here" only as representatives of commodities must be seen in the same spirit as his remark in footnote 15 to paragraph 134:3/o of chapter One that "wages is a category that does not exist yet at this stage of our presentation." Marx does not mean that people are nothing other than representatives of the commodity relation; he rather means that right now, at the present stage of the presentation of the basic laws of the capitalist economy, this is all we need to know about individuals. Only after having understood the capitalist *social* relations can we discuss in depth the specific ways in which *individuals* fit themselves into or act to transform these relations.

Although people are more than the representatives of commodities, the legal relations necessary for unhindered commodity circulation reduce them to such representatives. In capitalism, people relate to each other not first and foremost as people but first and foremost as property owners. If you as a human being need something, for instance, food for survival, or medicine because you are ill, but you as a property owner cannot pay for it, then the property-owner aspect of you is considered by society more important than the human-being aspect of you. This makes capitalism an inherently *violent* system.

As we proceed to develop our investigation, we shall find, in general, that the persons' economic character masks are mere personifications of the economic relations as whose carriers they confront each other.

Wir werden überhaupt im Fortgang der Entwicklung finden, daß die ökonomischen Charaktermasken der Personen nur die Personifikationen der ökonomischen Verhältnisse sind, als deren Träger sie sich gegenüberstehen.

Fowkes translates *Charaktermasken* with "the characters who appear on the economic stage" Neither the

Moore-Aveling nor the Fowkes translation uses the term character mask. (The French has "masques divers.") The term

"*Charaktermaske*" was already used in 170:1. Something extraneous to human beings, often taken on only temporarily.

The word "character mask" comes from Greek theatre, where the actors wore masks representing the characters they were representing. A character mask is a surface relationship: it consists of the social roles which people play in their interactions. These roles are not a creation of the individuals themselves, but an outgrowth of the economic relations in which these individuals find themselves.

When we meet character masks again in the later development, they will be less innocuous than the fleeting character masks of buyer and seller discussed here. Marx wrote to Engels on April 2, 1858:

This simple circulation, considered as such—and it is the surface of bourgeois society, in which the deeper operations, from which it emanates, are extinguished—evinces no dis-

Diese einfache Zirkulation für sich betrachtet, und sie ist die Oberfläche der bürgerlichen Gesellschaft, worin die tieferen Operationen, aus denen sie hervorgeht, aus-

inction between the subjects of exchange, save formal and evanescent ones ... While everything may be “lovely” here, it will soon come to a sticky end, and this as a result of the law of equivalence.

gelöscht sind, zeigt keinen Unterschied zwischen den Subjekten des Austauschs, außer nur formelle und verschwindende ... Kurz, es ist hier alles „scheene“, wird aber gleich ein Ende mit Schrecken nehmen, und zwar infolge des Gesetzes der Äquivalenz.

In chapter Twenty-Three, 711:3/o, Marx shows how the character masks of *capitalist* and *worker* are no longer transitory but remain attached to the same persons.

2.2. [Dilemmas Inherent in the Barter of Commodities]

The long first paragraph of chapter Two said: products of labor can become commodities only if the commodity owners relate to each other in certain specific ways. This paragraph explored the relations of wills necessary for commodity production to be possible. After this, Marx addresses the opposite question: how does the commodity relation, once it is established, affect the interests and therefore the wills of the commodity owners?

The exchange process is the simplest economic interaction between individuals on the surface of the economy. In the first edition of *Capital*, 51:1, at the very end of what in later editions was to become chapter One, Marx explains why he is looking at the exchange process now:

The commodity is *immediate unity of use-value and exchange-value*, i.e., of two opposite moments. It is, therefore, an immediate *contradiction*. This contradiction must develop as soon as the commodity is not, as it has been so far, analytically considered once under the angle of use-value, once under the angle of exchange-value, but as soon as it is placed as a whole into an actual relation with other commodities. The *actual* relation of commodities with each other, however, is their *exchange process*.

Die Ware ist *unmittelbare Einheit von Gebrauchswert und Tauschwert*, also zweier Entgegengesetzten. Sie ist daher ein unmittelbarer *Widerspruch*. Dieser Widerspruch muß sich entwickeln, sobald sie nicht wie bisher analytisch bald unter dem Gesichtspunkt des Gebrauchswerts, bald unter dem Gesichtspunkt des Tauschwerts betrachtet, sondern als ein Ganzes wirklich auf andere Waren bezogen wird. Die *wirkliche* Beziehung der Waren aufeinander ist aber ihr *Austauschprozeß*.

Here is an attempt to formulate in my own words, and to elaborate, the same ideas which Marx expressed quite tersely in the above passage. It is not incorrect to say that chapter One discusses the inner anatomy of each commodity, and chapter Two discusses the most direct interactions between commodities. However, a characterization which goes a little deeper beneath the surface, and better expresses the connection between the two chapters, would be: chapter One discusses use-value and exchange-value separately, while Two discusses the relationship between use-value and exchange-value. Use-value and exchange-value do not relate with each other *within the commodity*. If we look at the commodity by itself, use-

value and exchange-value just sit next to each other like strangers in an airplane or train. This is what Marx means by “immediate unity.” There is no mediation between the two. Yet the commodity silently points to the place where the connection between use-value and exchange-value matters—because it is a commodity only *in relation to other commodities*. And if we look for a situation where this relation is not merely theoretical but practical we arrive at the exchange process. The exchange process is a transaction in which the relation between use-value and exchange-value plays a role: the owners trading their commodities must take both use-value and exchange-value into consideration.

2.2.a. [The Commodity Versus its Owner]

A simple commodity producer going to market in order to barter his products pursues two goals with the same transaction. On the one hand, he wants this exchange to yield the use-value that best suits his needs (this is the personal dimension of the transaction), and on the other, he wants to realize the value of the commodity given in exchange (this is the social dimensions of the transaction). These two goals do not complement each other harmoniously but on the contrary pull in different directions and obstruct each other. They are so much at odds that Marx metaphorically represents them as the goals of two different agents, of the commodity producer himself on the one hand, and his commodity on the other.

↓ Marx first discusses the point of view of the commodity. The commodity is depicted as having its own will because the market relations between commodities are beyond the control of the commodity owner. The commodity, representing the social dimension of the exchange transaction, is single-mindedly interested in realizing its *value*, and is therefore willing to exchange itself with any other commodity which has the same value as itself.

179:1 What chiefly distinguishes a commodity from its owner is the fact that for the commodity, the body of every other commodity counts only as the form of appearance of its own value. A born leveller and cynic, it is always ready to exchange not only soul, but body, with each and every other commodity, even one that is more repulsive than Maritornes herself.

100:1 Was den Warenbesitzer namentlich von der Ware unterscheidet, ist der Umstand, daß ihr jeder andre Warenkörper nur als Erscheinungsform ihres eignen Werts gilt. Geborner Leveller und Zyniker, ist sie daher stets auf dem Sprung, mit jeder andren Ware, sei selbe auch ausgestattet mit mehr Unannehmlichkeiten als Maritorne, nicht nur die Seele, sondern den Leib zu wechseln.

The first few words “*was den Warenbesitzer namentlich von der Ware unterscheidet*” lead us to expect that the commodity owner will be discussed. And taken as a whole, this paragraph does indeed discuss the commodity owner. But the second half of the first sentence and the second sentence

turn to the commodity as the main subject, not the commodity owner. The thing in which the commodity owner is interested is introduced as the thing in which the commodity itself is *not* interested. And before he gets to this, Marx delineates what commodities *are* interested in. In other words, Marx starts

with the commodity owner, then switches to the commodity, and then goes back to the commodity owner. This back-and-forth is confusing and clumsy. Therefore I eliminated one of these reversals in the translation: in the translation I first speak of the commodity and then of the commodity owner.

↑ The phrase “exchange not only soul but body” suggests a sexual analogy: a person’s animal instincts are eager to perform the sex act regardless with whom, while the person as a human being is selective about the person they want to share their life with.

Maritornes is a character from Cervantes’ novel *Don Quixote*.

Question 375 *Are commodities selfish?*

Whenever a commodity owner tries to exchange a commodity, he or she is entering a society-wide relationship—because this exchange determines whether the commodity offered fits into the social division of labor. Any exchange (short of a liquidation sale) is validation of the labor inside the commodity as socially necessary labor. The use-value of the other commodity for which a given commodity is exchanged is irrelevant for this validation. This is why Marx says: the commodities (which represent this social relation) are not interested in the use-values of the other commodity for which they are exchanged.

Question 377 *In chapter Two, Marx depicts commodities as conscious beings which are eager to be exchanged, but do not care about the use-value of the commodity they are exchanged for. Why are commodities, which are inanimate things, depicted here as beings with their own will which comes into conflict with the will of their owners, and why do they not care about the use-value of the other commodity?*

Question 378 *Is is a good characterization of the exchange process to say: The commodity owner throws his commodity on the market and tries to get as much use-value as he can for it?*

↓ The exchange transaction also has a private dimension, because it also decides whether the commodity producer will be rewarded for the labor he or she put into the commodity. This is a different point of view than the social point of view. Now the use-value of the commodity received in exchange matters very much. If the commodity which the producer gets in return is not useful to him or her, then the producer’s labor may be socially validated, yet the producer’s personal objective, to receive the use-value he or she needs, is not achieved. This private dimension of the exchange is depicted here as the point of view of the commodity-owner. In contrast to the commodity itself, the commodity owner is very interested in the use-value of the other commodity:

The commodity’s lacking sense for the concrete bodily features of the other commodity is supplemented by the five or more senses of the commodity owner.

Diesen der Ware mangelnden Sinn für das Konkrete des Warenkörpers ergänzt der Warenbesitzer durch seine eignen fünf und mehr Sinne.

“Sinn für das Konkrete des Warenkörpers” is a pun. “Sinn für das Konkrete” means practical

sense. The “Konkrete des Warenkörpers” is its use-value aspect, produced by concrete

labor.

↓ One can even say that the owner’s actions are *only* governed by use-values—if one extends the concept of use-value a little. The five or more senses of the commodity owner do not include a sense for the social relations in which the commodity is embedded.

For the owner, his commodity possesses no immediate use-value. If it did, he would not bring it to market. It has use-value for others. For him, immediately, its only use-value is that of being a carrier of exchange-value, and therefore a means of exchange.³⁹ This is why he wants to relinquish it, in exchange for commodities whose use-values are of service to him.

Seine Ware hat für ihn keinen unmittelbaren Gebrauchswert. Sonst führte er sie nicht zu Markt. Sie hat Gebrauchswert für andere. Für ihn hat sie unmittelbar nur den Gebrauchswert, Träger von Tauschwert und so Tauschmittel zu sein.³⁹ Darum will er sie veräußern für Ware, deren Gebrauchswert ihm Genüge tut.

↑ This is the Hegelian conclusion that becoming a use-value is the union of not being a use-value and being a use-value. But while Hegel begins with being, Marx begins here with non-being. The commodity (say a sandal) is not an immediate use-value for its producer. This non-being implies being: the sandal has use-value as a means of exchange exactly because it does not have immediate use-value. The aim of the exchange is then the becoming, since the intention is to turn the sandal into something which the owner can actually use.

Question 380 *In 179:1, Marx seems to enjoy the play of words that the use-value which the commodity has immediately is not an immediate use-value for its owner. Explain.*

Question 381 *First Marx says that the commodity has no immediate use-value for its owner. Then he says that its immediate use-value is that of serving as a means of exchange. Aren’t these two statements contradictory? Does or doesn’t have the commodity an immediate use-value?*

Marx distinguishes here two kinds of use-value. The *immediate* use-value is the use-value we know from the beginning of chapter One, this is the use-value which only realizes itself in use or consumption (see 126:1). The use-value referred to in the fourth sentence, the use-value of a commodity as means of exchange, is its *formal* use-value, see 184:1 later in chapter Two. ↓ Footnote 39 clarifies once more the distinction between immediate and formal use-value, and at the same time documents that this distinction goes all the way back to Aristotle:

³⁹ ‘For twofold is the use of every object . . . The one is peculiar to the object as such, the other is not, as a sandal which may be worn and is also exchangeable. Both are uses of the sandal, for even he who exchanges the sandal for the money or food he is in need of, makes use of the sandal as a sandal. But not in its natural way. For it does not exist for the sake of being exchanged’ (Aristotle, Republic, I, i, c. 9).

³⁹ „Denn zweifach ist der Gebrauch jedes Guts.—Der eine ist dem Ding als solchem eigen, der andre nicht, wie einer Sandale, zur Beschuhung zu dienen und austauschbar zu sein. Beides sind Gebrauchswerte der Sandale, denn auch wer die Sandale mit dem ihm Mangelnden, z.B. der Nahrung austauscht, benutzt die Sandale als Sandale. Aber nicht in ihrer natürlichen Gebrauchsweise. Denn sie ist nicht da des Aus-

tausches wegen.“ (Aristoteles, „De Rep.“, I. I, c. 9.)

Question 382 Aristotle said that exchange-value is a second use-value of things. Marx apparently considers this a too narrow characterization, see Contribution, 283:1/o. Why?

2.2.b. [Use-Value Depends on Exchange-Value and Vice Versa]

↓ Marx has not yet specified how this “becoming” of the use-value in the exchange-process is achieved. A common-sense solution would be that the commodity producers simply barter their goods with each other. However Marx argues that direct barter is so contradictory that a different solution is needed. This is not the first time that Marx points out a real-life contradiction which may not be obvious to the practical agents. This time, it is especially unintuitive to argue that direct barter is plagued with prohibitive contradictions, because in simple situations, direct barter is clearly possible and often used. Since the result Marx is trying to derive is unintuitive, he is very thorough and formulates the contradictions of the exchange in three different ways. The contradictions which Marx is taking pains to point out make direct barter infeasible in any other than the simplest situations.

Since it is possible, in simple situations, to sneak through between the blades of this contradiction, one should not be surprised that Marx’s opening move in the argument is to get away from the individual situation and to generalize. Not only the weaver but also every other commodity producer enters the market with the intention to convert the use-value for others into something they themselves can use.

All commodities are non-use-values for their owners, and use-values for their non-owners.

Alle Waren sind Nicht-Gebrauchswerte für ihre Besitzer, Gebrauchswerte für ihre Nicht-Besitzer.

↑ Marx likes those inversions.

Question 383 Give other examples of inversions in Marx’s Capital.

Consequently, they all must change hands.

Sie müssen also allseitig die Hände wechseln.

↑ This itself is not yet contradictory. A transfer of products from producer to consumer must occur in every society that has division of labor. ↓ The contradiction lies in the social form through which this is achieved.

This change of hands is accomplished by their exchange. But the exchange places them in relation with each other as values and realizes them as values.

Aber dieser Händewechsel bildet ihren Austausch, und ihr Austausch bezieht sie als Werte aufeinander und realisiert sie als Werte.

“Is accomplished by” is a somewhat free translation of “bildet.” I chose this translation because I believe that “dieser Händewechsel bildet ihren

Austausch” is a contracted version of what should strictly have been “dieser Händewechsel wird durch ihren Austausch gebildet.” I also broke the sentence into two

and put the “but” at the beginning of the second sentence, because I think Marx wrote *aber* because of this second half.

↑ This last sentence begins with a “but” because we started from use-values “but” ended up with values. ↓ Marx summarizes this in the next sentence:

It follows that commodities must be realized as values before they can be realized as use-values.

Die Waren müssen sich daher als Werte realisieren, bevor sie sich als Gebrauchswerte realisieren können.

↑ This is a temporal condition for the surface process: in order to get the desired use-value, i.e., in order to benefit from the labor put into the commodity one has produced, one first has to realize the value of this commodity. And what are the conditions for the realization of my commodity as value? Two conditions: on the one hand, the labor going into my commodity must be socially necessary labor only, and on the other, the use-value I am producing must be needed by others. ↓ Marx formulates here only the second of these conditions, because this is the condition which leads us in a circle.

179:2 On the other hand, they must stand the test as use-values before they can be realized as values. For the labor expended on them only counts in so far as it is expended in a form which is useful for others.

100:2/o Andererseits müssen sie sich als Gebrauchswerte bewähren, bevor sie sich als Werte realisieren können. Denn die auf sie verausgabte menschliche Arbeit zählt nur, soweit sie in einer für andre nützlichen Form verausgabt ist.

↑ I.e., my commodity being useful for you is the condition for me being able to acquire your commodity through the exchange. ↓ In other words, we are in a circle in which the condition for the exchange of commodities is—the exchange of commodities already: However, only their exchange can prove whether that labor is useful for others, i.e., whether its product satisfies the needs of others.

Ob sie andren nützlich, ihr Produkt daher fremde Bedürfnisse befriedigt, kann aber nur ihr Austausch beweisen.

↑ In Contribution, 284:1/o, Marx calls this “a defective circle of problems, in which the solution of one problem presupposes the solution of the other.”

Question 385 Is it true that exchange is the ultimate proof that a commodity is useful? What if the consumer who acquires the commodity in exchange takes it home and discovers that it is not useful after all?

2.2.c. [Contradiction Between Social and Individual Aspect]

We have arrived, once again, at an impasse situation: the selection of the use-values by the commodity consumer relies on the realization of the values they have produced, but this

realization already presupposes the selection of use-values by other consumers, and so on ad infinitum. Before developing a solution, Marx shows that this impasse is even deeper than what we have seen so far. Not only do realization of value and selection of use-values pre-suppose each other in a circular way, they also contradict each other. Here is one pole of this contradiction:

180:1 The owner is willing to part with his commodity only in return for other commodities whose use-values satisfy his needs. To that extent, exchange is for him a purely individual process.

101:1 Jeder Warenbesitzer will seine Ware nur veräußern gegen andre Ware, deren Gebrauchswert sein Bedürfnis befriedigt. Sofern ist der Austausch für ihn nur individueller Prozeß.

↑ Regarding the commodity the market participant is acquiring, the exchange process is a purely individual process; the commodity owner does not have to consult with anyone and is not bound by any social constraints regarding the use-value he is selecting. ↓ Regarding the commodity he is giving in exchange, his expectation is that he will get a fair equivalent for it.

On the other hand, he wishes to realize his commodity as a value, i.e., in any other commodity of equal value which suits him, regardless of whether his own commodity has any use-value for the owner of the other commodity or not.

Andrerseits will er seine Ware als Wert realisieren, also in jeder ihm beliebigen andren Ware von demselben Wert, ob seine eigne Ware nun für den Besitzer der andren Ware Gebrauchswert habe oder nicht.

↑ But here is the hitch: he wants credit for his commodity according to its *value*, whether or not it has use-value for the recipient.

To that extent, exchange is for him a general social process.

Sofern ist der Austausch für ihn allgemein gesellschaftlicher Prozeß.

↓ These two requirements do not fit together. The second requirement can only be met if everyone has to accept any use-value in exchange for their own which has the same value as their own, therefore they are not free to choose which use-value they receive for their own commodity.

But the same process cannot be both: be exclusively individual for all owners of commodities, and at the same time be exclusively social and general.

Aber derselbe Prozeß kann nicht gleichzeitig für alle Warenbesitzer nur individuell und zugleich nur allgemein gesellschaftlich sein.

Question 386 Which contradictions do commodity owners face if they want to barter their products (as opposed to buying and selling them)? Make up imaginary dialogs on the market place in which these contradictions are expressed.

This contradiction between the individual and the social dimension of the exchange process is a matter of our daily experience. We are confronted with this contradiction whenever we have to decide whether we want to buy exactly the use-value we want and pay premium price for it, or whether we prefer to make do with whatever is on sale.

2.2.d. [More Specific Formulation of the Contradiction]

Through a “closer” look, Marx arrives at a more specific formulation of the contradiction—a formulation from which he will derive, in the next step, a solution for this contradiction:

180:2 Let us take a closer look. The owner of a commodity considers every other commodity as the Particular equivalent of his own commodity, which makes his own commodity the General equivalent of all other commodities.

101:2 Sehn wir näher zu, so gilt jedem Warenbesitzer jede fremde Ware als besonderes Äquivalent seiner Ware, seine Ware daher als allgemeines Äquivalent aller andren Waren.

I translated the passive “*gilt*” with the active “*considers*” because the next sentence refers to it as an act.

Question 387 In 180:2, Marx writes: “The owner of a commodity considers every other commodity as the Particular equivalent of his own commodity, which makes his own commodity the General equivalent of all other commodities.” This automatic link between the Expanded form of value (whith its multiple Particular equivalents) and the General forms of value is in contradiction to section 3 of chapter One. In that earlier section, the General form of value did not immediately flow from the Expanded form, but a social act was necessary to establish it. Comment.

The commodity-owner expresses the value of his commodity in a large circle of use-values of other commodities. Applying the categories from section 3 in chapter One, see 155:2, his own commodity is in the Expanded relative form. These categories give Marx a bird’s eyes view of the multitude of individual activities and motivations.

An individual commodity producer’s wish that his or her commodity be in the Expanded relative form does not place the commodity into this form for society. His commodity can only then be in the Expanded relative form if everybody else consider it as the General equivalent (which is simply the Expanded form of value read backwards). Marx makes here exactly the same reversal as in 157:3. Unfortunately, it is impossible for the others to consider his commodity as the General equivalent:

But since every owner does the same thing, none of the commodities is General equivalent, and the commodities do not possess a General relative form of value in order to equate each other as values and compare the magnitudes of their values.

Da aber alle Warenbesitzer dasselbe tun, ist keine Ware allgemeines Äquivalent und besitzen die Waren daher auch keine allgemeine relative Wertform, worin sie sich als Werte gleichsetzen und als Wertgrößen vergleichen.

For every commodity producer, her own product is the point of reference, it is her treasure, whose value she wants to express in all other products. It is the “money” with which she wishes to buy the other commodities. But overall, there can only be one money in society. Therefore the points of view of different individuals—which by their nature do not spontaneously fit together but have to be adjusted to each other—cannot even be formulated

in a common language that make such an adjustment possible. This is why Marx writes that in this situation, the commodities do not have a general *form of value*. ↓ Their confrontation on the market does not take a form which reflects the social fact that they are commodities. Therefore they do not even confront each other as commodities, but only as products or use-values.

↑ They *are* commodities, but they do not have an interactive relation with each other which does justice to this. Giving the objects a commodity form means providing a common social language in which the individuals can express, in a socially coherent manner, their individual attitudes towards the use-values and exchange-values of the things they are producing. Compare especially the above criterion (2) for a form of value. What individuals spontaneously try to do for their own benefit does not cohere into a social relation shared by all.

2.2.e. [The Deed]

The lack of social coordination in the more specific formulation of the contradiction gives a hint where the solution of this contradiction must be found. It cannot be resolved on an individual level but requires a social act. Society has a way out, even if the individuals do not. Society can designate a certain commodity as General equivalent. This gives the commodities a social form in which the inherent dilemmas of the commodity, though still present, are expressed in a coherent way equally for everyone. If the individuals view their connection to the social labor process no longer in a different and incoherent manner, they are able to align their activities with each other. The “preparatory act of circulation” necessary for this took place a long time ago:

180:3–181:1 In their dilemma our commodity-owners think like Faust: ‘In the beginning was the deed.’

101:3–4 In ihrer Verlegenheit denken unsre Warenbesitzer wie Faust. Im Anfang war die Tat.

↑ This is a reference to Goethe’s *Faust*, Part I, Scene 3, Faust’s Study.

Exam Question 388 Which “deed” is Marx referring to in the following passage: “In their dilemma our commodity-owners think like Faust: ‘In the beginning was the deed.’ They have therefore already acted before thinking.”

They have therefore already acted before thinking.

Sie haben daher schon gehandelt, bevor sie gedacht haben.

Implicit in Marx’s formulation here is an important distinction:

- As individuals, humans first think and then act, and therefore act purposefully.
- As a society, they still act before they think.

The laws of the commodity nature come to fruition in the natural instinct of the commodity owners.

Die Gesetze der Warennatur betätigen sich im Naturinstinkt der Warenbesitzer.

↑ The word “natural instinct” is a pun: it is not an instinct which the commodity owners have *by* nature, but it is an instinct *for* the commodity nature which the commodity owners gain by their spontaneous market activity. The remainder of this paragraph, which is a nutshell summary of section 1.3, explain this process:

They can only relate their commodities to each other as values, and therefore as commodities, if they place them in a polar relationship with a third commodity that serves as the General equivalent. We concluded this from our analysis of the commodity. But only a social deed can turn one specific commodity into the General equivalent. The social action of all other commodities, therefore, excludes one specific commodity, in which all others represent their values. The natural form of this commodity thereby becomes the socially recognized equivalent form. Through the agency of the social process it becomes the specific social function of the excluded commodity to be the general equivalent. It thus becomes—money.

‘These have one mind, and shall give their power and strength unto the beast’ (Revelation 17:13). ‘And that no man might buy or sell, save that he had the mark, or the name of the beast, or the number of his name’ (Revelation 13:17).

Sie können ihre Waren nur als Werte und darum nur als Waren aufeinander beziehn, indem sie dieselben gegensätzlich auf irgendeine andre Ware als allgemeines Äquivalent beziehn. Das ergab die Analyse der Ware. Aber nur die gesellschaftliche Tat kann eine bestimmte Ware zum allgemeinen Äquivalent machen. Die gesellschaftliche Aktion aller andren Waren schließt daher eine bestimmte Ware aus, worin sie allseitig ihre Werte darstellen. Dadurch wird die Naturalform dieser Ware gesellschaftlich gültige Äquivalentform. Allgemeines Äquivalent zu sein wird durch den gesellschaftlichen Prozeß zur spezifisch gesellschaftlichen Funktion der ausgeschlossenen Ware. So wird sie—Geld.

„Illi unum consilium habent et virtutem et potestatem suam bestiae tradunt. Et ne quis possit emere aut vendere, nisi qui habet characterem aut nomen bestiae, aut numerum nominis ejus.“ (Apokalypse.)

Question 389 Why can commodity owners relate their commodities to each other as commodities only if they relate them to each other as values? Also explain what it means to “relate their commodities to each other as commodities” and “relate their commodities to each other as values.”

And indeed, there are no direct exchanges of commodities in modern markets. Everything is sold and purchased, only a tiny fraction of the goods are directly bartered. The form $C - M - C$, which replaces the direct barter, will be discussed in chapter Three. In 199:2, Marx will pick up the thread from here.

2.3. [Historical Development of the Commodity Form]

Since the resolution of the contradictions of commodity exchange requires a social deed, Marx looks now at the history of the commodity form in order to see when this deed hap-

pened. It turns out that this social deed was not a one-time act (so that commodity production first existed before this social deed and then after it), but that the commodity form gradually emerged along with commodity production itself.

181:2 The money crystal is a necessary product of the exchange process, in which different products of labor are in fact equated with each other, and thus are in fact converted into commodities.

↑ Marx does not say here “money is a necessary product of the exchange of commodities,” but he says that money is necessary product of the exchange of *products* which by this exchange are converted into commodities. I.e., the development of money and the development of commodity production go in parallel. ↓ Marx gives a very abstract argument why this must be so. The next sentence is parallel to 160:4:

The historical broadening and deepening of exchange develops the opposition between use-value and value dormant in the nature of the commodity.

101:5/o Der Geldkristall ist ein notwendiges Produkt des Austauschprozesses, worin verschiedenartige Arbeitsprodukte einander tatsächlich gleichgesetzt und daher tatsächlich in Waren verwandelt werden.

Die historische Ausweitung und Vertiefung des Austausches entwickelt den in der Warennatur schlummernden Gegensatz von Gebrauchswert und Wert.

Both translations (Moore-Aveling and Fowkes) say “latent” instead

of “dormant.” This is the epistemic fallacy. One does not become

invisible if one falls asleep.

↑ With the increasing variety of commodities on the market, the value and use-value of each commodity come more and more in contradiction with each other.

Question 390 *How does the historical broadening and deepening of exchange develop the opposition between use-value and value dormant in the nature of the commodity?*

↓ In order to practically handle this contradiction, its two poles have to be spread over two different commodities: the ordinary commodity representing the use-value, and the money commodity representing the value.

The need to have an external representation of this opposition for the purposes of commercial intercourse generates the drive towards an independent form of value. It finds neither rest nor peace until this independent form has been achieved once and for all by the differentiation of commodities into commodities and money.

Das Bedürfnis, diesen Gegensatz für den Verkehr äußerlich darzustellen, treibt zu einer selbständigen Form des Warenwerts und ruht und rastet nicht, bis sie endgültig erzielt ist durch die Verdopplung der Ware in Ware und Geld.

Important connection between the external expression of the inner nature and the practical necessities of commerce. Since commodity production develops gradually, and with it its (initially dormant) inner contradictions, and since these contradictions, the more they are developed, require external expression, the development of commodity to money parallels the development of commodity production.

At the same rate, then, as the transformation of the products of labor into commodities is accomplished, one particular commodity is transformed into money.⁴⁰

In the light of this close historical connection between form and content, Gray’s theory of labor money seems especially absurd.

⁴⁰ From this we may form an estimate of the craftiness of petty-bourgeois socialism, which wants to perpetuate the production of commodities while simultaneously abolishing the ‘antagonism between money and commodities’, i.e. while abolishing money itself, since money only exists in and through this antagonism. One might just as well abolish the Pope while leaving Catholicism in place. For more on this point see my work *A Contribution to the Critique of Political Economy*, p. 320:2–321:3 ff.

This footnote 40 has a similar theme as footnote 24 to paragraph 161:1 in section 3 of chapter One.

The first stage in the historical development of the commodity form is what Marx calls the direct barter of products:

Question 393 *Why is the occasional exchange of surplus products between tribes not an exchange of “commodities” but one of “products”?*

181:3/o The direct barter of products in one respect does and in another respect does not yet have the form of the Simple expression of value. That form was *x commodity A = y commodity B*. The form of the direct barter of products is: *x use-value A = y use-value B*.⁴¹

↓ Footnote 41 refers to a situation which, as it so happens, is described at the very beginning of Jevons’s [Jev75]. But Jevons did not recognize that this was not barter but a social form preceding barter:

⁴¹ So long as a chaotic mass of articles is offered as the equivalent for a single article (as is often the case among savages), instead of two distinct objects of utility being exchanged, we are only at the threshold of even the direct exchange of products.

In demselben Maße daher, worin sich die Verwandlung der Arbeitsprodukte in Waren, vollzieht sich die Verwandlung von Ware in Geld.⁴⁰

⁴⁰ Danach beurteile man die Pffiffigkeit des kleinbürgerlichen Sozialismus, der die Warenproduktion verewigen und zugleich den „Gegensatz von Geld und Ware“, also das Geld selbst, denn es ist nur in diesem Gegensätze, abschaffen will. Ebenso wohl könnte man den Papst abschaffen und den Katholizismus bestehen lassen. Das Nähere hierüber sieh in meiner Schrift „Zur Kritik der Pol. Oekonomie“, p. 320:2–321:3 sqq.

102:1/o Der unmittelbare Produktaustausch hat einerseits die Form des einfachen Wertausdrucks und hat sie andererseits noch nicht. Jene Form war *x Ware A = y Ware B*. Die Form des unmittelbaren Produktaustausches ist: *x Gebrauchsgegenstand A = y Gebrauchsgegenstand B*.⁴¹

⁴¹ Solange noch nicht zwei verschiedene Gebrauchsgegenstände ausgetauscht, sondern, wie wir das bei Wilden oft finden, eine chaotische Masse von Dingen als Äquivalent für ein Drittes angeboten wird, steht der unmittelbare Produktaustausch selbst erst in seiner Vorhalle.

↓ The remainder of the paragraph describes the transition from direct barter of use-values to the exchange of commodities.

The articles *A* and *B* in this case are not as yet commodities, but become so only through the act of exchange.

Two conditions must be met for products to

The first mode in which an object of utility is potentially an exchange-value is that it is a non-use-value for its owner, a certain amount of use-value exceeding its owner's immediate needs.

Die Dinge *A* und *B* sind hier nicht Waren vor dem Austausch, sondern werden es erst durch denselben.

become commodities.

Die erste Weise, worin ein Gebrauchsgegenstand der Möglichkeit nach Tauschwert ist, ist sein Dasein als Nicht-Gebrauchswert, als die unmittelbaren Bedürfnisse seines Besitzers überschießendes Quantum von Gebrauchswert.

Whenever Marx uses the word "Dasein" he refers to specific relations in which a thing stands. An accurate though verbose translation of the term "Dasein" in the sentence: "Die erste Weise ... ist sein Dasein als Nicht-Gebrauchswert" would be: "The first mode ... is to stand in a relation in which it is a non-use-value." We are talking

here about an object of utility, i.e., something which, by definition, has a use-value. Such an object can become a commodity only if it stands in a relation in which its use-value is, so to say, turned off—in other words, if it does not have a use-value for its owner. Instead of the above accurate translation I chose to unpack the concept, i.e., instead of saying "is

to stand in a relation in which it is a non-use-value" I named this relation and said: "is to be a non-use-value for its owner." It is significant that Marx specifies here "a certain amount" (quantum). Because by assumption, the object of utility as such is useful, but its owner has too much of it.

But this condition only makes the development of the commodity possible. A second condition is necessary before this potential can be actualized. Before formulating this condition, Marx makes a short digression into some very general underlying facts:

Things are in and for themselves external to man, and therefore separable from him. In order that this separation may be reciprocal, it is only necessary that humans tacitly treat each other as the private owners of these separable things and, by this very act, confront each other as independent persons.

Dinge sind an und für sich dem Menschen äußerlich und daher veräußerlich. Damit diese Veräußerung wechselseitig, brauchen Menschen nur stillschweigend sich als Privateigentümer jener veräußerlichen Dinge und eben dadurch als voneinander unabhängige Personen gegenüberzutreten.

The word "tacit" is explained in *Notes on Wagner*, p. [mecw24]553:4–554:1. The mutual recognition as commodity owners does not have to precede the exchange but comes with the exchange. (By contrast, marriage does not come with having sex but for many years was required to precede the sex act.) A similar use of the phrase "tacitly recognize" also in the *Critique of the Gotha Programme*, [mecw].

From this very general truth follows the second condition for the development of commodity production: Since humans are not Robinsons but very social animals, this mutual independence can only be a social product. In human pre-history, individuals have this degree of independence only if they belong to different tribes:

But this relationship of reciprocal isolation and foreignness does not exist for the members of a primitive community of natural origin, whether it takes the form of a patriarchal family, an ancient Indian commune or an Inca state. The exchange of commodities begins where communities have their boundaries, at their points of contact with other communities, or with members of the latter. However, as soon as products have become commodities in the external relations of a community, they also, by reaction, become commodities in the internal life of the community. Their quantitative exchange-relation is at first determined purely by chance. They become exchangeable through the mutual desire of their owners to alienate them.

To sum up: The immediate product exchange is a mutual giving away of products based on the mutual desire of their owners to exchange them. This possibility always exists, because things are external to man and can therefore be given away. But also a set of other conditions must be satisfied.

1. The individuals who make this trade must have no need for the use-values of their own things. This is not the only situation in which people trade use-values but it is the "first modality."
2. The two traders must have authority to dispose over these things and to transfer ownership. Today this looks as follows: If *P* receives commodity *B* from *Q* in exchange for his commodity *A*, and later it turns out that *Q* was not the owner of commodity *B*, then *P* does not own *B* either. People cannot transfer ownership of things they do not own. In the ancient tribal situation, the traders receive this authority not from some set of codified property laws, but they must recognize each other as the private owners of these things.

In this immediate product-exchange, the quantitative exchange-proportion is accidental. Not only is the deviation of prices from values accidental, as in the fully developed circulation, but the magnitude of the full price is accidental. The proportions in which the two exchangers agree to exchange their things can be anything; there is no force or "dull compulsion" to do it proportionally to labor-time or whatever.

Question 396 *What is the difference between the exchange of products and the exchange of commodities? Why does the exchange of products usually involve surplus-products, and why does it first take place between members of different communities?*

Solch ein Verhältnis wechselseitiger Fremdheit existiert jedoch nicht für die Glieder eines naturwüchsigen Gemeinwesens, habe es nun die Form einer patriarchalischen Familie, einer altindischen Gemeinde, eines Inkastaates usw. Der Warenaustausch beginnt, wo die Gemeinwesen enden, an den Punkten ihres Kontakts mit fremden Gemeinwesen oder Gliedern fremder Gemeinwesen. Sobald Dinge aber einmal im auswärtigen, werden sie auch rückschlagend im innern Gemeinleben zu Waren. Ihr quantitatives Austauschverhältnis ist zunächst ganz zufällig. Austauschbar sind sie durch den Willensakt ihrer Besitzer, sie wechselseitig zu veräußern.

Next Marx describes the process by which the immediate exchange of *products* becomes exchange of *commodities*.

In the meantime, the need for others' objects of utility gradually establishes itself. The constant repetition of exchange makes it a normal social process. In the course of time, therefore, at least some part of the products must be produced intentionally for the purpose of exchange. From that moment the distinction between the usefulness of things for direct consumption and their usefulness in exchange becomes firmly established. Their use-value becomes distinguished from their exchange-value. On the other hand, the quantitative proportion in which the things are exchangeable becomes dependent on their production itself. Custom fixes their values at definite magnitudes.

Transition to *commodities*. Now the commodity-owners do not merely exchange surplus products, but produce things for exchange and depend on the products they get in return for them. The commodities are socially related even before the exchange takes place. Already the labors going into these products stand in relation to each other, they form a general system of division of labor. And the quantitative proportions are no longer subject to the will of the exchangers but depend on the market. If the products are commodities, the direct exchange is no longer adequate for them.

After the development of commodity production, now the development of the exchange:

182:1 In the direct barter of products, each commodity is a direct means of exchange to its owner, and an equivalent to those who do not possess it, although only in so far as it has use-value for them. At this stage, therefore, the articles exchanged do not acquire a value form independent of their own use-value, or of the individual needs of the exchangers. The need for this form first develops with the increase in the number and variety of the commodities entering into the process of exchange.

One facet of the problem is discussed concretely in *Grundrisse*. In the direct barter of the products, the product serves for the producer as a means of exchange. This can no longer be

Indes setzt sich das Bedürfnis für fremde Gebrauchsgegenstände allmählich fest. Die beständige Wiederholung des Austausches macht ihn zu einem regelmäßigen gesellschaftlichen Prozeß. Im Laufe der Zeit muß daher wenigstens ein Teil der Arbeitsprodukte absichtlich zum Behuf des Austausches produziert werden. Von diesem Augenblick befestigt sich einerseits die Scheidung zwischen der Nützlichkeit der Dinge für den unmittelbaren Bedarf und ihrer Nützlichkeit zum Austausch. Ihr Gebrauchswert scheidet sich von ihrem Tauschwert. Andererseits wird das quantitative Verhältnis, worin sie sich austauschen, von ihrer Produktion selbst abhängig. Die Gewohnheit fixiert sie als Wertgrößen.

103:1/o Im unmittelbaren Produktaustausch ist jede Ware unmittelbar Tauschmittel für ihren Besitzer, Äquivalent für ihren Nichtbesitzer, jedoch nur soweit sie Gebrauchswert für ihn. Der Tauschartikel erhält also noch keine von seinem eignen Gebrauchswert oder dem individuellen Bedürfnis der Austauscher unabhängige Wertform. Die Notwendigkeit dieser Form entwickelt sich mit der wachsenden Anzahl und Mannigfaltigkeit der in den Austauschprozeß eintretenden Waren.

the case if these products are fully grown-up commodities, since the division of labor is so deep and the use-values become so differentiated that it becomes less and less likely that the double coincidence of use-values occurs.

The further the division of labor develops, the more the product ceases to be means of exchange. The necessity arises for a general means of exchange, which is independent of the specific production of each individual. If production is aimed at the immediate subsistence, then not *each* article can be exchanged against *each* other one; a specific activity can be exchanged only against *specific* products. The more the products becomes particular, manifold, dependent on each other, the more a general means of exchange becomes necessary. (*Grundrisse* 199:1).

At the same time that this problem arises, also the means of its solution come into existence. How? With the development of commodity production spontaneously leads to it that, for some of the central articles of trade, the Simple form of value develops into the Expanded form of value:

The problem and the means for its solution arise simultaneously. Commercial intercourse in which the commodity owners exchange and compare their own articles with various other articles never takes place without different kinds of commodities, that belong to different owners, being exchanged for, and equated as values with, one single further kind of commodity. This further commodity, by becoming the equivalent of various other commodities, directly acquires the form of a General or social equivalent, if only within narrow limits.

Die Aufgabe entspringt gleichzeitig mit den Mitteln ihrer Lösung. Ein Verkehr, worin Warenbesitzer ihre eignen Artikel mit verschiedenen andren Artikeln austauschen und vergleichen, findet niemals statt, ohne daß verschiedene Waren von verschiedenen Warenbesitzern innerhalb ihres Verkehrs mit einer und derselben dritten Warenart ausgetauscht und als Werte verglichen werden. Solche dritte Ware, indem sie Äquivalent für verschiedene andre Waren wird, erhält unmittelbar, wenn auch in engen Grenzen, allgemeine oder gesellschaftliche Äquivalentform.

This "further" commodity is often one of the central commodities (cattle), and since there is so much of it and everybody needs it, it naturally acquires the expanded relative form in the hands of those who produce it. As the need for a General equivalent becomes more and more acute, these commodities are then the logical candidates.

Next Marx discusses the transition from the General equivalent to the Money form. There are two kinds of use-values which initially served as money:

The General equivalent form comes and goes with the momentary social contacts which call it into existence. It is transiently attached to this or that commodity in alternation. But with the development of ex-

Diese allgemeine Äquivalentform entsteht und vergeht mit dem augenblicklichen gesellschaftlichen Kontakt, der sie ins Leben rief. Abwechselnd und flüchtig kommt sie dieser oder jener Ware zu. Mit der Entwick-

change it fixes itself firmly and exclusively onto particular kinds of commodity, i.e. it crystallizes out into the money-form.

↓ Now the question: which use-value is chosen to be the money commodity?

The particular kind of commodity to which it sticks is at first a matter of accident. Nevertheless there are two circumstances which are by and large decisive. The money-form comes to be attached either to the most important articles of exchange from outside, which are in fact the most naturally arising forms of manifestation of the exchange-value of local products, or to the object of utility which forms the chief element of indigenous alienable wealth, for example cattle. Nomadic peoples are the first to develop the money-form, because all their worldly possessions are in a movable and therefore directly alienable form, and because their mode of life, by continually bringing them into contact with foreign communities, encourages the exchange of products. Men have often made man himself into the primitive material of money, in the shape of the slave, but they have never done this with the land and soil. Such an idea could only arise in a bourgeois society, and one which was already well developed. It dates from the last third of the seventeenth century, and the first attempt to implement the idea on a national scale was made a century later, during the French bourgeois revolution.

Question 400 Why could the idea to use land as money arise only when capitalism was already developed?

Marx does not explain why the main articles do not remain general equivalents: because then their production would not be regulated by the market, since the equivalent form does not have quantitative determination.

But in the end, that commodity becomes money whose use-value best allows it to be the independent incarnation of value, i.e., whose physical properties fitted best for the *functions* of money.

lung des Warenaustausches heftet sie sich aber ausschließlich fest an besondere Warenarten oder kristallisiert zur Geldform.

An welcher Warenart sie kleben bleibt, ist zunächst zufällig. Jedoch entscheiden im großen und ganzen zwei Umstände. Geldform heftet sich entweder an die wichtigsten Eintauschartikel aus der Fremde, welche in der Tat naturwüchsige Erscheinungsformen des Tauscherts der einheimischen Produkte sind, oder an den Gebrauchsgegenstand, welcher das Hauptelement des einheimischen veräußerlichen Besitztums bildet, wie z.B. Vieh. Nomadenvölker entwickeln zuerst die Geldform, weil all ihr Hab und Gut sich in beweglicher, daher unmittelbar veräußerlicher Form befindet, und weil ihre Lebensweise sie beständig mit fremden Gemeinwesen in Kontakt bringt, daher zum Produktenaustausch sollizitiert. Die Menschen haben oft den Menschen selbst in der Gestalt des Sklaven zum ursprünglichen Geldmaterial gemacht, aber niemals den Grund und Boden. Solche Idee konnte nur in bereits ausgebildeter bürgerlicher Gesellschaft aufkommen. Sie datiert vom letzten Drittel des 17. Jahrhunderts, und ihre Ausführung, auf nationalem Maßstab, wurde erst ein Jahrhundert später in der bürgerlichen Revolution der Franzosen versucht.

183:1 In the same proportion as exchange bursts its local bonds, and the value of commodities accordingly expands more and more into the material embodiment of human labor as such, in that proportion does the money-form become transferred to commodities which are by nature fitted to perform the social function of a General equivalent. These commodities are the precious metals.

183:2/o The truth of the statement that 'although gold and silver are not by nature money, money is by nature gold and silver',⁴² is shown by the congruence between the natural properties of gold and silver and the functions of money.⁴³

After a reference to *Contribution*, Footnote 42 brings a Galiani quote which Marx had to reverse to make it true:

⁴² Karl Marx, op. cit., p. 387:1. 'The metals ... are by their nature money'. Galiani [Gal03, t. III, p. 137]

Marx would say instead: money is by nature gold and silver.

⁴³ For further details on this subject see the chapter on 'The Precious Metals' in my work cited above.

↑ The reference is 385:1.

For now we only know one function of money, namely, to serve as the form of appearance of the value of commodities, i.e., as the material in which the magnitudes of their values are socially expressed. Only a material whose every sample possesses the same uniform quality can be an adequate form of appearance of value, that is a material embodiment of abstract and therefore equal human labor. On the other hand, since the difference between the magnitudes of value is purely quantitative, the money commodity must be capable of purely quantitative differentiation, it must therefore be divisible at will, and it must also be possi-

104:1 In demselben Verhältnis, worin der Warenaustausch seine nur lokalen Bande sprengt, der Warenwert sich daher zur Materiatut menschlicher Arbeit überhaupt ausweitert, geht die Geldform auf Waren über, die von Natur zur gesellschaftlichen Funktion eines allgemeinen Äquivalents taugen, auf die edlen Metalle.

104:2 Daß nun, „obgleich Gold und Silber nicht von Natur Geld, Geld von Natur Gold und Silber ist“,⁴² zeigt die Kongruenz ihrer Natureigenschaften mit seinen Funktionen.⁴³

⁴² Karl Marx, l.c. p. 387:1. „Die Metalle ... sind von Natur Geld.“ Galiani [Gal03, t. III, p. 137]

⁴³ Das Nähere darüber in meiner eben zitierten Schrift, Abschnitt: „Die edlen Metalle“.

Bisher kennen wir aber nur die eine Funktion des Geldes, als Erscheinungsform des Warenerts zu dienen oder als das Material, worin die Wertgrößen der Waren sich gesellschaftlich ausdrücken. Adäquate Erscheinungsform von Wert oder Materiatut abstrakter und daher gleicher menschlicher Arbeit kann nur eine Materie sein, deren sämtliche Exemplare dieselbe gleichförmige Qualität besitzen. Andererseits, da der Unterschied der Wertgrößen rein quantitativ ist, muß die Geldware rein quantitativer Unterschiede fähig, also nach Willkür teilbar und aus ihren Teilen wieder zusammensetzbar sein. Gold und Silber besitzen aber

ble to assemble it again from its component parts. Gold and silver possess these properties by nature.

diese Eigenschaften von Natur.

Question 401 *One important property of gold is also that it does not deteriorate over time, it does not rust etc. Is this a reflection of the fact that value itself does not deteriorate over time?*

Question 402 *Explain in your own words the meaning of Marx's statement: "Although gold and silver are not by nature money, money is by nature gold and silver."*

Question 403 *In a modern society, would use-values other than gold be possible candidates for a money commodity?*

Question 404 *Shouldn't the explanation why gold is the money commodity be in chapter Three instead of chapter Two?*

Question 405 *Is there also a congruence between the properties of gold and the other functions of money discussed in chapter Three?*

The development of the forms of value look, from the side of the money commodity, like a development of a new use-value:

184:1 The money commodity acquires a dual use-value. Alongside its particular use-value as a commodity (gold, for instance, serves to fill hollow teeth, forms the raw material for luxury articles, etc.) it acquires a formal use-value, arising out of its specific social function.

184:2 Since all other commodities are merely particular equivalents for money, the latter being their universal equivalent, they relate to money as particular commodities relate to the universal commodity.⁴⁴

⁴⁴ 'Money is the universal commodity' Verri, [Ver04, p. 16].

104:3 Der Gebrauchswert der Geldware verdoppelt sich. Neben ihrem besondern Gebrauchswert als Ware, wie Gold z.B. zum Ausstopfen hohler Zähne, Rohmaterial von Luxusartikeln usw. dient, erhält sie einen formalen Gebrauchswert, der aus ihren spezifischen gesellschaftlichen Funktionen entspringt.

104:4 Da alle andren Waren nur besondere Äquivalente des Geldes, das Geld ihr allgemeines Äquivalent, verhalten sie sich als besondere Waren zum Geld als der allgemeinen Ware.⁴⁴

⁴⁴ „Das Geld ist die allgemeine Ware.“ Verri, [Ver04, p. 16]

2.4. [Ideologies of Money and its Fetish-Like Character]

The last three paragraphs of chapter Two form a unit, whose secret organizing principle is a discussion of quality, quantity, and form.

Marx discusses here some misconceptions about money, documenting the wrong and right things written about them, their causes, and their kernels of truth. These are good examples of immanent critique.

The first misconception is the notion that money itself does not have value but its value comes from social agreement. As in some other instances, Marx does not give indication to the reader that this is the problematic which he is going to discuss, but simply plunges into the discussion. On the other hand, Marx converses with the reader in such a way as if the reader knew which question was being answered.

184:3/oo We have seen that the Money form is only the reflection, attached to one particular commodity, of the relationships of all other commodities.

105:1/o Man hat gesehen, daß die Geldform nur der an einer Ware festhaftende Reflex der Beziehungen aller andren Waren.

Marx means here the Money form of value discussed in subsection 1.3.D, not the money form or the price of a commodity. A commodity becomes money by the joint action of all other commodities, by a social agreement which decides that every commodity should express its value in that specific commodity.

Why is there an "only" in Marx's sentence which we are presently discussing? Because the question Marx is addressing here (without explicitly announcing it to the reader) is: to what extent is the function of money based on a social agreement? Marx concedes that yes, a social agreement is involved, but this social agreement does not say, let's all act as if the thing that circulates as money had a value. Rather, this social agreement *only* consists in the selection of a specific kind of commodity to which a form of value is to be permanently attached namely, the form of General equivalent. In principle, any commodity can have this form, but by its nature, this form needs to become the specialty of one specific commodity. 162:5/o is important here; this is the bridge to the next sentence following below. (Marx is acutely aware of what can and what cannot be decided by social agreement. It cannot be decided by a social agreement that everyone should accept an intrinsically valueless money in exchange for their valuable commodities. These kinds of decision must remain based on competition. But it can be decided by social agreement which use-value everyone uses as general equivalent.)

Since commodities can express their values only in something that has value itself (because only in this way can the other commodities say that they have as much value as this thing there), Marx continues:

That money is a commodity⁴⁵ is therefore a discovery only for those who proceed from its finished shape in order to analyze it afterwards.

Daß Geld Ware ist,⁴⁵ ist also nur eine Entdeckung für den, der von seiner fertigen Gestalt ausgeht, um sie hinterher zu analysieren.

The Moore-Aveling translation

omits the "fertig."

In other words, only those people are surprised that money is a commodity who ask: "What is money?" Marx asks instead: "How can commodities express their values?" In the

analysis tracing the development of money it is clear from the beginning that money must be a commodity.

⁴⁵ 'Silver and gold themselves, which we may call by the general name of Bullion, are ... commodities ... rising and falling in ... value ... Bullion then may be reckoned to be of higher value, where the smaller weight will purchase the greater quantity of the product or manufacture of the country etc.' (S. Clement, A Discourse of the General Notions of Money, Trade, and Exchange, as They Stand in Relations to Each Other. By a Merchant, London 1695, p. 7). 'Silver and gold, coined or uncoined, tho' they are used for a measure of all other things, are no less a commodity than wine, oyl, tobacco cloth or stuffs' (J. Child, A Discourse Concerning Trade, and That in Particular of the East-Indies etc., London, 1689, p. 2). 'The stock and riches of the kingdom cannot properly be confined to money, nor ought gold and silver to be excluded from being merchandize' (T. Papillon, The East-India Trade a Most Profitable Trade, London, 1677, p. 4).

First misconception: the value of money is imaginary. This misconception arises because gold gets its specific form of value from a different place than where it gets its value.

The exchange process gives to the commodity which it has designated as money not its value but its specific value form.

Moore-Aveling says: "The act of exchange gives to the commodity converted into money, not its value but its specific value form." This misleads the reader into thinking

that Marx talks about the exchange of commodities for money. Fowkes has it better: "The process of exchange gives to the commodity which it has converted

into money not its value but its specific form of value." Even this is understandable, therefore I wrote "which it has designated as money."

Exam Question 408 Marx writes: "The exchange process gives the commodity which it has designated as money not its value, but its specific form of value." Which form of value does Marx mean here? Why does Marx call this form the specific form of value of the money commodity? (Assume we are under the gold standard.)

Through the exchange process, one commodity is selected as the General equivalent. This selection process does not give the General equivalent its value but gives it a "specific" form of value, i.e., a form of value which, from then on, will be associated with that use-value alone.

⁴⁵ „Silber und Gold an sich, die wir mit dem allgemeinen Namen Edelmetall bezeichnen können, sind im ... Werte ... steigende und fallende ... Waren ... Dem Edelmetall kann man dann einen höheren Wert zuerkennen, wenn ein geringeres Gewicht davon eine größere Menge des Produkts oder Fabrikats des Landes etc. kauft.“ ([S. Clement,] „A Discourse of the General Notions of Money, Trade, and Exchange, as they stand in relations to each other. By a Merchant“, Lond. 1695, p. 7.) „Silber und Gold, gemünzt oder ungemünzt, werden zwar als Maßstab für alle anderen Dinge gebraucht, sind aber nicht weniger eine Ware als Wein, Öl, Tabak, Tuch oder Stoffe.“ ([J. Child,] „A Discourse concerning Trade, and that in particular of the East Indies etc.“, London 1689, p. 2.) Vermögen und Reichtum des Königreiches können genau genommen nicht auf Geld beschränkt, noch können Gold und Silber als Waren ausgeschlossen werden. ([Th. Papillon,] „The East India Trade a most Profitable Trade“, London 1677, p. 4.)

Der Austauschprozeß gibt der Ware, die er in Geld verwandelt, nicht ihren Wert, sondern ihre spezifische Wertform.

Confusion between these two attributes has misled some writers into maintaining that the value of gold and silver is imaginary.⁴⁶

In the footnote, Galiani got it right, Locke was wrong, and Law gave a correct criticism of Locke but he himself did not get it entirely right either:

⁴⁶ 'Gold and silver have value as metals before they are money' Galiani, [Gal03, p. 72]. Locke says, 'The universal consent of mankind gave to silver, on account of its qualities which made it suitable for money, an imaginary value' [John Locke, [Loc77, p. 15].] Law retorts 'How could different nations give an imaginary value to any single thing ... or how could this imaginary value have maintained itself?' But he himself understood very little of the matter, for example 'Silver was exchanged in proportion to the use-value it possessed, consequently in proportion to its real value. By its adoption as money it received an additional value (une valeur additionnelle)'. Jean Law, [Law43, pp. 469–70].

Die Verwechslung beider Bestimmungen verleitete dazu, den Wert von Gold und Silber für imaginär zu halten.⁴⁶

⁴⁶ „Gold und Silber haben Wert als Metalle, bevor sie Geld sind.“ Galiani, [Gal03, p. 72]. Locke sagt: „Die allgemeine Übereinstimmung der Menschen legte dem Silber, wegen seiner Qualitäten, die es zum Geld geeignet machten, einen imaginären Wert bei.“ [John Locke, [Loc77, p. 15].] Dagegen Law: „Wie könnten verschiedene Nationen irgendeiner Sache einen imaginären Wert geben ... oder wie hätte sich dieser imaginäre Wert erhalten können?“ Wie wenig er selbst aber von der Sache verstand: „Das Silber tauschte sich aus nach dem Gebrauchswert, den es hatte, also nach seinem wirklichen Wert; durch seine Bestimmung als Geld erhielt es einen zuschüssigen Wert (une valeur additionnelle).“ Jean Law, [Law43, p. 469, 470].

It cannot be decided by a social agreement how much value a commodity has, but it can be decided by social agreement which use-value everyone uses as general equivalent.

Second misconception: Money is merely a symbol. Again Marx takes pains to explain how this misconception could arise.

The fact that money can, in certain functions, be replaced by mere symbols of itself, gave rise to another mistaken notion, that it is itself a mere symbol.

Weil Geld in bestimmten Funktionen durch bloße Zeichen seiner selbst ersetzt werden kann, entsprang der andre Irrtum, es sei ein bloßes Zeichen.

A wedding ring is a symbol: it symbolizes a relation which exists independently of it. Gold coin, on the other hand, does not *symbolize* value, it *is* value.

Nevertheless, this error did contain the hunch that the money-form of the thing is external to the thing itself, being simply the form of appearance of human relations hidden behind it. In this sense every commodity is a symbol, since, as value, it is only the material shell of the human labor expended on it.⁴⁷

Andrerseits lag darin die Ahnung, daß die Geldform des Dings ihm selbst äußerlich und bloße Erscheinungsform dahinter versteckter menschlicher Verhältnisse. In diesem Sinn wäre jede Ware ein Zeichen, weil als Wert nur sachliche Hülle der auf sie verausgabten menschlichen Arbeit.⁴⁷

Money is not a symbol. It is true that money is only the materialized form of a social relation; but this does not license us to forget that this social relation has a materialized

form.

Imagine you are standing in a boat in New York Harbor close to the Statue of Liberty and just making some photos of it when it creaks, and a big part of the statue crashes into the water barely missing you. You cannot argue: the collapse of the statue could not have hurt you, because the statue is only the symbolic expression of one of the principles on which our government is based. Yes it is the expression of an idea, but the near-miss is a reminder that it is a very material expression of that idea.

The footnote starts with a few quotes: from wrong (Forbonnais, Montesquieu) to right (Le Trosne) to lucid (Hegel):

⁴⁷ 'Money is their (the commodities') symbol' (V. de Forbonnais, *Éléments du commerce*, new edn, Leyden, 1776, Vol. 2, p. 143). 'As a symbol it is attracted by the commodities' (ibid. p. 155). 'Money is a symbol of a thing and represents it' (Montesquieu, [Mon69, p. 3, vol. 2]). 'Money is not a mere symbol, for it is itself wealth; it does not represent the values, it is their equivalent' (Le Trosne, [LT46, p. 910]). 'If we consider the concept of value, we must look on the thing itself only as a symbol; it counts not as itself, but as what it is worth' (Hegel, [Heg40, p. 100]).

In the rest of the footnote, Marx describes historical situations in which this false theory was a handy excuse for the enrichment of the king.

^{47 ctd} Long before the economists, it was the lawyers who made fashionable the idea that money is a mere symbol, and that the value of the precious metals is purely imaginary. This they did in the sycophantic service of the royal power, supporting the right of the latter to debase the coinage, during the whole of the Middle Ages, by the traditions of the Roman Empire and the conceptions of money to be found in the Digest. 'Let no one call into question,' says their apt pupil, Philip of Valois, in a decree of 1346, 'that the trade, the composition, the supply, and the power of issuing ordinances on the currency ... belongs exclusively to us and to our royal majesty, to fix such a rate and at such a price as it shall please us and seem good to us.' It was a maxim of Roman Law that the value of money was fixed by Imperial decree. It was expressly forbidden to treat money as a commodity. 'However, it shall not be lawful for anyone to buy

⁴⁷ „Das Geld ist ihr“ (der Waren) „Zeichen.“ (V. de Forbonnais, *„Éléments du Commerce“*, Nouv. Édit. Leyde 1766, t. II, p. 143.) „Als Zeichen wird es von den Waren angezogen.“ (l.c. p. 155.) „Das Geld ist Zeichen für eine Sache und vertritt sie.“ Montesquieu, [Mon69, p. 3, t. II]. „Das Geld ist nicht bloßes Zeichen, denn es ist selbst Reichtum; es vertritt nicht die Werte, es ist ihr Äquivalent.“ Le Trosne, [LT46, p. 910]. „Betrachtet man den Begriff des Werts, so wird die Sache selbst nur als ein Zeichen angesehen, und sie gilt nicht als sie selber, sondern als was sie wert ist.“ Hegel [Heg40, p. 100].

^{47 ctd} Lange vor den Ökonomen brachten die Juristen die Vorstellung von Geld als bloßem Zeichen und dem nur imaginären Wert der edlen Metalle in Schwung, im Sykophantendienst der königlichen Gewalt, deren Münzverfälschungsrecht sie das ganze Mittelalter hindurch auf die Traditionen des römischen Kaiserreichs und die Geldbegriffe der Pandekten stützten. „Niemand kann und darf Zweifel hegen“, sagt ihr gelehriger Schüler, Philipp von Valois, in einem Dekret von 1346, „daß nur Uns und Unserer königlichen Majestät zukommt ... das Münzgeschäft, die Herstellung, die Beschaffenheit, der Vorrat und alle die Münzen betreffenden Verordnungen, sie so und zu solchem Preis in Umlauf zu setzen, wie es Uns gefällt und gutdünkt.“ Es war römisches Rechtsdogma, daß der Kaiser den Geldwert dekretiert. Es war ausdrücklich verboten, das Geld als Ware zu behandeln. Geld jedoch zu kaufen soll niemand gestattet sein, denn zum allge-

money, for, as it was created for public use, it is not permissible for it to be a commodity'. There is a good discussion of this by G. F. Pagnini, in *Saggio sopra il giusto pregio delle cose*, 1751, printed in Custodi's collection, Parte moderna, Vol. 2. In the second part of his work Pagnini directs his polemic especially against the legal gentlemen.

Third misconception: Money is an arbitrary product of human reflection.

By declaring that the social characteristics which material objects obtain on the basis of a specific mode of production, or that the material characteristics which the social determinations of labor obtain, are mere symbols, one declares them at the same time to be deliberate products of human reflection. This was the kind of explanation favored by the eighteenth century: in this way the Enlightenment endeavoured, at least for the time being, to remove the semblance of strangeness from the mysterious shapes assumed by human relations whose origins one was as yet unable to decipher.

The error of declaring social relations as arbitrary products of human reflection is called "voluntarism." The effect of this explanation is that the relations no longer seem unfamiliar—at least initially, until one has noticed that this explanation is not satisfactory.

After quality of value, the second of the three concluding paragraphs of chapter Two discusses the quantity. First: how does the quantity of value of money express itself in circulation? Marx ties here into 147:3/o.

186:1 It has already been remarked earlier that the equivalent form of a commodity does not include a determination of the magnitude of its value. Therefore, even if we know that gold is money, and consequently directly exchangeable with all other commodities, this still does not tell us how much 10 lb. of gold is worth. Money, like every other commodity, can express the magnitude of its value only relatively, in other commodities. Its value is determined by the labor-time required for its production, and

meinen Gebrauch geschaffen, darf es nicht Ware sein. Gute Auseinandersetzung hierüber von G. F. Pagnini, „Saggio sopra il giusto pregio delle cose“, 1751, bei Custodi, Parte Moderna, t. II. Namentlich im zweiten Teil der Schrift polemisiert Pagnini gegen die Herren Juristen.

Indem man aber die gesellschaftlichen Charaktere, welche Sachen, oder die sachlichen Charaktere, welche gesellschaftliche Bestimmungen der Arbeit auf Grundlage einer bestimmten Produktionsweise erhalten, für bloße Zeichen, erklärt man sie zugleich für willkürliches Reflexionsprodukt der Menschen. Es war dies beliebte Aufklärungsmanier des 18. Jahrhunderts, um den rätselhaften Gestalten menschlicher Verhältnisse, deren Entstehungsprozeß man noch nicht entziffern konnte, wenigstens vorläufig den Schein der Fremdheit abzustreifen.

106:1/o Es ward vorhin bemerkt, daß die Äquivalentform einer Ware die quantitative Bestimmung ihrer Wertgröße nicht einschließt. Weiß man, daß Gold Geld, daher mit allen andren Waren unmittelbar austauschbar ist, so weiß man deswegen nicht, wieviel z.B. 10 Pfund Gold wert sind. Wie jede Ware kann das Geld seine eigene Wertgröße nur relativ in andren Waren ausdrücken. Sein eigener Wert ist bestimmt durch die zu seiner Produktion erheischte Arbeitszeit und drückt sich in dem Quan-

is expressed in the quantity of every other commodity in which the same amount of labor-time is congealed.⁴⁸ Its relative value is therefore established at the source of its production, where it is engaged in immediate barter. As soon as it enters into circulation as money, its value is already given.

Therefore one does not see how the price level is determined. Marx could bring lots of quotes here about the quantity theory of money. Instead he only brings the quote of someone who sees it right:

⁴⁸ 'If a man can bring to London an ounce of silver out of the Earth of Peru, in the same time that he can produce a bushel of corn, then the one is the natural price of the other: now, if by reason of new or more easie mines a man can procure two ounces of silver as easily as he formerly did one, the corn will be as cheap at ten shillings the bushel as it was before at five shillings, caeteris paribus' William Petty [Pet67, p. 31].

All previous misconceptions could be cleared up by emphasizing that money is a commodity. But this is not enough to understand money. An additional misconception about money, the fourth, is the failure to identify that what distinguishes money from the other commodities.

In the last decades of the seventeenth century the first step in the analysis of money, the discovery that money is a commodity, had long been taken; but this was merely the first step, and nothing more. The difficulty lies not in comprehending that money is a commodity, but in discovering how, why and through what a commodity is money.⁴⁹

Fowkes's translation: "how, why and by what means a commodity becomes money" misses the whole point: the emphasis is not that it

becomes money but that it already is money. Also the word "means" is misleading, since a commodity does not need an (external) means

to become money, but it has inner money traits.

This echoes Marx's emphasis on the genesis of money out of the commodity in 139:1.

tum jeder andren Ware aus, worin gleichviel Arbeitszeit geronnen ist.⁴⁸ Diese Festsetzung seiner relativen Wertgröße findet statt an seiner Produktionsquelle in unmittelbarem Tauschhandel. Sobald es als Geld in die Zirkulation eintritt, ist sein Wert bereits gegeben.

⁴⁸ „Wenn jemand eine Unze Silber aus dem Innern der Erde Perus in derselben Zeit nach London bringen kann, die er zur Produktion eines Bushel Korn brauchen würde, dann ist das eine der natürliche Preis des anderen; wenn er nun durch Abbau neuer und ergiebigerer Bergwerke statt der einen zwei Unzen Silber mit dem gleichen Aufwand gewinnen kann, wird das Korn bei einem Preis von 10 Shilling pro Bushel ebenso billig sein wie vorher bei einem Preis von 5 Shilling, caeteris paribus“ William Petty [Pet67, p. 31].

Wenn es schon in den letzten Dezennien des 17. Jahrhunderts weit überschrittner Anfang der Geldanalyse, zu wissen, daß Geld Ware ist, so aber auch nur der Anfang. Die Schwierigkeit liegt nicht darin zu begreifen, daß Geld Ware, sondern wie, warum, wodurch Ware Geld ist.⁴⁹

Question 410 *How, why, and through what is a commodity already money, as Marx says in 186:1?*

⁴⁹ The learned Professor Roscher, after first informing us that 'the false definitions of money may be divided into two main groups: those which make it more, and those which make it less, than a commodity', gives us a motley catalogue of works on the nature of money, which does not provide even the glimmer of an insight into the real history of the theory. He then draws this moral: 'For the rest, it is not to be denied that most of the later economists do not bear sufficiently in mind the peculiarities that distinguish money from other commodities' (it is then, after all, either more or less than a commodity!) ... 'So far, the semi-mercantilist reaction of Ganilh is not altogether without foundation' (Wilhelm Roscher, *Die Grundlagen der Nationalökonomie*, 3rd edn, 1858, pp. 207–10). More! Less! Not sufficiently! So far! Not altogether! What a way of determining one's concepts! And this eclectic professorial twaddle is modestly baptized by Herr Roscher 'the anatomico-physiological method' of political economy! However, he does deserve credit for one discovery, namely, that money is 'a pleasant commodity'.

Question 411 *Was Roscher in error when he said that money is a pleasant commodity?*

Question 412 *List and briefly discuss all those theories of money which Marx mentioned on pages p – 186:1 and about which he said they were incorrect.*

The third paragraph covers the form of value, especially the equivalent form:

187:1 We have already seen, from the simplest expression of value, x commodity $A = y$ commodity B , that the thing in which the magnitude of the value of another thing is represented seems to have the equivalent form independently of this relation, as a social property which it possesses by nature. We followed the process by which this false semblance solidified itself.

⁴⁹ Nachdem Herr Professor Roscher uns belehrt: „Die falschen Definitionen von Geld lassen sich in zwei Hauptgruppen teilen: solche, die es für mehr, und solche, die es für weniger halten als eine Ware“, folgt ein kunterbunter Katalog von Schriften über das Geldwesen, wodurch auch nicht die entfernteste Einsicht in die wirkliche Geschichte der Theorie durchschimmert, und dann die Moral: „Zu leugnen ist übrigens nicht, daß die meisten neueren Nationalökonomien die Eigentümlichkeiten, welche das Geld von andren Waren unterscheiden“ (also doch mehr oder weniger als Ware?), „nicht genug im Auge behalten haben ... Insofern ist die halb-mercantilistische Reaktion von Ganilh etc. nicht ganz unbegründet.“ Wilhelm Roscher [Ros58, p. 297–210]. Mehr—weniger—nicht genug—insofern—nicht ganz! Welche Begriffsbestimmungen! Und dergleichen eklektische Professoralfaselei tauft Herr Roscher bescheiden „die anatomisch-physiologische Methode“ der politischen Ökonomie! Eine Entdeckung ist ihm jedoch geschuldet, nämlich, daß Geld „eine angenehme Ware“ ist.

107:1/o Wir sahen, wie schon in dem einfachsten Wertaussdruck, x Ware $A = y$ Ware B , das Ding, worin die Wertgröße eines andren Dings dargestellt wird, seine Äquivalentform unabhängig von dieser Beziehung als gesellschaftliche Natureigenschaft zu besitzen scheint. Wir verfolgten die Befestigung dieses falschen Scheins.

Fowkes's "We followed the process by which this false semblance became firmly established" sounds as if the process was the one that more and more people believed in this false

semblance. This is a misunderstanding of the text. Moore-Aveling have: "We followed up this false appearance to its final establishment." This leads the possibility open, which I

consider to be the right interpretation, that Marx does not mean the establishment in the minds of the observers, but the establishment as a reality.

It is as if not only the observer but the world itself was misled, and therefore the world allowed this false semblance to become reality.

Now the next pronoun, "Er,"

should strictly be "Sie":

This process was completed when the universal equivalent form became identified with the natural form of a particular commodity, and thus crystallized into the money-form. Although a particular commodity only becomes money because all other commodities express their values in it, it seems, on the contrary, that all other commodities universally express their values in a particular commodity because it is money. The movement which mediated this process vanishes in its own result, leaving no trace behind. Without having to do anything to achieve it, the commodities find the form of their own value, in its finished shape, in the body of a commodity existing outside and alongside them.

Marx is talking here about the fetish-like character of money. Money is so mysterious because the mediating movement has vanished and has left no trace in the result.

This physical object, gold or silver in its crude state, becomes, as soon as it emerges from the bowels of the earth, the immediate incarnation of all human labor. Hence the magic of money. The merely atomistic behavior of men in their social process of production, and hence the fact that their own relations of production take on an objectified form which is beyond their control and independent of their conscious individual striving, manifest themselves at first in the fact

Er ist vollendet, sobald die allgemeine Äquivalentform mit der Naturalform einer besondern Warenart verwachsen oder zur Geldform kristallisiert ist. Eine Ware scheint nicht erst Geld zu werden, weil die andren Waren allseitig ihre Werte in ihr darstellen, sondern sie scheinen umgekehrt allgemein ihre Werte in ihr darzustellen, weil sie Geld ist. Die vermittelnde Bewegung verschwindet in ihrem eignen Resultat und läßt keine Spur zurück. Ohne ihr Zutun finden die Waren ihre eigne Wertgestalt fertig vor als einen außer und neben ihnen existierenden Warenkörper.

Diese Dinge, Gold und Silber, wie sie aus den Eingeweiden der Erde herauskommen, sind zugleich die unmittelbare Inkarnation aller menschlichen Arbeit. Daher die Magie des Geldes. Das bloß atomistische Verhalten der Menschen in ihrem gesellschaftlichen Produktionsprozeß und daher die von ihrer Kontrolle und ihrem bewußten individuellen Tun unabhängige, sachliche Gestalt ihrer eignen Produktionsverhältnisse erscheinen zunächst darin, daß ihre Arbeits-

that the products of labor generally take the form of commodities. The riddle of the money fetish is therefore merely the riddle of the commodity fetish, has become visible and blinding the eyes.

The German says "Verhalten," not "Verhältnis," which can either mean "behavior" or also "way of relating"; Moore-Aveling translate it with "behavior," while Fowkes writes "are related." I considered "die sachliche Gestalt

ihrer Produktionsverhältnisse" (literally: objectified form of their own relations of production) to be an abbreviated formulation for: "die Tatsache daß die Produktionsverhältnisse eine sachliche Gestalt annehmen" (the

fact that their own relations of production take on an objectified form), rather than that form itself.

Instead of "dazzling" I translated "blendend" with "blinding," since it does make blind.

Again, as in section 1.4.b, Marx looks for the roots of this fetish-like character in the direct relations of the producers. This is a remarkable passage, because Marx is here quite critical of these producers. He says here quite explicitly that "the merely atomistic behavior of men in their social process of production" is not a consequence of but in some way prior to the commodity form. Marx seems to blame the fetish-like character of the commodity on the atomistic behavior of the individual producers. However, in the French edition, this criticism of the individual producers is omitted again. In French, the last sentence of chapter Two is: "Hence the magic of money." The two long sentences after this are missing.

Question 415 *Are people, by their atomistic attitude towards each other, responsible for their lack of control over their own social relations?*

3. Money or the Circulation of Commodities

Why is the topic of this chapter described as money *or* the circulation of commodities? Aren't these two different things? Yes, but they are closely related. Marx calls money the "crystallization" of the form changes of the commodities in circulation. To understand this, remember that the form change has two phases. The commodity that has been produced must realize its value and turn into a use-value that is useful for its producer. I.e., from its original use-value form it has to go into its value-form and then into its final use-value form. But its value form consists in it being exchanged for money. This is why one can say that money is the crystallization of the commodity's value form. In *Contribution*, 323:1, he writes:

In the process establishing prices, the commodities acquire the form in which they are able to circulate, and gold acquires its monetary character. After this has been accomplished, circulation will at the same time express and resolve the contradictions contained in the exchange process of commodities. The actual exchange of commodities, i.e., the process of social metabolism, takes place through a form change in which the dual nature of the commodity as a use-value and exchange-value unfolds itself, but where at the same time its own form change crystallizes itself in the various determinate forms of money.

Just as a solid dissolved into a liquid under certain circumstances precipitates in the form of crystals, the transitional phase in the form change of a commodity crystallizes out in the form of money. Elsewhere in *Contribution*, p. 393:1–396:0, Marx uses the formulation

393:1–396:0 The processing movement of commodities, which springs from the contradiction of exchange-value and use-value contained in them, which is reflected in the circulation of money, and which is

Nachdem die Ware im Prozeß der Preisgebung ihre zirkulationsfähige Form und das Gold seinen Geldcharakter erhalten hat, wird die Zirkulation die Widersprüche, die der Austauschprozeß der Waren einschloß, zugleich darstellen und lösen. Der wirkliche Austausch der Waren, d.h. der gesellschaftliche Stoffwechsel, geht vor in einem Formwechsel, worin sich die Doppelnatur der Ware als Gebrauchswert und Tauschwert entfaltet, ihr eigener Formwechsel sich aber zugleich in bestimmten Formen des Geldes kristallisiert.

137:1–140:0 Die prozessierende Bewegung der Waren, die aus dem in ihnen enthaltenen Gegensatz von Tauschwert und Gebrauchswert entspringt, in dem Umlauf des Geldes erscheint und in den verschie-

3. Money or the Circulation of Commodities

crystallized in the various form determinations of money, ...

And here is a very similar quote from 292:2:

292:2 As they develop, the interrelations of commodities crystallize into distinct aspects of the general equivalent, and thus the exchange process becomes at the same time the process of formation of money. This process as a whole, which comprises the carrying out of several processes, constitutes *circulation*.

Here is a different, unrelated, remark, before going into the chapter itself. Money is for Marx the complex of several things. There is not one property which makes something money, but money is the combination of two distinct (though related) things: measure of value and means of circulation. In order to delineate the scope of chapter Three, it should be noted that drawing interest etc. are *not* functions of money but functions of *capital*. Again, *Contribution* is helpful here, look at 303:2:

The main difficulty in the analysis of money is overcome as soon as one has grasped its origin out of the commodity itself. Once this is accomplished, the only task remaining is to comprehend the peculiar determinations of its form without alien admixtures, which is not very easy, because all bourgeois relations appear gilded, i.e., as money relations, and the money form, therefore, seems to possess an infinitely varied content, which is alien to the money form as such.

denen Formbestimmtheiten des letztern sich kristallisiert, ...

37:2 Die prozessierenden Beziehungen der Waren aufeinander kristallisieren sich als unterschiedene Bestimmungen des allgemeinen Äquivalents, und so ist der Austauschprozeß zugleich Bildungsprozeß des Geldes. Das Ganze dieses Prozesses, der sich als ein Verlauf verschiedener Prozesse darstellt, ist die *Zirkulation*.

Die Hauptschwierigkeit in der Analyse des Geldes ist überwunden, sobald sein Ursprung aus der Ware selbst begriffen ist. Unter dieser Voraussetzung handelt es sich nur noch darum, seine eigentümlichen Formbestimmtheiten rein aufzufassen, was einigermaßen erschwert wird, weil alle bürgerlichen Verhältnisse vergoldet oder versilbert, als Geldverhältnisse erscheinen, und die Geldform daher einen unendlich mannigfaltigen Inhalt zu besitzen scheint, der ihr selbst fremd ist.

3.1. Measure of Value

Chapter One, section 1.3, derived money as the culmination of a long development, from the Simple to the Expanded to the General form, and finally to the Money form of value. Now this same Money form is the starting point for a new development, in which various functions of money are derived. This is a new beginning, not the continuation of the earlier development. This new beginning has become possible because of the special nature of the step from the General equivalent form to the Money form. In 162:3, Marx stresses that this step no longer represents a development of the form of value itself, but it means that "by social custom" a certain form of value coalesces with a certain use-value. Such a merging

of several determinations is what Marx calls something “concrete”:

The concrete is concrete because it is the meeting point of many determinations, thus a unity of the diverse. *Grundrisse*, 101p.

The Money form of the commodity is the meeting point of *two* determinations: a certain use-value (gold) and a certain form of value (General equivalent). Once these two disparate things are reliably conjoined, so that the same use-value, gold, always occupies the role of General equivalent, new possibilities are opened up and new developments are set in motion. The economic determinations of money therefore greatly exceed those of a General equivalent. Chapter Three develops the further determinations flowing from this synthesis.

Section 1 of chapter Three moves back and forth several times between the relative form of value and the equivalent form. After one side has reached a certain stage of development, also the other side is developed further. This is a common *research* procedure: one first understands one thing better, then this throws light on a related thing, then that throws light on the first thing again, and so it goes back and forth. However here it is meant as an social process: since the General equivalent has by a social convention become fixed on gold, new social functions accrue to it due to the creative practical activity of the individuals involved. These new social functions modify the relative General form of value, then this acts back on the equivalent form, and so on.

Here is a summary of this back-and-forth:

- (0) The final transition in section 1.3 of chapter One, p. 162:1, was the concerted act by which the “ordinary” commodities always select the same commodity, gold, as General equivalent. This is an activity emanating from the relative form of value.
 - (1) On the equivalent form this has the effect that gold becomes the *measure of values*.
 - (2) The development of the equivalent into measure of value acts back on the relative form, which becomes the *Price form*. The price becomes a “natural” attribute of the commodity.
- From the Price form, Marx identifies two causal influences back on the equivalent form:
- (3a) For its function as measure of value, gold need not be physically present. Only its quality, not the quantity counts.
 - (3b) Since different commodities relate through their prices not only to gold but also to *each other*, a certain quantity of gold must be socially fixed as *standard of prices*. (Then Marx discusses the confusion between measure of value and standard of prices.)
 - (4) The standard of prices (which is a development of the equivalent form) turns prices into mere numbers, the “*money names*.”

- (5) The abstractness of the money names (the money name of a commodity is a version of its relative form of value) also causes the equivalent form to become abstract and turns it into *money of account*.

Money of account, the most abstract form of the General equivalent, is the climax of the repeated back-and-forth motion in this section. After this, Marx makes one more cycle, which no longer develops the form but goes over to something new. The transition from the equivalent form to the relative form is again twofold

- (6a) Although it is the surface representation of the quantity of value, the relative form of value is also subject to influences that have nothing to do with value but with demand and supply. This is not a defect but it is necessary to ensure that those things are produced which are needed.
- (6b) The general function of money as measure of value of all commodities leads to it that also other things, which are not commodities, are measured in money.

These two transitions discuss therefore the quantitative and qualitative discrepancies between price and value.

- (7) The general acceptance of money as measure of value also leads to it that money itself must enter the circulation process.

This final step is the transition to section 2, Means of Circulation.

3.1.a. [First Function of Gold: Measure of Value]

After this overview let us discuss section 3.1 paragraph by paragraph.

188:1 Throughout this work I assume, for the sake of simplicity, that gold is the money-commodity.	109:1 Ich setze überall in dieser Schrift, der Vereinfachung halber, Gold als die Geldware voraus.
--	--

Chapter Two, starting with 183:1, explains why the money form attaches itself to one of the noble metals. In order to simplify the discussion, Marx disregards the fact that during his time not one but two commodities, gold and silver, served as international money. Paragraph 190:1 below, and footnote 108 to paragraph 241:1 in the subsection 3.3.c about World Money discuss this “bimetallism.”

The next paragraph picks up the thread from section 1.3 of chapter One. At the end of that section, the commodities, by their joint action, turn gold into money. As the formulation in 162:1 makes very clear, this is an act on the part of the relative value form. As step (1) in his series of back-and-forth steps, Marx asks: what does this mean for the equivalent form? It means that the money commodity becomes “measure of value.” *Contribution*, 304:1/o, formulates it as follows:

Since <i>all</i> commodities measure their exchange values in gold, in the proportion, in which a	Weil <i>alle</i> Waren ihre Tauschwerte in Gold messen, in dem Verhältnis, worin bestimm-
---	---

given amount of gold and a given amount of commodity contain equal amounts of labor-time, Gold becomes the *measure of value*.

Here is the formulation in *Capital*:

188:2 The first function of gold is: to provide the world of commodities with the material in which they can express their values, or: to represent the values of the commodities as magnitudes of the same denomination, qualitatively equal and quantitatively comparable.

The Moore-Aveling translation says “first function of money” where the German says “first function of gold.” Fowkes says “gold.” I think “gold” is better. Marx is not yet talking about money but about the noble metal which has monopolized the role of General equivalent and through this *becomes* money. Until section 3.2 of chapter Three, only the becoming of money is discussed.

In those parts of section 1.3 of chapter One which discuss the money form (pp. 162:1–163:2) Marx never says: “Gold is money,” but always uses formulations such as: “Gold becomes the money commodity,” or “functions as money,” “gold faces the other commodities as money.” Also the presently discussed passage at the beginning of chapter Three, section 3.1 (p. 188:2) reads: “gold

te Quantität Gold und bestimmte Quantität Ware gleich viel Arbeitszeit enthalten, wird das Gold zum *Maß der Werte*, ...

109:2 Die erste Funktion des Goldes besteht darin, der Warenwelt das Material ihres Wertausdrucks zu liefern oder die Warenwerte als gleichnamige Größen, qualitativ gleiche und quantitativ vergleichbare, darzustellen.

... become(s) money.” It is not until section 3.3 of chapter Three that Marx indicates that this becoming of money has been completed: “The commodity which functions as measure of value and therefore also as means of circulation is money. Gold is therefore money. It functions as money ...” (p. 227:1).

↑ Marx calls this the first function of *gold*, not of money, because it is the first function of the material which by social custom now and everywhere is the General equivalent. A specific use-value (gold) is now merged with a specific social relation (general Equivalent).

The formulation “qualitatively equal and quantitatively comparable” can also be found in 188:2.

↓ Something that serves as an Simple or Particular Expanded equivalent plays, as Marx argued in 158:5/o, a very passive role. If it is General equivalent, its role is no longer so passive, and if it is money, then this role develops into a function of that thing.

It thus functions as a general measure of value, and it is at first only by this function that gold, the specific equivalent commodity, becomes money.

So funktioniert es als allgemeines Maß der Werte, und nur durch diese Funktion wird Gold, die spezifische Äquivalentware, zunächst Geld.

The “specific equivalent commodity” is, by definition, that commodity whose natural form has become irrevocably joined with the form of universal exchangeability or the General equivalent form. “At first” because in section 3 we will see that this is only the beginning of a development in which gold “becomes” money. If Marx says here that gold at first becomes money by its function of measure of value, he means that this is what is needed in order to trigger the whole process of becoming, which will be detailed throughout this chapter.

Even though today’s money is no longer *commodity* money, it can still be argued that its first function is ‘measure of value’.

Question 417 *Is Marx’s claim in Contribution 286:3/ooo still valid today that the commodity’s “second existence as exchange-value itself can only be another commodity, because it is only commodities which confront one another in the exchange process”?*

The next paragraph reminds us that the function of money as measure of value is the result of the activity on the side of the commodities in the relative form of value.

188:3 The commodities do not become commensurable through money. Quite the contrary. Only because all commodities, as values, are objectified human labor, and are therefore in and for themselves commensurable, can they jointly measure their values in one and the same specific commodity, and thus turn this commodity into the common measure of their values, i.e. into money.

109:3 Die Waren werden nicht durch das Geld kommensurabel. Umgekehrt. Weil alle Waren als Werte vergegenständlichte menschliche Arbeit, daher an und für sich kommensurabel sind, können sie ihre Werte gemeinschaftlich in derselben spezifischen Ware messen und diese dadurch in ihr gemeinschaftliches Wertmaß oder Geld verwandeln.

↑ Causality goes from production to the circulation and from the relative form of value to the equivalent form. ↓ Also the next sentence implies that the inner measure, labor-time, is the primary driving force, generating the exterior measure, money.

Money as a measure of value is the necessary form of appearance of the immanent measure of value of the commodities, namely labor-time.⁵⁰

Geld als Wertmaß ist notwendige Erscheinungsform des immanenten Wertmaßes der Waren, der Arbeitszeit.⁵⁰

At Marx’s time, paper money represented gold. Today it represents credit. Neither now nor then did it represent labor. Footnote 50 explains why money cannot represent labor:

⁵⁰ The question why money does not directly represent labor-time itself, so that a piece of paper may represent, for instance, x labor hours, comes down simply to the question why, on the basis of commodity production, the products of labor must take the form of commodities, since their assuming the form of commodities implies their differentiation into commodities on the one hand and the money commodity on the other. It is the question why private labor cannot be treated as its opposite, directly social labor. Elsewhere I have given an exhaustive discussion of the shallow utopianism of the idea of ‘labor money’ in a society founded on the production of commodities (op. cit., p. 320:2–321:4 ff.)

⁵⁰ Die Frage, warum das Geld nicht unmittelbar die Arbeitszeit selbst repräsentiert, so daß z.B. eine Papiernote x Arbeitsstunden vorstellt, kommt ganz einfach auf die Frage heraus, warum auf Grundlage der Warenproduktion die Arbeitsprodukte sich als Waren darstellen müssen, denn die Darstellung der Ware schließt ihre Verdoppelung in Ware und Geldware ein. Oder warum Privatarbeit nicht als unmittelbar gesellschaftliche Arbeit, als ihr Gegenteil, behandelt werden kann. Ich habe den seichten Utopismus eines Arbeitsgelds auf Grundlage der Warenproduktion anderswo ausführlich erörtert. (l.c. p. 320:2–321:4 ff.)

↑ Marx refers here to his discussion of *Gray*’s labor money in *Contribution*, 320:2–321:4.

↓ The second half of the footnote reminds us that Gray's theory should not be confused with that of *Robert Owen*. Gray wants to maintain commodity production, while Owen wants to abolish it. Marx's critique of labor money only refers to Gray, not to Owen:

Question 419 *Why this detour over gold, why not measure value directly by labor-time?*

^{50 ctd} At this point I will only say further that Owen's 'labor money', for instance, is no more 'money' than a theater ticket is. Owen presupposes directly socialized labor, a form of production diametrically opposite to the production of commodities. The certificate of labor is merely evidence of the part taken by the individual in the common labor, and documents his claim to a portion of the common product that has been set aside for consumption. But Owen never makes the mistake of presupposing the production of commodities and hoping that he can, by tinkering with money, avoid the necessary conditions for that form of production.

^{50 ctd} Hier sei noch bemerkt, da z.B. das Owensche „Arbeitsgeld“ ebensowenig „Geld“ ist wie etwa eine Theatermarke. Owen setzt unmittelbar vergesellschaftete Arbeit voraus, eine der Warenproduktion diametral entgegengesetzte Produktionsform. Das Arbeitszertifikat konstatiert nur den individuellen Anteil des Produzenten an der Gemeinarbeit und seinen individuellen Anspruch auf den zur Konsumtion bestimmten Teil des Gemeinprodukts. Aber es fällt Owen nicht ein, die Warenproduktion voraussetzen und dennoch ihre notwendigen Bedingungen durch Geldpfuschereien umgehn zu wollen.

Question 420 *Why is “labor money” not money?*

3.1.b. [Exchange-Value Becomes Price]

Step (2) goes back from the equivalent to the relative form of value. What happens to the *relative* form of value if gold becomes the measure of value? It becomes the price. The next two pages discuss the price of one single commodity, one ton of iron.

189:1 The expression of the value of a commodity in gold— x commodity $A = y$ money commodity—is the commodity's money form or its price. A single equation, such as 1 ton of iron = 2 ounces of gold, now suffices to express the value of iron in a socially valid manner. There is no longer any need for this equation to line up together with all other equations that express the values of the other commodities, because the equivalent commodity, gold, already possesses the character of money. The commodities' general relative value form has thus the same shape as their original relative value form, the Simple or Individual form of value.

110:1 Der Wertausdruck einer Ware in Gold— x Ware $A = y$ Geldware—ist ihre Geldform oder ihr Preis. Eine vereinzelt Gleichung, wie 1 Tonne Eisen = 2 Unzen Gold, genügt jetzt, um den Eisenwert gesellschaftlich gültig darzustellen. Die Gleichung braucht nicht länger in Reih und Glied mit den Wertgleichungen der andren Waren aufzumarschieren, weil die Äquivalentware, das Gold, bereits den Charakter von Geld besitzt. Die allgemeine relative Wertform der Waren hat daher jetzt wieder die Gestalt ihrer ursprünglichen, einfachen oder einzelnen relativen Wertform.

Definition of price. One single equation, which looks like the Simple form of value, is now a “socially valid” expression of the value of one ton of iron. The word “single” in the second sentence of Marx's text above is in German “*vereinzelt*,” indicating that this single-ness is not original but produced, the result of a social process. A *social* relation takes form of a relationship between two individual commodities.

Exam Question 421 *What is the price of a commodity? Say how it is defined, and say as much as you can about it without going into Marx's theory how its magnitude is determined.*

Question 424 *Compare the Price form with the Simple form of value.*

Whereas the expression of the value of any ordinary commodity looks now like the Simple form of value, the expression of the value of money looks like the Expanded form of value: On the other hand, the Expanded relative expression of value, the endless series of equations, has now become the specific relative form of value of the money commodity.

Andrerseits wird der entfaltete relative Wertausdruck oder die endlose Reihe relativer Wertausdrücke zur spezifisch relativen Wertform der Geldware.

↓ Usually the commodity in the relative form of value plays an active role. This is not the case here:

The endless series, however, is already socially given in the prices of the commodities. We only need to read the quotations of a price list backwards, to find the magnitude of the value of money expressed in all possible commodities.

Diese Reihe ist aber jetzt schon gesellschaftlich gegeben in den Warenpreisen. Man lese die Quotationen eines Preiskurants rückwärts und man findet die Wertgröße des Geldes in allen möglichen Waren dargestellt.

↑ Money does not have to work to establish its form of value. Rather, this form of value is already given. Since all goods express their values in money, money becomes “directly exchangeable” for them. Compare 159:2/o. The fact that money can buy everything is a powerful expression of the value of money.

Question 425 *How is the value of money expressed?*

Question 426 *If linen is offered in exchange for a coat, Marx is adamant that this is not an expression of the value of the coat, only of the linen. But if linen is offered in exchange for money, then this is part of the expression of the value of money. How did this difference come about?*

There is also something that is called the “price of gold,” namely, the mint price at which is converted into coins. This “price” of gold however is not an expression of its value:

A price, however, money does not have. This uniform relative form of value of the other commodities is not open to money, be-

Geld hat dagegen keinen Preis. Um an dieser einheitlichen relativen Wertform der andren Waren teilzunehmen, müßte es auf

cause money cannot be brought into relation with itself as its own equivalent.

↑ The so-called “price of gold” or “mint price of gold” in a monetary system based on the gold standard is not a true price. It is not connected with the function of money as measure of value, but with the function of money as standard of prices. Marx will say more about this shortly.

Question 427 *Is the “mint price” of gold a price?*

189:2–190 The price or money form of commodities, like their form of value generally, is a form different from their palpable and real bodily forms, i.e., it is a merely notional or imagined form.

Marx says here something about the price form which is true for all value forms of a commodity: it is “notional.” The German word translated here by “notional” is “*ideell*.” It is incorrect to translate “*ideell*” with “ideal.” Marx makes a strict distinction between the German terms “*ideal*” and “*ideell*.” Something which is *ideal* is by definition not real, it is an idealization of something real. The price of a commodity is not *ideal* in this sense. Marx held the view that social relations are real forces, that they are independent causal powers. A defense of this causal criterion of “reality” is given by Bhaskar in [Bha89, p. 69:2]. Nevertheless, certain social relations “exist” most importantly in the heads of the individuals, i.e., they are “notional” (*ideell*). One should not be confused by this formulation and think Marx wanted to deny their reality.

↓ The value of a commodity is not a surface category. It represents the social relations under which the commodity was produced, namely, the abstract human labor spent during its production. In the negotiations between buyer and seller, only the properties of the product itself are discussed; the labor spent by the producer is treated as if it was the private affair of the producer. In this sense, the value is “invisible” to the surface agents:

Although invisible, the value of iron, linen and corn exists in these very articles: it is made accessible through their equality with gold, a relation with gold which exists, so to speak, only in their heads.

↑ Although nobody is talking about this labor content it plays an important role in the surface interactions, it is so-to-say the elephant in the room. If market prices are above the value determined by this labor content, more suppliers will tend to appear on the market until the discrepancy between values and prices disappears, and if market prices are below value, supply will diminish. One can think of value as a substance inside the commodities which is squeezed, and therefore tends to raise prices, if the commodity is sold below its value, and which is stretched, and therefore tends to lower prices, if the commodity is sold

sich selbst als sein eignes Äquivalent bezogen werden.

110:2–111 Der Preis oder die Geldform der Waren ist, wie ihre Wertform überhaupt, eine von ihrer handgreiflich reellen Körperform unterschiedne, also nur ideelle oder vorgestellte Form.

Der Wert von Eisen, Leinwand, Weizen usw. existiert, obgleich unsichtbar, in diesen Dingen selbst; er wird vorgestellt durch ihre Gleichheit mit Gold, eine Beziehung zum Gold, die sozusagen nur in ihren Köpfen spukt.

above its value. This is why Marx says it is invisibly present in the commodity. By their attempts to get a price as high as possible the market participants take part in the process in which value finds its magnitude. This is why Marx says that the value is “*vorgestellt*,” i.e., represented, introduced into social interactions, by its exchange relationship with gold on the surface of the economy. But the last half of this sentence above seems to indicate that we have not made much headways, since this relation is still inside the heads of the commodity owners. ↓ Alas, all they have to do is write this relation down in form of a price sign:

The guardian of the commodities must therefore lend them his tongue, or hang a ticket on them, in order to communicate their prices to the outside world.⁵¹

Question 428 *Why do the commodity owners write the price on their price signs and not the labor-content of the commodity they are producing?*

⁵¹ Savages and semi-savages use the tongue differently. Captain Parry says of the inhabitants of the West coast of Baffin’s Bay: ‘In this case (the case of barter) they licked it (the thing represented to them) twice to their tongues, after which they seemed to consider the bargain satisfactorily concluded.’ In the same way, among the Eastern Eskimos, the exchanger licked each article on receiving it. If the tongue is thus used in the North as the organ of appropriation, it is no wonder that in the South the stomach serves as the organ of accumulated property. A Kaffir estimates the wealth of a man by the size of his belly. The Kaffirs know what they are doing, for at the same time as the official British Health Report of 1864 was bemoaning the deficiency of fat-forming substances among a large part of the working class, a certain Dr. Harvey (not, however, the man who discovered the circulation of the blood) was doing well by advertising recipes for reducing the surplus fat of the bourgeoisie and the aristocracy.

Der Warenhüter muß daher seine Zunge in ihren Kopf stecken oder ihnen Papierzettel umhängen, um ihre Preise der Außenwelt mitzuteilen.⁵¹

⁵¹ Der Wilde oder Halbwilde braucht die Zunge anders. Kapitän Parry bemerkt z.B. von den Bewohnern an der Westküste der Baffins-bay: „In diesem Falle“ (beim Produktaus-tausch) „...beleckten sie es“ (das ihnen Ange-botene) „zweimal mit der Zunge, wonach sie das Geschäft als zur Zufriedenheit abgeschlossen zu betrachten schienen.“ Ebenso beleckte bei den östlichen Eskimos der Eintauscher jedesmal den Artikel beim Empfang desselben. Wenn die Zun-ge so im Norden als Organ der Aneignung, ist es kein Wunder, daß der Bauch im Süden als Organ des akkumulierten Eigentums gilt und der Kaffer den Reichtum eines Mannes nach seinem Fett-wanst schätzt. Die Kaffern sind grundgeschei-te Kerle, denn während der offizielle britische Gesundheitsbericht von 1864 den Mangel eines großen Teils der Arbeiterklasse an fettbildenden Substanzen beklagt, machte ein Dr. Harvey, der jedoch nicht die Blutzirkulation erfunden hat, in demselben Jahre sein Glück durch Puff-Rezepte, die der Bourgeoisie und Aristokratie Fettüber-flusseslast abzutreiben versprochen.

Marx’s source for Captain Parry’s report is [Par21, p. 227].

By their price tags, the commodities tell the world what they are worth (or at least what their owner thinks they are worth). This is not merely a theoretical musing but has practical implications: the price tag commits the owner to hand the commodity over to anyone who is willing to pay the marked price. The price therefore has real effects, but the gold which makes pricing possible does not have to be present.

Since expression of the value of commodities in gold is a purely notional act, it requires only imagined or notional gold. Every owner knows that by giving price form (i.e., imagined gold form) to the value of his commodities he is nowhere near turning them into gold. It also does not require the tiniest particle of real gold to give a valuation in gold of millions of pounds' worth of commodities.

3.1.c. [Commodity Prices and the Value of Gold]

The process of giving a price does not require actual gold and also does not immediately yield actual gold. This observation seems too trivial to be worth repeating. However it opens up the nontrivial question: what *is* the real basis of the act of price-giving? Marx claims that gold does enter this process. Since it does not have to be present and also will not necessarily be present, Marx calls it "imagined".

In its function as measure of value, money serves therefore—as only imagined or notional money.

This is the step (3a), going back to the equivalent form. Now Marx uses the word "money," not "gold," because this is true for all other forms of currency too. Since this invites false theories of money, this would be a good place to give some theory-critical remarks. Instead of making such remarks here, Marx refers to *Contribution*:

This circumstance has given rise to the wildest theories.⁵²

⁵² See Karl Marx, *Contribution to the Critique* etc., 'Theories of the Standard of Money', pp. 53 ff. [English translation, pp. 76 ff.].

Marx asks now: what information about money is needed?

But, although the money that performs the function of a measure of value is only imagined, the price depends entirely on the actual substance that is money. The value, i.e. the quantity of human labor contained in a ton of iron, is expressed by an imagined quantity of the money commodity containing the same amount of labor as the iron. Therefore according to whether it is gold, silver or copper which is serving as the measure

Da der Ausdruck der Warenwerte in Gold ideell ist, ist zu dieser Operation auch nur vorgestelltes oder ideelles Gold anwendbar. Jeder Warenhüter weiß, daß er seine Waren noch lange nicht vergoldet, wenn er ihrem Wert die Form des Preises oder vorgestellte Goldform gibt, und daß er kein Quentchen wirkliches Gold braucht, um Millionen Warenwerte in Gold zu schätzen.

In seiner Funktion des Wertmaßes dient das Geld daher—als nur vorgestelltes oder ideelles Geld.

Dieser Umstand hat die tollsten Theorien veranlaßt.⁵²

⁵² Siehe Karl Marx, „Zur Kritik etc.“, „Theorien von der Maßeinheit des Geldes“, p. 53 sqq.

Obgleich nur vorgestelltes Geld zur Funktion des Wertmaßes dient, hängt der Preis ganz vom reellen Geldmaterial ab. Der Wert, d.h. das Quantum menschlicher Arbeit, das z.B. in einer Tonne Eisen enthalten ist, wird ausgedrückt in einem vorgestellten Quantum der Geldware, welches gleich viel Arbeit enthält. Je nachdem also Gold, Silber oder Kupfer zum Wertmaß dienen, erhält der Wert der Tonne Eisen ganz ver-

of value, the value of the ton of iron obtains very different price expressions, or will be represented by very different quantities of those metals.

One should not take this to mean that the seller needs to know how much labor is contained in gold. There is a connection, but it is more complicated than this.

Question 429 *By putting a price tag on a commodity, does the seller declare, assert, that this commodity contains as much labor as the corresponding amount of gold?*

Question 430 *Marx says that under the gold standard the magnitude of the price of a commodity is that amount of gold which contains the same amount of socially necessary labor as the commodity. However the person who purchases the commodity has, as a rule, no idea how much labor his gold coin represents. Which mechanism did Marx postulate for the dependence of the price level on the labor content of gold?*

To illustrate the role played by the actual money material, Marx discusses next the relation between gold prices and silver prices of commodities.

190:1 If therefore two different commodities, such as gold and silver, serve simultaneously as measures of value, all commodities will have two separate price-expressions, the price in gold and the price in silver, which will quietly co-exist as long as the ratio of the value of silver to that of gold remains unchanged, say at 1:15. However, every alteration in this ratio disturbs the ratio between the gold prices and the silver prices of commodities, and thus proves in fact that a duplication of the measure of value contradicts the function of that measure.⁵³

⁵³ 'Wherever silver and gold exist side by side as legal money, i.e. as measure of value, the vain attempt has invariably been made to treat them as one and the same substance. If one assumes that a given labor-time must be objectified in the same unchanging proportion in silver and gold, then one assumes, in fact, that gold and silver are the same substance, and that silver, the less valuable metal, represents a constant fraction of gold. From the reign of Edward III to the time of George II, the history of money in England con-

schiedne Preisausdrücke oder wird in ganz verschiedenen Quantitäten Gold, Silber oder Kupfer vorgestellt.

111:1 Dienen daher zwei verschiedene Waren, z.B. Gold und Silber, gleichzeitig als Wertmaße, so besitzen alle Waren zweierlei verschiedene Preisausdrücke, Goldpreise und Silberpreise, die ruhig nebeneinander laufen, solange das Wertverhältnis von Silber zu Gold unverändert bleibt, z.B. = 1:15. Jede Veränderung dieses Wertverhältnisses stört aber das Verhältnis zwischen den Goldpreisen und den Silberpreisen der Waren und beweist so tatsächlich, daß die Verdopplung des Wertmaßes seiner Funktion widerspricht.⁵³

⁵³ Note zur 2. Ausg. „Wo Gold und Silber gesetzlich als Geld, d.h. als Wertmaß nebeneinander bestehen, ist stets der vergebliche Versuch gemacht worden, sie als eine und dieselbe Materie zu behandeln. Unterstellt man, daß dieselbe Arbeitszeit sich unveränderlich in derselben Proportion von Silber und Gold vergegenständlichen muß, so unterstellt man in der Tat, daß Silber und Gold dieselbe Materie sind und daß eine bestimmte Masse des minder wertvollen Metalls, des Silbers, den unveränderlichen Bruch-

sists of one long series of perturbations caused by the clash between the legally fixed ratio between the values of gold and silver, and the fluctuations in their real values. At one time gold was too high, at another, silver. The metal that was estimated below its value was withdrawn from circulation, melted down and exported. The ratio between the two metals was then again altered by law, but the new nominal ratio soon came into conflict, in its turn, with the real ratio. In our own times, the slight and transient fall in the value of gold compared with silver, which was a consequence of the Indian and Chinese demand for silver, produced on a far more extended scale in France the same phenomena, export of silver, and its expulsion from circulation by gold. During the years 1855, 1856 and 1857, the excess in France of gold-imports over gold-exports amounted to £41,580,000, while the excess of silver-exports over silver-imports came to £34,704,000. In fact, in countries in which both metals are legally measures of value, and therefore both legal tender, so that everyone has the option of paying in either metal, the metal that rises in value is at a premium, and, like every other commodity, measures its price in the overvalued metal which alone serves in reality as the measure of value. All the experience of history in this area can be reduced simply to this fact, that where two commodities perform by law the functions of a measure of value, in practice only one maintains that position' (Karl Marx, op. cit., pp. 52-3) [English edition, pp. 75-6].

Question 432 *Why does only the overvalued metal serve as measure of value?*

More about bimetallism will be said in 241:1, especially Footnote 108.

From chapter One, section 1.3 we know that value must express itself in one commodity only. Bimetallism is a form of value that does not meet this requirement, and therefore leads

teil einer bestimmten Goldmasse bildet. Von der Regierung Edwards III. bis zur Zeit von Georg II. verläuft sich die Geschichte des englischen Geldwesens in eine fortlaufende Reihe von Störungen, hervorgehend aus der Kollision zwischen der gesetzlichen Festsetzung des Wertverhältnisses von Gold und Silber und ihren wirklichen Wertschwankungen. Bald war Gold zu hoch geschätzt, bald Silber. Das zu niedrig geschätzte Metall wurde der Zirkulation entzogen, umgeschmolzen und exportiert. Das Wertverhältnis beider Metalle wurde dann wieder gesetzlich verändert, aber der neue Nominalwert trat bald mit dem wirklichen Wertverhältnis in denselben Konflikt wie der alte.—In unserer eigenen Zeit hat der sehr schwache und vorübergehende Fall im Wert von Gold gegen Silber, infolge der indisch-chinesischen Silbernachfrage, dasselbe Phänomen auf der größten Stufenleiter in Frankreich erzeugt, Ausfuhr von Silber und seine Vertreibung aus der Zirkulation durch Gold. Während der Jahre 1855, 1856, 1857 betrug der Überschuss der Goldeinfuhr in Frankreich über die Goldausfuhr aus Frankreich 41 580 000 Pfd.St., während der Überschuss der Silbereinfuhr über die Silbereinfuhr 34 704 000 Pfd.St. betrug. In der Tat, in Ländern, wo beide Metalle gesetzliche Wertmaße sind, daher beide in Zahlung angenommen werden müssen, jeder aber beliebig in Silber oder Gold zahlen kann, trägt das im Wert steigende Metall ein Agio und mißt wie jede andere Ware seinen Preis in dem überschätzten Metall, während letzteres allein als Wertmaß dient. Alle geschichtliche Erfahrung in diesem Gebiet reduziert sich einfach darauf, daß, wo gesetzlich zwei Waren die Funktion des Wertmaßes versehen, faktisch immer nur eine als solches den Platz behauptet.“ (Karl Marx, l.c. p. 52, 53.)

to crises (Gresham's law: small differences in preferability induce the money holders to make huge shifts in money holdings).

Question 433 *Assume under bimetallism the nominal value of silver falls below its real value. Will then silver coins be used for exchange or gold coins?*

The disturbances created by the duplication of the measure of value in bimetallism are proof that the production costs of gold and silver do matter and are closely watched.

3.1.d. [Standard of Prices]

If we know that 1 lb of wheat has as much labor as 2 g of gold, we still don't know the *price* of wheat. For this it is also necessary to know how much gold is represented by 1 monetary unit. This second step is the function of gold as standard of prices. This is not a "higher" function than measure of value, but an additional, more technical function. After gold, in its function as measure of value, has associated every commodity with a certain amount of gold, the need arises to compare different gold quantities with each other. In this comparison, gold functions as standard of prices.

The function of gold as standard of prices is introduced by an alternative transition from the relative form of value, i.e., the price, back to the equivalent form. In our numbering it is back-and-forth-step (3b). In prices, all commodities have a uniform value expression which expresses two things:

- the value of each commodity differs from its use-value.
- the values of different commodities are qualitatively equal, they only differ by their quantities.

While 189:1–190:1 discussed the price of one single commodity, one ton of iron, step (3b) addresses the second aspect and looks at the prices of several commodities together.

191:1/o After they are given their prices, all commodities present themselves in the form: *a* commodity $A = x$ gold; *b* commodity $B = y$ gold; *c* commodity $C = z$ gold, etc., where *a*, *b*, *c* represent definite quantities of the commodities *A*, *B*, *C*, and *x*, *y*, *z* definite quantities of gold. The values of these commodities are therefore transformed into imagined amounts of gold of different magnitudes. Despite the colorful variety of the commodities themselves, their values become magnitudes of the same denomination, gold-magnitudes.

112 Die preisbestimmten Waren stellen sich alle dar in der Form: *a* Ware $A = x$ Gold, *b* Ware $B = z$ Gold, *c* Ware $C = y$ Gold usw., wo *a*, *b*, *c* bestimmte Massen der Warenarten *A*, *B*, *C* vorstellen, *x*, *z*, *y* bestimmte Massen des Goldes. Die Warenwerte sind daher verwandelt in vorgestellte Goldquanta von verschiedner Größe, also, trotz der wirren Buntheit der Warenkörper, in gleichnamige Größen, Goldgrößen.

↓ With this qualitative homogenization for all commodities, the need arises to compare different quantities of gold, which represent the values of different commodities, with each other:

As different quantities of gold, they can be compared with each other and measure each other. For technical reasons the need arises to relate them to some fixed quantity of gold as their unit of measurement. This unit, by subsequent division into aliquot parts, becomes itself an entire scale, the standard of measurement.

↓ One would think that this need is already met, because the commodities gold, silver, copper had standards of measurement already before they became money.

Before they become money, gold, silver and copper already possess such standards in their weights, so that, for example, a pound, which serves as a unit of measurement, can on the one hand be divided into ounces, and on the other hand be combined with others to make up hundredweights.⁵⁴

↓ And indeed, the names of monetary units derive from weight units (e.g. Pound Sterling). It is owing to this that, in all metallic currencies, the names given to the standards of money or of price were originally taken from the preexisting names of the standards of weight.

But weight units were used at monetary units only at the beginning. Over time, the monetary standard evolved away from these weight measures. This is why it is justified to say that the measurement of different gold quantities is an additional function of the money commodity gold.

⁵⁴ The peculiar circumstance that while the ounce of gold serves in England as the unit of the standard of money, it is not divided up into aliquot parts, has been explained as follows: 'Our coinage was originally adapted to the employment of silver only, hence an ounce of silver can always be divided into a certain adequate number of pieces of coin; but as gold was introduced at a later period into a coinage adapted only to silver, an ounce of gold cannot be coined into an aliquot number of pieces' (Maclaren, *A Sketch of the History of the Currency*, London, 1858, p.

Als solche verschiedene Goldquanta vergleichen und messen sie sich untereinander, und es entwickelt sich technisch die Notwendigkeit, sie auf ein fixiertes Quantum Gold als ihre Maßeinheit zu beziehen. Diese Maßeinheit selbst wird durch weitere Einteilung in aliquote Teile zum Maßstab fortentwickelt.

Vor ihrer Geldwerdung besitzen Gold, Silber, Kupfer bereits solche Maßstäbe in ihren Metallgewichten, so daß z.B. ein Pfund als Maßeinheit dient und nach der einen Seite wieder in Unzen usw. abgeteilt, nach der andren in Zentner usw. zusammenaddiert wird.⁵⁴

Bei aller metallischen Zirkulation bilden daher die vorgefundenen Namen des Gewichtsmaßstabs auch die ursprünglichen Namen des Geldmaßstabs oder Maßstabs der Preise.

⁵⁴ Note zur 2. Ausg. Die Sonderbarkeit, daß die Unze Gold in England als Einheit des Geldmaßstabs nicht in aliquote Teile abgeteilt ist, erklärt sich wie folgt: „Unser Münzwesen war ursprünglich nur der Verwendung von Silber angepaßt—daher kann eine Unze Silber immer in eine bestimmte aliquote Anzahl von Geldstücken geteilt werden; da aber Gold erst in einer spätern Zeit in ein Münzwesen eingeführt wurde, das nur dem Silber angepaßt war, kann eine Unze Gold nicht in eine aliquote Anzahl von Münzen ausgeprägt werden.“ (Maclaren, „History of the

16).

| Currency“, London 1858, p. 16.)

3.1.e. [Complementarity and Conflict between Measure of Values and Standard of Prices]

Under the gold standard, the price signs in the stores are not denominated in ounces or grams of gold, but in Pound Sterling or other currencies. The Pound Sterling is here a specific quantity of gold which serves as measuring unit. In the equation a commodity $A = z$ Pound Sterling, money serves therefore in two functions: on the one hand as measure of value which leads to the equation a commodity $A = x$ gold, and then as standard of prices which specifies the gold quantity x by comparing it to the gold quantity which represents 1 Pound Sterling. Although the function of money as a standard of prices is a trivial function, Marx devotes here some room to it because the economists of his time often confused changes in the measure of value with those in the standard of prices.

192:1 As measure of value and as standard of price, money performs two quite different functions. It is the measure of value as the social incarnation of human labor; it is the standard of price as a quantity of metal with a fixed weight. As the measure of value it serves to convert the values of all the manifold commodities into prices, into imagined quantities of gold; as the standard of price it measures those quantities of gold. The measure of values allows commodities to measure themselves as values; the standard of price, by contrast, measures quantities of gold by a unit quantity of gold, not the value of one quantity of gold by the weight of another.

↑ Marx emphasizes here the contrast between the fundamental economic function of money as measure of value and its trivial merely technical function as standard of prices. ↓ These two different functions have different and even conflicting requirements. As measure of value, gold must have a variable value like every other commodity, but as standard of prices it must be a fixed quantity:

For the standard of price, a certain weight of gold must be fixed as the unit of measurement. In this case, as in all cases where quantities of the same denomination are to be measured, the stability of the measurement is of decisive importance. Hence the

113:1 Als Maß der Werte und als Maßstab der Preise verrichtet das Geld zwei ganz verschiedene Funktionen. Maß der Werte ist es als die gesellschaftliche Inkarnation der menschlichen Arbeit, Maßstab der Preise als ein festgesetztes Metallgewicht. Als Wertmaß dient es dazu, die Werte der bunt verschiedenen Waren in Preise zu verwandeln, in vorgestellte Goldquanta; als Maßstab der Preise mißt es diese Goldquanta. Am Maß der Werte messen sich die Waren als Werte, der Maßstab der Preise mißt dagegen Goldquanta an einem Goldquantum, nicht den Wert eines Goldquantums am Gewicht des andren.

Für den Maßstab der Preise muß ein bestimmtes Goldgewicht als Maßeinheit fixiert werden. Hier, wie in allen andren Maßbestimmungen gleichnamiger Größen, wird die Festigkeit der Maßverhältnisse entscheidend. Der Maßstab der Preise erfüllt daher

less the unit of measurement (here a quantity of gold) is subject to variation, the better the standard of price fulfils its office.

↑ Therefore gold money fulfils its functions best if one pound sterling always represents the same amount of gold (i.e., if there is no debasement of the currency). ↓ Now if we look at the function of money as measure of value, the same criterion of constancy of the measuring unit seems in principle unachievable:

But gold can serve as a measure of value only because it is itself a product of labor, and therefore potentially variable in value.⁵⁵

The footnote remarks that the economists failed to make this distinction between measure of value and standard of prices and therefore ran into “indescribable confusions.”

⁵⁵ With English writers the confusion over measure of value and standard of price (‘standard of value’) is indescribable. Their functions, and therefore their names, are constantly interchanged.

Does this variability in the value of gold disqualify gold from performing the two functions of measure of value and standard of prices? Marx considers this question in detail and his answer will be that this variability is not an obstacle. ↓ First he shows that the variability in the value of gold does not interfere with the function of gold as standard of prices:

192:2/o It is, first of all, quite clear that a change in the value of gold in no way impairs its function as standard of prices. No matter how the value of gold varies, different quantities of gold always remain in the same value-relation to each other. If the value of gold fell by 1,000 per cent, 12 ounces of gold would continue to have twelve times the value of one ounce of gold, and when we are dealing with ounces we are only concerned with the relation between different quantities of gold. Since, on the other hand, an ounce of gold undergoes no change in weight when its value rises or falls, no change can take place in the weight of its aliquot parts. Thus gold always renders the same service as a fixed measure of price, however much its value may vary.

↑ For trivial reasons, a change of value does not affect the role of gold as standard of prices at all. With a fall of the value of gold by 1000%, Marx presumably means a fall in the

seine Funktion um so besser, je unveränderlicher ein und dasselbe Quantum Gold als Maßeinheit dient.

Als Maß der Werte kann Gold nur dienen, weil es selbst Arbeitsprodukt, also der Möglichkeit nach ein veränderlicher Wert ist.⁵⁵

⁵⁵ Note zur 2. Ausg. In englischen Schriften ist die Konfusion über Maß der Werte (measure of value) und Maßstab der Preise (standard of value) unsäglich. Die Funktionen und daher ihre Namen werden beständig verwechselt.

113:2 Es ist zunächst klar, daß ein Wertwechsel des Goldes seine Funktion als Maßstab der Preise in keiner Weise beeinträchtigt. Wie auch der Goldwert wechsle, verschiedene Goldquanta bleiben stets in selbem Wertverhältnis zueinander. Fiele der Goldwert um 1000%, so würden nach wie vor 12 Unzen Gold 12mal mehr Wert besitzen als eine Unze Gold, und in den Preisen handelt es sich nur um das Verhältnis verschiedener Goldquanta zueinander. Da andererseits eine Unze Gold mit dem Fallen oder Steigen ihres Werts keineswegs ihr Gewicht verändert, verändert sich ebensowenig das ihrer aliquoten Teile, und so tut das Gold als fixer Maßstab der Preise stets denselben Dienst, wie immer sein Wert wechsle.

value by the factor of 10, which raises all gold prices to 1000% of their earlier levels. ↓ A change of value also does not affect its role as measure of values, but here the reasoning is not quite as trivial. Marx proceeds here in two steps. First he says that the relative values of two ordinary commodities is not affected by a change in the value of gold:

A change in the value of gold also does not prevent it from fulfilling its function as measure of value. The change affects all commodities simultaneously, and therefore, other things being equal, leaves the mutual relations between their values unaltered, although those values are now all expressed in higher or lower gold-prices than before.

↑ The variability of the value of gold does not preclude it from functioning as measure of value because it leaves the relative prices unchanged. ↓ Next Marx investigates how the variability in value affects the absolute prices. Here the earlier discussion from Section 3 of Chapter One applies:

193:1 Just as in the case of the representation of the value of one commodity in the use-value of any other commodity, so also in this case, where commodities measure their values in gold, we assume nothing more than that the production of a given quantity of gold costs, at a given period, a given amount of labor. As regards the fluctuations of commodity prices in general, they are subject to the laws of the simple relative expression of value which we developed in an earlier chapter.

Despite the differences between simple equivalent and general equivalent, value changes affect both forms in the same way. These laws were developed earlier, starting 145:1.

↓ A brief summary of those laws shows that their application gives interesting results:

193:2 A general rise in the prices of commodities can result either from a rise in their values, which happens when the value of money remains constant, or from a fall in the value of money, which happens when the values of commodities remain constant. The process also occurs in reverse: a general fall in prices can result either from a fall in the values of commodities, if the value of money remains constant, or from a rise in

113:3/o Der Wertwechsel des Goldes verhindert auch nicht seine Funktion als Wertmaß. Er trifft alle Waren gleichzeitig, läßt also caeteris paribus ihre wechselseitigen relativen Werte unverändert, obgleich sie sich nun alle in höheren oder niedrigeren Goldpreisen als zuvor ausdrücken.

114:1 Wie bei der Darstellung des Werts einer Ware im Gebrauchswert irgendeiner andren Ware, ist auch bei der Schätzung der Waren in Gold nur vorausgesetzt, daß zur gegebenen Zeit die Produktion eines bestimmten Goldquantums ein gegebenes Quantum Arbeit kostet. In bezug auf die Bewegung der Warenpreise überhaupt gelten die früher entwickelten Gesetze des einfachen relativen Wertausdrucks.

114:2 Die Warenpreise können nur allgemein steigen, bei gleichbleibendem Geldwert, wenn die Warenwerte steigen; bei gleichbleibenden Warenwerten, wenn der Geldwert fällt. Umgekehrt. Die Warenpreise können nur allgemein fallen, bei gleichbleibendem Geldwert, wenn die Warenwerte fallen; bei gleichbleibenden Warenwerten, wenn der Geldwert steigt.

the value of money, if the values of commodities remain constant.

A change in the price of a commodity evenly depends on both the value of the money and the value of the commodity. Those who worry about the variability of the value of money should therefore also consider the variability of the values of ordinary commodities:

It therefore by no means follows that a rise in the value of money necessarily implies a proportional fall in the prices of commodities, or that a fall in the value of money implies a proportional rise in prices. This would hold only for commodities whose value remains constant. But commodities whose value rises simultaneously with and in proportion to that of money would retain the same price. And if their value rose either slower or faster than that of money, the fall or rise in their prices would be determined by the difference between the path described by their value and that described by the value of money. And so on.

↑ As productivity rises, a given amount of gold represents less and less labor-time. This does not impair the ability of gold to function as measure of value because ordinary commodities also represent less and less labor. On the contrary, the variability of the value of money is an advantage, since prices remain more stable if gold takes part in the general development of productivity. This concludes Marx's reasoning that the variability in the value of gold does not impair its function as measure of value, but on the contrary even enhances it. This is not really a paradoxical result if one looks at it as follows: Quantitative variability is an intrinsic characteristic of value, which the measuring stick should share with that what it measures.

Question 435 *If the value of gold changes over time, does this impair its role as standard of prices? Does it impair its role as measure of value?*

3.1.f. [Separation of Money Names from Weight Names]

193:3/o Let us now return to our investigation of the price form.

After this short digression, clarifying certain issues regarding measure of value and standard of prices, let us see now what this new determination on the side of the equivalent form does to the side of the relative values. This is back-and-forth step (4): Price no longer expressed in weight quantities of gold but in a money name.

Es folgt daher keineswegs, daß steigender Geldwert proportionelles Sinken der Warenpreise und fallender Geldwert proportionelles Steigen der Warenpreise bedingt. Dieses gilt nur für Waren von unverändertem Wert. Solche Waren z.B., deren Wert gleichmäßig und gleichzeitig steigt mit dem Geldwert, behalten dieselben Preise. Steigt ihr Wert langsamer oder rascher als der Geldwert, so wird der Fall oder das Steigen ihrer Preise bestimmt durch die Differenz zwischen ihrer Wertbewegung und der des Geldes usw.

114:3 Kehren wir nun zur Betrachtung der Preisform zurück.

This step can be divided into two substeps. First substep: the names in which prices are called no longer coincide with the weight names of the money commodity but they are their own specific words. This is a somewhat unexpected transition, since this is the development of a form which is not true to its content. If it is true that prices are equivalent quantities of gold, why are they not called this? As in the discussion starting in 680:3, Marx describes here the circumstances facilitating the transition from a truer form to a more mystified form.

For various reasons, the money names of the metal weights gradually diverge from their original weight-names. The historically decisive reasons are: (1) The introduction of foreign money among less developed peoples. This happened at Rome in its early days, where gold and silver coins circulated at first as foreign commodities. The names of these foreign coins were different from those of the indigenous weights. (2) With the development of material wealth, the more precious metal extrudes the less precious from its function as measure of value. Silver drives out copper, gold drives out silver, however much this sequence may contradict the chronology of the poets.⁵⁶ The word "pound," for instance, was the money-name given to an actual pound weight of silver. As soon as gold had driven out silver as a measure of value, the same name became attached to, say, one fifteenth of a pound of gold, depending on the ratio between the values of gold and silver. Pound as a moneyname and pound as the ordinary weight-name of gold are now two different things.⁵⁷ (3) Centuries of continuous debasement of the currency by kings and princes have in fact left nothing behind of the original weights of gold coins but their names.⁵⁸

⁵⁶ In any case, its historical validity is not entirely universal.

114:4/o Die Geldnamen der Metallgewichte trennen sich nach und nach von ihren ursprünglichen Gewichtsnamen aus verschiedenen Gründen, darunter historisch entscheidend: 1. Einführung fremden Geldes bei minderentwickelten Völkern, wie z.B. im alten Rom Silber- und Goldmünzen zuerst als ausländische Waren zirkulierten. Die Namen dieses fremden Geldes sind von den einheimischen Gewichtsnamen verschieden. 2. Mit der Entwicklung des Reichtums wird das minder edle Metall durch das edlere aus der Funktion des Wertmaßes verdrängt. Kupfer durch Silber, Silber durch Gold, sosehr diese Reihenfolge aller poetischen Chronologie widersprechen mag.⁵⁶ Pfund war nun z.B. Geldname für ein wirkliches Pfund Silber. Sobald Gold das Silber als Wertmaß verdrängt, hängt sich derselbe Name vielleicht an 1/15 usw. Pfund Gold, je nach dem Wertverhältnis von Gold und Silber. Pfund als Geldname und als gewöhnlicher Gewichtsname des Goldes sind jetzt getrennt.⁵⁷ 3. Die Jahrhunderte fortgesetzte Geldfälschung der Fürsten, welche vom ursprünglichen Gewicht der Geldmünzen in der Tat nur den Namen zurückließ.⁵⁸

⁵⁶ Sie ist übrigens auch nicht von allgemein historischer Gültigkeit.

Question 436 *What does Marx mean with footnote 56 to 193:3/o?*

⁵⁷ Thus the pound sterling denotes less than one-third of its original weight, the 'pound scots' before the union, only one 36th, the French livre one 74th, the Spanish maravedi, less than one 1,000th, and the Portuguese rei a still smaller fraction.

⁵⁸ 'The coins which today have a merely ideal denomination are in all nations the oldest; once upon a time they were all real, and because they were real people reckoned with them' [Gal03, p. 153].

One should expect now that Marx goes back to the relative form of value, in order to look at the corresponding modifications in the price form. But he first gives a little more detail about what happens to the equivalent form when the money commodity obtains the function as standard of prices. In the first paragraph a historical fact about the measuring unit is quoted: it separates itself from the weight name.

194:1 These historical processes have made the separation of the money-name from the weight-name into a fixed popular custom. Since the standard of money is on the one hand purely conventional, while on the other hand it must possess universal validity, it is in the end regulated by law.

Role of the state: on the one hand the monetary unit is purely conventional, on the other it must have general validity, therefore regulated by law. The economic determinations are such that they require conscious intervention.

A given weight of one of the precious metals, an ounce of gold for instance, becomes officially divided into aliquot parts, baptized by the law as a pound, a thaler, etc. These aliquot parts, which then serve as the actual units of money, are subdivided into other aliquot parts with legal names, such as a shilling, a penny etc.⁵⁹ But, despite this, a definite weight of metal remains the standard of metallic money. All that has changed is the subdivision and the denomination of the money.

⁵⁹ David Urquhart remarks in his 'Familiar Words' [Urq55, p. 105] on the monstrosity (!) that nowadays a pound (sterling), which is the

⁵⁷ Note zur 2. Ausg. So bezeichnet das englische Pfund weniger als ein Drittel seines ursprünglichen Gewichts, das schottische Pfund vor der Union nur noch 1/36, der französische Livre 1/74, der spanische Maravedi weniger als 1/1000, der portugiesische Rei eine noch viel kleinere Proportion.

⁵⁸ Note zur 2. Ausg. „Die Münzen, deren Namen heute nur noch ideell sind, sind bei allen Nationen die ältesten; sie alle waren einst real, und eben weil sie real waren, hat man mit ihnen gerechnet.“ [Gal03, p. 153].

115:1 Diese historischen Prozesse machen die Trennung des Geldnamens der Metallgewichte von ihrem gewöhnlichen Gewichtsnamen zur Volksgewohnheit. Da der Geldmaßstab einerseits rein konventionell ist, andererseits allgemeiner Gültigkeit bedarf, wird er zuletzt gesetzlich reguliert.

Ein bestimmter Gewichtsteil des edlen Metalls, z.B. eine Unze Gold, wird offiziell abgeteilt in aliquote Teile, die legale Taufnamen erhalten, wie Pfund, Taler usw. Solcher aliquote Teil, der dann als die eigentliche Maßeinheit des Geldes gilt, wird untergeteilt in andre aliquote Teile mit gesetzlichen Taufnamen, wie Shilling, Penny etc.⁵⁹ Nach wie vor bleiben bestimmte Metallgewichte Maßstab des Metallgeldes. Was sich geändert, ist Einteilung und Namensgebung.

⁵⁹ Note zur 2. Ausg. Herr David Urquhart bemerkt in seinen „Familiar Words“ über das Ungeheuerliche (!), daß heutzutage ein Pfund (£ St.),

unit of the English standard of money, is equal to about a quarter of an ounce of gold. 'This is falsifying a measure, not establishing a standard.' In this 'false denomination' of the weight of gold, he finds what he finds everywhere else, the falsifying hand of civilization.

194:2 The prices, or quantities of gold, into which the values of commodities are ideally changed, are therefore now expressed in the money-names, or the legally valid names of the subdivisions of the gold standard made for the purpose of reckoning. Hence, instead of saying that a quarter of wheat is worth an ounce of gold, people in England would say that it was worth £3 17s. 10 1/2d. In this way commodities tell each other by their money-names how much they are worth, and money serves as money of account whenever it is a question of fixing a thing as a value and therefore in its money form.⁶⁰

⁶⁰ 'When Anacharsis was asked what the Greeks used money for, he replied: for reckoning' (Athenaeus, Deipnosophistae, Bk IV, 49, v. 2, ed. Schweighäuser, 1802)

Here Marx finally says what happens to the relative form of value, the prices, after the equivalent form developed into a standard of price. They are expressed in money names (i.e., people do not even know anymore that prices represent certain quanta of gold). Therefore, by back-and-forth step (5), money is transformed into money of account.

195:1 The name of a thing is altogether external to its nature. I know nothing of a man if I merely know his name is Jacob. In the same way, every trace of the value relation disappears in the money names pound, thaler, franc, ducat, etc. It adds to the confusion about the hidden meaning of these cabalistic signs that these money names express both the values of commodities and, simultaneously, proportional parts of a certain weight of metal, namely of that amount

die Einheit des englischen Geldmaßstabs, gleich ungefähr 1/4 Unze Gold ist: „Das ist Fälschung eines Maßes und nicht Festsetzung eines Maßstabs“ [Urq55, p. 105]. Er findet in dieser „falschen Benennung“ des Goldgewichts wie überall sonst die fälschende Hand der Zivilisation.

115:2 Die Preise, oder die Goldquanta, worin die Werte der Waren ideell verwandelt sind, werden jetzt also ausgedrückt in den Geldnamen oder gesetzlich gültigen Rechennamen des Goldmaßstabs. Statt also zu sagen, der Quarter Weizen ist gleich einer Unze Gold, würde man in England sagen, er ist gleich 3 Pfd.St. 17 sh. 10 1/2 d. Die Waren sagen sich so in ihren Geldnamen, was sie wert sind, und das Geld dient als Rechnungsgeld, sooft es gilt, eine Sache als Wert und daher in Geldform zu fixieren.⁶⁰

⁶⁰ Note zur 2. Ausg. „Als man den Anacharsis fragte, wozu die Hellenen das Geld brauchen, antwortet er: zum Rechnen.“ (Athen[aeus], „Deipn[osophistae]“, I. IV, 49, v. 2 [p. 120], ed. Schweighäuser, 1802.)

115:3/o Der Name einer Sache ist ihrer Natur ganz äußerlich. Ich weiß nichts vom Menschen, wenn ich weiß, daß ein Mensch Jacobus heißt. Ebenso verschwindet in den Geldnamen Pfund, Taler, Franc, Dukat usw. jede Spur des Wertverhältnisses. Die Wirre über den Geheimsinn dieser kabbalistischen Zeichen ist um so größer, als die Geldnamen den Wert der Waren und zugleich aliquote Teile eines Metallgewichts, des Geldmaßstabs, ausdrücken.⁶¹

of metal which serves as the standard of money.⁶¹ On the other hand, it is in fact necessary that value, as opposed to the multifarious objects of the world of commodities, should develop into this form which is objective and gives no hint at its conceptual origin, but which is also a simple social form.⁶²

Fowkes translates “*Wirre über den Geheimsinn dieser kabbalistischen Zeichen*” as “confusion caused by

attributing a hidden meaning to these cabalistic signs” “*begriffslos sachlich*” as “material and

nonmental”. These translations are clearly wrong.

⁶¹ ‘Because as standard of price gold is expressed by the same names of account as the prices of commodities—for example £3 17s. 10 d. may denote an ounce of gold just as well as a ton of iron—these names of account are called the mint-price of gold. Thus the strange notion arose that gold is estimated in its own material and that, unlike all other commodities, its price is fixed by the State. The establishing of names of account for definite weights of gold was mistaken for the establishing of the value of these weights’ (Karl Marx, op. cit., p. 52) [English edition, p. 74].

This is a quote from *Contribution*, 312:2/oo.

⁶² Cf. ‘Theories of the Standard of Money’, in *Zur Kritik etc.*, pp. 53 ff. [English edition, pp. 76 ff.]. Some theorists had fantastic notions of raising or lowering the ‘mint-price’ of money by getting the state to transfer to greater or smaller weights of gold or silver the names already legally appropriated to fixed weights of those metals, so that for example 1/4 ounce of gold could be minted into 40 shillings in the future instead of 20. However, Petty dealt with these so exhaustively in his *Quantulumcunque Concerning Money: To the Lord Marquis of Halifax*, 1682, at least in those cases where they aimed not at clumsy financial operations against public and private creditors but rather at economic quack remedies, that even his immediate

Andrerseits ist es notwendig, daß der Wert im Unterschied von den bunten Körpern der Warenwelt sich zu dieser begriffslos sachlichen, aber auch einfach gesellschaftlichen Form fortentwickle.⁶²

⁶¹ Note zur 2. Ausg. „Weil das Gold als Maßstab der Preise in denselben Rechenamen erscheint wie die Warenpreise, also z.B. eine Unze Gold ebensowohl wie der Wert einer Tonne Eisen in 3 Pfd.St. 17 sh. 10 1/2 d. ausgedrückt wird, hat man diese seine Rechenamen seinen Münzpreis genannt. Die wunderliche Vorstellung entstand daher, als ob das Gold (resp. Silber) in seinem eignen Material geschätzt werde und im Unterschied von allen Waren von Staats wegen einen fixen Preis erhalte. Man versah die Fixierung von Rechenamen bestimmter Goldgewichte für Fixierung des Werts dieser Gewichte.“ (Karl Marx, l.c. p. 52.)

⁶² Vgl. „Theorien von der Maßeinheit des Geldes“ in „Zur Kritik der Pol. Oekon. etc.“, p. 53 sqq. Die Phantasien über Erhöhung oder Erniedrigung des „Münzpreises“, die darin besteht, die gesetzlichen Geldnamen für gesetzlich fixierte Gewichtteile Gold oder Silber auf größere oder kleinere Gewichtteile von Staats wegen zu übertragen und demgemäß auch etwa 1/4 Unze Gold statt in 20 künftig in 40 sh. zu prägen—diese Phantasien, soweit sie nicht ungeschickte Finanzoperationen gegen Staats und Privatgläubiger, sondern ökonomische „Wunderkuren“ bezwecken, hat Petty so erschöpfend behandelt in „Quantulumcunque concerning Money. To the Lord Marquis of Halifax, 1682“, daß schon seine unmittelbaren Nachfolger, Sir Dud-

followers, Sir Dudley North and John Locke, not to mention later ones, could only repeat in more shallow terms what he had said. ‘If the wealth of a nation,’ he remarks, ‘could be increased ten times by a proclamation, it were strange that such proclamations have not long since been made by our Governors’ (Petty, op. cit., p. 36).

With money of account we are back on the side of the equivalent. A name is an example of a form extraneous to its content. Fetish character of this highest developed form. Necessity of this.

This is the climax of this section. When Marx returns now to the relative form of value, he no longer pushes the derivation of the price form forward, but he discusses the (qualitative and quantitative) discrepancies, incongruities, between value and price.

Question 438 *At the beginning of chapter Three, pages 188–195:1 Marx shows how the development of the equivalent form of value causes the relative form of value to develop, and this again acts on the equivalent form, and this acts back, etc. Shortly describe the steps of this back-and-forth motion.*

3.1.g. [Incongruities between Value and Price]

First quantitative incongruity. This is what we called back-and-forth step (6a).

195:2/o The price of a commodity is the money name of the labor objectified in it. It is therefore a tautology to say that the commodity, and the amount of money named by its price, are equivalents.⁶³ The relative expression of the value of a commodity is always the expression of the equivalence of two commodities.

⁶³ ‘Or indeed it must be admitted that a million in money is worth more than an equal value in commodities’ (Le Trosne, op. cit., p. 919), and hence ‘that one value is worth more than another value which is equal to it’.

↑ If I express the magnitude of the value of a commodity in money, then it follows tautologically that this amount of money is exchangeable (Marx uses: equivalent) with the commodity (because this is exactly how I express the value of my commodity). ↓ However the opposite does not follow: if a commodity is exchangeable for a certain amount of money, this amount of money need not necessarily be an expression of the value of that commodity. (For instance in a fire sale, it may be the expression of the financial distress of its owner.)

ley North und John Locke, von späteren gar nicht zu reden, ihn nur verflachen konnten. „Wenn der Reichtum einer Nation“, sagt er u.a., „durch eine Verordnung verzehnfacht werden könnte, wäre es eigenartig, daß unsere Regierungen nicht schon längst derartige Verordnungen erlassen haben.“ (l.c. p. 36.)

116:1/o Der Preis ist der Geldname der in der Ware vergegenständlichten Arbeit. Die Äquivalenz der Ware und des Geldquantums, dessen Name ihr Preis ist, ist daher eine Tautologie,⁶³ wie ja überhaupt der relative Wertausdruck einer Ware stets der Ausdruck der Äquivalenz zweier Waren ist.

⁶³ „Oder man muß schon zugeben, daß eine Million in Geld mehr wert ist als ein gleicher Wert in Waren“ (Le Trosne, l.c. p. 919), also „daß ein Wert mehr wert ist als ein gleicher anderer.“

Let's try an illustration: if the weather is good, people will take a walk on the beach. However that there are many people on the beach does not necessarily mean that the weather is good (it may be July 4th or D-day).

But although price, being the exponent of the magnitude of a commodity's value, is the exponent of its exchange ratio with money, it does not follow that the exponent of its exchange ratio is necessarily the exponent of the magnitude of the commodity's value.

↑ Exponent = that which exposes, indicator.

There is no mechanism which causes the value of those things to rise that are traded at a high price. On the contrary.

There is a fundamental asymmetry between form and content. While the content has to express itself in the form, the form may also incorporate extraneous influences. This is due to the openness of the world and, more specifically, in the social realm, due to the fact that societies are composed of individuals who make their own decisions. Other influences may be active which override the economic laws which Marx is developing here.

The law that values express their magnitude in the quantity of prices is therefore only a tendential law. The socially necessary labor-time in a commodity is the most enduring factor regulating its exchange-relation with money, but this exchange-relation may also be influenced by factors that have nothing to do with labor-time.

Suppose equal quantities of socially necessary labor are represented by 1 quarter of wheat and £2 (approximately 1/2 ounce of gold), respectively. £2 is the expression in money of the magnitude of the value of the quarter of wheat. It is its price. If circumstances now allow this price to be raised to £3, or compel it to be reduced to £1, then although £1 and £3 may be too small or too large to give proper expression to the magnitude of the wheat's value, they are nevertheless prices of the wheat, for they are, in the first place, the form of its value, i.e. money, and, in the second place, the exponents of its exchange-ratio with money. If the conditions of production, or the productivity of labor, remain constant, the same amount of social labor-time must be expended on the reproduction of a quarter of

Wenn aber der Preis als Exponent der Wertgröße der Ware Exponent ihres Austauschverhältnisses mit Geld, so folgt nicht umgekehrt, daß der Exponent ihres Austauschverhältnisses mit Geld notwendig der Exponent ihrer Wertgröße ist.

Gesellschaftlich notwendige Arbeit von gleicher Größe stelle sich in 1 Quarter Weizen und in 2 Pfd.St. (ungefähr 1/2 Unze Gold) dar. Die 2 Pfd.St. sind Geldausdruck der Wertgröße des Quarter Weizens, oder sein Preis. Erlauben nun die Umstände, ihn zu 3 Pfd.St., oder zwingen sie, ihn zu 1 Pfd.St. zu notieren, so sind 1 Pfd.St. und 3 Pfd.St. als Ausdrücke der Wertgröße des Weizens zu klein oder zu groß, aber sie sind dennoch Preise desselben, denn erstens sind sie seine Wertform, Geld, und zweitens Exponenten seines Austauschverhältnisses mit Geld. Bei gleichbleibenden Produktionsbedingungen oder gleichbleibender Produktivkraft der Arbeit muß nach wie vor zur Reproduktion des Quarter Weizen gleich viel gesellschaftliche Arbeitszeit verausgabt werden. Dieser Umstand hängt vom Wil-

wheat, both before and after the change in price. This situation is not dependent on the will of the wheat producer or that of the owners of the other commodities. The magnitude of the value of a commodity therefore expresses a necessary relation to social labor-time which is inherent in the process by which the commodity is produced.

The socially necessary labor-time in a commodity cannot be changed by decree, and also not by the exchange decisions of the commodity traders; this is why Marx calls the magnitude of value a "necessary relation." Exchange relations however *can* be changed by voluntary acts. People are free to exchange things at exchange relations that do not conform with the value relations, but they cannot change those value relations themselves.

With the transformation of the magnitude of value into the price, this necessary relation appears as the exchange ratio between a given commodity and the money commodity which exists outside it. In this relation, however, not only the magnitude of value of the commodity may express itself, but also the greater or lesser quantity in which it can be sold under the given circumstances. The possibility, therefore, of a quantitative incongruity between price and magnitude of value, i.e. the possibility that the price may diverge from the magnitude of value, is inherent in the price form itself.

↑ Marx argues that such incongruity is inherent in the form of value because price is the *exterior* expression of the *immanent* value, and this exterior expression is open to other influences as well.

↓ But then he goes further and says this discrepancy between value and price is not a defect but a necessity for private commodity production.

This is not a defect but, on the contrary, it makes this form the adequate form for a mode of production whose laws can only assert themselves as the blindly operating law of averages of constant irregularities.

These deviations of value and price are the mechanism by which the general necessities of the general division of labor are imposed on the individual producers and consumers.

len weder des Weizenproduzenten noch der andren Warenbesitzer ab. Die Wertgröße der Ware drückt also ein notwendiges, ihrem Bildungsprozeß immanentes Verhältnis zur gesellschaftlichen Arbeitszeit aus.

Mit der Verwandlung der Wertgröße in Preis erscheint dies notwendige Verhältnis als Austauschverhältnis einer Ware mit der außer ihr existierenden Geldware. In diesem Verhältnis kann sich aber ebensowohl die Wertgröße der Ware ausdrücken, als das Mehr oder Minder, worin sie unter gegebenen Umständen veräußerlich ist. Die Möglichkeit quantitativer Inkongruenz zwischen Preis und Wertgröße, oder der Abweichung des Preises von der Wertgröße, liegt also in der Preisform selbst.

Es ist dies kein Mangel dieser Form, sondern macht sie umgekehrt zur adäquaten Form einer Produktionsweise, worin sich die Regel nur als blindwirkendes Durchschnittsgesetz der Regellosigkeit durchsetzen kann.

Question 439 *Why is it not a defect but a sign that the price form is “admirably” adapted to commodity production, as the Moore-Aveling translation says, that prices can deviate from values due to demand and supply?*

This is already the second thing which looks like a flaw but which turns out to be necessary: after the variability of the value of gold now also the deviation of commodity prices from their values.

Exam Question 440 *Which two aspects of the function of money as a measure of value first look like flaws but on a closer look turn out to be necessary?*

Next comes what we called back-and-forth step (6b):

197:1 The price-form, however, is not only compatible with the possibility of a quantitative incongruity between magnitude of value and price, i.e. between the magnitude of value and its own expression in money, but it may also harbor a qualitative contradiction, with the result that price ceases altogether to express value, despite the fact that money is nothing but the value-form of commodities. Things which in and for themselves are not commodities, things such as conscience, honor, etc., can be offered for sale by their holders, and thus acquire the form of commodities through their price. Hence a thing can, formally speaking, have a price without having a value. The expression of price is in this case imaginary, like certain quantities in mathematics. On the other hand, the imaginary price-form may also conceal a real value-relation or one derived from it, as for instance the price of uncultivated land, which is without value because no human labor is objectified in it.

After the quantitative now the qualitative incongruity: once the price-form of commodities is developed, also things which do not have a value can obtain a price.

This possibility, that things can obtain a price from circulation, is also expressed in 229:0c/o:

“Since money does not reveal what has been converted into it, everything, commodity or not, is convertible into money.”

Here is also a relevant passage from the Wage chapter:

117:1 Die Preisform läßt jedoch nicht nur die Möglichkeit quantitativer Inkongruenz zwischen Wertgröße und Preis, d.h. zwischen der Wertgröße und ihrem eignen Geldausdruck zu, sondern kann einen qualitativen Widerspruch beherbergen, so daß der Preis überhaupt aufhört, Wertausdruck zu sein, obgleich Geld nur die Wertform der Waren ist. Dinge, die an und für sich keine Waren sind, z.B. Gewissen, Ehre usw., können ihren Besitzern für Geld feil sein und so durch ihren Preis die Warenform erhalten. Ein Ding kann daher formell einen Preis haben, ohne einen Wert zu haben. Der Preisausdruck wird hier imaginär wie gewisse Größen der Mathematik. Andererseits kann auch die imaginäre Preisform, wie z.B. der Preis des unkultivierten Bodens, der keinen Wert hat, weil keine menschliche Arbeit in ihm vergegenständlicht ist, ein wirkliches Wertverhältnis oder von ihm abgeleitete Beziehung verbergen.

In the expression ‘value of labor’, the concept of value is not only altogether extinguished, but it is turned into its opposite. It is an imaginary expression, like, say, ‘value of the earth’. However these imaginary expressions arise from the relations of production themselves. They are categories for the forms of appearance of essential relations. That in their appearance things are often presented in an inverted way is something familiar in just about every science, except in political economy. (677:2).

A systematic analysis of the imaginary expressions: value of labor, value of the earth, value of money as capital (interest), etc., will be given in Part VI of *Capital I* and Part VII of *Capital III*.

The comparison with imaginary numbers will also be taken up in chapter Nineteen, p. 677:2.

On the other hand, such a price may still hide an underlying value relation. That the price of labor hides the value of labor-power is the most prominent example here, this will be discussed on p. 1051 below. Other examples: price of land hides ground rent, capitalization gives a fictitious value to a claim on an income, etc.

In *Resultate* 1072:4/o, Marx gives a slightly stronger argument, claiming that every price *must* be reducible to value:

Every *price* must be reducible to a *value*, because price, in and for itself, is nothing but the monetary expression of value. The circumstance that the actual price of a commodity may stand above or below the level corresponding to its value does not alter the fact that prices are an expression of the values of the commodities, even though the expression is in this case *quantitatively* too large or too small—quantitatively incongruent. But here in the *price of labor* the lack of congruence is *qualitative*.

Question 442 *Discuss the phenomena which Marx refers to as “quantitative and qualitative incongruities between price and value”*

3.1.h. [From Measure of Value to Means of Circulation]

In order to make the transition to the function of money as means of circulation, Marx looks at what the price tag means operationally. This is the final back-and-forth step (7). If the price of one ton of iron is one ounce of gold, then this obligates the owner of iron to give one ton of iron for each ounce of gold the gold owner is willing to pay (as long as the owner of iron has this much iron in stock, and there may be other circumstances where this obligation is voided). Marx says that one ounce of gold is “directly exchangeable for iron.”

197:2/o Just as any other relative form of value, the price is the expression of the value of a commodity. It expresses the value of a

117:2/o Wie die relative Wertform überhaupt, drückt der Preis den Wert einer Ware, z.B. einer Tonne Eisen, dadurch aus, daß

ton of iron, for instance, by asserting that a given quantity of the equivalent, an ounce of gold for instance, is directly exchangeable with iron. But the price form by no means asserts the converse, that iron is directly exchangeable with gold.

↑ Marx throws in the remark that the price tag does not make iron directly exchangeable for gold. Every child knows that the owner of iron cannot approach the owner of money and demand one ounce of gold for each ton of iron the iron owner is willing to give him. Why does Marx mention here this trivial fact? Because the producer of iron finds himself exactly in the position of having to exchange his iron for all other commodities, i.e., for him, iron must indeed serve as the general equivalent. Marx said this already in 180:2. At that earlier point, this was posed as an impossibility (all commodities cannot be general equivalent at the same time). ↓ But now a solution presents itself: if the producers first convert their ordinary commodities into money, then they will indeed hold a general equivalent in their hands.

In order to take effect in practice as an exchange-value, the commodity must therefore divest itself of its natural physical body. It must transform itself from merely imagined gold into real gold, although this act of transubstantiation may be more 'burdensome' for it than the transition from necessity to freedom for the Hegelian 'concept', the casting of his shell for a lobster, or the putting-off of the old Adam for Saint Jerome.⁶⁴

⁶⁴ If Jerome had to wrestle hard in his youth with the material flesh, as is shown by his fight in the desert with visions of beautiful women, he had also to wrestle in his old age with the spiritual flesh. 'I thought', he says, 'I was in the spirit before the Judge of the Universe.' 'Who art thou?' asked a voice. 'I am a Christian.' 'Thou liest,' thundered back the great Judge, 'thou art nought but a Ciceronian'. [Letter XXII, Ad Eustochium].

Question 444 *Why did God say St. Jerome was only a Ciceronian?*

↑ Marx emphasizes here the difficulties to sell commodities which are, of course, the necessary counterpart of the ease with which money buys. ↓ Now Marx repeats on a more formal, abstract level what he just said:

ein bestimmtes Quantum Äquivalent, z.B. eine Unze Gold, unmittelbar austauschbar mit Eisen, aber keineswegs umgekehrt, daß seinerseits das Eisen unmittelbar austauschbar mit Gold ist.

Um also praktisch die Wirkung eines Tausch-werts auszuüben, muß die Ware ihren natürlichen Leib abstreifen, sich aus nur vorgestelltem Gold in wirkliches Gold verwandeln, obgleich diese Transsubstantiation ihr „saurer“ ankommen mag als dem Hegelschen „Begriff“ der Übergang aus der Notwendigkeit in die Freiheit oder einem Hummer das Sprengen seiner Schale oder dem Kirchenvater Hieronymus das Abstreifen des alten Adam.⁶⁴

⁶⁴ Wenn Hieronymus in seiner Jugend viel mit dem materiellen Fleisch zu ringen hatte, wie sein Wüstenkampf mit schönen Frauenbildern zeigt, so im Alter mit dem geistigen Fleisch. „Ich glaubte mich“, sagt er z.B., „im Geist vor dem Weltrichter.“ „Wer bist du?“ fragte eine Stimme. „Ich bin ein Christ.“ „Du lügst“, donnerte der Weltrichter. „Du bist nur ein Ciceronianer!“

Alongside its actual shape (iron, for instance), a commodity may possess a notional value shape or imagined gold shape in the form of its price, but it cannot simultaneously be both real iron and real gold. To establish its price it is sufficient for it to be equated with gold in the imagination. But to enable it to render its owner the service of a universal equivalent, it must be actually replaced by gold. If the owner of the iron were to go to the owner of some other earthly commodity, and were to refer him to the price of iron as its money form, he would receive as answer the terrestrial equivalent of the answer given by St. Peter in heaven to Dante, when the latter recited the creed:

'Right well hath now been tested
this coin's alloy and weight—
but tell me if thou hast it in thy purse'
(Dante, Divina Commedia, Paradiso, Canto XXIV, lines 84–5)

Question 445 *Every child knows that a commodity cannot simultaneously be both real iron and real gold. What did Marx mean to say when he wrote this sentence here?*

This passage brings a new aspect of the money form: in the presence of money, direct barter becomes more difficult. The dominant role of money as General equivalent deprives the other commodities of the capacity to serve as the expressions of value themselves. See 161:1! This implies that each commodity *must* be converted into money before it can act as exchange-value itself. The conclusion is: although the pricing of the commodity only required imagined money, this pricing implies that commodities must be turned into real gold in order to change hands. This gives the transition from the measure of value to the means of circulation.

198:1 The price form implies both the possibility to convert the commodities into money and the necessity of this conversion. On the other hand, gold serves as the notional measure of value only because it is already present as the money commodity in the process of exchange.

This succinct formulation leaves out many intermediary steps. The price form implies

Neben ihrer reellen Gestalt, Eisen z.B., kann die Ware im Preise ideelle Wertgestalt oder vorgestellte Goldgestalt besitzen, aber sie kann nicht zugleich wirklich Eisen und wirklich Gold sein. Für ihre Preisgebung genügt es, vorgestelltes Gold ihr gleichzusetzen. Durch Gold ist sie zu ersetzen, damit sie ihrem Besitzer den Dienst eines allgemeinen Äquivalents leiste. Träte der Besitzer des Eisens z.B. dem Besitzer einer weltlustigen Ware gegenüber und verwiese ihn auf den Eisenpreis, der Geldform sei, so würde der Weltlustige antworten, wie im Himmel der heilige Petrus dem Dante, der ihm die Glaubensformel hergesagt:

„Assai bene è trascorsa
D esta moneta già la lega e'l peso,
Ma dimmi se tu l'hai nella tua borsa.“
(Dante, Divina Commedia, Paradiso, Canto XXIV, lines 84–5)

118:1 Die Preisform schließt die Veräußerlichkeit der Waren gegen Geld und die Notwendigkeit dieser Veräußerung ein. Andererseits funktioniert Gold nur als ideelles Wertmaß, weil es sich bereits im Austauschprozeß als Geldware umtreibt.

1. the *possibility* of alienation (*Veräußerlichkeit*) of the commodity against money; i.e., the only condition necessary for someone to get the commodity is that he gives the money. Because of this possibility, commodity producers will no longer accept non-money commodities in exchange for their products. I.e., the possibility of alienation implies the
2. *necessity* of alienation (*Veräußerung*): Every commodity must be turned into money before it can be converted into other commodities. That means, the price form, which the commodities obtained without money actually being present, requires them to be exchanged against real money. Is this money available? The answer is yes, because
3. “on the other hand,” gold is the material in which commodities express their values only because gold is already present in circulation. I.e., the task implied in the price form arises together with the means to solve this task.

Question 447 *If gold serves as the notional measure of value only because it is already present as the money commodity in the process of exchange, why does Marx then say that the function of measure of value, and not the function as means of circulation, is the first function of money?*

In the notional measure of values lurks therefore hard cash.		Im ideellen Maß der Werte lauert daher das harte Geld.
--	--	--

Question 449 *Describe the relationship between the function of money as measure of value and as means of circulation in Marx’s theory and in modern mainstream monetary theories.*

3.2. Means of Circulation

While the first section of chapter Three was a continuation of the development in section 1.3 of chapter One, this second section here is a continuation of chapter Two.

3.2.a. The Metamorphosis of Commodities

The word “metamorphosis” denotes the passing of the same entity through different forms (metamorphosis of a butterfly).

After some general remarks about *contradictions* in the first paragraph 198:2, the three next paragraphs 198:3–199:2 argue that one must look at the circulation process from its *form side*. After this Marx shows how these formal aspects interface with the purposeful individual activity of the commodity traders. A famous passage that Say’s law need not hold, i.e., that crises are possible, concludes subsection 3.2.a.

[Preliminary Remarks about Contradiction]

Marx begins with the following metaphor: the exchange process provides a stage where the contradictions of the direct barter can play themselves out, just as an elliptical orbit allows the contradictions between gravity and inertia to play themselves out. The very first sentence ties into the passage of chapter Two, pp. 179:1–180:3–181:1, discussing the contradictions of the direct barter and their resolution:

198:2 We saw that the process of exchanging commodities contains contradictory and mutually exclusive relationships.

118:2/o Man sah, daß der Austauschprozeß der Waren widersprechende und einander ausschließende Beziehungen einschließt.

Question 450 *Describe the contradictory and mutually exclusive relationships in the process of exchanging commodities.*

↓ The next sentence stresses that the development of the value forms does not *resolve* the contradictions, but merely give them room to move:

Whereas the development of the commodity does not resolve these contradictions, it provides the form in which they can move.

Die Entwicklung der Ware hebt diese Widersprüche nicht auf, schafft aber die Form, worin sie sich bewegen können.

The splitting of the barter into sale and purchase, made possible by the separation of the world of commodities into ordinary commodities and money, gives room for the movement of the contradictory aspects included in the barter.

Marx stresses throughout this section that the activity on the market place must be seen “from the form side.” I.e., what is important about the market events is not whether the trades are better or poorer bargains for the market participants, or the transaction costs, but the information which these surface activities send to the producers watching the market. The interest of the traders is relevant only in so far as it promotes or hinders these formal aspects of their activities. If the market fails to provide an appropriate form for the underlying relations of production, then it will not continue to exist; the interests of the traders are here secondary. If the traders come up with technical devices facilitating their practical activities, which are such that they would inhibit the function of the market as the agency giving direction to the economy, then these technical devices will probably be obstructed or prohibited.

This is generally the method how real contradictions resolve themselves.

Dies ist überhaupt die Methode, worin sich wirkliche Widersprüche lösen.

↑ A true resolution of a contradiction would be a structural change which makes the contradiction go away. Marx implies here that “real” contradictions do not go away. If they find ways of actualizing themselves without erupting into a crisis, this is the closest they can come to “resolve” themselves. In order to actualize itself (or, as the translation below says, assert itself) a contradiction needs a form which allows all contradictory aspects to assert themselves. This actualization is not a resolution because the underlying contradiction still persists. For instance, the separation of the direct barter into sale and purchase is a form

which allows both contradictory aspects of the barter to be achieved. But we will see in 208:2/o that the separation between sale and purchase makes *crises* possible, i.e., it does not eliminate the contradiction as a contradiction. For instance, it is a contradiction that a material body constantly falls towards another and at the same time constantly flies away from it. The ellipse is one of the forms of motion in which this contradiction both asserts itself and resolves itself.

Es ist z.B. ein Widerspruch, daß ein Körper beständig in einen andren fällt und ebenso beständig von ihm wegfällt. Die Ellipse ist eine der Bewegungsformen, worin dieser Widerspruch sich ebenso sehr verwirklicht als löst.

The Fowkes translation shifts the contradiction from the physical process to the description of the physical process: "For instance, it is a contradiction to depict a material body as constantly falling

towards another and at the same time constantly flying away from it." And in both the sentence before and the one after it, Fowkes's formulation is not that contradictions resolve themselves,

but they are resolved: "This is, in general, the way in which real contradictions are resolved." "The ellipse is a form of motion within which this contradiction is both realized and resolved."

A distinction between surface and core is implicit in this example. Underneath, in the sphere of the real, two conflicting forces are at work: gravity which makes bodies fall into each other, and inertia, which forces bodies to maintain the state of motion they already have. In an elliptical orbit, sometimes inertia and sometimes gravity is predominant (unless they balance each other exactly at every point, in which case the orbit is a circle, or gravity overwhelms inertia, in which case it is a parabola). This is analogical to the metamorphosis of commodities, where, as we will see shortly, sometimes the use-value and sometimes the value is predominant. The example of the ellipse therefore sets the stage for Marx's investigation of the exchange process as the surface mediation of underlying contradictory tendencies.

Question 452 *If physics yields such good examples for dialectics, why are modern physicists not using dialectics?*

[Looking at the Circulation Process from the Form Side]

Let us therefore first look at this process going on underneath. On the most general level, this underlying process is the social metabolism of use-values. In every society with a division of labor, the products must change hands after they are produced. Everybody parts with his or her own product and receives the products of others.

198:3/o In so far as the process of exchange transfers commodities from hands in which they are non-use-values to hands in which they are use-values, it is a process of social metabolism. The product of one kind of useful labor replaces that of another.

119:1 Soweit der Austauschprozeß Waren aus der Hand, worin sie Nicht-Gebrauchswerte, in die Hand überträgt, worin sie Gebrauchswerte, ist er gesellschaftlicher Stoffwechsel. Das Produkt einer nützlichen Arbeitsweise ersetzt das der andren.

Not in every society is this process mediated by an exchange of products. The object of the present investigation is the *social form* in which this transfer is carried out in a commodity-producing society. I.e., Marx asks here which motivations, behaviors, and institutions on the surface of the economy induce the economic agents to perform the actions necessary to keep this society-wide metabolism going. The next passage clarifies that the content of the process is not of interest here, only its form:

Once a commodity has arrived at a place where it can serve as use-value, it falls out of the sphere of exchange into that of consumption. Only the exchange is of interest to us here. Therefore we must look at the whole process from the form side. We must investigate the form change—or the metamorphosis—of commodities, which mediates the social metabolism.

Einmal angelangt zur Stelle, wo sie als Gebrauchswert dient, fällt die Ware in die Sphäre der Konsumption aus der Sphäre des Warentauschs. Letztre allein interessiert uns hier. Wir haben also den ganzen Prozeß nach der Formseite zu betrachten, also nur den Formwechsel oder die Metamorphose der Waren, welche den gesellschaftlichen Stoffwechsel vermittelt.

A similar formulation can be found in chapter Four, 247:2.

In the last sentence of the preceding paragraph, the process of selling and buying is not called "exchanges" but "metamorphoses" or "form changes" of the commodities (to be understood in the sense of "switching forms" or "migrating from one form to the next").

Question 453 *What does Marx mean when he says in 198:3/o: one must look at the circulation of commodities from its form side?*

⇓ If one looks at the market transactions from their form side one must avoid the following mistake: one should not consider the surface activities by which the social metabolism is mediated as *exchanges*. Marx stresses that a sale or purchase has a quite different character than a barter between two ordinary commodities. People's thought processes and decision criteria are different when they make a sale or purchase than when they barter two commodities against each other.

199:1 This change of form has been very imperfectly grasped as yet, owing to the circumstance that, quite apart from the lack of clarity in the concept of value itself, every change of form in a commodity results from the exchange of two commodities, namely an ordinary commodity and the money commodity. If we keep in mind only this material aspect, that is, the exchange of the commodity for gold, we overlook the very thing we ought to observe, namely what has happened to the form of the commodity. We do not see that gold, as a mere commodity,

119:2 Die durchaus mangelhafte Auffassung dieses Formwechsels ist, abgesehen von Unklarheit über den Wertbegriff selbst, dem Umstand geschuldet, daß jeder Formwechsel einer Ware sich vollzieht im Austausch zweier Waren, einer gemeinen Ware und der Geldware. Hält man an diesem stofflichen Moment, dem Austausch von Ware mit Gold, allein fest, so übersieht man grade, was man sehn soll, nämlich was sich mit der Form zuträgt. Man übersieht, daß Gold als bloße Ware nicht Geld ist und daß die andren Waren sich selbst in ihren

is not money, and that the other commodities, through their prices, relate themselves to gold as the their *own monetary shape*.

↓ Here is this same passage in the French edition (with a translation from the French edition). The French is clearer than both English and German versions.

[mew] The formal aspect of this movement is a little difficult to grasp, since every form change of one commodity is brought about by the exchange of two commodities. An example of such a form change is a commodity stripping off its useful form and putting on its money form. How does this happen? By its exchange with gold. A simple exchange of two commodities, if we view it as a tangible fact; but it is necessary to look at it more closely.

Preisen auf Gold als ihre *eigne Geldgestalt* beziehen.

[megaII/7]81:2 Ce côté morphologique du mouvement est un peu difficile à saisir, puisque tout changement de forme d'une marchandise s'effectue par l'échange de deux marchandises. Une marchandise dépouille, par exemple, sa forme usuelle pour revêtir sa forme monnaie. Comment cela arrive-t-il? Par son échange avec l'or. Simple échange de deux marchandises, voilà le fait palpable; mais il faut y regarder de plus près.

Question 454 *The empirical appearance of the processes of sale and purchase encourages a naive mistake, which makes it difficult to understand the metamorphosis of the commodity. Which mistake?*

Every form change of a commodity is accomplished by an *exchange* of two things, an ordinary commodity and the money commodity. Nevertheless, this form change cannot be understood if one equates it to a barter between two different commodities on the market. In a barter, one has to divide one's attention between two commodities, that which one gives away and that which one receives. In C–M–C, the sale is exclusively devoted to the realization of the value of the commodity sold, without interference of the use-value which one intends to purchase afterwards, and the purchase is not burdened with the use-value which is sold to get the money.

Now that we know what circulation is *not*, Marx begins to develop what circulation *is*. Before he can explain circulation, he first has to explain money, an indispensable ingredient in the circulation process. ↓ Marx begins with the observation that money is created in the circulation process.

199:2 Commodities first enter into exchange ungilded, without a sugar coating, in their original home-grown shapes. The process of exchange, however, produces a duplication of the commodity into commodity and money, an external opposition in which the commodities represent their internal opposition between use-value and value.

119:3 Die Waren gehen zunächst unvergoldet, unverzuckert, wie der Kamm ihnen gewachsen ist, in den Austauschprozeß ein. Er produziert eine Verdopplung der Ware in Ware und Geld, einen äußeren Gegensatz, worin sie ihren immanenten Gegensatz von Gebrauchswert und Wert darstellen.

↑ This is a reference to the social “deed” preparatory to circulation, discussed in chapter Two, 180:3–181:1. This deed allows the inner contradiction between use-value and exchange-value of each individual commodity to be represented on the surface by the contradiction between commodities and money. This contradiction already exists between the Simple relative and equivalent form, as discussed in 153:1, and the logic of that earlier place is very similar to here.

In this opposition, commodities as use-values confront money as exchange-value. It is true, both sides of this opposition are commodities, i.e., unities of use-value and value. But this unity of differences represents itself at each of the two opposite poles in an opposite way, and therefore at the same time represents their mutual interrelationship. The commodity is in actuality a use-value—the fact that it is a value appears only notionally, in its price, that puts it in relation with gold as the actual shape of its value. On the other hand, gold counts only as the materialization of value, as money. In its actuality it is therefore exchange-value. Its use-value appears only notionally in the series of relative value-expressions, through which it refers to all other commodities as the scope of its actual useful shapes.

↑ In other words, the use-value of gold for filling teeth is ignored. The French edition of *Capital*, 81:3, explains very well how the relation between commodity and money differs from that between two ordinary commodities:

Gold occupies one pole, and all the useful articles the opposite pole. On both sides are commodities, unities of use-value and exchange-value. But this unity of opposites is, on these two extremes, represented in two manners inverse to each other. The useful form of the commodity is its actual form, while its exchange-value is expressed only notionally, in imagined gold, by its price. By contrast, the natural, metallic form of *gold* is the form of its general exchangeability, its value form, while its use-value is only notionally expressed in the series of

In diesem Gegensatz treten die Waren als Gebrauchswerte dem Geld als Tauschwert gegenüber. Andererseits sind beide Seiten des Gegensatzes Waren, also Einheiten von Gebrauchswert und Wert. Aber diese Einheit von Unterschieden stellt sich auf jedem der beiden Pole umgekehrt dar und stellt dadurch zugleich deren Wechselbeziehung dar. Die Ware ist reell Gebrauchswert, ihr Wertsein erscheint nur ideell im Preis, der sie auf das gegenüberstehende Gold als ihre reelle Wertgestalt bezieht. Umgekehrt gilt das Goldmaterial nur als Wertmaterial, Geld. Es ist reell daher Tauschwert. Sein Gebrauchswert erscheint nur noch ideell in der Reihe der relativen Wertausdrücke, worin es sich auf die gegenüberstehenden Waren als den Umkreis seiner reellen Gebrauchsgestalten bezieht.

L'or occupe un pôle, tous les articles utiles le pôle opposé. Des deux côtés, il y a marchandise, unité de valeur d'usage et de valeur d'échange. Mais cette unité de contraires se représente inversement aux deux extrêmes. La forme usuelle de la marchandise en est la forme réelle, tandis que sa valeur d'échange n'est exprimée qu'idéalement, en or imaginé, par son prix. La forme naturelle, métallique de l'or est au contraire sa forme d'échangeabilité générale, sa forme valeur, tandis que sa valeur d'usage n'est exprimée qu'idéalement dans la série des marchan-

commodities acting as its equivalents. That is why a commodity, when it is exchanged against gold, changes at the same time its useful form into its value form. When gold is exchanged against a commodity, then it changes, with that, its value form into a useful form.

In comparison with the French, the German and English editions contain additional information. They are overloaded and therefore more difficult to read. At the beginning of the paragraph, the remark is added that this exterior opposition commodity—money is a product of the exchange process and represents the interior opposition use-value—exchange-value in every commodity. The German edition has the following additional sentence at the end:

These opposite forms of the commodities are the actual forms of motion of the process of exchange.

dises qui figurent comme ses équivalents. Or, quand une marchandise s'échange contre de l'or, elle change du même coup sa forme usuelle en forme valeur. Quand l'or s'échange contre une marchandise, il change de même sa forme valeur en forme usuelle.

Diese gegensätzlichen Formen der Waren sind die wirklichen Bewegungsformen ihres Austauschprozesses.

One should note how Marx argues here. The separation of barter into sale and purchase is not described as a device deliberately introduced by the market participants in order to resolve the practical difficulties of direct barter. Rather, money has been introduced as a surface expression of the relations of production in the core of the economy. Money functions as “form of value.” Following our above definition of form of value, money is a surface relation setting the stage for individual behaviors through which the value relations between the producers, i.e., the pooling of their private labors as abstract labor, are actualized and reproduced. With the existence of money, the contradiction between use-value and exchange-value inside every commodity is externalized in the separation of the world of commodities into ordinary commodities and money.

When the commodity goes through the exchange process, it passes through these two opposite commodity forms. The terminology “form of motion” reminds of the example of the ellipse: Just as in an ellipse, sometimes gravity and sometimes inertia is dominant, so in the exchange of the commodities, first the exchange-value and then the use-value are dominant.

After this discussion of the two way-stations of the circulation process,⁶⁵ Money and ordinary commodity, Marx discusses now the process itself.

199:3/o Let us now accompany the owner of some commodity, say our old friend the linen weaver, to the scene of action, the market. Her commodity, 20 yards of linen, has a definite price, £2.

119:4/o Begleiten wir nun irgendeinen Warenbesitzer, unsren altbekannten Leinweber z.B., zur Szene des Austauschprozesses, dem Warenmarkt. Seine Ware, 20 Ellen Leinwand, ist preisbestimmt. Ihr Preis ist 2 Pfd.St.

↑ I.e., the linen weaver finds this price on the market.

She exchanges it for the £2, and then, being a woman of the old school, she parts with

Er tauscht sie aus gegen 2 Pfd.St. und, Mann von altem Schrot und Korn, tauscht die 2

the £2 in return for a family Bible of the same price.

↑ Here Marx uses the word “exchange” because he describes the practical actions. A little earlier he had said that although it was physically an exchange between two things, the commodity involved (linen or bible) and money, it should be considered a form change of the commodity rather than an exchange. The next sentence redescribes this activity as a form change. (This illustrates what he meant when he said in 198:3/o that one has to look at the process from its form side.)

The linen, for her nothing but a commodity, carrier of value, is disembodied in exchange for gold, which is the material shape of the linen's value. Then it is taken out of this shape and re-embodied, externalized, again in exchange for another commodity, the Bible, a commodity destined to enter the weaver's house as an object of utility and there to satisfy her family's need for edification.

Marx uses here the pair of words “disembody” or “transfigure” (*entäußern*), which means, strip off its external shell, i.e., selling, and “re-embody” or “re-externalize” (*rückveräußern*), the resumption of an external form, i.e., buying. The words *entäußern* and *veräußern* are used in the same meanings also in 212:1. But elsewhere, Marx plays on the paradox that the word *veräußern* has in German also the meaning “alienate by sale” (“alienate” here in the literal sense of making it the property of a stranger). More details in the translation note to 203:3/oo.

The process of exchange is therefore accomplished through two opposite yet mutually complementary metamorphoses—the conversion of the commodity into money, and the re-conversion of the money into a commodity.⁶⁵

Pfd.St. wieder aus gegen eine Familienbibel vom selben Preis.

Die Leinwand, für ihn nur Ware, Wertträger, wird entäußert gegen Gold, ihre Wertgestalt, und aus dieser Gestalt rückveräußert gegen eine andre Ware, die Bibel, die aber als Gebrauchsgegenstand ins Weberhaus wandern und dort Erbauungsbedürfnisse befriedigen soll.

Der Austauschprozeß der Ware vollzieht sich also in zwei entgegengesetzten und einander ergänzenden Metamorphosen—Verwandlung der Ware in Geld und ihre Rückverwandlung aus Geld in Ware.⁶⁵

Seen from the form side, the weaver does not give away her commodity, but she still has the same commodity in her hands, which only changes its form. It first burns into money-ashes and then rises from these ashes in the shape of the use-value which she can actually use:

⁶⁵ ‘As Heracleitus says, all things exchange for fire, and fire for all things, just as gold does for goods and goods for gold’ (F. Lassalle, *Die Philosophie Herakleitos des Dunkeln*, Berlin, 1858, Vol. I, p. 222.) Lassalle, in his note on this passage, p. 224, n. 3, erroneously declares

⁶⁵ „Aus dem ... Feuer aber wird Alles, sagte Heraklit, und Feuer aus Allem, gleich wie aus Gold Güter und aus Gütern Gold.“ (F. Lassalle, „Die Philosophie Herakleitos des Dunkeln“, Berlin 1858, Bd. I, p. 222.) Lassalles Note zu dieser Stelle, p. 224, n. 3, erklärt das Geld unrichtig für

money to be a mere symbol of value.

bloßes Wertzeichen.

↑ While Heracleitus uses the metaphor of burning, Marx himself uses the metaphor of a chrysalis in 159:2/o and 227:3/o, and the metaphor of a larva in 210:2/oo.

Question 455 *Come up with other metaphors and see what insights can be gained from them.*

So far, we argued by a transcendental argument that the exchange process must be viewed from its form side, and arrived at the above form change by a redescription of the exchange process. Now Marx looks whether we can recognize the elements of this metamorphosis in the practical activities of the commodity exchangers:

Question 456 *Enumerate four other transcendental arguments in Capital.*

The moments of the metamorphosis of the commodity are at the same time transactions effected by the commodity owner—selling, or the exchange of the commodity for money, buying, or the exchange of the money for a commodity, and the unity of the two acts: selling in order to buy.

Die Momente der Warenmetamorphose sind zugleich Handel des Warenbesitzers—Verkauf, Austausch der Ware mit Geld; Kauf, Austausch des Gelds mit Ware, und Einheit beider Akte: verkaufen, um zu kaufen.

After producing her commodities, the commodity producer must go to market and engage in two different transactions, a sale and a purchase, in order to obtain the products she needs. She has come to depend on it that her practical dealing and wheeling on the market will, as a rule, lead to the desired results: she will find a buyer for her wares and she will be able to purchase the use-values she needs. This exchange of use-values is her final aim.

200:1 The end result of the transaction, from the point of view of the weaver, is that instead of being in possession of the linen, she now has the Bible; instead of her original commodity, she now possesses another of the same value but of different utility. She procures her other means of subsistence and production in a similar way. For the weaver, the whole process accomplishes nothing more than the exchange of the product of her labor for the product of someone else's, nothing more than an exchange of products.

120:1 Besieht sich der Leinweber nun das Endresultat des Handels, so besitzt er Bibel statt Leinwand, statt seiner ursprünglichen Ware eine andre vom selben Wert, aber verschiedener Nützlichkeit. In gleicher Weise eignet er sich seine andren Lebens- und Produktionsmittel an. Von seinem Standpunkt vermittelt der ganze Prozeß nur den Austausch seines Arbeitsprodukts mit fremdem Arbeitsprodukt, den Produktaustausch.

It is a transformation of her labor from linen-weaving into the kinds of labor that fulfill her various needs. It is of little concern to her that the market routine is also an evolution of the forms of the value of the commodity, despite the fact that she would not be able to achieve

her individually desired outcome if it were otherwise. We, however, will take a close look at these form changes now:

200:2 The process of exchange is therefore accomplished through the following changes of form:

Commodity—Money—Commodity
 $C - M - C$.

120:2 Der Austauschprozeß der Ware vollzieht sich also in folgendem Formwechsel:

Ware—Geld—Ware
 $W - G - W$.

These two stages are first considered from the point of view of their result, then separately, and then in their unity.

200:3 As far as its material content is concerned, the movement is $C - C$, the exchange of one commodity for another, the metabolic interaction of social labor, ...

120:3 Nach ihrem stofflichen Inhalt ist die Bewegung $W - W$, Austausch von Ware gegen Ware, Stoffwechsel der gesellschaftlichen Arbeit, ...

From the point of view of its content it is $C - C$, metabolism of social labor. ... in whose result the process itself becomes extinguished.

... in dessen Resultat der Prozeß selbst erlischt.

The process is like a fire; it dies down after its result is achieved. The result does *not* recreate the conditions for the renewal of the process.

Now Marx brings more details how this result is achieved.

[C-M]

200:4/o $C - M$. First metamorphosis of the commodity, or sale. The leap taken by value from the body of the commodity into the body of the gold is the commodity's salto mortale, as I have called it elsewhere. If the leap falls short, it is not the commodity which is bruised but rather its owner.

120:4/oo $W - G$. Erste Metamorphose der Ware oder Verkauf. Das Überspringen des Warenwerts aus dem Warenleib in den Goldleib ist, wie ich es anderswo bezeichnet, der Salto mortale der Ware. Mißlingt er, so ist zwar nicht die Ware geprellt, wohl aber der Warenbesitzer.

“Elsewhere” is a reference to *A Contribution to the Critique of Political Economy*, p. 325:1/o. “Bruised” is in German “geprellt” which also means “defrauded.” The commodity owner must subject his commodity to the test of the market and pass this test, otherwise his labor is in vain. The private producer, individually, must absorb the costs if social production exceeds demand, but they benefit in the symmetric imbalance that social production falls short of demand.

Question 457 *Why is the commodity not bruised, and why is the commodity owner “bruised,” if the commodity's salto mortale fails?*

The social division of labor makes the nature of her labor as one-sided as her needs are many-sided. The product of her labor

Die gesellschaftliche Teilung der Arbeit macht seine Arbeit ebenso einseitig als seine Bedürfnisse vielseitig. Ebendeswegen dient

serves her therefore merely as exchange-value.

↑ Here Marx refers to the social structure in the background of these individual activities: the commodity producers live in a society with a division of labor; they cannot use their own products themselves, and they have many needs which require the specialized products of others. Their product is for them only an *exchange-value*, destined to be traded away for a wide variety of other commodities. For this function, the General equivalent form would be the appropriate social form:

It cannot acquire a General socially valid equivalent form except by being converted into money—however that money is in someone else's pocket.

This transition from a personal equivalent to a generally recognized equivalent is developed in more detail in chapter Two, 180:2. It is Marx's more specific formulation of the contradiction faced by the commodity traders that in terms of use-values their transaction is purely individual, and in terms of value it is purely social. This contradiction cannot be solved on an individual basis, since every commodity producer wants his commodity to be the General equivalent, but only one General equivalent is possible. But society at large steps in and designates one commodity, gold, as the General equivalent. This was discussed in chapter Two. Here, in chapter Three, we are discussing how the individuals act in the presence of money. They must convert their products into money. This conversion will only happen if their product is a use-value for the money owner.

In order to extract this money, the commodity produced by its owner's labor must above all be a use-value for the owner of the money. The labor expended on it must therefore be of a socially useful kind, i.e. it must prove its validity as a branch of the social division of labor.

↑ This intertwining of different commodity metamorphoses is not the reflection of some necessity of production, but it merely comes from circulation. Its implications will be discussed in detail next. ↓ The rest of the paragraph shows that the evolving social structure underlying this transaction only enters this activity as a disturbance creating uncertainties. As is typical for Marx, he first formulates the result in a catchy phrase and develops it.

But the division of labor is an organization of production which has evolved spontaneously, a web which was, and continues to be, woven behind the backs of the producers of commodities.

I.e., the market uncertainties which will be discussed next come from a lack of conscious planning and coordination. Now Marx describes eight different situations in which a com-

ihm sein Produkt nur als Tauschwert.

Allgemeine gesellschaftlich gültige Äquivalentform erhält es aber nur im Geld, und das Geld befindet sich in fremder Tasche.

Um es herauszuziehen, muß die Ware vor allem Gebrauchswert für den Geldbesitzer sein, die auf sie verausgabte Arbeit also in gesellschaftlich nützlicher Form verausgabt sein oder sich als Glied der gesellschaftlichen Teilung der Arbeit bewähren.

Aber die Teilung der Arbeit ist ein naturwüchsiger Produktionsorganismus, dessen Fäden hinter dem Rücken der Warenproduzenten gewebt wurden und sich fortweben.

modity may not find a buyer.

(1) The labor aims to satisfy a new need: Perhaps the commodity is the product of a new kind of labor, and claims to satisfy a newly arisen need, or is even trying to bring forth a new need on its own account.

(2) A particular operation splits off and becomes its own trade:

Perhaps a particular operation, which yesterday still formed one out of many operations conducted by the same producer in creating a given commodity, today tears itself out of this framework, establishes itself as an independent branch of labor, and sends its part of the product to market as an independent commodity. The circumstances may or may not be ripe for such a process of separation.

(3) A product is replaced by a substitute: Today the product satisfies a social need. Tomorrow it may perhaps be expelled partly or completely from its place by a similar product.

Note that Marx assumes an ongoing economy. He assumes that the product used to be socially necessary, but certain changes come about which make it no longer so. But even if none of the above changes occur, our individual producer may be upstaged by her competitors: Grammatically, the evolution of the division of labor is described here not as the deed of the workers, but their labor and the commodities themselves are the subjects. This is reminiscent of chapter Two, where Marx also distinguished between the will of the commodity owners and the will of the commodities themselves.

(4) The labor itself is useful but the need for this kind of product has already been satisfied by other suppliers.

Moreover, although our weaver's labor may be a recognized branch of the social division of labor, yet that fact is by no means sufficient to guarantee the utility of her 20 yards of linen. If the society's need for linen—and such a need has a limit like every other need—has already been satisfied by the products of rival weavers, our friend's product is in excess, superfluous, and conse-

Vielleicht ist die Ware Produkt einer neuen Arbeitsweise, die ein neu aufgekommenes Bedürfnis zu befriedigen vorgibt oder auf eigne Faust ein Bedürfnis erst hervorrufen will.

Gestern noch eine Funktion unter den vielen Funktionen eines und desselben Warenproduzenten, reißt sich eine besondere Arbeitsverrichtung heute vielleicht los von diesem Zusammenhang, verselbständigt sich und schickt ebendeshalb ihr Teilprodukt als selbständige Ware zu Markt. Die Umstände mögen reif oder unreif sein für diesen Scheidungsprozeß.

Das Produkt befriedigt heute ein gesellschaftliches Bedürfnis. Morgen wird es vielleicht ganz oder teilweise von einer ähnlichen Produktenart aus seinem Platze verdrängt.

Ist auch die Arbeit, wie die unsres Leinwebers, patentiertes Glied der gesellschaftlichen Arbeitsteilung, so ist damit noch keineswegs der Gebrauchswert grade seiner 20 Ellen Leinwand garantiert. Wenn das gesellschaftliche Bedürfnis für Leinwand, und es hat sein Maß wie alles andere, bereits durch nebenbuhlerische Leinweber gesättigt ist, wird das Produkt unsres

quently useless.

Freundes überschüssig, überflüssig und damit nutzlos.

Since this product has use-value, it can probably still be sold if the price is low enough. Two paragraphs down, in 203:1, Marx describes this as a situation in which a form change leads to a gain or loss in quantity; at the present time, he only remarks that a loss in value is against the intention of the seller:

Although people do not look a gift-horse in the mouth, our friend does not frequent the market to make presents of his products.

Einem geschenkten Gaul sieht man nicht ins Maul, aber er beschreitet nicht den Markt, um Präsente zu machen.

This is the transition from the qualitative to the quantitative discussion. Next Marx assumes that the product indeed turns out to be a use-value, and asks how much money it attracts. This is now a quantitative question, after the qualitative criteria above whether or not the commodity is a use-value at all.

Let us assume, however, that the use-value of her product proves itself, and that the commodity therefore attracts money. Now we have to ask: how much money? No doubt the answer is already anticipated in the price of the commodity, which is the exponent of the magnitude of its value.

Gesetzt aber, der Gebrauchswert seines Produkts bewähre sich und Geld werde daher angezogen von der Ware. Aber nun fragt sich's, wieviel Geld? Die Antwort ist allerdings schon antizipiert im Preis der Ware, dem Exponenten ihrer Wertgröße.

↑ Of course, every commodity has a price tag, but the price actually received on the market may differ from the price expected by the seller for various reasons.

(5) If a wrong price was set due to mis-calculations of the commodity producer, the market's correction of this price is not a change in the quantity value, therefore Marx disregards this here:

We leave out of consideration here any possible subjective errors in calculation by the owner of the commodity, which will immediately be corrected objectively in the market.

Wir sehn ab von etwaigen rein subjektiven Rechenfehlern des Warenbesitzers, die auf dem Markt sofort objektiv korrigiert werden.

(6) If the commodity is not produced under average conditions, the market may not reward all the labor going into this product. Marx disregards this case too; he assumes all goods are produced under average conditions:

We suppose him to have spent on his product only the average socially necessary quantity of labor-time.

Er soll auf sein Produkt nur den gesellschaftlich notwendigen Durchschnitt von Arbeitszeit verausgabt haben.

If the goods are produced under average conditions and if there are no miscalculations of the price, then the price reflects the labor input of the commodity:

The price of the commodity is therefore just the money-name of the quantity of social labor objectified in it.

Der Preis der Ware ist also nur Geldname des in ihr vergegenständlichten Quantum gesellschaftlicher Arbeit.

Does this mean the market will accept the price? Marx brings two situations in which it won't:

(7) Even if the commodity is produced under average conditions, there may be changes in the production of the same commodity elsewhere. In other words, even if this producer, individually, does everything right, she may be rudely reminded that abstract labor is a social concept:

But now the old-established conditions of production in weaving are thrown into the melting-pot, without the permission of, and behind the back of, our weaver. What was yesterday undoubtedly labor-time socially necessary for the production of a yard of linen ceases to be so today, a fact which the owner of the money is only too eager to prove from the prices quoted by our friend's competitors. Unluckily for the weaver, people of her kind are in plentiful supply.

Aber ohne Erlaubnis und hinter dem Rücken unsres Leinwebers gerieten die altverbürgten Produktionsbedingungen der Leinweberei in Gärung. Was gestern zweifelsohne gesellschaftlich notwendige Arbeitszeit zur Produktion einer Elle Leinwand war, hört heute auf, es zu sein, wie der Geldbesitzer eifrigst demonstriert aus den Preisquotationen verschiedener Nebenbuhler unsres Freundes. Zu seinem Unglück gibt's viele Weber auf der Welt.

Question 458 Usually, Marx says that the strength of the proletariat comes from its numbers; but in 200:4/o, Marx says that is is unluckily for the weaver that there are many weavers in the world. How can he come to such conflicting pronouncements?

(8) And again the case in which too much was produced. This is similar to (4), but this time all producers have to cut their prices. Marx says this is tantamount to them producing at a below-normal productivity:

Let us suppose, finally, that every piece of linen on the market contains nothing but socially necessary labor-time. In spite of this, all these pieces taken as a whole may contain superfluously expended labor-time. If the market cannot stomach the whole quantity at the normal price of 2 shillings a yard, this proves that too great a portion of the total social labor-time has been expended in the form of weaving. The effect is the same as if each individual weaver had expended more labor-time on his or her particular product than was socially necessary. As the German proverb has it: caught together, hung together. All the linen on the market counts as one single article of commerce, and each piece of linen is only a pro-

Gesetzt endlich, jedes auf dem Markt vorhandne Stück Leinwand enthalte nur gesellschaftlich notwendige Arbeitszeit. Trotzdem kann die Gesamtsumme dieser Stücke überflüssig verausgabte Arbeitszeit enthalten. Vermag der Marktmagen das Gesamtquantum Leinwand, zum Normalpreis von 2 sh. per Elle, nicht zu absorbieren, so beweist das, daß ein zu großer Teil der gesellschaftlichen Gesamtarbeitszeit in der Form der Leinweberei verausgabt wurde. Die Wirkung ist dieselbe, als hätte jeder einzelne Leinweber mehr als die gesellschaftlich notwendige Arbeitszeit auf sein individuelles Produkt verwandt. Hier heißt's: Mitgefangen, mitgegangen. Alle Leinwand auf dem Markt gilt nur als ein Handelsartikel, jedes

portional part of it. And in fact the value of each single yard is also nothing but the materialization of the same socially determined quantity of homogeneous human labor.

Question 459 Which difficulties may the commodity producer encounter when trying to sell the commodity?

↓ Marx draws the following conclusion from the difficulties in selling the commodity:

202:1/o We see then that commodities are in love with money, but ‘the course of true love never does run smooth’. The quantitative articulation of society’s productive organism, by which its scattered elements are integrated into the system of the division of labor, is as haphazard and spontaneous as its qualitative articulation. The owners of commodities therefore find out that the same division of labor which turns them into independent private producers also makes the social process of production and the relations of the individual producers to each other within that process independent of the producers themselves; they also find out that the independence of the individuals from each other is supplemented by a system of all-round material dependence.

Stück nur als aliquoter Teil. Und in der Tat ist der Wert jeder individuellen Elle ja auch nur die Materialität desselben gesellschaftlich bestimmten Quantums gleichartiger menschlicher Arbeit.

122:1 Man sieht, die Ware liebt das Geld, aber „the course of true love never does run smooth“. Ebenso naturwüchsig zufällig wie die qualitative ist die quantitative Gliederung des gesellschaftlichen Produktionsorganismus, der seine membra disjecta im System der Teilung der Arbeit darstellt. Unsere Warenbesitzer entdecken daher, daß dieselbe Teilung der Arbeit, die sie zu unabhängigen Privatproduzenten, den gesellschaftlichen Produktionsprozeß und ihre Verhältnisse in diesem Prozeß von ihnen selbst unabhängig macht, daß die Unabhängigkeit der Personen voneinander sich in einem System allseitiger sachlicher Abhängigkeit ergänzt.

Question 461 Marx says that the independence of the individuals from each other is supplemented by a system of all-round material dependence. Explain what this means.

Although the producers are personally independent of each other, also the system of social interconnections of the production process is independent of the producers, and forces the producers into a system of material dependence of each other.

↓ After all this, Marx assumes that the process goes smoothly despite the above obstacles. Discrepancies between demand and supply are also discussed in 195:2/o, and *Capital II* is discussing the conditions necessary for demand and supply to coincide.

203:1 The division of labor converts the product of labor into a commodity, and thereby makes necessary its conversion into money. At the same time, it makes it a matter of chance whether this transubstantiation

122:2 Die Teilung der Arbeit verwandelt das Arbeitsprodukt in Ware und macht dadurch seine Verwandlung in Geld notwendig. Sie macht es zugleich zufällig, ob diese Transsubstantiation gelingt. Hier ist

succeeds or not. Here, however, we have to look at the phenomenon in its pure shape, and must therefore assume it has proceeded normally. In any case, if the process is to take place at all, i.e. if the commodity is not impossible to sell, a change of form must always occur, although there may be an abnormal loss or accretion of substance—that is, of the magnitude of value.

Marx does not speak here of division of labor in general, but the very specific division of labor with private producers producing for the market. In 132:4 Marx emphasizes that non-market division of labor is also possible.

Next follows a summary preparing the transition to the back side of $C - M$, namely, this $C - M$ is the $M - C$ for someone else.

203:2 The seller has her commodity replaced by gold, the buyer has his gold replaced by a commodity. The palpable phenomenon here is that a commodity and gold, 20 yards of linen and £2, have changed hands and places, in other words that they have been exchanged. But what is the commodity exchanged for? For the general shape assumed by its own value. And what is the gold exchanged for? For a particular form of its own use-value.

jedoch das Phänomen rein zu betrachten, sein normaler Vorgang also vorauszusetzen. Wenn es übrigens überhaupt vorgeht, die Ware also nicht unverkäuflich ist, findet stets ihr Formwechsel statt, obgleich abnormal in diesem Formwechsel Substanz—Wertgröße—eingebüßt oder zugesetzt werden mag.

122:3/o Dem einen Warenbesitzer ersetzt Gold seine Ware und dem andren Ware sein Gold. Das sinnfällige Phänomen ist der Hände- oder Stellenwechsel von Ware und Gold, von 20 Ellen Leinwand und 2 Pfd.St., d.h. ihr Austausch. Aber womit tauscht sich die Ware aus? Mit ihrer eignen allgemeinen Wertgestalt. Und womit das Gold? Mit einer besondern Gestalt seines Gebrauchswerts.

Fowkes translates “*sinnfällig*” as “striking” which is wrong.

Sale is not exchange with other use-value, i.e., it is not a transaction involving two commodities, but realization of the commodity’s own value in money, i.e., it involves only one commodity. Whereas the direct barter $C - C$ is a symmetric relation between the commodities, $C - M$ is asymmetric. Therefore it is legitimate to ask: what is the sale for the money? Realization of its notional (*ideell*) use-value. The next question is: how did M get into this special position in the circulation process? Because it is measure of value.

Why does gold confront the linen as money? Because the linen’s price of £2, its money-name, already brings it into relation with the gold as money.

Warum tritt Gold der Leinwand als Geld gegenüber? Weil ihr Preis von 2 Pfd.St. oder ihr Geldname sie bereits auf Gold als Geld bezieht.

In the second half of the paragraph, Marx makes the transition from $C - M$ to $M - C$. Since the form change of the commodity involves money, it is also a form change of money:

The disembodiment of the original commodity form is effected by the externalization, the sale, of the commodity, i.e., in the moment when its use-value actually attracts the gold to which it previously had a merely imagined relation in its price. The actualization of a commodity's price, or of its merely notional value form, is therefore at the same time, and inversely, the actualization of the merely notional use-value of money; the conversion of a commodity into money is the conversion of money into a commodity. This single process is two-sided: from one pole, that of the commodity owner, it is a sale, from the other pole, that of the money owner, it is a purchase. In other words, a sale is a purchase, $C - M$ is also $M - C$.⁶⁶

⁶⁶ 'Every sale is a purchase' (Dr. Quesnay, *Dialogues sur le commerce et les travaux des artisans*, Physiocrates, ed. Daire, Part I, Paris, 1846, p. 170), or, as Quesnay says in his *Maximes générales*, 'To sell is to buy.'

Once more the transition from $C - M$ to $M - C$, but this time not from point of view of money and commodity, but of money owner and commodity owner. I.e., the practical question where the buyer has his money from. This is also a society-wide issue, but not one emerging from the core of the economy, but from the surface.

203:3/oo Up to this point we have considered only one economic relation between people, namely, that between commodity owners. They can own the product of alien labor only by alienating the product of their own labor. For a commodity owner to confront another as a money owner it is therefore necessary either that the product of the latter should possess by its nature the form of money, i.e. it should be gold, the material of which money consists, or that his product should already have changed its skin and stripped off its original form of a useful object.

Die Entäußerung der ursprünglichen Warenform vollzieht sich durch die Veräußerung der Ware, d.h. in dem Augenblicke, wo ihr Gebrauchswert das in ihrem Preis nur vorgestellte Gold wirklich anzieht. Die Realisierung des Preises oder der nur ideellen Wertform der Ware ist daher zugleich umgekehrt Realisierung des nur ideellen Gebrauchswerts des Geldes, die Verwandlung von Ware in Geld zugleich Verwandlung von Geld in Ware. Der eine Prozeß ist zweiseitiger Prozeß, vom Pol des Warenbesitzers Verkauf, vom Gegenpol des Geldbesitzers Kauf. Oder Verkauf ist Kauf, $W - G$ zugleich $G - W$.⁶⁶

⁶⁶ „Jeder Verkauf ist Kauf“ (Dr. Quesnay, *„Dialogues sur le Commerce et les Travaux des Artisans“*, [in] *„Physiocrates“*, éd. Daire, I. Partie, Paris 1846, p. 170), oder, wie Quesnay in seinen *„Maximes Générales“* sagt: „Verkaufen ist kaufen.“

123:1/o Wir kennen bisher kein ökonomisches Verhältnis der Menschen außer dem von Warenbesitzern, ein Verhältnis, worin sie fremdes Arbeitsprodukt nur aneignen, indem sie eignes entfremden. Einem Warenbesitzer kann der andre daher nur als Geldbesitzer gegenüberreten, entweder weil sein Arbeitsprodukt von Natur die Geldform besitzt, also Geldmaterial ist, Gold usw., oder weil seine eigne Ware sich bereits gehäutet und ihre ursprüngliche Gebrauchsform abgestreift hat.

The next passage elaborates, in more detail, the two possibilities how the buyer can have obtained his money:

In order to function as money, gold must of course enter the market at some point or other. This point is to be found at its source of production, where the gold is exchanged, as the immediate product of labor, for some other product of equal value. But from that moment onwards, it always represents the actualized price of some commodity.⁶⁷

With every commodity other than gold, the natural way why the seller has possession of it is that he has produced it, and this is the simplifying assumption Marx makes here. With gold it is otherwise; the original sale of gold by the gold producers is only a small part of its presence on the market. Most market participants who have gold in their pocket have it because they have sold their own product.

Leaving aside the exchange of gold for other commodities at its source of production, gold is, in the hands of every commodity-owner, the disembodied shape of the sold commodity, it is the product of the first metamorphosis $C - M$.⁶⁸ Gold, as we saw, became notional money, or measure of value, because all commodities measured their values in it and thus made it the imagined opposite of their natural shape as objects of utility, i.e., made it the shape of their value. It became actual money because the commodities, through their all-sided externalization, alienation, turned the money into their actually disembodied or transfigured useful shape, thus making it the actual embodiment of their values. When they thus assume the shape of values, commodities strip off every trace of their natural and original use-values, and of the particular kind of useful labor to which they owe their creation, in order to pupate into the homogeneous social materialization of undifferentiated human labor. From the mere look of a piece of money we cannot tell what breed of commodity has been transformed into it.

Um als Geld zu funktionieren, muß das Gold natürlich an irgendeinem Punkt in den Warenmarkt eintreten. Dieser Punkt liegt an seiner Produktionsquelle, wo es sich als unmittelbares Arbeitsprodukt mit andrem Arbeitsprodukt von demselben Wert austauscht. Aber von diesem Augenblick stellt es beständig realisierte Warenpreise vor.⁶⁷

Abgesehen vom Austausch des Golds mit Ware an seiner Produktionsquelle, ist das Gold in der Hand jedes Warenbesitzers die entäußerte Gestalt seiner veräußerten Ware, Produkt des Verkaufs oder der ersten Warenmetamorphose $W - G$.⁶⁸ Ideelles Geld oder Wertmaß wurde das Gold, weil alle Waren ihre Werte in ihm maßen und es so zum vorgestellten Gegenteil ihrer Gebrauchsgestalt, zu ihrer Wertgestalt machten. Reelles Geld wird es, weil die Waren durch ihre allseitige Veräußerung es zu ihrer wirklich entäußerten oder verwandelten Gebrauchsgestalt und daher zu ihrer wirklichen Wertgestalt machen. In ihrer Wertgestalt streift die Ware jede Spur ihres naturwüchsigen Gebrauchswerts und der besondern nützlichen Arbeit ab, welcher sie den Ursprung verdankt, um sich in die gleichförmige gesellschaftliche Materialität unterschiedsloser menschlicher Arbeit zu verpuppen. Man sieht dem Geld daher nicht an, welchen Schlags die in es verwandelte Ware. Eine sieht in ihrer Geldform grade aus wie die andre. Geld mag daher Dreck sein, obgleich Dreck nicht Geld ist.

In their money-form all commodities look alike. Hence money may be dirt, although dirt is not money.

Marx's formulation played on the fact that in German, "veräußern" not only means "externalize," but this same word is also used for selling something, just as the English word "alienate" is sometimes used in the meaning of "selling something." This is

paradoxical. The transaction which in German is called externalization is, if looked at from the form side, exactly the opposite, namely the transition of the commodity *away from* its exterior bodily form to its disembodied money form. Marx

used this as a pun, but since it is impossible to reproduce this pun in a meaningful way in English, the above translation translated "veräußert" simply by "sold," and omitted the explanatory reference to sale immediately following in the same sentence.

Question 463 *What does Marx mean with the aphorism: "Money may be dirt, although dirt is not money."*

⁶⁷ 'The price of one commodity can only be paid by the price of another commodity.' (Mercier de la Rivière, *L'Ordre naturel et essentiel des sociétés politiques*, [in] *Physiocrates*, éd. Daire, Part 2, p. 554.)

⁶⁸ 'In order to have this money, one must have made a sale' (ibid., p. 543).

Usually the buyer obtains his money by selling another commodity; this leads us over to the discussion of the second metamorphosis of a commodity.

We will assume that the two golden coins in return for which our weaver has parted with her linen are the metamorphosed shape of a quarter of wheat. The sale of the linen, $C - M$, is at the same time its purchase, $M - C$. But this process, considered as the sale of the linen, starts off a movement which ends with its opposite: the purchase of a Bible. Considered as purchase of the linen, on the other hand, the process completes a movement which began with its opposite, the sale of the wheat. $C - M$ (linen—money), which is the first phase of C (linen—money—Bible), is also $M - C$ (money—linen), the last phase of another movement $C - M - C$ (wheat—money—linen). The first metamorphosis of one commodity, its transformation from the commodity-form into money, is there-

⁶⁷ „Der Preis einer Ware kann nur mit dem Preis einer anderen Ware bezahlt werden.“ (Mercier de la Rivière, „L'Ordre naturel et essentiel des sociétés politiques“, [in] „Physiocrates“, éd. Daire, p. 554.)

⁶⁸ „Um dieses Geld zu haben, muß man verkauft haben.“ (I.c. p. 543.)

Wir wollen annehmen, daß die zwei Goldfüchs wogegen unser Leinweber seine Ware veräußert die verwandelte Gestalt eines Quarters Weizen sind. Der Verkauf der Leinwand, $W - G$, ist zugleich ihr Kauf, $G - W$. Aber als Verkauf der Leinwand beginnt dieser Prozeß eine Bewegung, die mit seinem Gegenteil endet, mit dem Kauf der Bibel; als Kauf der Leinwand endet er eine Bewegung, die mit seinem Gegenteil begann, mit dem Verkauf des Weizens. $W - G$ (Leinwand—Geld), diese erste Phase von $W - G - W$ (Leinwand—Geld—Bibel), ist zugleich $G - W$ (Geld—Leinwand), die letzte Phase einer andren Bewegung $W - G - W$ (Weizen—Geld—Leinwand). Die erste Metamorphose einer Ware, ihre Verwandlung aus der Warenform in Geld, ist stets zugleich zweite entgegengesetzte Metamorphose einer and-

fore also invariably the second, and diametrically opposite, metamorphosis of some other commodity, the retransformation of the latter from money into a commodity.⁶⁹

⁶⁹ As remarked previously, the producer of gold or silver forms an exception. He exchanges his product without having sold it first.

[M—C]

The first paragraph looks at one individual commodity:

205:1 $M - C$. The second or concluding metamorphosis of the commodity: purchase. Money is the absolutely alienable commodity, because it is the disembodied shape of all other commodities, the product of their universal externalization, alienation. It reads all prices backwards, and thus as it were mirrors itself in the bodies of all other commodities, which provide the material through which it itself can come into being as a commodity. At the same time the prices, those wooing glances cast at money by commodities, define the limit of its convertibility, namely its own quantity.

Money is absolutely alienable, i.e., it is a commodity always welcome on the market. Pun with the German word *Hingabe* which means to give away but also sexual surrender. The commodities surrender their bodies in two ways: they give their bodies away and they achieve bodily fulfilment by doing it. In this way they also become the material through which the abstract money becomes commodity.

At the end Marx mention very briefly that the only obstacle (*Schranke*) for money is its quantity. This theme will be taken up again in the discussion of the miser on p. 230:1/o and in 252:2/o in chapter Four.

Since every commodity disappears when it becomes money it is impossible to tell from the money itself how it got into the hands of its possessor, or what article has been changed into it. It has no smell, from whatever source it may come. If it represents, on the one hand, a commodity which has been sold, it also represents, on the other hand, a

ren Ware, ihre Rückverwandlung aus der Geldform in Ware.⁶⁹

⁶⁹ Ausnahme, wie vorher bemerkt, bildet der Gold- resp. Silberproduzent, der sein Produkt austauscht, ohne es vorher verkauft zu haben.

124:1 $G - W$. Zweite oder Schlußmetamorphose der Ware: Kauf.—Weil die entäußerte Gestalt aller andren Waren oder das Produkt ihrer allgemeinen Veräußerung, ist Geld die absolut veräußerliche Ware. Es liest alle Preise rückwärts und spiegelt sich so in allen Warenleibern als dem hingebenden Material seiner eignen Warenwerdung. Zugleich zeigen die Preise, die Liebesaugen, womit ihm die Waren winken, die Schranke seiner Verwandlungsfähigkeit, nämlich seine eigne Quantität.

Da die Ware in ihrer Geldwerdung verschwindet, sieht man dem Geld nicht an, wie es in die Hände seines Besitzers gelangt oder was in es verwandelt ist. Non olet, wessen Ursprungs auch immer. Wenn es einerseits verkaufte Ware repräsentiert, so andererseits kaufbare Ware.⁷⁰

commodity which can be bought.⁷⁰

Again Marx makes the point that for a purchase, it is irrelevant where the money comes from; money represents both the commodities sold and the commodities to buy.

⁷⁰ 'If money represents, in our hands, the things we can wish to buy, it also represents the things we have sold for this money' (Mercier de la Riviere, op. cit., p. 586).

The next paragraph goes over to the backside again: $M - C$ is also the first metamorphosis $C - M$ for a different commodity. Many different $M - C$ often come out of one $C - M$. Transition from point of view of the commodity to that of the individual.

205:2/o $M - C$, a purchase, is at the same time $C - M$, a sale; the concluding metamorphosis of one commodity is the first metamorphosis of another. For our weaver, the life of her commodity ends with the Bible into which she has reconverted her £2. But suppose the seller of the Bible turns the £2 set free by the weaver into brandy. $M - C$, the concluding phase of $C - M - C$ (linen—money—Bible), is also $C - M$, the first phase of $C - M - C$ (Bible—money—brandy). Since the producer of the commodity offers only a single product, he often sells it in large quantities, whereas the fact that he has many needs compels him to split up the price realized, the sum of money set free, into numerous purchases. Hence a sale leads to many purchases of different commodities. The concluding metamorphosis of a commodity thus constitutes an aggregate of the first metamorphoses of other commodities.

[C-M-C]

206:1 If we now consider the completed metamorphosis of a commodity as a whole, we see in the first place that it is made up of two opposite and complementary movements, $C - M$ and $M - C$. These two an-

⁷⁰ „Wenn das Geld in unserer Hand die Dinge darstellt, die wir zu kaufen wünschen können, so stellt es auch die Dinge dar, die wir für dieses Geld verkauft haben.“ (Mercier de la Rivière, l.c. p. 586.)

124:2/o $G - W$, der Kauf ist zugleich Verkauf, $W - G$; die letzte Metamorphose einer Ware daher zugleich die erste Metamorphose einer andren Ware. Für unsren Leinweber schließt der Lebenslauf seiner Ware mit der Bibel, worin er die 2 Pfd. St. rückverwandelt hat. Aber der Bibelverkäufer setzt die vom Leinweber gelösten 2 Pfd.St. in Kornbranntwein um. $G - W$, die Schlußphase von $W - G - W$ (Leinwand—Geld—Bibel), ist zugleich $W - G$, die erste Phase von $W - G - W$ (Bibel—Geld—Kornbranntwein). Da der Warenproduzent nur ein einseitiges Produkt liefert, verkauft er es oft in größeren Massen, während seine vielseitigen Bedürfnisse ihn zwingen, den realisierten Preis oder die gelöste Geldsumme beständig in zahlreiche Käufe zu zersplittern. Ein Verkauf mündet daher in viele Käufe verschiedner Waren. Die Schlußmetamorphose einer Ware bildet so eine Summe von ersten Metamorphosen andrer Waren.

125:1 Betrachten wir nun die Gesamtmetamorphose einer Ware, z.B. der Leinwand, so sehn wir zunächst, daß sie aus zwei entgegengesetzten und einander ergänzenden Bewegungen besteht, $W - G$ und $G - W$.

tithetical transmutations of the commodity are accomplished through two antithetical social processes in which the commodity-owner takes part, and are reflected in the antithetical economic characteristics of the two processes. By taking part in the act of sale, the commodity-owner becomes a seller; in the act of purchase, he becomes a buyer. But just as, in every transmutation of a commodity, its two forms, the commodity-form and the money-form, exist simultaneously but at opposite poles, so every seller is confronted with a buyer, every buyer with a seller. While the same commodity is successively passing through the two inverted transmutations, from a commodity into money and from money into another commodity, the owner of the commodity successively changes his role from seller to buyer. Being a seller and being a buyer are therefore not fixed roles, but constantly attach themselves to different persons in the course of the circulation of commodities.

Marx describes a duality here. In each of the two transactions a seller is facing a buyer, just as in each stage of the metamorphosis of the commodity, both forms, the commodity form and the money form, exist at the same time, only on different poles. Just as the same commodity successively makes two form changes (i.e., three stages), the seller in the first is the buyer in the second.

206:2 The complete metamorphosis of a commodity, in its simplest form, implies four dénouements and three dramatis personae. First, a commodity comes face to face with money; the latter is the form taken by the value of the former, and exists over there in someone else's pocket in all its hard, material reality. A commodity-owner is thus confronted with a money-owner. Now as soon as the commodity has been changed into money, the money becomes its vanishing equivalent-form, whose use-value or content exists here on the spot, in the bod-

Diese zwei entgegengesetzten Wandlungen der Ware vollziehn sich in zwei entgegengesetzten gesellschaftlichen Prozessen des Warenbesitzers und reflektieren sich in zwei entgegengesetzten ökonomischen Charakteren desselben. Als Agent des Verkaufs wird er Verkäufer, als Agent des Kaufs Käufer. Wie aber in jeder Wandlung der Ware ihre beiden Formen, Warenform und Geldform, gleichzeitig existieren, nur auf entgegengesetzten Polen, so steht demselben Warenbesitzer als Verkäufer ein andrer Käufer und als Käufer ein andrer Verkäufer gegenüber. Wie dieselbe Ware die zwei umgekehrten Wandlungen sukzessiv durchläuft, aus Ware Geld und aus Geld Ware wird, so wechselt derselbe Warenbesitzer die Rollen von Verkäufer und Käufer. Es sind dies also keine festen, sondern innerhalb der Warenzirkulation beständig die Personen wechselnden Charaktere.

125:2 Die Gesamtmetamorphose einer Ware unterstellt, in ihrer einfachsten Form, vier Extreme und drei personae dramatis. Erst tritt der Ware das Geld als ihre Wert-Gestalt gegenüber, die jenseits, in fremder Tasche, sachlich harte Realität besitzt. So tritt dem Warenbesitzer ein Geldbesitzer gegenüber. Sobald die Ware nun in Geld verwandelt, wird letzteres zu ihrer verschwindenden Äquivalentform, deren Gebrauchswert oder Inhalt diesseits in andren Warenkörpern existiert. Als Endpunkt der ersten Warenwandlung ist das Geld zugleich

ies of other commodities. Money, the final stage of the first transformation, is at the same time the starting-point for the second. The person who is a seller in the first transaction thus becomes a buyer in the second, in which a third commodity-owner comes to meet him as a seller.⁷¹

⁷¹ 'There are accordingly ... four final terms and three contracting parties one of whom intervenes twice' (Le Trosne, op. cit., p. 909).

Four extremes (*C*, *M*, *M*, *C*) but only three persons since the seller in the first step is the buyer in the second.

207:1 The two inverted phases of the movement which makes up the metamorphosis of a commodity constitute a circuit: commodity form, stripping off of this form, and return to it. Of course, the commodity itself is here subject to contradictory determinations. At the starting-point it is a non-use-value to its owner; at the end it is a use-value. So too the money appears in the first phase as a solid crystal of value into which the commodity has been transformed, but afterwards it dissolves into the mere equivalent form of the commodity.

Circle *C* – *M* – *C*: The four extremes are here explained better: the difference between the first and the last *C* is that the last *C* is a use-value for its owner, and the first is not. There is also a difference between the *M* in the first and the *M* in the second transaction.

Now the link of this *C* – *M* – *C* with the *C* – *M* – *C* of others. The complete metamorphosis of one commodity is at the same time the second metamorphosis of another and the first metamorphosis of a third commodity. This observation furnishes the transition from the metamorphosis of a single commodity to the metamorphoses of all commodities and their interconnection.

207:2 The two metamorphoses which constitute the commodity's circular path are at the same time two inverse partial metamorphoses of two other commodities. One and the same commodity (the linen) opens the series of its own metamorphoses, and completes the metamorphosis of another (the wheat). In its first transformation, the

Ausgangspunkt der zweiten. So wird der Verkäufer des ersten Akts Käufer im zweiten, wo ihm ein dritter Warenbesitzer als Verkäufer gegenübertritt.⁷¹

⁷¹ „Demnach gibt es vier Endpunkte und drei Vertragspartner, von denen einer zweimal ein- greift.“ (Le Trosne, l.c. p. 909.)

126:1 Die beiden umgekehrten Bewegungsphasen der Warenmetamorphose bilden einen Kreislauf: Warenform, Abstreifung der Warenform, Rückkehr zur Warenform. Allerdings ist die Ware selbst hier gegensätzlich bestimmt. Am Ausgangspunkt ist sie Nicht-Gebrauchswert, am Endpunkt Gebrauchswert für ihren Besitzer. So erscheint das Geld erst als der feste Wertkristall, worin sich die Ware verwandelt, um hinterher als ihre bloße Äquivalentform zu zerrinnen.

126:2 Die zwei Metamorphosen, die den Kreislauf einer Ware, bilden zugleich die umgekehrten Teilmetamorphosen zweier andren Waren. Dieselbe Ware (Leinwand) eröffnet die Reihe ihrer eignen Metamorphosen und schließt die Gesamtmetamorphose einer andren Ware (des Weizens). Während ihrer ersten Wandlung, dem Ver-

sale, the linen plays these two parts in its own person. But then it goes the way of all flesh, enters the chrysalis state as gold, and thereby simultaneously completes the first metamorphosis of a third commodity. Hence the circuit made by one commodity in the course of its metamorphoses is inextricably entwined with the circuits of other commodities. The process as a whole presents itself as the circulation of commodities.

Fowkes: This whole process

constitutes the circulation of

commodities.

After having arrived at commodity circulation, Marx takes a look back at his starting point, the direct barter of products, and concludes that circulation differs from barter not only formally but also essentially:

207:3 The circulation of commodities differs from the direct barter of products not only in form, but in its essence. We have only to consider the course of events. The weaver has undoubtedly exchanged her linen for a Bible, her own commodity for someone else's. But this phenomenon is only true for her. The Bible pusher, who prefers a warming drink to cold sheets, had no intention of exchanging linen for his Bible; the weaver did not know that wheat had been exchanged for her linen. *B*'s commodity replaces that of *A*, but *A* and *B* do not mutually exchange their commodities. It may in fact happen that *A* and *B* buy from each other, but a particular relationship of this kind is by no means the necessary result of the general conditions of the circulation of commodities. We see here, on the one hand, how the exchange of commodities breaks through all the individual and local limitations of the direct barter of products, and develops the metabolic process of human labor. On the other hand, there devel-

kauf, spielt sie diese zwei Rollen in eigner Person. Als Goldchrysalide dagegen, worin sie selbst den Weg alles Fleisches wandert, endet sie zugleich die erste Metamorphose einer dritten Ware. Der Kreislauf, den die Metamorphosenreihe jeder Ware beschreibt, verschlingt sich also unentwirrbar mit den Kreisläufen andrer Waren. Der Gesamtprozeß stellt sich dar als Warenzirkulation.

126:3 Die Warenzirkulation ist nicht nur formell, sondern wesentlich vom unmittelbaren Produktaustausch unterschieden. Man werfe nur einen Rückblick auf den Vorgang. Der Leinweber hat unbedingt Leinwand mit Bibel vertauscht, eigne Ware mit fremder. Aber dies Phänomen ist nur wahr für ihn. Der Bibelagent, der dem Kühlen Heißes vorzieht, dachte nicht daran, Leinwand für Bibel einzutauschen, wie der Leinweber nicht davon weiß, daß Weizen gegen seine Leinwand eingetauscht worden ist usw. Die Ware des *B* ersetzt die Ware des *A*, aber *A* und *B* tauschen nicht wechselseitig ihre Waren aus. Es kann in der Tat vorkommen, daß *A* und *B* wechselweis voneinander kaufen, aber solche besondere Beziehung ist keineswegs durch die allgemeinen Verhältnisse der Warenzirkulation bedingt. Einerseits sieht man hier, wie der Warenaustausch die individuellen und lokalen Schranken des unmittelbaren Produktaustausches durchbricht und den Stoffwechsel der menschlichen Arbeit entwickelt. Andererseits ent-

ops a whole network of social connections of natural origin, entirely beyond the control of the human agents. Only because the farmer has sold his wheat is the weaver able to sell her linen, only because the weaver has sold her linen is our rash and intemperate friend able to sell his Bible, and only because the latter already has the water of everlasting life is the distiller able to sell his eau-de-vie. And so it goes on.

The form in which the circulation takes place affects its content (Marx writes here “essence,” *Wesen*), the transfer of commodities. A different pattern of transfers is created by commodity circulation than by direct exchange. In the latter, if *B* obtains the commodities of *A*, then *A* obtains those of *B*. In circulation, *B* obtains those of *A*, but *C* those of *B*, and so forth. Thus commodity circulation breaks through individual and local barriers of direct barter. On the other hand, the economic agents’ social connection becomes uncontrollable.

Question 467 *What is the deeper reason that reciprocity agreements, i.e., agreements of the form: “I buy this from you if you buy that from me” are illegal in the U.S.?*

208:1 The circulation process, therefore, does not die down, as the direct barter does, with the change of places or change of hands of the use-values. When the money finally drops out of the series of metamorphoses undergone by a commodity, this does not mean that it vanishes. It always stays behind at a point in the arena of circulation vacated by the commodities. In the complete metamorphosis of the linen, for example, linen—money—Bible, the linen first falls out of circulation, and money steps into its place. Then the Bible falls out of circulation, and again money takes its place. When one commodity replaces another, the money commodity always sticks to the hands of some third person.⁷² Circulation sweats money from every pore.

wickelt sich ein ganzer Kreis von den handelnden Personen unkontrollierbarer, gesellschaftlicher Naturzusammenhänge. Der Weber kann nur Leinwand verkaufen, weil der Bauer Weizen, Heißsporn nur die Bibel, weil der Weber Leinwand, der Destillateur nur gebranntes Wasser, weil der andre das Wasser des ewigen Lebens bereits verkauft hat usw.

126:4/o Der Zirkulationsprozeß erlischt deswegen auch nicht, wie der unmittelbare Produktaustausch, in dem Stellen- oder Händewechsel der Gebrauchswerte. Das Geld verschwindet nicht, weil es schließlich aus der Metamorphosenreihe einer Ware herausfällt. Es schlägt immer nieder auf eine durch die Waren geräumte Zirkulationsstelle. Z.B. in der Gesamtmetamorphose der Leinwand: Leinwand—Geld—Bibel fällt erst die Leinwand aus der Zirkulation, Geld tritt an ihre Stelle, fällt dann die Bibel aus der Zirkulation, Geld tritt an ihre Stelle. Der Ersatz von Ware durch Ware läßt zugleich an dritter Hand die Geldware hängen.⁷² Die Zirkulation schwitzt beständig Geld aus.

Fowkes’s “the process of circulation does not disappear

from view” is again an epistemic twist.

A second characteristic of commodity circulation which has no parallel in direct barter is that it “sweats out money.” If *A* and *B* have exchanged their products, then all commodities which had taken part in the transaction have fallen out of circulation. In circulation, after linen has been replaced with a bible, for the linen-weaver, also this transaction is completed and it had exactly the effect of displacing these products. But a change has occurred also on a different place: the man who sold the bible has money now which he did not have before, and the man who bought the linen had had money before which he does not have now. That always someone has money indicates that there are always unfinished circulation processes.

⁷² This phenomenon may be self-evident, but it is in most cases overlooked by political economists, especially by the average free-trader.

⁷² Note zur 2. Ausg. So handgreiflich dieses Phänomen ist, wird es dennoch von politischen Ökonomen meist übersehen, namentlich vom Freihändler vulgaris.

[Unity and Opposition between C–M and M–C]

The concluding passage of section 3.2.a begins with a rebuttal of Say’s law, followed by a discussion of the identity, polarity, unity, and contradiction between sale and purchase. The main result of this discussion is that commodity circulation contains the possibility of crisis.

Marx begins with a flat-out denunciation of Say’s law which he calls a “silly dogma”:

208:2/o Nothing can be sillier than the dogma that, because every sale is a purchase and every purchase a sale, the circulation of commodities necessarily implies an equilibrium between sales and purchases.

127:1/o Nichts kann alberner sein als das Dogma, die Warenzirkulation bedinge ein notwendiges Gleichgewicht der Verkäufe und Käufe, weil jeder Verkauf Kauf und vice versa.

↑ But this is, of course, exactly the argument of Say’s law: the buyer gives money into the hands of the seller and therefore enables the seller to buy the commodity which the buyer has to sell. In other words, Say’s law tries to make an inference from the direct identity of sale and purchase to an equilibrium between sales and purchases. ↓ According to Marx, such an inference can only be made if one gives it a tautological meaning:

If this means that the number of actual sales accomplished is equal to the number of purchases, it is a flat tautology. But it purports to show that every seller brings his own buyer to market with him. Nothing of the kind.

Meint dies, daß die Zahl der wirklich vollzogenen Verkäufe gleich derselben Zahl von Käufen, so ist es platte Tautologie. Aber es soll beweisen, daß der Verkäufer seinen eigenen Käufer zu Markt führt.

The Fowkes translation “but its real intention is” is incorrect.

The little sentence “nothing of the kind” (announcing the proof) is

absent in the German 4th and the French editions.

After these denunciations Marx looks at the situation in more detail. Sale and purchase are at the same time identical acts and opposite poles. This is a contradiction. Marx re-describes this situation in such a way that it is no longer a logical contradiction: “being identical” and “being opposite poles” is now distributed over the transactors and the transaction itself:

Sale and purchase constitute one identical act, as an interaction between two persons assuming opposite roles like two poles, the commodity owner and the money owner.

Verkauf und Kauf sind ein identischer Akt als Wechselbeziehung zwischen zwei polarisch entgegengesetzten Personen, dem Warenbesitzer und dem Geldbesitzer.

↑ If you look at sale and purchase as two sides of one and the same transaction between two persons, then there is an ambiguity whether this transaction is a sale or a purchase; it is a sale for one and a purchase for the other. Marx said this already in 203:2. But there is no ambiguity regarding the role of the transactors: one is a seller and the other a buyer.

They constitute two acts of polar and opposite characters when carried out by one and the same person.

Sie bilden zwei polarisch entgegengesetzte Akte als Handlungen derselben Person

↑ By contrast, if you follow one person who first sells and then buys, then it is unambiguous which of these acts is a sale and which is a purchase. They form polar opposites. However all we can say about the person is that she is both a seller and a buyer; she sells first and then buys. Marx calls her simply “one and the same person.”

One might say that in the first situation, sale and purchase form an immediate unity, and in the second situation, they are two polar acts which are bound together by an inner unity. Since Say’s law is an attempt to conclude from the immediate unity to the inner unity, Marx looks carefully at all the implications that can be drawn from this immediate unity:

The identity of sale and purchase implies therefore that the commodity is useless if, on being thrown into the alchemistical retort of circulation, it does not come out again in the shape of money, i.e., if it is not sold by the commodity owner, i.e., bought by the money owner.

Die Identität von Kauf und Verkauf schließt daher ein, daß die Ware nutzlos wird, wenn sie, in die alchemistische Retorte der Zirkulation geworfen, nicht als Geld herauskommt, nicht vom Warenbesitzer verkauft, daher vom Geldbesitzer gekauft wird.

↑ The commodity is not only useless for its producer or seller, but it cannot be used by anyone at all if it does not emerge from circulation as money. The transaction which moves the commodity into the hands of its final consumer is at the same time the realization of the value produced by the producer. The two sides of the transaction—realization of value and selection of use-value by the consumer—are inseparably bound together; one cannot be done without the other. If values cannot be realized, then use-values rot.

That identity further implies that the process, if it reaches fruition, constitutes a point of rest, an interval, long or short, in the life of the commodity. Since the first metamorphosis of a commodity is at once a sale

Jene Identität enthält ferner, daß der Prozeß, wenn er gelingt, einen Ruhepunkt, einen Lebensabschnitt der Ware bildet, der länger oder kürzer währen kann. Da die erste Metamorphose der Ware zugleich Verkauf und

and a purchase, this partial process is at the same time an independent process in itself. The buyer has the commodity, the seller has the money, i.e., a commodity which remains in a form capable of circulating, whether it reappears on the market at an earlier or later date.

Marx apparently uses here a logical rule according to which something, in order to have an independent existence, must contain its opposite in itself. He does not justify it by an appeal to a general rule but by looking at the specifics of the situation. The next two sentences summarize his arguments in concrete terms, without philosophical ballast:

No one can sell unless someone else purchases. But no one is forthwith bound to purchase, because he has just sold.

Kauf, ist dieser Teilprozeß zugleich selbstständiger Prozeß. Der Käufer hat die Ware, der Verkäufer hat das Geld, d.h. eine Ware, die zirkulationsfähige Form bewahrt, ob sie früher oder später wieder auf dem Markt erscheine.

Keiner kann verkaufen, ohne daß ein anderer kauft. Aber keiner braucht unmittelbar zu kaufen, weil er selbst verkauft hat.

This independence of the acts makes Say’s law invalid. There is no need to purchase again right away because even after many years the same money will still be able to make purchases.

Question 470 *Formulate Say’s Law. How is it proved? Which arguments does Marx bring to show that the proof is invalid?*

Question 471 *Marx uses the following argument that Say’s law is a fallacy: No one can sell unless someone else purchases. But no one is forthwith bound to purchase, because he has just sold. Why does he need two pages for this? Does he bring any other arguments than the above two sentences?*

After this refutation of Say’s law, Marx continues his discussion of the unity and polarity of sale and purchase. ↓ It is a good thing that sale and purchase do not form an undissoluble unit but can be separated in time and space.

Circulation bursts through all the temporal, spatial, and individual barriers imposed by the direct exchange of products, and it does this by splitting up the direct identity present in the barter between the exchange of one’s own product and the acquisition of someone else’s into the two antithetical segments of sale and purchase.

Die Zirkulation sprengt die zeitlichen, örtlichen und individuellen Schranken des Produktaustausches ebendadurch, daß sie die hier vorhandne unmittelbare Identität zwischen dem Austausch des eignen und dem Eintauch des fremden Arbeitsprodukts in den Gegensatz von Verkauf und Kauf spaltet.

Marx says two things here:

1. Sale and purchase form an inner unity because they originate from splitting up the exchange process into two.
2. This splitting-up enables circulation to burst through any restrictions as to time, place, and individual.

In the French, the connection between points 1 and 2 is given a little more clearly:

After having sold, I am not forced to buy, neither at the same place, nor at the same time, nor from the same person to whom I have sold.

This is a good thing. But this splitting-up also has its downside. Marx arrives at this downside by a perspectival switch: the *unity* of opposites is also a unity of *opposites*.

To say that these two independent and antithetical processes have an intrinsic unity, are essentially one, is the same as to say that this intrinsic oneness expresses itself in an external antithesis.

Daß die selbständig einander gegenüberstehenden Prozesse eine innere Einheit bilden, heißt ebenso sehr, daß ihre innere Einheit sich in äußeren Gegensätzen bewegt.

In French this statement is less interconnected: “It is true that purchase is the necessary complement of sale; but it is no less true that their unity is the unity of opposites.”

If therefore the externally independent evolution of two processes—which have an internal connection because they complement each other—proceeds to a certain point, their unity violently makes itself felt by producing—a crisis.

Geht die äußerliche Verselbständigung der innerlich Unselbständigen, weil einander ergänzenden, bis zu einem gewissen Punkt fort, so macht sich die Einheit gewaltsam geltend durch eine—Krise.

This is a definition of crisis, compare also the last two sentences of [mecw32]139/o, and the end of [mecw32]144:0, which has a more comprehensive definition, namely, also the forcible separation of moments which are essentially one, and *Grundrisse* 414:2–415:1, where this separation and reunification is formulated in terms of “forgetting” and “reminder.”

Exam Question 472 *How does Marx define a crisis?*

Term Paper Topic 474 *Marxist Perspectives on the 2008 Financial Meltdown and the developments since then.*

The externally independent representation of two aspects that form an inner unity has therefore two results: it allows circulation to burst through all restrictions of time and place, but it can also contains the possibility of crises.

However here the discussion of crises breaks off already. We arrived at the *possibility* of crisis but our development cannot lead us any further. In a concluding summary Marx explains that the actuality of crises cannot be derived from the laws of circulation:

Immanent in the commodity there is an antithesis between use-value and value, between private labor which must simultaneously manifest itself as directly social labor, and a particular concrete kind of labor which simultaneously counts as merely ab-

Der der Ware immanente Gegensatz von Gebrauchswert und Wert, von Privatarbeit, die sich zugleich als unmittelbar gesellschaftliche Arbeit darstellen muß, von besonderer konkreter Arbeit, die zugleich nur als abstrakt allgemeine Arbeit gilt, von Per-

stract general labor, between the personification of things and the reification of persons. This immanent contradiction obtains its developed forms of motion in the antithetical phases of the metamorphosis of the commodity. These forms therefore imply the possibility of crises, though no more than the possibility. For the development of this possibility into actuality a whole series of relations is required, which do not yet exist from the standpoint of the simple circulation of commodities.⁷³

The first sentence enumerates the three peculiarities of the equivalent form, see 148:1, and adds the fetish-like character as fourth peculiarity, as was done in *Contribution*.

⁷³ See my observations on James Mill in *A Contribution to the Critique* etc., pp. 332:2–333. There are two points here which are characteristic of the methods of the bourgeoisie’s economic apologists. The first is the identification of the circulation of commodities with the direct exchange of products, achieved by simply abstracting from their differences. The second is the attempt to deny the contradictions of the capitalist production process by dissolving the relations of the agents of capitalist production into the simple relationships arising from the circulation of commodities. The production and circulation of commodities are however phenomena which are to be found in the most diverse modes of production, even if they vary in extent and importance. If we are only familiar with the abstract categories of circulation, which are common to all of them, we cannot know anything of their *differentia specifica*, and we cannot therefore pronounce judgement on them. In no other science are elementary commonplaces mouthed with more self-importance than in political economy. For instance, J. B. Say sets himself up as a judge of crises because he knows that a commodity is a product.

Question 475 *Marx said that the resolution of a real contradiction does not consist in its abolition but in the provision of “room in which it can move.” How does the metamorphosis of the commodity $C - M - C$ provide room for the contradictions of the direct barter, and in*

sonifizierung des Sache und Versachlichung der Personen—dieser immanente Widerspruch erhält in den Gegensätzen der Warenmetamorphose seine entwickelten Bewegungsformen. Diese Formen schließen daher die Möglichkeit, aber auch nur die Möglichkeit der Krisen ein. Die Entwicklung dieser Möglichkeit zur Wirklichkeit erfordert einen ganzen Umkreis von Verhältnissen, die vom Standpunkt der einfachen Warenzirkulation noch gar nicht existieren.⁷³

⁷³ Vergleiche meine Bemerkungen über James Mill, „Zur Kritik etc.“, p. 332:2–333. Zwei Punkte sind hier charakteristisch für die Methode der ökonomistischen Apologetik. Erstens die Identifizierung von Warenzirkulation und unmittelbarem Produktaustausch durch einfache Abstraktion von ihren Unterschieden. Zweitens der Versuch, die Widersprüche des kapitalistischen Produktionsprozesses wegzuleugnen, indem man die Verhältnisse seiner Produktionsagenten in die einfachen Beziehungen auflöst, die aus der Warenzirkulation entspringen. Warenproduktion und Warenzirkulation sind aber Phänomene, die den verschiedensten Produktionsweisen angehören, wenn auch in verschiedenem Umfang und Tragweite. Man weiß also noch nichts von der *differentia specifica* dieser Produktionsweisen und kann sie daher nicht beurteilen, wenn man nur die ihnen gemeinschaftlichen, abstrakten Kategorien der Warenzirkulation kennt. In keiner Wissenschaft außer der politischen Ökonomie herrscht so große Wichtigtuerei mit elementarischer Gemeinplätlichkeit. Z.B. J. B. Say nimmt sich heraus, über die Krisen abzuurteilen, weil er weiß, daß die Ware Produkt ist.

which respect does it still contain the possibility of crises?

Question 476 Describe how and why commodity circulation contains the possibility of crises.

In the fourth German edition, the following paragraph provides a transition to the next subsection:

209:1 As mediator of the circulation of commodities, money obtains the function of means of circulation.

128:1 Als Vermittler der Warenzirkulation erhält das Geld die Funktion des Zirkulationsmittels.

This short paragraph should be on p. 209:1 in the Vintage edition, but it is not. Did they forget to typeset it?

3.2.b. The Flow of Money

The first section of chapter Three, section 3.1, discussed money as a measure of value, and the corresponding relative form of value, namely, the price form of commodities. We are in the middle of the second section 3.2, which shows how these forms give rise to a process. In subsection 3.2.a, this process was looked at from the angle of the commodity. Now it will be looked at from the angle of money.

[Form Change of Commodity Misrepresented by Money Flows]

↓ The form change $C - M - C$ of every individual commodity may be called *circulation* because it is a circle: the value held by the commodity owner putting his commodity up for sale returns to him in form of a different use-value.

210:1 The change of form through which the metabolism of the products of labor is accomplished, $C - M - C$, requires that a given value shall form the starting-point of the process, in the shape of a commodity, and that it shall return to the same point in the shape of a commodity. This movement of commodities is therefore a circle.

↓ On the other hand, this circulation of commodities is *not* a circulation of the money, but rather *excludes* the circulation of money.

On the other hand, the form of this movement excludes money from the circle. The result of the movement is not the return of the money, but its continued removal further and further away from its starting-point. As

128:2/o Der Formwechsel, worin sich der Stoffwechsel der Arbeitsprodukte vollzieht, $W - G - W$, bedingt, daß derselbe Wert als Ware den Ausgangspunkt des Prozesses bildet und zu demselben Punkt zurückkehrt als Ware. Diese Bewegung der Waren ist daher Kreislauf.

Andrerseits schließt dieselbe Form den Kreislauf des Geldes aus. Ihr Resultat ist beständige Entfernung des Geldes von seinem Ausgangspunkt, nicht Rückkehr zu demselben. Solange der Verkäufer die ver-

long as the seller sticks fast to his money, which is the transformed shape of his commodity, that commodity is still at the stage of the first metamorphosis, in other words it has completed only the first half of its circulatory course. Once the process of selling in order to buy is complete the money again leaves the hands of its original possessor.

↓ The money *returns* (in the sense that the person who has spent the money gets it back) only if the circulation of commodities is *renewed*. This return is only due to the renewal of the process, not the process itself, and it is only temporary and turns into another displacement once the renewed process is completed:

It is true that if the weaver, having bought the Bible, sells more linen, then money comes back into her hands. But this return is not a result of the circulation of the first 20 yards of linen; that circulation rather removed money from the hands of the weaver and placed it in those of the Bible-pusher. The return of money to the weaver results only from the renewal or repetition of the same process of circulation with a fresh commodity, and it ends in the same way as the previous process.

↓ Marx therefore does not call it “circulation” of money but uses the more neutral term “flow” of money.

Hence the form of motion directly imparted on money by the circulation of commodities is that of a constant removal from its starting-point, a movement from the hands of one commodity-owner into those of the next. This path we will call its flow (currency, cours de la monnaie).

wandelte Gestalt seiner Ware festhält, das Geld, befindet sich die Ware im Stadium der ersten Metamorphose oder hat nur ihre erste Zirkulationshälfte zurückgelegt. Ist der Prozeß, verkaufen um zu kaufen, vervollständigt, so ist auch das Geld wieder aus der Hand seines ursprünglichen Besitzers entfernt.

Allerdings, wenn der Leinweber, nachdem er die Bibel gekauft, von neuem Leinwand verkauft, kehrt auch das Geld in seine Hand zurück. Aber es kehrt nicht zurück durch die Zirkulation der ersten 20 Ellen Leinwand, wodurch es vielmehr aus den Händen des Leinwebers in die des Bibelverkäufers entfernt ist. Es kehrt nur zurück durch die Erneuerung oder Wiederholung desselben Zirkulationsprozesses für neue Ware und endet hier wie dort mit demselben Resultat.

Die dem Geld durch die Warenzirkulation unmittelbar erteilte Bewegungsform ist daher seine beständige Entfernung vom Ausgangspunkt, sein Lauf aus der Hand eines Warenbesitzers in die eines andren, oder sein Umlauf (currency, cours de la monnaie).

Exam Question 478 Why does Marx call the process of buying and selling a circulation of commodities but not a circulation of money?

A closer look at the movement which the metamorphosis $C - M - C$ imparts on the money shows that the true nature of the process is mystified, instead of revealed, in this movement. Marx identifies here two mystifications, which we will call (a) and (b).

(a) Money always does the same thing, while the commodity does two different things. It is therefore not visible, from the movement of money, that the circulation of each commodity

consists of two phases.

210:2/oo The circulation of money shows the constant and monotonous repetition of the same process. The commodity is always in the hands of the seller; the money, as a means of purchase, always in the hands of the buyer. It functions as means of purchase by realizing the price of the commodity. While realizing the commodity's price, it transfers the commodity from the seller to the buyer and at the same time removes itself from the hands of the buyer into those of the seller. There, it repeats the same process with a different commodity. The origin of this one-sided form of motion of the money in the two-sided progression of the commodity through its forms is hidden from view.

↓ How did this semblance arise of exactly the opposite of what is really happening?

The very nature of the commodity circulation produces a semblance of the opposite of itself. The first metamorphosis of a commodity is visible not only as the money's movement, but also as that of the commodity itself; its second metamorphosis, however is only visible as the movement of the money. In the first phase of its circulation the commodity changes places with the money. Thereupon the commodity, in its shape as an object of utility, falls out of circulation into consumption.⁷⁴ Its value-shape or monetary larva steps into its shoes. It then passes through the second phase of its circulation, no longer in its own natural skin, but in its gold skin.

⁷⁴ Even if the commodity is sold over and over again, a situation which does not yet exist for us here, it falls, when definitely sold for the last time, out of the sphere of circulation into that of consumption, where it serves either as means of subsistence or as means of production.

129:1/o Der Umlauf des Geldes zeigt beständige, eintönige Wiederholung desselben Prozesses. Die Ware steht stets auf Seite des Verkäufers, das Geld stets auf Seite des Käufers, als Kaufmittel. Es funktioniert als Kaufmittel, indem es den Preis der Ware realisiert. Indem es ihn realisiert, überträgt es die Ware aus der Hand des Verkäufers in die Hand des Käufers, während es sich gleichzeitig aus der Hand des Käufers in die des Verkäufers entfernt, um denselben Prozeß mit einer andren Ware zu wiederholen. Daß diese einseitige Form der Geldbewegung aus der doppelseitigen Formbewegung der Ware entspringt, ist verhüllt.

Die Natur der Warenzirkulation selbst erzeugt den entgegengesetzten Schein. Die erste Metamorphose der Ware ist nicht nur als Bewegung des Geldes, sondern als ihre eigne Bewegung sichtbar, aber ihre zweite Metamorphose ist nur als Bewegung des Geldes sichtbar. In ihrer ersten Zirkulationshälfte wechselt die Ware den Platz mit dem Geld. Damit fällt zugleich ihre Gebrauchsgestalt aus der Zirkulation heraus, in die Konsumtion.⁷⁴ Ihre Wertgestalt oder Geldlarve tritt an ihre Stelle. Die zweite Zirkulationshälfte durchläuft sie nicht mehr in ihrer eignen Naturalhaut, sondern in ihrer Goldhaut.

⁷⁴ Selbst wenn die Ware wieder und wieder verkauft wird, ein Phänomen, das hier noch nicht für uns existiert, fällt sie mit dem letzten definitiven Verkauf aus der Sphäre der Zirkulation in die der Konsumtion, um hier als Lebensmittel oder als Produktionsmittel zu dienen.

(b) This deeper look ↑ at the origin of the first mystification reveals a second mystification:

With this, the continuity of the movement lies entirely with the money, and the same movement which, for the commodity, includes two opposite processes, is, when considered as the movement of the money, always one and the same process, a constant change of places with commodities that are always different. Hence the result of the circulation of commodities, namely the replacement of one commodity by another, appears not to have been mediated by its own change of form, but rather by the function of money as means of circulation. As means of circulation, money circulates commodities, which in and for themselves lack the power of movement, and transfers them from hands in which they are non-use-values into hands in which they are use-values; and this process always takes the opposite direction to the path of the commodities themselves. Money constantly removes commodities from the sphere of circulation, by constantly stepping into their place in circulation, and in this way continually moving away from its own starting-point. Hence although the movement of money is merely the expression of the circulation of commodities, the situation appears as the reverse of this, namely the circulation of commodities appears as the result of the movement of money.⁷⁵

↓ In the footnote, Le Trosne says the same thing which Marx formulated as "the movement of money is merely the expression of the circulation of commodities."

⁷⁵ 'It [money] has no other motion than that with which it is endowed by the products' (Le Trosne, [LT46, p. 885]).

Die Kontinuität der Bewegung fällt damit ganz auf die Seite des Geldes und dieselbe Bewegung, die für die Ware zwei entgegengesetzte Prozesse einschließt, schließt als eigne Bewegung des Geldes stets denselben Prozeß ein, seinen Stellenwechsel mit stets andrer Ware. Das Resultat der Warenzirkulation, Ersatz von Ware durch andre Ware, erscheint daher nicht durch ihren eignen Formwechsel vermittelt, sondern durch die Funktion des Geldes als Zirkulationsmittel, welches die an und für sich bewegungslosen Waren zirkuliert, sie aus der Hand, worin sie Nicht-Gebrauchswerte, in die Hand überträgt, worin sie Gebrauchswerte, stets in entgegengesetzter Richtung zu seinem eignen Lauf. Es entfernt die Waren beständig aus der Zirkulationssphäre, indem es beständig an ihre Zirkulationsstelle tritt und sich damit von seinem eignen Ausgangspunkt entfernt. Obgleich daher die Geldbewegung nur Ausdruck der Warenzirkulation, erscheint umgekehrt die Warenzirkulation nur als Resultat der Geldbewegung.⁷⁵

⁷⁵ „Es“ (das Geld) „hat keine andere Bewegung als die, die ihm durch die Produkte verliehen wird.“ Le Trosne, [LT46, p. 885].

Question 479 Marx argues that, despite appearances, money does not push inert commodities around, but the movement of commodities is the result of their own form change. Is it therefore wrong to say that money functions as means of circulation?

↓ After showing how the flow of money misrepresents (or, rather, represents as their opposites) two important aspects of the circulation of the commodity, Marx gives a very abstract argument why the movement of money must somehow *reflect* the underlying process.

212:1 On the other hand, money obtains the function of means of circulation only because in it the value possessed by commodities has taken on an independent shape. Hence its movement, as the medium of circulation, is in fact merely the movement undergone by commodities while changing their form. This fact must therefore make itself plainly visible in the circulation of money.

↑ The argument is here: money is the independent objectification of the value of the commodity. Therefore the form change of this value must be reflected in the money. ↓ Indeed, money moves twice, and each movement corresponds to a phase in the commodity circulation. Marx illustrates this with the linen–bible example:

Thus the linen, for instance, first of all changes its commodity-form into its money form. The final term of its first metamorphosis $C - M$, the money form, then becomes the first term of its final metamorphosis $M - C$, its transformation back into the shape of the Bible. But each of these two changes of form is accomplished by an exchange between commodity and money, by their reciprocal displacement. The same pieces of coin come into the seller's hand as the alienated form of the commodity and leave it as the commodity in its absolutely alienable form. They are displaced twice. The first metamorphosis of the linen puts these coins into the weaver's pocket, the second draws them out of it.

From this Marx derives the first aspect how the expression is accurate: The two opposite changes undergone by the same commodity are therefore reflected in the displacement, twice repeated but in opposite directions, of the same pieces of coin.

Exam Question 480 *If the commodity changes its form twice, does this mean it has three forms?*

130:1 Andererseits kommt dem Geld nur die Funktion des Zirkulationsmittels zu, weil es der verselbständigte Wert der Waren ist. Seine Bewegung als Zirkulationsmittel ist daher in der Tat nur ihre eigne Formbewegung. Diese muß sich daher auch sinnlich im Umlauf des Geldes widerspiegeln.

So verwandelt z.B. die Leinwand zuerst ihre Warenform in ihre Geldform. Das letzte Extrem ihrer ersten Metamorphose $W - G$, die Geldform, wird dann das erste Extrem ihrer letzten Metamorphose $G - W$, ihrer Rückverwandlung in die Bibel. Aber jeder dieser zwei Formwechsel vollzieht sich durch einen Austausch zwischen Ware und Geld, durch ihren gegenseitigen Stellenwechsel. Dieselben Geldstücke kommen als entäußerte Gestalt der Ware in die Hand des Verkäufers und verlassen sie als absolut veräußerliche Gestalt der Ware. Sie wechseln zweimal die Stelle. Die erste Metamorphose der Leinwand bringt diese Geldstücke in die Tasche des Webers, die zweite holt sie wieder heraus.

Die beiden entgegengesetzten Formwechsel derselben Ware spiegeln sich also wider im zweimaligen Stellenwechsel des Geldes in entgegengesetzter Richtung.

↑ The two phases of the metamorphosis are correctly reflected in the double movement of money: it first enters the pockets of the seller, and then leaves them again. ↓ Of course the commodity seller may be tempted to keep the money in his pocket; but this leads to an interruption of the metamorphoses of commodities.

212:2 If however only a one-sided metamorphosis takes place, if there are only sales or only purchases, then a given piece of money changes its place only once. Its second change of place always expresses the second metamorphosis of the commodity, its reconversion from money. The frequently repeated displacement of the same coins reflects not only the series of metamorphoses undergone by a single commodity, but also the mutual interlacing of the innumerable metamorphoses in the whole world of commodities.

↑ From this we can see a second aspect which is properly represented on the surface: if money runs smoothly from one seller to the next, this means that the metamorphoses of the different commodities are interlaced well with each other. ↓ At the end of this discussion Marx mentions that all this is, of course, only valid in the form $C - M - C$,

It is in any case evident that all this is valid only for the simple circulation of commodities, the form we are considering here.

130:2 Finden dagegen nur einseitige Warenmetamorphosen statt, bloße Verkäufe oder bloße Käufe, wie man will, so wechselt dasselbe Geld auch nur einmal den Platz. Sein zweiter Stellenwechsel drückt stets die zweite Metamorphose der Ware aus, ihre Rückverwandlung aus Geld. In der häufigen Wiederholung des Stellenwechsels derselben Geldstücke spiegelt sich wider nicht nur die Metamorphosenreihe einer einzigen Ware, sondern auch die Verschlingung der zahllosen Metamorphosen der Warenwelt überhaupt.

Es versteht sich übrigens ganz von selbst, daß alles dies nur für die hier betrachtete Form der einfachen Warenzirkulation gilt.

[Quantity of Money in Circulation]

After discussing how the circulation of money mystifies and reflects the underlying metamorphoses of commodities, Marx looks now at the circulation of money as a process in its own right. The first question is: how much money is circulating?

212:3–213:1p Every commodity, when it first steps into circulation and undergoes its first change of form, does so only to fall out of circulation once more and be replaced again and again by fresh commodities. Money, on the contrary, as the medium of circulation, resides in the sphere of circulation and constantly moves around in it. The question therefore arises of how much money this sphere constantly absorbs.

131:1–2p Jede Ware, bei ihrem ersten Schritt in die Zirkulation, bei ihrem ersten Formwechsel, fällt aus der Zirkulation heraus, in welche stets neue Ware eintritt. Das Geld dagegen als Zirkulationsmittel haust beständig in der Zirkulationssphäre und treibt sich beständig in ihr um. Es entsteht also die Frage, wieviel Geld diese Sphäre beständig absorbiert.

↓ What follows now is Marx's derivation of the *equation of exchange*, about which

[Bor87] has a good overview and also good historical references, except that Bordo does of course not mention Marx:

213:1a In a given country there take place every day at the same time, though in different places, numerous one-sided metamorphoses of commodities; in other words, simple sales on one hand, simple purchases on the other. In their prices, the commodities have already been equated with definite but imaginary quantities of money. And since, in the direct form of circulation being considered here, money and commodities always come into physical confrontation with each other, one at the positive pole of purchase, the other at the negative pole of sale, it is clear that the amount of means of circulation required is determined beforehand by the sum of the prices of all these commodities. As a matter of fact, the money is only the representation in real life of the quantity of gold previously expressed in the imagination by the sum of the prices of the commodities. It is therefore self-evident that these two quantities are equal.

↑ First equation: The sum of all money circulating is determined by the sum of prices of the commodities to be sold.

$$\sum p_i q_i = m \quad (3.1)$$

The analysis of the different determinations, developed in 203:2, or also in the first section 3.1 of chapter Three, leads here to concrete conclusions: Since money is only the actualization of the notionally already existing prices, and since money does not cause the commodities to circulate, but its movement is the reflection and result of this circulation, the sum of money in circulation is determined by the sum of prices of those commodities which go through their metamorphosis.

Question 481 *How does Marx come to the conclusion that the price sum of commodities determines the sum of money in circulation and not vice versa?*

Question 482 *Does the quantity of the means of circulation depend on the commodity prices, or do commodity prices depend on the quantity of the means of circulation? (Give separate answers for gold coins and for inconvertible paper money, and give Marx's arguments why the quantity theory of money is wrong.)*

131:2a In einem Lande gehn jeden Tag zahlreiche, gleichzeitige und daher räumlich nebeneinander laufende einseitige Warenmetamorphosen vor, oder in andren Worten, bloße Verkäufe von der einen Seite, bloße Käufe von der andren. In ihren Preisen sind die Waren bereits bestimmten vorgestellten Geldquantis gleichgesetzt. Da nun die hier betrachtete, unmittelbare Zirkulationsform Ware und Geld einander stets leiblich gegenüberstellt, die eine auf den Pol des Verkaufs, das andre auf den Gegenpol des Kaufs, ist die für den Zirkulationsprozeß der Warenwelt erheischte Masse von Zirkulationsmitteln bereits durch die Preissumme der Waren bestimmt. In der Tat stellt das Geld nur reell die in der Preissumme der Waren bereits ideell ausgedrückte Goldsumme dar. Die Gleichheit dieser Summen versteht sich daher von selbst.

Question 483 *How is, according to Ricardo, the value of gold coins determined? How did Marx criticize Ricardo's theory?*

Question 484 *Why can gold in its function as means of circulation be replaced by gold symbols (coins or other metals, or paper bills)? Can all gold thus be replaced?*

We have seen that the quantity of money does not determine the price level but, conversely, the price level determines the quantity of money. However there are also situations in which money causes prices to change: not by a change in its quantity but by a change in its value. Changes in the value of money will be discussed next in detail.

213:1b/o We know however that, the values of commodities remaining constant, their prices vary with the value of gold (the material of money), rising in proportion as it falls, and falling in proportion as it rises. Given that the sum of the prices of commodities falls or rises in this way, it follows that the quantity of money in circulation must fall or rise to the same extent. This change in the quantity of the circulating medium is certainly caused by the money itself, yet not in virtue of its function as a medium of circulation, but rather in virtue of its function as a measure of value. First the price of the commodities varies inversely as the value of the money, and then the quantity of the medium of circulation varies directly as the price of the commodities.

↑ A change in the value of money causes prices to change, and this price change then causes the quantity of money in circulation to change. ↓ To clarify this, Marx brings a related situation, in which it is obvious that the change in quantities comes after the change in prices, not before it:

Exactly the same phenomenon would arise if, for instance, instead of the value of gold falling, silver were to replace it as the measure of value, or if, instead of the value of silver rising, it were to be driven out of its function as measure of value by gold. In the one case, more silver would be in circulation than there was previously gold, and in the other case, less gold would be in circulation than there was previously silver. In

131:2b/o Wir wissen jedoch, daß bei gleichbleibenden Werten der Waren ihre Preise mit dem Werte des Goldes (des Geldmaterials) selbst wechseln, verhältnismäßig steigen, wenn er fällt, und fallen, wenn er steigt. Ob die Preissumme der Waren so steige oder falle, die Masse des zirkulierenden Geldes muß gleichmäßig steigen oder fallen. Der Wechsel in der Masse der Zirkulationsmittel entspringt hier allerdings aus dem Geld selbst, aber nicht aus seiner Funktion als Zirkulationsmittel, sondern aus seiner Funktion als Wertmaß. Der Preis der Waren wechselt erst umgekehrt wie der Wert des Geldes, und dann wechselt die Masse der Zirkulationsmittel direkt wie der Preis der Waren.

Ganz dasselbe Phänomen würde sich ereignen, wenn z.B. nicht der Wert des Goldes sänke, sondern Silber es als Wertmaß ersetzte, oder nicht der Wert des Silbers stiege, sondern Gold es aus der Funktion des Wertmaßes verdrängte. In dem einen Fall müßte mehr Silber zirkulieren als vorher Gold, in dem andren weniger Gold als vorher Silber. In beiden Fällen hätte sich der Wert des Geldmaterials verändert, d.h. der Wa-

each case the value of the money material, i.e. the value of the commodity serving as the measure of value, would have undergone a change, and so too, therefore, would the prices of commodities which express their values in money, as well as the quantity of money which would need to be in circulation to realize those prices.

Now return to the original problem: what happens when the value of money changes? When Marx writes in the next sentence “we have already seen,” he is referring back to 203:3/oo.

We have already seen that the sphere of circulation has a hole in it, through which gold (or silver, or the money material in general) enters as a commodity with a given value. Hence, when money begins to function as a measure of value, when it is used to determine prices, its value is presupposed.

↓ Now an interesting discussion of the adjustment process if the value of the money commodity falls:

If that value falls, the fall first shows itself in a change in the prices of those commodities which are directly exchanged with the precious metals at their source. The greater part of all other commodities, especially at the less developed stages of bourgeois society, will continue for a long time to be estimated in terms of the former value of the measure of value, which has now become antiquated and illusory. Nevertheless, one commodity infects another through their common value relation, so that their prices, expressed in gold or silver, gradually settle down into the proportions determined by their comparative values, until finally the values of all commodities are estimated in terms of the new value of the monetary metal. This process of equalization is accompanied by a continued increase in the quantity of the precious metals, owing to the influx needed to replace the commodities directly exchanged

re, die als Maß der Werte funktioniert, daher der Preisausdruck der Warenwerte, daher die Masse des zirkulierenden Geldes, das zur Realisierung dieser Preise dient.

Man hat gesehen, daß die Zirkulationssphäre der Waren ein Loch hat, wodurch Gold (Silber, kurz das Geldmaterial) in sie eintritt als Ware von gegebenem Wert. Dieser Wert ist vorausgesetzt bei der Funktion des Geldes als Wertmaß, also bei der Preisbestimmung.

Sinkt nun z.B. der Wert des Wertmaßes selbst, so erscheint dies zunächst im Preiswechsel der Waren, die unmittelbar an den Produktionsquellen der edlen Metalle mit ihnen als Waren ausgetauscht werden. Namentlich in minder entwickelten Zuständen der bürgerlichen Gesellschaft wird ein großer Teil der andren Waren noch längere Zeit in dem nun illusorisch gewordenen, veralteten Wert des Wertmaßes geschätzt werden. Indes steckt die eine Ware die andre an durch ihr Wertverhältnis zu derselben, die Gold- oder Silberpreise der Waren gleichen sich allmählich aus in den durch ihre Werte selbst bestimmten Proportionen, bis schließlich alle Warenwerte dem neuen Wert des Geldmetalles entsprechend geschätzt werden. Dieser Ausgleichungsprozeß ist begleitet von dem fortwährenden Wachstum der edlen Metalle, welche im Ersatz für die direkt mit ihnen ausgetauschten

with them. In proportion therefore as the adjusted prices of the commodities become general, in proportion as their values come to be estimated according to the new value of the metal (which has fallen and may, up to a certain point, continue to fall), in that same proportion does the increased mass of metal which is necessary for the realization of the new prices become available.

↓ This sequence of events is open to misinterpretation: since the higher quantity of money precedes the higher prices, the quantity theory of money seems vindicated. The quantity theory offers a much simpler alternative to Marx's rather complicated explanation.

A one-sided observation of the events which followed the discovery of fresh supplies of gold and silver led some people in the seventeenth and more particularly in the eighteenth century to the false conclusion that the prices of commodities had risen because there was more gold and silver acting as the means of circulation. Henceforth we shall assume the value of gold as a given factor, as in fact it is if we take it at the moment when we estimate the price of a commodity.

Waren einströmen. In demselben Maß daher, worin die berichtigte Preisgebung der Waren sich verallgemeinert, oder ihre Werte dem neuen, gesunkenen und bis zu einem gewissen Punkt fortsinkenden Wert des Metalls gemäß geschätzt werden, ist auch bereits seine zu ihrer Realisierung notwendige Mehrmasse vorhanden.

Einseitige Beobachtung der Tatsachen, welche der Entdeckung der neuen Gold und Silberquellen folgten, verleitete im 17. und namentlich im 18. Jahrhundert zum Trugschluß, die Warenpreise seien gestiegen, weil mehr Gold und Silber als Zirkulationsmittel funktionierten. Im folgenden wird der Wert des Goldes als gegeben vorausgesetzt, wie er in der Tat im Augenblick der Preisschätzung gegeben ist.

Question 486 *If the value of gold changes, then events happen which can easily be misinterpreted to mean that prices rise because the quantity of gold rises. What are these events?*

This is the end of the digression about changes in the value of the money commodity.

Question 487 *If gold is the money commodity, doesn't that mean that so much gold will be mined that it would never be possible to use it all if one wanted to use it?*

Question 488 *What would have happened that Alchemists in the Middle Ages had been successful in producing gold with simple means? What did their error consist in?*

214:1/o On this assumption, then, the quantity of the medium of circulation is determined by the sum of the prices to be realized. If we now further assume that the price of each commodity is given, the sum of the prices clearly depends on the total amount of commodities found in circulation. We do

132:1 Unter dieser Voraussetzung also ist die Masse der Zirkulationsmittel durch die zu realisierende Preissumme der Waren bestimmt. Setzen wir nun ferner den Preis jeder Warenart als gegeben voraus, so hängt die Preissumme der Waren offenbar von der in Zirkulation befindlichen Warenmasse ab.

not need to rack our brains to grasp that if our quarter of wheat costs £2, 100 quarters will cost £200, 200 quarters £400, and so on, and therefore that the quantity of money which changes places with the wheat, when it is sold, must increase as the quantity of the wheat increases.

↑ Marx takes the equation $\sum p_i q_i = m$ and varies q_i while keeping p_i fixed. If the prices of the commodities are fixed, then the mass of means of circulation is determined by the mass of commodities. ↓ Next Marx keeps q_i fixed but varies p_i :

215:1 If the mass of commodities remains constant, the quantity of money in circulation surges up or down according to the fluctuations in the prices of the commodities. It rises and falls because the sum of the prices increases or diminishes as a result of the change of price. For this it is by no means necessary that the prices of all commodities should rise or fall simultaneously. A rise or a fall in the prices of a number of leading articles is sufficient in the one case to increase, in the other to diminish, the sum of the prices of all commodities, and therefore to put more or less money in circulation. Whether the change in the price reflects an actual change in the value of the commodities, or merely fluctuations in their market prices, the effect on the quantity of the medium of circulation remains the same.

↑ If the mass of commodities is given, then the mass of means of circulation changes with the changes in their prices. It does not matter here whether these price changes are due to real value changes (either of money or the commodities) or are only (temporary) fluctuations—presumably those “gravitation” movements without which a market economy cannot function.

↓ Next Marx varies the turnover frequency of the money:

215:2/oa Let us assume that there occur a number of unconnected and simultaneous sales, or partial metamorphoses, in different localities, sales of, say, 1 quarter of wheat, 20 yards of linen, 1 Bible and 4 gallons of brandy. If the price of each article

Es gehört wenig Kopfbrechens dazu, um zu begreifen, daß, wenn 1 Quarter Weizen 2 Pfd.St., 100 Quarter 200 Pfd.St., 200 Quarter 400 Pfd.St. usw. kosten, mit der Masse des Weizens daher die Geldmasse wachsen muß, die beim Verkauf den Platz mit ihm wechselt.

132:2 Die Warenmasse als gegeben vorausgesetzt, flutet die Masse des zirkulierenden Geldes auf und ab mit den Preisschwankungen der Waren. Sie steigt und fällt, weil die Preissumme der Waren infolge ihres Preiswechsels zu oder abnimmt. Dazu ist keineswegs nötig, daß die Preise aller Waren gleichzeitig steigen oder fallen. Die Preissteigerung einer gewissen Anzahl leitender Artikel in dem einen oder ihre Preissenkung in dem andren Fall reicht hin, um die zu realisierende Preissumme aller zirkulierenden Waren zu erhöhen oder zu senken, also auch mehr oder weniger Geld in Zirkulation zu setzen. Ob der Preiswechsel der Waren wirkliche Wertwechsel widerspiegelt oder bloße Schwankungen der Marktpreise, die Wirkung auf die Masse der Zirkulationsmittel bleibt dieselbe.

133:1a Es sei gegeben eine Anzahl zusammenhangsloser, gleichzeitiger und daher räumlich nebeneinander laufender Verkäufe oder Teilmetamorphosen, z.B. von 1 Quarter Weizen, 20 Ellen Leinwand, 1 Bibel, 4 Gallons Kornbranntwein. Wenn der Preis

is £2, and the sum of the prices to be realized is consequently £8, it follows that £8 in money must enter into circulation. If, on the other hand, these same articles are links in the following chain of metamorphoses: 1 quarter of wheat—£2—20 yards of linen—£2—1 Bible—£2—4 gallons of brandy—£2, a chain which is already well known to us, in that case the £2 causes the different commodities to circulate after realizing their prices successively, and therefore realizing the sum of those prices, which is £8, the £2 finally comes to rest in the hands of the distiller. The £2 has turned over four times. It has performed four acts of circulation. This repeated change of place of the same pieces of money corresponds to the double change of form undergone by the commodities, it corresponds to their movement through two diametrically opposed stages of circulation, and the intertwining of the metamorphoses of different commodities.⁷⁶ These antithetical and mutually complementary phases, through which the process passes, cannot take place alongside each other. They must follow in temporal succession. It is segments of time therefore which form the measure of the duration of the process, in other words, the velocity of the circulation of money is measured by the number of times the same piece of money turns over within a given period. Suppose the process of circulation of the four articles takes a day. The sum of prices to be realized is £8, the number of times the £2 turns over during the day is four, and the quantity of money in circulation is £2. Hence, for a given interval of time during the process of circulation, we have the following equation: the quantity of money functioning as the circulating medium = the sum of the prices of the com-

jedes Artikels 2 Pfd.St., die zu realisierende Preissumme daher 8 Pfd.St., so muß eine Geldmasse von 8 Pfd.St. in die Zirkulation eingehn. Bilden dieselben Waren dagegen Glieder der uns bekannten Metamorphosenreihe: 1 Quarter Weizen—2 Pfd.St.—20 Ellen Leinwand—2 Pfd.St.—1 Bibel—2 Pfd.St.—4 Gallons Kornbranntwein—2 Pfd.St., so machen 2 Pfd.St. die verschiedenen Waren der Reihe nach zirkulieren, indem sie deren Preise der Reihe nach, also auch die Preissumme von 8 Pfd.St., realisieren, um schließlich in der Hand des Destillateurs auszuruhen. Sie vollbringen vier Umläufe. Dieser wiederholte Stellenwechsel derselben Geldstücke stellt den doppelten Formwechsel der Ware dar, ihre Bewegung durch zwei entgegengesetzte Zirkulationsstadien und die Verschlingung der Metamorphosen verschiedener Waren.⁷⁶ Die gegensätzlichen und einander ergänzenden Phasen, wodurch dieser Prozeß verläuft, können nicht räumlich nebeneinander fallen, sondern nur zeitlich aufeinander folgen. Zeitabschnitte bilden daher das Maß seiner Dauer, oder die Anzahl der Umläufe derselben Geldstücke in gegebener Zeit mißt die Geschwindigkeit des Geldumlaufs. Der Zirkulationsprozeß jener vier Waren dauere z.B. einen Tag. So beträgt die zu realisierende Preissumme: 8 Pfd.St., die Anzahl der Umläufe derselben Geldstücke während des Tags: 4 und die Masse des zirkulierenden Geldes: 2 Pfd.St., oder für einen gegebenen Zeitabschnitt des Zirkulationsprozesses:

$$\frac{\text{Preissumme der Waren}}{\text{Umlaufanzahl gleichnamiger Geldstücke}} = \text{Masse des als Zirkulationsmittel funktionierenden Geldes.}$$

modities divided by the number of times coins of the same denomination turn over.

⁷⁶ 'It is products which set it' (money) 'in motion and make it circulate ... The velocity of its' (money's) 'motion supplements its quantity. When necessary, it does nothing but slide from hand to hand, without stopping for a moment' (Le Trosne, op. cit., pp. 915-16).

Marx contrasts four isolated sales or purchases with the repeated change of place of the same coin. In the second case one needs less money but more time.

216:0b This law holds generally. The process of circulation in a given country is made up, on the one hand, of numerous isolated and simultaneous partial metamorphoses, sales (and purchases) running parallel to each other in which each coin changes its position only once, or performs only one act of circulation, on the other hand, it is made up of many distinct series of metamorphoses, partly running parallel, partly coalescing with each other, and in each of these series each coin turns over a number of times. How often each coin turns over varies according to the circumstances. Given the total number of times all the circulating coins of one denomination turn over, we can arrive at the average number of times a single coin turns over, or, in other words, the average velocity of circulation of money.

↑ If one looks at the overall circulation in the whole country, both of the earlier discussed situations occur: on the one hand, independent transactions at different locations, on the other, linked transactions where the same piece of money moves several times. But if one adds up and takes averages, it is not necessary to distinguish between these two situations. "Coins of one denomination:" to avoid complications, it is assumed that all circulating pieces of money have the same denomination.

$$\frac{\text{Sum of prices of commodities moved on a given day}}{\text{Frequency with which all pieces of money make transactions}} = \text{Mass of money functioning as means of circulation.}$$

↓ Now Marx describes the real mechanisms whose activity makes it possible for the researcher to aggregate and take the averages:

⁷⁶ „Die Produkte sind es, die es“ (das Geld) „in Bewegung setzen und es zirkulieren machen... Durch die Geschwindigkeit seiner“ (d.h. des Geldes) „Bewegung wird seine Quantität ergänzt. Wenn notwendig, gleitet es nur von einer Hand in die andre, ohne sich einen Augenblick aufzuhalten.“ Le Trosne [LT46, p. 915, 916]

133:1b/o Dies Gesetz gilt allgemein. Der Zirkulationsprozeß eines Landes in einem gegebenen Zeitabschnitt umfaßt zwar einerseits viele zersplitterte, gleichzeitige und räumlich nebeneinander fallende Verkäufe (resp. Käufe) oder Teilmetamorphosen, worin dieselben Geldstücke nur einmal die Stelle wechseln oder nur einen Umlauf vollziehen, andererseits viele teils nebeneinander herlaufende, teils sich ineinander verschlingende mehr oder minder gliederreiche Metamorphosenreihen, worin dieselben Geldstücke mehr oder minder zahlreiche Umläufe zurücklegen. Die Gesamtzahl der Umläufe aller in Zirkulation befindlichen gleichnamigen Geldstücke ergibt jedoch die Durchschnittszahl der Umläufe des einzelnen Geldstücks oder die Durchschnittsgeschwindigkeit des Geldumlaufs.

The quantity of money thrown into the process of circulation at the beginning of each day is of course determined by the sum of the prices of all the commodities circulating simultaneously and side by side. But within that process coins are, so to speak, made responsible for each other. If one increases its velocity of circulation, the other slows down or completely leaves the sphere of circulation. This is because the sphere of circulation can absorb only the amount of gold which, multiplied by the average number of times its basic unit turns over, is equal to the sum of prices to be realized. Hence, if the number of acts of circulation performed by the separate pieces increases, the total number of those pieces in circulation diminishes. If the number of acts of circulation diminishes, the total number of pieces increases. Since the quantity of money which can function as means of circulation is fixed for a given average velocity of circulation, one has only to throw a given quantity of £1 notes into circulation in order to extract the same number of sovereigns from it. This trick is well known to all banks.

Question 489 What does Marx mean with the phrase: "in circulation, one coin is, so-to-say, made responsible for the other"?

↑ At the beginning of the day, mass of coins determined by price sum of commodities. But during the process, one piece of money is made responsible for the other, if one accelerates, the other slows down. (1) This is why it is legitimate to speak of an average. (2) But this same process also regulated the number of coins in circulation. Banks took advantage of this: by throwing bank notes into circulation, they pushed gold coins (sovereigns) out.

217:1 Just as the flow of money is in general merely a reflection of the process of circulation of commodities, i.e. their circular path through diametrically opposed metamorphoses, so too the velocity of circulation of money is merely a reflection of the rapidity with which commodities change

Die Geldmasse, die bei Beginn z.B. des täglichen Zirkulationsprozesses in ihn hineingeworfen wird, ist natürlich bestimmt durch die Preissumme der gleichzeitig und räumlich nebeneinander zirkulierenden Waren. Aber innerhalb des Prozesses wird ein Geldstück sozusagen für das andre verantwortlich gemacht. Beschleunigt das eine seine Umlaufgeschwindigkeit, so erlahmt die des andren, oder es fliegt ganz aus der Zirkulationssphäre heraus, da diese nur eine Goldmasse absorbieren kann, welche, multipliziert mit der mittlern Umlaufszahl ihres einzelnen Elements, gleich der zu realisierenden Preissumme ist. Wächst daher die Anzahl der Umläufe der Geldstücke, so nimmt ihre zirkulierende Masse ab. Nimmt die Anzahl ihrer Umläufe ab, so wächst ihre Masse. Weil die Masse des Geldes, die als Zirkulationsmittel funktionieren kann, bei gegebener Durchschnittsgeschwindigkeit gegeben ist, hat man daher z.B. nur eine bestimmte Quantität von Ein-Pfund-Noten in die Zirkulation hineinzuworfen, um ebenso viele Sovereigns hinauszuworfen, ein allen Banken wohlbekanntes Kunststück.

134:1 Wie im Geldumlauf überhaupt nur der Zirkulationsprozeß der Waren, d.h. ihr Kreislauf durch entgegengesetzte Metamorphosen erscheint, so in der Geschwindigkeit des Geldumlaufs die Geschwindigkeit ihres Formwechsels, das kontinuierliche Ineinandergreifen der Metamorphosenreihen,

their forms, the continuous interlocking of the series of metamorphoses, the hurried nature of society's metabolic process, the quick disappearance of commodities from the sphere of circulation, and their equally quick replacement by fresh commodities. In the velocity of circulation, therefore, there appears the fluid unity of the antithetical and complementary phases, i.e. the transformation of the commodities from the form of utility into the form of value and their re-transformation in the reverse direction, or the two processes of sale and purchase. Inversely, when the circulation of money slows down, the two processes become separated, they assert their independence and mutual antagonism; stalling occurs in the form changes and hence in the metabolic process. The circulation itself, of course, gives no clue to the origin of this stalling; it merely presents us with the phenomenon.

↑ Here Marx says how the velocity of money is determined: it depends on how smoothly the different metamorphoses follow one another. Marx's formulation clarifies what the word "appears" means: an appearance is a remotely controlled phenomenon. ↓ However there is always the temptation to seek the reason for these phenomena in the sphere of circulation itself:

Popular opinion is naturally inclined to attribute this phenomenon to a quantitative deficiency in the circulating medium, since it sees money appear and disappear less frequently at all points on the periphery of circulation, in proportion as the circulation of money slows down.⁷⁷

Fast turnover speed means: commodities are picked up by buyers quickly and are quickly replaced by other commodities. Slow circulation derives from stoppage or stalling (*Stokkung*); but where this interruption comes from, cannot be seen from circulation itself. The popular view is tempted to derive this interruption from lacking quantity of money (although with lower velocity the money in circulation actually increases). Good footnote describing these illusions:

⁷⁷ 'Money being ... the common measure of buying and selling, everybody who hath anything

die Hast des Stoffwechsels, das rasche Verschwinden der Waren aus der Zirkulationsphäre und ihr ebenso rascher Ersatz durch neue Waren. In der Geschwindigkeit des Geldumlaufs erscheint also die flüssige Einheit der entgegengesetzten und sich ergänzenden Phasen, Verwandlung der Gebrauchsgestalt in Wertgestalt und Rückverwandlung der Wertgestalt in Gebrauchsgestalt, oder der beiden Prozesse des Verkaufs und Kaufs. Umgekehrt erscheint in der Verlangsamung des Geldumlaufs die Trennung und gegensätzliche Verselbständigung dieser Prozesse, die Stockung des Formwechsels und daher des Stoffwechsels. Woher diese Stockung entspringt, ist natürlich der Zirkulation selbst nicht anzusehn. Sie zeigt nur das Phänomen selbst.

Der populären Anschauung, welche mit verlangsamtem Geldumlauf das Geld minder häufig auf allen Punkten der Zirkulationsperipherie erscheinen und verschwinden sieht, liegt es nah, das Phänomen aus mangelnder Quantität der Zirkulationsmittel zu deuten.⁷⁷

⁷⁷ „Weil Geld ... das allgemeine Maß für Kauf und Verkauf darstellt, ist jeder, der etwas zu ver-

to sell, and cannot procure chapmen for it, is presently apt to think, that want of money in the kingdom, or country, is the cause why his goods do not go off; and so, want of money is the common cry; which is a great mistake ... What do these people want, who cry out for money? ... The farmer complains ... he thinks that were more money in the country, he would have a price for his goods. Then it seems money is not his want, but a price for his corn and cattel, which he would sell, but cannot ... Why cannot he get a price? ... (1) Either there is too much corn and cattel in the country, so that most who come to market have need of selling, as he hath, and few of buying; or (2) there wants the usual vent abroad by transportation ...; or (3) the consumption fails, as when men, by reason of poverty, do not spend so much in their houses as formerly they did; wherefore it is not the increase of specific money, which would at all advance the farmer's goods, but the removal of any of these three causes, which do truly keep down the market ... The merchant and shopkeeper want money in the same manner, that is, they want a vent for the goods they deal in, by reason that the markets fail ... [A nation] never thrives better, than when riches are tost from hand to hand' (Sir Dudley North, *Discourses upon Trade*, London, 1691, pp. 11–15 passim).

Question 490 What is the difference between: "the seller is lacking money" and: "the seller is lacking a price for his commodities"?

Presumably Marx was in full agreement with North (he also quotes him approvingly in footnote 81 to paragraph 222:1), but he certainly did not agree with Herrenschwand:

^{77 ctd} Herrenschwand's fanciful notions amount merely to this, that the contradictions which arise from the nature of commodities, and therefore come to the surface in circulation, can be removed by increasing the amount of the medium of circulation.

The contradictions are located in the core, they only *appear* in circulation. Increasing the quantity of the means of circulation is therefore an attempt to cure the symptoms, not the

kaufen hat, aber keinen Käufer finden kann, sofort geneigt, zu denken daß Mangel an Geld im Kingdom oder im Lande schuld sei, wenn seine Waren keinen Absatz finden; daher allenthalben das Geschrei über den Mangel an Geld, was jedoch ein großer Irrtum ist ... Was brauchen diese Leute, die nach Geld schreien? ... Der Pächter klagt ... er denkt, wenn mehr Geld im Lande wäre, könnte er einen Preis für seine Güter bekommen ... Also fehlt ihm anscheinend nicht Geld, sondern ein Preis für sein Korn und sein Vieh, das er verkaufen möchte, aber nicht kann ... Warum kann er keinen Preis erzielen? ... 1. Entweder es gibt zu viel Korn und Vieh im Land, so daß den meisten, die auf den Markt kommen, ebenso wie ihm das Verkaufen not tut, das Kaufen aber nur wenigen, oder 2. der gewöhnliche Absatz durch Ausfuhr stockt ... oder 3. der Konsum wird geringer, wenn z.B. die Leute infolge Armut nicht mehr soviel für ihren Haushalt ausgeben wie früher. Deshalb ist es nicht die Vermehrung von Geld schlechthin, die sich günstig auf die Güter des Pächters auswirken würde, sondern die Beseitigung einer dieser drei Ursachen, die wirklich den Markt niederhalten ... Kaufmann und Krämer brauchen in gleicher Weise Geld, d.h., weil die Märkte stocken, fehlt ihnen der Absatz der Güter, mit denen sie handeln ... Eine Nation gedeiht niemals besser, als wenn die Reichtümer schnell von Hand zu Hand gehen." Sir Dudley North, [Nor91, pp. 11–15 passim].

^{77 ctd} Herrenschwands Schwindeleien kommen alle darauf hinaus, daß die aus der Natur der Ware entspringenden und daher in der Warenzirkulation erscheinenden Widersprüche durch Vermehrung der Zirkulationsmittel beseitigt werden können.

disease.

The final remark in this footnote, apparently aimed against 1844 Bank Act, points out that the reverse can however happen: disturbances originating in circulation can indeed have effects on the core:

^{77 ctd} It should be mentioned in passing that it by no means follows, from the fact that the popular ascription of stagnation in the processes of production and circulation to an insufficiency of the circulating medium is a delusion, that an actual shortage of the circulating medium resulting from say, bungling government interference with the 'regulation of currency' may not for its part give rise to stagnation.

Now in the main text a summary:

217:2/o The total quantity of money functioning during a given period as the circulating medium is determined on the one hand by the sum of the prices of the commodities in circulation, and on the other hand by the rapidity of alternation of the antithetical processes of circulation. The proportion of the sum of the prices which can on average be realized by each single coin depends on this rapidity of alternation. But the sum of the prices of the commodities depends on the quantity, as well as on the price, of each kind of commodity. These three factors, the movement of prices, the quantity of commodities in circulation, and the velocity of circulation of money, can all vary in various directions under different conditions. Hence the sum of the prices to be realized and consequently the quantity of the circulating medium conditioned by that sum, will vary with the very numerous variations of the three factors in combination. Here we shall outline only the most important variations in the history of commodity prices.

Reformulates the basic equation as

$$\frac{\sum p_i q_i}{v} = m$$

^{77 ctd} Aus der Volksillusion, welche Stockungen des Produktions- und Zirkulationsprozesses einem Mangel an Zirkulationsmitteln zuschreibt, folgt übrigens keineswegs umgekehrt, daß wirklicher Mangel an Zirkulationsmitteln, z.B. infolge offizieller Pfuschereien mit der „regulation of currency“, nicht seinerseits Stockungen hervorrufen kann.

135:1 Das Gesamtquantum des in jedem Zeitabschnitt als Zirkulationsmittel funktionierenden Geldes ist also bestimmt einerseits durch die Preissumme der zirkulierenden Warenwelt, andererseits durch den langsameren oder rascheren Fluß ihrer gegensätzlichen Zirkulationsprozesse, von dem es abhängt, der wievielte Teil jener Preissumme durch dieselben Geldstücke realisiert werden kann. Die Preissumme der Waren hängt aber ab sowohl von der Masse als den Preisen jeder Warenart. Die drei Faktoren: die Preisbewegung, die zirkulierende Warenmasse und endlich die Umlaufgeschwindigkeit des Geldes, können aber in verschiedner Richtung und verschiedenen Verhältnissen wechseln, die zu realisierende Preissumme, daher die durch sie bedingte Masse der Zirkulationsmittel, also sehr zahlreiche Kombinationen durchmachen. Wir zählen hier nur die in der Geschichte der Warenpreise wichtigsten auf.

Next, Marx goes through different combinations of variations which were historically relevant:

218:1 While prices remain constant, the quantity of the circulating medium may increase owing to an increase in the number of commodities in circulation, or a decrease in the velocity of circulation of money, or a combination of the two. On the other hand, the quantity of the circulating medium may decrease with a decreasing number of commodities, or with an increasing rapidity of circulation.

218:2 With a general rise in the prices of commodities, the quantity of the circulating medium will remain constant, if the number of commodities in circulation decreases proportionally to the increase in their prices, or if the velocity of monetary circulation increases at the same rate as prices rise, the number of commodities in circulation remaining constant. The quantity of the circulating medium may decrease, owing to a more rapid decrease in the number of commodities, or to a more rapid increase in the velocity of monetary circulation, in comparison with the fall in the prices of commodities.

219:1 With a general fall in the prices of commodities, the quantity of the circulating medium will remain constant, if the number of commodities increases proportionally to their fall in price, or if the velocity of monetary circulation decreases in the same proportion. The quantity of the circulating medium will increase, if the number of commodities increases more quickly, or the rapidity of circulation decreases more quickly, than the prices fall.

⇓ These influences must be compensating each other because one sees much less variability of the amount of money in circulation than one should expect:

219:2 The variations of the different fac-

135:2/o Bei gleichbleibenden Warenpreisen kann die Masse der Zirkulationsmittel wachsen, weil die Masse der zirkulierenden Waren zunimmt oder die Umlaufgeschwindigkeit des Geldes abnimmt oder beides zusammenwirkt. Die Masse der Zirkulationsmittel kann umgekehrt abnehmen mit abnehmender Warenmasse oder zunehmender Zirkulationsgeschwindigkeit.

136:1 Bei allgemein steigenden Warenpreisen kann die Masse der Zirkulationsmittel gleichbleiben, wenn die Masse der zirkulierenden Waren in demselben Verhältnis abnimmt, worin ihr Preis zunimmt, oder die Umlaufgeschwindigkeit des Geldes ebenso rasch zunimmt als die Preiserhöhung während die zirkulierende Warenmasse konstant bleibt. Die Masse der Zirkulationsmittel kann fallen, weil die Warenmasse rascher ab- oder die Umlaufgeschwindigkeit rascher zunimmt als die Preise.

136:2 Bei allgemein fallenden Warenpreisen kann die Masse der Zirkulationsmittel gleichbleiben, wenn die Warenmasse in demselben Verhältnis wächst, worin ihr Preis fällt, oder die Umlaufgeschwindigkeit des Geldes in demselben Verhältnis abnimmt wie die Preise. Sie kann wachsen, wenn die Warenmasse rascher wächst oder die Zirkulationsgeschwindigkeit rascher abnimmt, als die Warenpreise fallen.

136:3 Die Variationen der verschied-

tors may be mutually compensatory, so that notwithstanding their continued instability, the sum of the prices to be realized and the quantity of money in circulation remains constant; consequently, we find, especially if we take long periods into consideration, that the quantity of money in circulation in each country diverges far less from its average level than we should at first sight have expected, with the exception of the violent perturbations which arise periodically, either from crises in production and commerce, or, more rarely, from changes in the value of money itself.

[The Quantity Theory of Money]

In the last paragraph in subsection 3.2.b Marx discusses the illusion that prices depend on the quantity of money. A much more detailed discussion of this can be found in *Contribution*, 390:1/o.

↓ Marx first reformulates the actual law, derived in 213:1a, in such a way that the quantity theory of money is just the opposite of this reformulated law:

219:3/o The law that the quantity of the circulating medium is determined by the sum of the prices of the commodities in circulation, and the average velocity of the circulation of money,⁷⁸ may also be stated as follows: given the sum of the values of commodities, and the average rapidity of their metamorphoses, the quantity of money or of the material of money in circulation depends on its own value.

↓ The footnote begins with a long quote from Petty showing that Petty got it right:

⁷⁸ 'There is a certain measure and proportion of money requisite to drive the trade of a nation, more or less than which would prejudice the same. Just as there is a certain proportion of farthings necessary in a small retail trade, to change silver money, and to even such reckon-

nen Faktoren können sich wechselseitig kompensieren, so daß ihrer beständigen Unstätigkeit zum Trotz die zu realisierende Gesamtsumme der Warenpreise konstant bleibt, also auch die zirkulierende Geldmasse. Man findet daher, namentlich bei Betrachtung etwas längerer Perioden, ein viel konstanteres Durchschnittsniveau der in jedem Lande zirkulierenden Geldmasse und, mit Ausnahme starker Perturbationen, die periodisch aus den Produktions- und Handelskrisen, seltener aus einem Wechsel im Geldwert selbst entspringen, viel geringere Abweichungen von diesem Durchschnittsniveau, als man nach dem Augenschein erwarten sollte.

136:4/oo Das Gesetz, daß die Quantität der Zirkulationsmittel bestimmt ist durch die Preissumme der zirkulierenden Waren und die Durchschnittsgeschwindigkeit des Geldumlaufs,⁷⁸ kann auch so ausgedrückt werden, daß bei gegebener Wertsumme der Waren und gegebener Durchschnittsgeschwindigkeit ihrer Metamorphosen, die Quantität des umlaufenden Geldes oder des Geldmaterials von seinem eignen Wert abhängt.

⁷⁸ „Es gibt ein bestimmtes Maß und Verhältnis des Geldes, das erforderlich ist, um den Handel einer Nation in Gang zu halten; ein Mehr oder Weniger würde ihm Abbruch tun. Geredes wie in einem kleinen Detailgeschäft eine bestimmte Menge von Farthings notwendig ist,

ings as cannot be adjusted with the smallest silver pieces ... Now, as the proportion of the number of farthings requisite in commerce is to be taken from the number of people, the frequency of their exchanges: as also, and principally, from the value of the smallest silver pieces of money; so in like manner, the proportion of money (gold and silver specie) requisite in our trade, is to be likewise taken from the frequency of commutations, and from the bigness of the payments' (William Petty, *A Treatise of Taxes and Contributions*, London, 1667, p. 17).

↓ Hume, of course, had it wrong. Marx discussed Hume in detail in *Contribution*, therefore he brings here only a quote from one of his defenders:

^{78 ctd} Hume's theory was defended against the attacks of J. Steuart and others by A. Young, in his *Political Arithmetic*, London, 1774, where there is a special chapter on this, entitled 'Prices Depend on Quantity of Money', pp. 112 ff.

The rest of the footnote is about A. Smith. Marx takes off from his own remarks in *Contribution*, 398:1/o:

^{78 ctd} I stated in *Zur Kritik* etc., p. 149: 'He' (Adam Smith) 'quietly eliminates the question about the amount of coin in circulation by quite improperly regarding money as a simple commodity.' This is only true in so far as Adam Smith treats of money while developing his own theories. Occasionally, however, for example in criticizing earlier systems of political economy, he takes the correct view: 'The quantity of coin in every country is regulated by the value of the commodities which are to be circulated by it ... The value of the goods annually bought and sold in any country requires a certain quantity of money to circulate and distribute them to their proper consumers, and can give employment to no more. The channel of circulation necessarily draws to itself a sum sufficient to fill it, and never admits any more' (*Wealth of Nations*, Bk. IV, Ch. 1).

This is not the only contradiction in Smith's work:

^{78 ctd} In similar fashion Smith begins his work

um die Silbermünzen zu wechseln und solche Zahlungen zu leisten, die mit den kleinsten Silbermünzen nicht geleistet werden können ... Ebenso wie nun das zahlenmäßige Verhältnis der im Handel notwendigen Farthings von der Zahl der Käufer, der Häufigkeit ihrer Käufe und vor allem auch von dem Wert der kleinsten Silbermünze abhängig ist, so ist in ähnlicher Weise das Verhältnis des für unseren Handel notwendigen Geldes (Gold und Silbermünzen) bestimmt durch die Häufigkeit der Tauschvorgänge und die Höhe der Zahlungen.“ William Petty, [Pet67, p. 17].

^{78 ctd} Die Humesche Theorie ward gegen J. Steuart u.a. verteidigt von A. Young in seiner „*Political Arithmetic*“, Lond. 1774, wo ein eigenes Kapitel: „Prices depend on quantity of money“, p. 112 sqq.

^{78 ctd} Ich bemerke „*Zur Kritik* etc.“, p. 149: „Die Frage über die Quantität der zirkulierenden Münze beseitigt er (A. Smith) stillschweigend, indem er das Geld ganz falsch als bloße Ware behandelt.“ Dies gilt nur, soweit A. Smith ex officio das Geld behandelt. Gelegentlich jedoch, z.B. in der Kritik der früheren Systeme der Pol. Ökon., spricht er das Richtige aus: „Die Menge des gemünzten Geldes wird in jedem Lande durch den Wert der Waren geregelt, deren Umlauf es zu vermitteln hat ... Der Wert der in einem Lande jährlich gekauften und verkauften Güter erfordert eine gewisse Menge Geld, um sie zu zirkulieren und an ihre eigentlichen Verbraucher zu verteilen, kann aber für mehr Geld keine Verwendung schaffen. Der Kanal der Zirkulation zieht notwendigerweise eine Summe an, die genügt, um ihn zu füllen, nimmt aber nie eine größere auf.“ („*Wealth of Nations*“, [vol. III], l. IV, ch. 1. [p. 87, 89.])

^{78 ctd} Ähnlich eröffnet A. Smith sein Werk ex

in the official manner with an apotheosis of the division of labor. Later on, in the last book, on the sources of the public revenue, he occasionally reproduces the denunciations of the division of labor made by his teacher, A. Ferguson.

↑ Adam Ferguson's denunciation of the division of labor is discussed in the chapter about division of labor, p. 473:1/o.

↓ But let us go back to the main text. Marx brings here only the deepest level, the "root," of the theoretical error leading to the quantity theory of money:

The illusion that it is, on the contrary, prices which are determined by the quantity of the circulating medium, and that the latter for its part depends on the amount of monetary material which happens to be present in a country,⁷⁹ had its roots in the absurd hypothesis adopted by the original representatives of this view that commodities enter into the process of circulation without a price, and money enters without a value, and that, once they have entered circulation, an aliquot part of the medley of commodities is exchanged for an aliquot part of the heap of precious metals.⁸⁰

A much more detailed explanation of the same thoughts can be found in *Contribution*, in the excessively long paragraph 393:1–396:0.

⁷⁹ 'The prices of things will certainly rise in every nation, as the gold and silver increase amongst the people; and consequently, where the gold and silver decrease in any nation, the prices of all things must fall proportionately to such decrease of money' (Jacob Vanderlint, *Money Answers All Things* London, 1734, p. 5). A close comparison of this book with Hume's *Essays* leaves not the slightest doubt in my mind that Hume knew and used Vanderlint's work, which is certainly an important one. The opinion that prices are determined by the quantity of the circulating medium was also held by Barbon and other much earlier writers. 'No inconvenience,' says Vanderlint, 'can arise by an unrestrained trade, but very great advantage; since, if the cash of the nation be decreased by it, which prohibi-

fficio mit einer Apotheose der Teilung der Arbeit. Hinterher, im letzten Buch über die Quellen des Staatseinkommens, reproduziert er gelegentlich A. Fergusons, seines Lehrers, Denunziation der Teilung der Arbeit.

Die Illusion, daß umgekehrt die Warenpreise durch die Masse der Zirkulationsmittel und letztere ihrerseits durch die Masse des in einem Lande befindlichen Geldmaterials bestimmt werden,⁷⁹ wurzelt bei ihren ursprünglichen Vertretern in der abgeschmackten Hypothese, daß Waren ohne Preis und Geld ohne Wert in den Zirkulationsprozeß eingehn, wo sich dann ein aliquoter Teil des Warenbreis mit einem aliquoten Teil des Metallbergs austausche.⁸⁰

⁷⁹ „Die Preise der Dinge werden sicherlich in jedem Lande so steigen, wie die Menge an Gold und Silber unter den Leuten anwächst; folglich müssen auch, wenn in einem Lande Gold und Silber sich vermindern, die Preise aller Waren einer solchen Verminderung des Geldes entsprechend fallen.“ Jacob Vanderlint, [Van34, p. 5]. Nähere Vergleichung zwischen Vanderlint und Humes „Essays“ läßt mir nicht den geringsten Zweifel, daß Hume V.'s übrigens bedeutende Schrift kannte und benutzte. Die Ansicht, daß die Masse der Zirkulationsmittel die Preise bestimmt, auch bei Barbon und noch viel älteren Schriftstellern. „Keine Ungelegenheit“, sagt Vanderlint, „kann durch ungehinderten Handel entstehen, sondern nur sehr großer Nutzen, denn wenn die Bargeldmenge der Nation durch ihn verringert wird, was

tions are designed to prevent, those nations that get the cash will certainly find everything advance in price, as the cash increases amongst them. And . . . our manufactures, and everything else, will soon become so moderate as to turn the balance of trade in our favour, and thereby fetch the money back again' (op. cit., pp. 43, 44).

⁸⁰ That each single kind of commodity, through its price, forms an element in the sum of the prices of all the commodities in circulation, is self-evident. But how mutually incommensurable use-values are to be exchanged, en masse, for the total sum of gold or silver in a country is quite incomprehensible. If we can perform the swindle of converting the world of commodities into one single total commodity, of which each commodity is merely an aliquot part, we arrive at this beautiful calculation: the total commodity = x cwt of gold; commodity A = an aliquot part of the total commodity = the same aliquot part of x cwt of gold. This is stated in all seriousness by Montesquieu: 'If one compares the amount of gold and silver in the world with the sum of the commodities available, it is certain that each product or commodity, taken in isolation, could be compared with a certain portion of the total amount of money. Let us suppose that there is only one product, or commodity, in the world, or only one that can be purchased, and that it can be divided in the same way as money: a certain part of this commodity would then correspond to a part of the total amount of money; half the total of the one would correspond to half the total of the other, etc. . . the determination of the prices of things always depends, fundamentally, on the relation between the total amount of things and the total amount of their monetary symbols' (Montesquieu, op. cit., Vol. 3, pp. 12, 13). As to the further development of this theory by Ricardo and his disciples, James Mill, Lord Overstone and others, see *Zur Kritik*, etc., pp. 140–46, and pp. 150 ff. [English edition, pp. 179–85 and 169–77].

ja die Prohibitionsmaßnahmen verhindern sollen, so werden die Nationen, denen das Bargeld zufließt, sicher feststellen, daß alle Dinge in dem Maße im Preise steigen, wie die Bargeldmenge bei ihnen anwächst. Und . . . unsere Manufakturprodukte und alle anderen Waren werden bald so billig, daß sich die Handelsbilanz wieder zu unseren Gunsten wendet, und infolgedessen das Geld zu uns zurückfließt.“ [Van34, p. 43, 44].

⁸⁰ Daß jede einzelne Warenart durch ihren Preis ein Element der Preissumme aller zirkulierenden Waren bildet, ist selbstverständlich. Wie aber untereinander inkommensurable Gebrauchswerte sich en masse mit der in einem Land befindlichen Gold oder Silbermasse austauschen sollen, ist völlig unbegreiflich. Verschwindet man die Warenwelt in eine einzige Gesamtware, wovon jede Ware nur einen aliquoten Teil bildet, so kommt das schöne Rechenexempel heraus: Gesamtware = x Ztr. Gold. Ware A = aliquoter Teil der Gesamtware = derselbe aliquote Teil von x Ztr. Gold. Dies ehrlich heraus bei Montesquieu: „Wenn man die Masse des auf der Welt vorhandenen Goldes und Silbers mit der Summe der vorhandenen Waren vergleicht, so kann man gewiß jedes einzelne Erzeugnis bzw. Ware mit einer bestimmten Menge des Geldes vergleichen. Unterstellen wir einmal, daß es nur ein einziges Erzeugnis bzw. eine einzige Ware auf der Welt gibt oder daß nur eine gekauft wird und daß sie ebenso teilbar ist wie das Geld: ein gewisser Teil dieser Ware wird dann einem Teil der Geldmasse entsprechen; die Hälfte der Gesamtheit der Waren der Hälfte der gesamten Geldmasse usw. . . die Bestimmung der Warenpreise hängt im Grunde genommen stets vom Verhältnis der Gesamtmenge der Waren zur Gesamtmenge der Geldzeichen ab.“ Montesquieu, [Mon69, t. III, p. 12, 13]. Über die Weiterentwicklung dieser Theorie durch Ricardo, seinen Schüler James Mill, Lord Overstone usw. vgl. „Zur Kritik etc.“ p. 140–146, und p. 150 sqq.

↓ Now some remarks about J. St. Mill:

^{80 ctd} John Stuart Mill, with his usual eclectic logic, understands how to hold at the same time the view of his father, James Mill, and the opposite view. When we compare the text of his compendium *Principles of Political Economy* with the Preface to the first edition, where he announces himself as the Adam Smith of his day, we do not know what we should be most astonished at, the naivete of the man or that of the public which accepted him in good faith as the new Adam Smith for he bears about as much resemblance to Adam Smith as General Williams 'of Kars' does to the Duke of Wellington. The original researches of Mr J. S. Mill in the domain of political economy, which are neither extensive nor profound, will all be found drawn up in neat and disciplined columns in his little pamphlet *Some Unsettled Questions of Political Economy*, which appeared in 1844.

↓ And finally Locke:

^{80 ctd} Locke expressly asserts that there is a connection between the absence of value in gold and silver, and the determination of their value by their quantity. 'Mankind having consented to put an imaginary value upon gold and silver ... the intrinsic value, regarded in these metals, is nothing but the quantity' (*Some Considerations*, etc., 1691, in *Works*, ed. 1777, Vol. 2, p. 15).

^{80 ctd} Herr J. St. Mill versteht es, mit der ihm geläufigen eklektischen Logik, der Ansicht seines Vaters J. Mill und zugleich der entgegengesetzten zu sein. Vergleicht man den Text seines Kompendiums: „*Princ. of Pol. Econ.*“, mit der Vorrede (erste Ausgabe), worin er sich selbst als Adam Smith der Gegenwart ankündigt, so weiß man nicht, was mehr bewundern, die Naivetät des Mannes oder die des Publikums, das ihn auf Treu und Glauben in den Kauf nahm als Adam Smith, zu dem er sich etwa verhält wie General Williams Kars von Kars zum Herzog von Wellington. Die weder umfangreichen noch gehaltreichen Originalforschungen des Herrn J. St. Mill im Gebiet der Pol. Ök. findet man alle in Reih' und Glied aufmarschiert in seinem 1844 erschienenen Schriftchen: „*Some Unsettled Questions of Political Economy.*“

^{80 ctd} Locke spricht direkt den Zusammenhang zwischen der Wertlosigkeit von Gold und Silber und der Bestimmung ihres Werts durch Quantität aus. „Da die Menschen übereingekommen sind, Gold und Silber einen imaginären Wert zu verleihen ... ist der innere Wert, den man in diesen Metallen erblickt, nichts als ihre Quantität.“ [*Loc*77, p. 15].

3.2.c. Coins and Symbols of Value

This subsection deals with yet another form accruing to money, which springs not from a change in the relative form of value, as those discussed in section 3.1, but from the circulation process. Since the price of the commodities must be physically present as means of circulation, it is no longer sufficient that a certain unit of gold is by law designated a dollar; it also must be readily available for circulation, i.e., must be minted.

Fowkes translates the title as: Coin. The Symbol of Value. This suggests that a coin is a symbol of

value. However in Marx's terminology coins are full-weighted gold coins, i.e., they

are not symbols of value but they are value themselves.

This text is very similar to *Contribution*, see 342:2.

[From Gold to Paper Money]

221:1/o From the function of money as means of circulation springs its shape of a coin. An amount of gold, whose weight is referred to by the prices or money-names of the commodities, must confront these commodities, within circulation, as coins or pieces of gold of the same denomination.

Due to the function of gold as measure of value, all prices are denominated in gold. For gold to function as means of circulation in addition to measure of value, the quantities of gold specified in the prices must be easily assembled and verified. This is why coins are necessary. A coin (*Münze*) is here always a gold coin; a coin which is not made of gold is called "token of value" ("Scheidemünze" and "Silber- oder Kupfermarken" in 222:2/o). Just as the establishment of a fixed standard of prices is the prerogative of the state, so is the business of coining.

These two tasks are closely related: the establishment of a standard of prices specifies how much gold is represented by a monetary unit, and the minting converts raw gold into coins denominated in these units.

↓ Under the gold standard, gold was money in many countries, but different countries used different coins since they had different standards of prices (i.e., monetary units). For international transfers, these coins were melted down and converted into gold bullion:

In the different national uniforms worn at home by gold and silver as coins, but taken off again when they circulate on the world market, the separation between the internal or national spheres of commodity circulation and its universal sphere, the world market, manifests itself.

138:1/o Aus der Funktion des Geldes als Zirkulationsmittel entspringt seine Münzgestalt. Der in dem Preise oder Geldnamen der Waren vorgestellte Gewichtsteil Gold muß ihnen in der Zirkulation als gleichnamiges Goldstück oder Münze gegenübertreten.

Wie die Feststellung des Maßstabs der Preise, fällt das Geschäft der Münzung dem Staat anheim.

In den verschiedenen Nationaluniformen, die Gold und Silber als Münzen tragen, auf dem Weltmarkt aber wieder ausziehen, erscheint die Scheidung zwischen den innern oder nationalen Sphären der Warenzirkulation und ihrer allgemeinen Weltmarktssphäre.

Marx sees an essential distinction between the many national spheres of commodity circulation and its international sphere. This distinction appears, i.e., is reflected and enforced on the surface, in the distinction between the many different national gold coins and the gold bullion. On the other hand, these spheres of commodity circulation are closely interrelated, which is reflected in the easy convertibility between gold coins and gold bullion. This convertibility is another proof that coins are nothing more and nothing less than quantities of gold in a specific physical shape.

222:1 From the very outset, therefore, the only difference between coin and bullion lies in their physical shape, and gold can at any time be converted from one form into

139:1 Goldmünze und Barrengold unterscheiden sich also von Haus aus nur durch die Figur, und das Gold ist beständig aus einer Form in die andre verwandelbar.⁸¹

the other.⁸¹

So far, therefore, it seems that there is very little difference between coins and gold bullion. They are continually converted into each other. The state bears the cost of this conversion because it wants coins and gold bullion to be treated as one and the same.

The footnote shows that this may lead to unnecessarily many conversions from one to the other:

⁸¹ It lies of course entirely beyond my purpose to deal with such details as the seigniorage on minting. Still, since the romanticist sycophant Adam Müller admires the ‘magnificent liberality’ with which ‘the English government coins for nothing’, I will quote the following assessment by Sir Dudley North: ‘Silver and gold, like other commodities, have their ebbs and flowings. Upon the arrival of quantities from Spain ... it is carried into the Tower, and coined. Not long after there will come a demand for bullion to be exported again. If there is none, but all happens to be in coin, what then? Melt it down again; there’s no loss in it, for the coining costs the owner nothing. Thus the nation has been abused, and made to pay for the twisting of straw for asses to eat. If the merchant’ (North was himself one of the biggest merchants at the time of Charles II) ‘were made to pay the price of the coinage, he would not have sent his silver to the Tower without consideration; and coined money would always keep a value above uncoined silver’ [Nor91, p. 18].

⁸¹ Es liegt natürlich ganz jenseits meines Zwecks, Details wie Schlagschatz u. dgl. zu behandeln. Gegenüber dem romantischen Sykophanten Adam Müller jedoch, der „die großartige Liberalität“ bewundert, womit die „englische Regierung unentgeltlich münzt“, folgendes Urteil Sir Dudley Norths: „Silber und Geld haben wie andere Waren ihre Ebbe und Flut. Wenn eine Ladung aus Spanien ankommt, ... wird sie in den Tower gebracht und ausgemünzt. Nicht lange danach entsteht Nachfrage nach Barren für die Ausfuhr. Wenn nun keine vorhanden sind, sondern zufällig alles gemünzt ist, was dann? Man wird es wieder einschmelzen; dies bedeutet keinen Verlust, da das Münzen den Eigentümer nichts kostet. Aber die Nation hat den Schaden, denn sie zahlt dafür, daß Stroh, mit dem man Esel füttert, vorher geflochten wird. Wenn der Kaufmann“ (North war selbst einer der größten Kaufleute zu Charles II. Zeit) „einen Preis für das Münzen zu zahlen hätte, würde er nicht, ohne zu überlegen, sein Silber in den Tower schicken, und gemünztes Geld würde dann stets einen höheren Wert haben, als ungemünztes Silber.“ [Nor91, p. 18]

The reference to Adam Müller is [Mül09, p. 280].

Question 491 *Why did the state not charge for it when it converted gold into coins?*

⇓ Next, an ominous sentence which stresses the identity but also forebodes the separation of the functions of coin and of gold in the form of bullion:

For a coin, the road from the mint is at the same time the path to the melting pot.

Der Weg aus der Münze ist aber zugleich der Gang zum Schmelztiegel.

Question 492 *Explain the sentence: “the road from the mint is at the same time the path to the melting pot.”*

Why? Here is the explanation:

In the course of circulation, coins wear down, some to a greater extent, some to a lesser. The denomination of the gold and its substance, the nominal content and the real content, part company. Coins of the same denomination come to be different in value, because their weights move apart. The weight of gold fixed upon as the standard of prices diverges from the weight which serves as the circulating medium, and the latter thereby ceases to be a real equivalent of the commodities whose prices it realizes. The history of these disturbances constitutes the history of the coinage throughout the Middle Ages and in modern times down to the eighteenth century. The natural and spontaneous tendency of the process of circulation to transform the coin from its metallic existence as gold into the semblance of gold, or to transform the coin into a symbol of its official metallic content, is itself recognized by the most recent laws on the degree of metal loss which demonetizes a gold coin, i.e. renders it incapable of being circulated.

Question 493 *Why were gold coins which were underweight still allowed to continue to circulate?*

Question 494 *Give an examples where there is a contradiction between money as means of circulation and as standard of prices.*

Although coins are merely the money commodity in a different physical shape, the weight loss in circulation (and its legal regulation allowing underweight coin still to be accepted at face value) is the first step towards a separation of the functions of money as standard of prices (i.e., fixing a certain weight of gold and giving it the name 1 dollar or 1 pound sterling) and means of circulation (which can be performed by underweight coins as well).

Question 495 *Assume it would have been possible to make gold coins which do not wear out at all in circulation: would that have meant that gold coins would not be replaced by tokens of value?*

Im Umlauf verschleßen nämlich die Goldmünzen, die eine mehr, die andre weniger. Goldtitel und Goldsubstanz, Nominalgehalt und Realgehalt beginnen ihren Scheidungsprozeß. Gleichnamige Goldmünzen werden von ungleichem Wert, weil verschiedenem Gewicht. Das Gold als Zirkulationsmittel weicht ab vom Gold als Maßstab der Preise und hört damit auch auf, wirkliches Äquivalent der Waren zu sein, deren Preise es realisiert. Die Geschichte dieser Wirren bildet die Münzgeschichte des Mittelalters und der Neuzeit bis ins 18. Jahrhundert. Die naturwüchsige Tendenz des Zirkulationsprozesses, das Goldsein der Münze in Goldschein oder die Münze in ein Symbol ihres offiziellen Metallgehalts zu verwandeln, ist selbst anerkannt durch die modernsten Gesetze über den Grad des Metallverlustes, der ein Goldstück kursunfähig macht oder demonetisiert.

222:2/o The fact that the circulation of money itself splits the nominal content of coins away from their real content, dividing their metallic existence from their functional existence, this fact latently implies the possibility of replacing metallic money with tokens made of some other material, i.e. symbols which would perform the function of coins.

The acceptance in the circulation process of coins which were slightly underweight showed that it was *possible* to replace gold coins with things that had lesser value. This replacement did not stop at the underweight gold coin but it went further. The next paragraph explains why gold coins were replaced by silver and copper:

The technical obstacles to coining extremely minute quantities of gold or silver, and the circumstance that at first the less precious metal is used as a measure of value instead of the more precious, copper instead of silver, silver instead of gold, and that the less precious circulates as money until dethroned by the more precious—these facts provide a historical explanation for the role played by silver and copper tokens as substitutes for gold coins. Silver and copper coins replace gold in those regions of the circulation of commodities where coins pass from hand to hand most rapidly, and are therefore worn out most quickly. This happens where sales and purchases on a very small scale recur unceasingly. In order to prevent these satellites from establishing themselves permanently in the place of gold, the law determines the very minute proportions in which alone they can be accepted as alternative payment. The particular tracks pursued by the different sorts of coin in circulation naturally run into each other. Small change appears alongside gold for the payment of fractional parts of the smallest gold coin; gold constantly enters into retail circulation, although it is just as constantly being

140:1 Wenn der Geldumlauf selbst den Realgehalt vom Nominalgehalt der Münze scheidet, ihr Metalldasein von ihrem funktionellen Dasein, so enthält er die Möglichkeit latent, das Metallgeld in seiner Münzfunktion durch Marken aus andrem Material oder Symbole zu ersetzen.

Die technischen Hindernisse der Münzung ganz diminutiver Gewichtsteile des Goldes resp. Silbers und der Umstand, daß niedrigere Metalle ursprünglich statt der edleren, Silber statt des Goldes, Kupfer statt des Silbers, zum Wertmaß dienen und daher als Geld zirkulieren im Augenblick, wo das edlere Metall sie entthront, erklären historisch die Rolle von Silber und Kupfermarken als Substituten der Goldmünze. Sie ersetzen das Gold in den Kreisen der Warenzirkulation, worin die Münze am schnellsten zirkuliert und sich daher am schnellsten abnutzt, d.h., wo Käufe und Verkäufe unaufhörlich im kleinsten Maßstab erneuert werden. Um die Festsetzung dieser Trabanten an der Stelle des Goldes selbst zu verhindern, werden gesetzlich die sehr niedrigen Proportionen bestimmt, worin sie allein an Zahlungen Statt für Gold angenommen werden müssen. Die besondern Kreise, worin die verschiedenen Münzsorten umlaufen, laufen natürlich ineinander. Die Scheidemünze erscheint neben dem Gold zur Zahlung von Bruchteilen der kleinsten Goldmünze; das Gold tritt beständig in die Detailzirkulation ein, wird aber durch Auswechslung mit Scheidemünze ebenso beständig

thrown out again by being exchanged with small change.⁸²

⁸² 'If silver never exceed what is wanted for the smaller payments, it cannot be collected in sufficient quantities for the larger payments ... the use of gold in the main payments necessarily implies also its use in the retail trade: those who have gold coins offering them for small purchases, and receiving with the commodity purchased a balance of silver in return; by which means the surplus of silver that would otherwise encumber the retail dealer is drawn off and dispersed into general circulation. But if there is as much silver as will transact the small payments independent of gold, the retail trader must then receive silver for small purchases; and it must of necessity accumulate in his hands' (David Buchanan, *Inquiry into the Taxation and Commercial Policy of Great Britain*, Edinburgh, 1844, pp. 248-9).

Replacement of gold coins by silver- or copper coins of lesser value is only the first step: the next step is the use of completely worthless things, namely, slips of paper:

223:1/o The metallic content of silver and copper tokens is arbitrarily determined by law. In the course of circulation they wear down even more rapidly than gold coins. Their function as coins is therefore in practice entirely independent of their weight, i.e. it is independent of all value. In its form of existence as coin, gold becomes completely divorced from the substance of its value. Relatively valueless objects, therefore, such as paper notes, can serve as coins in place of gold. This purely symbolic character of the currency is still somewhat disguised in the case of metal tokens. In paper money it stands out plainly.

After having arrived at money printed on worthless paper Marx concludes with the aphorism:

One sees: only the first step matters.

herausgeworfen.⁸²

⁸² „Wenn nie mehr Silbergeld vorhanden ist, als man für die kleineren Zahlungen benötigt, kann es nicht in für größere Zahlungen ausreichenden Mengen angesammelt werden ... Die Verwendung von Gold für große Zahlungen schließt notwendig auch seine Verwendung im Detailhandel ein: Wer Goldmünzen hat, benutzt sie auch bei kleineren Einkäufen und erhält mit der gekauften Ware den Rest in Silber zurück; dadurch wird der Überschuß an Silber, der sonst den Detailhändler belasten würde, diesem entzogen und in die allgemeine Zirkulation zurückgeführt. Wenn aber so viel Silber vorhanden ist, daß die kleinen Zahlungen unabhängig von Gold ausgeführt werden können, so wird der Detailhändler für kleine Käufe Silber erhalten, das sich dann notwendig bei ihm anhäufen wird.“ (David Buchanan, „*Inquiry into the Taxation and Commercial Policy of Great Britain*“, Edinburgh 1844, pp. 248, 249.)

140:2/o Der Metallgehalt der Silber- oder Kupfermarken ist willkürlich durch das Gesetz bestimmt. Im Umlauf verschleifen sie noch rascher als die Goldmünze. Ihre Münzfunktion wird daher faktisch durchaus unabhängig von ihrem Gewicht, d.h. von allem Wert. Das Münzdasein des Goldes scheidet sich völlig von seiner Werts substanz. Relativ wertlose Dinge, Papierzettel, können also an seiner Statt als Münze funktionieren. In den metallischen Geldmarken ist der rein symbolische Charakter noch einigermäßen versteckt. Im Papiergeld tritt er augenscheinlich hervor.

Man sieht: Ce n'est que le premier pas qui

coûte.

The first step is the continued circulation of slightly underweight coins. This indicated that people did not object to receiving gold coins that have less value than their face value in circulation. Once this is clarified, the silver- or copper coins and paper money follow almost automatically.

Marx concludes this description of the trajectory from gold coins to paper money by a clarifying “disclaimer”: we are not talking about credit money here:

224:1 Here we are concerned only with inconvertible paper money issued by the state and given forced currency. This money emerges directly out of the circulation of metallic money. Credit money on the other hand implies relations which are as yet totally unknown, from the standpoint of the simple circulation of commodities. But it may be noted in passing that just as true paper money arises out of the function of money as the circulating medium, so does credit-money take root spontaneously in the function of money as the means of payment.⁸³

The anecdotes in footnote 83 suggest that state paper money is in the interest of the state, while credit money is in the interest of the capitalists.

⁸³ The financial mandarin Wan Mao-in took it into his head one day to lay before the Son of Heaven a proposal which had the secret purpose of transforming the assignats of the Chinese Empire into convertible banknotes. The Committee on the assignats, in its report of April 1854, severely rebuked him for this. Whether he also received the traditional thrashing with bamboo-sticks is not stated. The concluding part of the report is as follows. ‘The Committee has carefully examined his proposal and finds that it is entirely in the interests of the merchants, and in no respect advantageous to the Crown’ (Arbeiten der Kaiserlich Russischen Gesandtschaft zu Peking über China, aus dem Russischen von Dr. K. Abel und F. A. Mecklenburg, Erster Band Berlin, 1858, p. 54). In his evidence before the Committee of the House of Lords on the Bank Acts, a governor of the Bank of England says, with regard to the abrasion of gold coins in the

141:1 Es handelt sich hier nur von Staatspapiergeld mit Zwangskurs. Es wächst unmittelbar aus der metallischen Zirkulation heraus. Kreditgeld unterstellt dagegen Verhältnisse, die uns vom Standpunkt der einfachen Warenzirkulation noch durchaus unbekannt sind. Im Vorbeigehn sei jedoch bemerkt, daß, wie eigentliches Papiergeld aus der Funktion des Geldes als Zirkulationsmittel entspringt, das Kreditgeld in der Funktion des Geldes als Zahlungsmittel seine naturwüchsige Wurzel besitzt.⁸³

⁸³ Der Finanzmandarin Wan-mao-in ließ sich beigehn, dem Sohn des Himmels ein Projekt zu unterbreiten, welches versteckt auf Verwandlung der chinesischen Reichsassignaten in konvertible Banknoten hinzielte. Im Bericht des Assignaten-Komitees vom April 1854 erhält er gehörig den Kopf gewaschen. Ob er auch die obligate Tracht Bambushiebe erhielt, wird nicht gemeldet. „Das Komitee“, lautet es am Schluß des Berichts, „hat sein Projekt aufmerksam erwogen und findet, daß alles in ihm auf den Vorteil der Kaufleute ausgeht und nichts für die Krone vorteilhaft ist.“ („Arbeiten der Kaiserlich Russischen Gesandtschaft zu Peking über China.“ Aus dem Russischen von Dr. K. Abel und F. A. Mecklenburg. Erster Band, Berlin 1858, p. 54.) Über die beständige Entmetallung der Goldmünzen durch ihren Umlauf sagt ein „Governor“ der Bank of England als Zeuge vor dem „House of Lord’s Committee“ (über „Bankacts“): „Jedes Jahr wird eine frische Klasse

course of their circulation: ‘Every year a fresh class of sovereigns’ (this is not a political statement, for ‘sovereign’ is a name for the pound sterling) ‘becomes too light. The class which one year passes with full weight, loses enough by wear and tear to draw the scales next year against it’ (House of Lords Committee, 1848, n. 429).

von Souverainen“ (dies nicht politisch, sondern der Sovereign ist Name des Pfd.St.) „zu leicht. Die Klasse, welche das eine Jahr als vollwichtig passiert, verliert durch den Verschleiß hinreichend, um das nächste Jahr die Waagschale gegen sich zu drehn.“ (H. o. Lords’ Committee 1848, n. 429.)

[The Quantity of Paper Money]

In this subsection, Marx asks the quantitative question: how much gold money can be replaced by paper money, and that happens if there is overissue of paper money?

224:2/o Pieces of paper on which money names are printed, such as £ 1, £ 5, etc., are thrown into the circulation process from outside by the state. In so far as they actually circulate in the place of the same amount of gold, their movement is simply a reflection of the laws of monetary circulation itself.

141:2/o Papierzettel, denen Geldnamen, wie 1 Pfd.St., 5 Pfd.St. usw. aufgedruckt sind, werden vom Staat äußerlich in den Zirkulationsprozeß hineingeworfen. Soweit sie wirklich an der Stelle der gleichnamigen Goldsumme zirkulieren, spiegeln sich in ihrer Bewegung nur die Gesetze des Geldumlaufs selbst wider.

Marx calls the state issuance of paper money “from the outside” (*äußerlich*) because if the state issues paper notes this does not yet mean that they will be used. Cagan’s analysis of hyperinflation is exactly a case where this condition is not satisfied. The state issued so much money that people did not want to use it in the normal way as means of circulation; instead they tried to get rid of it as quickly as possible. One might say, Gresham’s law had seized not only the worse kinds of money, but all money. Since this is one of the few times in which people actually exhibit preferences as to how much money they want to hold, monetarists use it as evidence supporting their theory. Marx however does not explain the amount and value of paper money circulating by the preferences of the money holders, but by the relation of the paper to gold.

The specific laws obeyed by paper circulation can only spring from its relation to gold, since it is the representative of gold.

Ein spezifisches Gesetz der Papierzirkulation kann nur aus ihrem Repräsentationsverhältnis zum Gold entspringen.

The general principle that paper money must draw its own quantity from the quantity of money which it replaces immediately gives a policy prescription about issuing paper money: the state cannot issue more paper money than the amount of gold that would be circulating. If overissue, then the paper slips represent less gold, this is as if standard of prices were changed.

This law is simply that the issue of paper money must be restricted to that quantity in which the gold (or silver) which it symbolizes would actually have to be in circulation.

Und dies Gesetz ist einfach dies, daß die Ausgabe des Papiergeldes auf die Quantität zu beschränken ist, worin das von ihm symbolisch dargestellte Gold (resp. Silber)

wirklich zirkulieren müßte.

This policy prescription does not seem operational because the quantity of gold coins in circulation is variable:

Now it is true that the quantity of gold which can be absorbed by the sphere of circulation constantly fluctuates above and below a certain average level.

Nun schwankt zwar das Goldquantum, welches die Zirkulationssphäre absorbieren kann, beständig über oder unter ein gewisses Durchschnittsniveau.

The resolution is that only the minimum amount can be replaced by paper:

But despite this, the mass of the circulating medium in a given country never sinks below a certain minimum, which can be ascertained by experience. The fact that this minimum mass continually undergoes changes in its constituent parts, or that the pieces of gold of which it consists are constantly being replaced by other pieces, does of course not make a difference to its extent or to the continuity with which it remains in the sphere of circulation. It can therefore be replaced by paper symbols.

Jedoch sinkt die Masse des zirkulierenden Mediums in einem gegebenen Land nie unter ein gewisses Minimum, das sich erfahrungsmäßig feststellt. Daß diese Minimalmasse fortwährend ihre Bestandteile wechselt, d.h. aus stets andren Goldstücken besteht, ändert natürlich nichts an ihrem Umfang und ihrem konstanten Umtrieb in der Zirkulationssphäre. Sie kann daher durch Papiersymbole ersetzt werden.

↓ What happens if more than the minimum is issued in paper?

If however all the channels of circulation were today filled with paper money to the full extent of their capacity for absorbing money, they might the next day be over-full owing to the fluctuations in the circulation of commodities. There would no longer be any standard. If the paper money exceeds its proper limit, i.e., the amount of gold coins of the same denomination which could have been in circulation, then, quite apart from the danger of becoming generally discredited, it will still represent within the world of commodities only that quantity of gold which is fixed by its immanent laws. No greater quantity is capable of being represented. If the quantity of paper money represents twice the amount of gold available, then in practice £1 will be the money-name not of 1/4 of an ounce of gold, but 1/8 of an ounce. The effect is the same as if an alter-

Werden dagegen heute alle Zirkulationskanäle zum vollen Grad ihrer Geldabsorptionsfähigkeit mit Papiergeld gefüllt, so können sie infolge der Schwankungen der Warenzirkulation morgen übertoll sein. Alles Maß geht verloren. Überschreitet aber das Papier sein Maß, d.h. die Quantität von Goldmünze gleicher Denomination, welche zirkulieren könnte, so stellt es, von der Gefahr allgemeiner Diskreditierung abgesehen, innerhalb der Warenwelt dennoch nur die durch ihre immanenten Gesetze bestimmte, also auch allein repräsentierbare Goldquantität vor. Stellt die Papierzettelmasse z.B. je 2 Unzen Gold statt je 1 Unze dar, so wird faktisch 1 Pfd.St. z.B. zum Geldnamen sage etwa von 1/8 Unze statt von 1/4 Unze. Die Wirkung ist dieselbe, als wäre das Gold in seiner Funktion als Maß der Preise verändert worden. Dieselben Werte, die

ation had taken place in the function of gold as the standard of prices. The values previously expressed by the price of £1 would now be expressed by the price of £2.

sich daher vorher im Preise von 1 Pfd.St., drücken sich jetzt im Preise von 2 Pfd.St. aus.

↑ This has a certain superficial resemblance to the quantity theory of money, but it is still quite different from it. First of all, if there is too much paper money, it might become generally (qualitatively) discredited—runaway inflation, use of a foreign currency as money. The normal process could be called “quantitative discrediting”: paper prices are at a premium.

Finally a clarifying remark that the paper symbols symbolize gold, not value or labor:

225:1 Paper money is a symbol of gold, a symbol of money. Its relation to the values of commodities consists only in this: they find imaginary expression in certain quantities of gold, and the same quantities are symbolically and physically represented by the paper. Only in so far as paper money represents gold, which like all other commodities has value, is it a symbol of value.⁸⁴

142:1 Das Papiergeld ist Goldzeichen oder Geldzeichen. Sein Verhältnis zu den Warenwerten besteht nur darin, daß sie ideell in denselben Goldquantis ausgedrückt sind, welche vom Papier symbolisch sinnlich dargestellt werden. Nur sofern das Papiergeld Goldquanta repräsentiert, die, wie alle andren Warenquanta, auch Wertquanta, ist es Wertzeichen.⁸⁴

The footnote shows that Fullarton, an economist highly regarded by Marx, makes an egregious error because he does not distinguish the function of means of circulation and measure of value:

⁸⁴ The following passage from Fullarton shows how unclear even the best writers on money are about its different functions: ‘That, as far as concerns our domestic exchanges, all the monetary functions which are usually performed by gold and silver coins, may be performed as effectually by a circulation of inconvertible notes, having no value but that factitious and conventional value . . . they derive from the law, is a fact which admits, I conceive, of no denial. Value of this description may be made to answer all the purposes of intrinsic value, and supersede even the necessity for a standard, provided only the quantity of issues be kept under due limitation’ [Ful45, p. 21]. In other words, because the money commodity is capable of being replaced in circulation by mere symbols of value, it is superfluous as a measure of value and a standard of prices!

⁸⁴ Note zur 2. Ausgabe. Wie unklar selbst die besten Schriftsteller über Geldwesen die verschiedenen Funktionen des Geldes auffassen, zeigt z.B. folgende Stelle aus Fullarton: „Was unseren inländischen Austausch betrifft, können alle Geldfunktionen, die gewöhnlich von Gold- oder Silbermünzen erfüllt werden, ebenso wirksam durch eine Zirkulation von nicht einlösbaren Noten erfüllt werden, die keinen anderen Wert haben als diesen künstlichen und auf Übereinkunft beruhenden Wert, den sie durch Gesetz erhalten haben—eine Tatsache, die, denke ich, nicht geleugnet werden kann. Ein Wert dieser Art könnte all den Zwecken eines inneren Wertes dienstbar gemacht werden und sogar die Notwendigkeit eines Wertmaßstabs überflüssig machen, sofern nur die Quantität seiner Ausgaben in den gehörigen Schranken gehalten wird.“ [Ful45, p. 21] Also weil die Geldware durch bloße Wertzeichen in der Zirkulation ersetzt werden kann, ist sie als Maß der Werte und Maßstab der Preise überflüssig!

Question 496 Compare Marx's theory about the quantity of paper money with the *Quantity Theory of Money*.

[Why Can Gold be Replaced by Paper?]

225:2/oo Finally, one may ask why gold is capable of being replaced by valueless symbols of itself.

Question 497 Why does Marx ask the question why gold can be replaced by valueless symbols of itself at the end, not the beginning?

This question comes surprisingly late. The replacement of gold coins by tokens occasioned by their wearing-out was merely the empirical proof *that* such a replacement was possible; this does not yet explain *why* it was possible. One reason why this was possible was already alluded to earlier: because the functions of money as means of circulation and the functions of money as measure of value are quite different and contradictory. But other conditions must be met for this replacement to become possible. Gold coins can be replaced by tokens only insofar their function as means of circulation can be isolated (*verselbstständigt*), i.e., for those amounts of money which do nothing other than function as means of circulation, and such money must be made legal tender by law.

As we have already seen, it is capable of being replaced in this way only if its function as coin or circulating medium can be singled out or rendered independent. Now this function of being the circulating medium does not attain an independent position as far as the individual gold coins are concerned, although that independent position does appear in the case of the continued circulation of abraded coins. A piece of money is a mere coin, or means of circulation, only as long as it is actually in circulation.

I.e., for individual coins this function is exactly *not* isolated (*verselbstständigt*), but they take on this function only when in circulation, and strip it off when outside of circulation.

The isolation of just this one function as means of circulation is not possible for individual coins, with one exception: the occasional exceptionally worn-off coin which everybody passes on as soon as they get it. But other than that, there are no specific coins which always circulate and never rest. But the example of the worn-off coin shows that people are selective in which coins they keep in their purses and which coins they pass on. This allows us to look at the isolation not of individual coins but of a given quantitative fraction of all coins:

But what is not valid for the individual gold coin is valid for that minimum mass of gold

142:2/o Es fragt sich schließlich, warum das Gold durch bloße wertlose Zeichen seiner selbst ersetzt werden kann?

Es ist aber, wie man gesehn, nur so ersetzbar, soweit es in seiner Funktion als Münze oder Zirkulationsmittel isoliert oder verselbstständigt wird. Nun findet die Verselbstständigung dieser Funktion zwar nicht für die einzelnen Goldmünzen statt, obgleich sie in dem Fortzirkulieren verschlissener Goldstücke erscheint. Bloße Münze oder Zirkulationsmittel sind die Goldstücke gerade nur, solange sie sich wirklich im Umlauf befinden.

Was aber nicht für die einzelne Goldmünze, gilt für die vom Papiergeld ersetzbare Mini-

which is capable of being replaced by paper money. That mass constantly dwells in the sphere of circulation, continually functions as a circulating medium, and therefore exists exclusively as the bearer of this function. Its movement therefore represents nothing but the continued alternation of the inverse phases of the metamorphosis $C - M - C$, phases in which the commodity's shape as a value confronts it only to disappear again immediately. The representation of the exchange-value of a commodity as an independent entity is here only a transient aspect of the process. The commodity is immediately replaced again by another commodity. Hence in this process which continually makes money pass from hand to hand, it only needs to lead a symbolic existence. Its functional existence so to speak absorbs its material existence. Since it is a transiently objectified reflection of the prices of commodities, it serves only as symbol of itself, and can therefore be replaced by another symbol.⁸⁵

⁸⁵ From the fact that gold and silver themselves become their own symbols, in so far as they are coins, i.e. exclusively have the function of the medium of circulation, Nicholas Barbon deduces the right of governments 'to raise money', i.e. to give to the quantity of silver called a shilling the name of a greater quantity, such as a crown, and so to pay back shillings to creditors instead of crowns. 'Money does wear and grow lighter by often telling over ... It is the denomination and currency of the money that men regard in bargaining, and not the quantity of silver ... 'Tis the public authority upon the metal that makes it money' (N. Barbon, op. cit., p. 29, 30, 25).

At the end, Marx gives a second condition under which this replacement is possible:

One thing is necessary, however: the symbol of money must have its own objective

malmasse Gold. Sie haust beständig in der Zirkulationssphäre, funktioniert fortwährend als Zirkulationsmittel und existiert daher ausschließlich als Träger dieser Funktion. Ihre Bewegung stellt also nur das fortwährende Ineinanderumschlagen der entgegengesetzten Prozesse der Warenmetamorphose $W - G - W$ dar, worin der Ware ihre Wertgestalt nur gegenübertritt, um sofort wieder zu verschwinden. Die selbständige Darstellung des Tauscherts der Ware ist hier nur flüchtiges Moment. Sofort wird sie wieder durch andre Ware ersetzt. Daher genügt auch die bloß symbolische Existenz des Geldes in einem Prozeß, der es beständig aus einer Hand in die andre entfernt. Sein funktionelles Dasein absorbiert sozusagen sein materielles. Verschwindend objektivierter Reflex der Warenpreise, funktioniert es nur noch als Zeichen seiner selbst und kann daher auch durch Zeichen ersetzt werden.⁸⁵

⁸⁵ Daraus, daß Gold und Silber als Münze oder in der ausschließlichen Funktion als Zirkulationsmittel zu Zeichen ihrer selbst werden, leitet Nicholas Barbon das Recht der Regierungen her, „to raise money“, d.h., z.B. einem Quantum Silber, das Groschen hieß, den Namen eines größeren Silberquantums, wie Taler, zu geben und so den Gläubigern Groschen statt Taler zurückzuzahlen. „Geld verbraucht sich und wird leichter durch vielfaches Auszählen ... Es ist die Benennung und der Kurs des Geldes, was die Leute im Handel beachten, und nicht die Menge des Silbers ... Es ist die Staatsautorität, die das Metall zum Gelde macht.“ N. Barbon, [Bar96, p. 29, 30, 25].

Nur bedarf das Zeichen des Geldes seiner eignen objektiv gesellschaftlichen Gültig-

social validity. The paper acquires this by its forced currency. The state's compulsion can only be of any effect within that internal sphere of circulation which is circumscribed by the boundaries of a given community, but it is also only within that sphere that money is completely absorbed in its function as medium of circulation, and is therefore able to receive, in the form of paper money, a purely functional mode of existence in which it is externally separated from its metallic substance.

Question 498 Enumerate all the conditions under which money be replaced by worthless tokens.

3.3. Money

A parallel and more detailed development of the following brief paragraph can be found in *Contribution*, 357:2/o. A very interesting two-page passage in the original text of *Contribution*, [mecw29]508:2–[mecw29]510:2, can be considered an even more detailed version of this.

227:1 The commodity which functions as the *measure of value* and therefore also, either in its own body or through a representative, as the *medium of circulation*, is *money*.

In the first section of chapter Three, p. 188:2, Marx had written “it is at first only by this function (general measure of value) that gold, the specific equivalent commodity, becomes money.” This formulation “*becomes* money” had indicated that the function of gold as measure of value is the beginning of a social process by which gold is turned into money.

When entering the second section of chapter Three, which discusses the practical activities of the commodity traders in the market, Marx argues that the function of money as a specific equivalent commodity makes it the obvious choice for a *means of circulation*. Even though this choice is obvious, a social act is necessary to in fact make this choice, i.e., to use the same commodity that is the measure of values also as means of circulation.

If this choice is made, i.e., if the same commodity has *both* functions, then it is money. This is not only how *Marx* defines money, but Marx claims that this is a “real definition.” If definitions carve up reality into chunks, real definitions carve reality where reality itself has its joints. It will become clear in this section here that the coincidence of the two functions of measure of value and means of circulation entails new powers. Marx describes here how money so-to-say creeps out of circulation: although both functions (measure of value

keit, und diese erhält das Papiersymbol durch den Zwangskurs. Nur innerhalb der von den Grenzen eines Gemeinwesens umschriebenen oder innern Zirkulationssphäre gilt dieser Staatszwang, aber auch nur hier geht das Geld völlig auf in seine Funktion als Zirkulationsmittel oder Münze und kann daher im Papiergeld eine von seiner Metallsubstanz äußerlich getrennte und bloß funktionelle Existenzweise erhalten.

143:1/o Die Ware, welche als *Wertmaß* und daher auch, leiblich oder durch Stellvertreter, als *Zirkulationsmittel* funktioniert, ist *Geld*.

and means of circulation) are necessary in circulation, their *coincidence* is not—yet this coincidence is an inevitable result of circulation.

Since at Marx's time gold was the commodity which performed these two functions, Marx concludes:

Gold (or silver) is therefore money.

Gold (resp. Silber) ist daher Geld.

Question 499 Marx defines money as the commodity which at the same time functions as *measure of value* and *means of circulation*. How does he justify this definition of money? Is there a commodity today which has these two functions? Is there money today?

If gold is money, this does not mean that gold always functions as money; often it only functions as measure of value or means of circulation. Next Marx defines those situations in which gold indeed functions as *money*:

It functions as *money*, on the one hand when it has to appear in person as gold, as the money commodity, i.e., neither merely notional, as when it is the measure of value, nor in a capacity in which it can be represented, as when it is the medium of circulation. On the other hand it functions as money when its function, whether performed in person or by a representative, *fixes* it as the *sole form of value*, or, in other words, as the *only adequate form of existence of exchange-value*, versus all the other commodities as mere *use-values*.

Als *Geld* funktioniert es, einerseits wo es in seiner goldnen (resp. silbernen) Leiblichkeit erscheinen muß, daher als *Geldware*, also weder bloß ideell, wie im Wertmaß, noch repräsentationsfähig, wie im Zirkulationsmittel; andererseits wo seine Funktion, ob es selbe nun in eigener Person oder durch Stellvertreter vollziehe, es als *alleinige Wertgestalt* oder *allein adäquates Dasein des Tausch-werts* allen andren Waren als bloßen *Gebrauchswerten* gegenüber *fixiert*.

↑ How can you tell that money functions as money? Marx uses here the criterion: if it is not notional (as in measure of value) and not capable of representation (as in means of circulation) then it is money.

Marx describes here an instance of emergence: as measure of value and means of circulation money is the representative, the servant, of commodities. It is less than the commodities, because it has no use-value. But out of this role as a servant grows its role as king: instead of being the *representative* of real wealth, monetary wealth now seems to be more real than wealth in form of commodities, which are degraded to “mere” use-values. All this is developed in much more detail in *Contribution*, p. 358:1/o, where Marx quotes *Boisguillebert* saying:

“Thus the slave of commerce has become its master ... The misery of the peoples is due to the fact that the slave has been turned into a master or rather into a tyrant.”

„Hier ist also der Sklave des Handels sein Herr geworden ... Das Elend der Völker kommt nur daher, daß man einen Herren oder vielmehr einen Tyrannen aus dem gemacht hat, der ein Sklave war.“

Question 500 *When does gold function as money as distinct from its function as measure of value or means of circulation?*

3.3.a. Hoarding

The German word translated here by “hoarding” is “Schatzbildung” (formation of a treasure), i.e., storing up of money so that at a later time it can be used as the general incarnation of wealth. This does not have the negative connotations of “unwillingness to share” connected with the English word “hoarding.”

227:2 The continuous circular movement of the two antithetical metamorphoses of commodities, or the repeated alternating flow of sale and purchase, is reflected in the unceasing turnover of money, in the function it performs as a *perpetuum mobile* of circulation.

Marx recapitulates here the false appearance of money in circulation introduced earlier in 210:2/oo: money seems as restless as a *perpetuum mobile*. It seems to have the desire and the ability to move, without apparent goal or driving force. But this is an illusion. The flow of the means of circulation is the result of the metamorphoses of the *commodities*. As long as these metamorphoses are ongoing, money flows incessantly. However one can see that the flow of money is induced by the metamorphoses of the commodities when these metamorphoses are interrupted. In this case, the flow of money stops as well:

But as soon as the series of metamorphoses is interrupted, as soon as sales are not supplemented by subsequent purchases, money is immobilized. In other words, it is transformed, as Boisguillebert says, from ‘meuble’ into ‘immeuble’, from coin into money.

↑ Once the movement is interrupted, i.e., as soon as the commodity owners no longer immediately supplement their sales with purchases, the means of circulation is transformed from coin into money. Why does this interruption turn the coin into *money*? Because suddenly the coin is no longer a vanishing interlude between two commodities, which stays with each commodity owner only for a moment and then moves on, but now it is held by the same commodity owner for a longer time.

These interruptions in circulation are due to individual decisions not to buy after having sold. Next Marx gives specific reasons why the commodity owners might want to hold money instead of continuing the circulation process. ↓ Before going into the specifics, the next paragraph makes four preliminary remarks: (1) Historically, hoards are as old as commodity circulation itself, and the forms of hoards develop in tandem with commodity circulation. (2) Instead of giving *specific* reasons why people might want to hoard (they

144:1 Der kontinuierliche Kreislauf der zwei entgegengesetzten Warenmetamorphosen oder der flüssige Umschlag von Verkauf und Kauf erscheint im rastlosen Umlauf des Geldes oder seiner Funktion als *perpetuum mobile* der Zirkulation.

Es wird immobilisiert, oder verwandelt sich, wie Boisguillebert sagt, aus meuble in immeuble, aus Münze in Geld, sobald die Metamorphosenreihe unterbrochen, der Verkauf nicht durch den nachfolgenden Kauf ergänzt wird.

come in the subsequent paragraphs), Marx classifies these reasons here into “necessity” and “passion.” (3) A sale with the intention to hoard is no longer a phase in commodity circulation, but it becomes and ends in itself. (4) Not only the sales transaction changes its economic form, but so does the money involved in this transaction.

227:3/o Together with the first development of the circulation of commodities there also develops the necessity and the passionate desire to hold fast to the product of the first metamorphosis, to hold fast to the transformed shape of the commodity, or its gold chrysalis.⁸⁶ Now, commodities are sold not in order to buy commodities, but in order to replace their commodity form with their money form. Instead of being merely a way of mediating the metabolic process, this change of form becomes an end in itself. The form of the commodity in which it is divested of content is prevented from functioning as its absolutely alienable form or even as its merely transient money form. The money is petrified into a hoard, and the seller of commodities becomes a hoarder of money.

⁸⁶ ‘Monetary wealth is nothing but ... wealth in products, transformed into money’ (Mercier de la Rivière, op. cit., p. 573). ‘A value in the form of a product has merely changed its form’ (ibid., p. 486).

144:2 Mit der ersten Entwicklung der Warenzirkulation selbst entwickelt sich die Notwendigkeit und die Leidenschaft, das Produkt der ersten Metamorphose, die verwandelte Gestalt der Ware oder ihre Goldpuppe festzuhalten.⁸⁶ Ware wird verkauft, nicht um Ware zu kaufen, sondern um Warenform durch Geldform zu ersetzen. Aus bloßer Vermittlung des Stoffwechsels wird dieser Formwechsel zum Selbstzweck. Die entäußerte Gestalt der Ware wird verhindert, als ihre absolut veräußerliche Gestalt oder nur verschwindende Geldform zu funktionieren. Das Geld versteinert damit zum Schatz, und der Warenverkäufer wird Schatzbildner.

⁸⁶ „Reichtum an Geld ist nichts weiter als ... Reichtum an Erzeugnissen, die in Geld verwandelt worden sind.“ Mercier de la Rivière, [MdlR46, p. 573] „Ein Wert in Form von Erzeugnissen hat nur die Form gewechselt.“ [MdlR46, p. 486]

Question 501 *Explain the individual motivation for hoarding money. Do these hoards have a function for the economy as a whole or only for the individual?*

↑ In part, the development of money into hoard is the product of economic necessity (there are economic reasons why circulation must sometimes be interrupted), but in part it is due to individual activity, due to the fascination which individuals have with money, an utterly useful and powerful social product. This is one of the few places where individual agency is not only guided by the economic forms with which the individuals are confronted, but where it leads to the development of new forms. Another example is the decision how much of the surplus-value to invest. Here, too, individual motivation does not follow blindly the economic imperatives to accumulate, but the capitalists make choices how much to accumulate. In both of these cases, Marx surveys these individual motivations not in general,

not in a vacuum, but traces the development of these individual motivations through history.

↓ (1) At the beginning of the circulation of commodities, only the *surplus* of the products becomes commodities, therefore the possession of gold and silver is an expression of surplus, wealth, luxury.

228:1 In the very beginnings of the circulation of commodities, it is only the excess amounts of use-value which are converted into money. Gold and silver thus become of themselves social expressions for superfluity or wealth.

↑ Gold and silver are therefore not useful for everyday products, but only for products which represent luxury and wealth.

↓ In traditional modes of production with a fixed circle of needs, the development of hoards is arrested at this stage:

This naïve form of hoarding is perpetuated among those peoples whose traditional mode of production, aimed at fulfilling their own requirements, corresponds to a fixed and limited range of needs. This is true of the Asiatics, particularly the Indians.

This explains the custom in India to bury money. Marx could not resist quoting Vanderlint here, in order to show how funny the quantity theory of money is:

Vanderlint, who imagines that the prices of commodities in a country are determined by the quantity of gold and silver to be found in it, asks himself why Indian commodities are so cheap. Answer: Because the Hindus bury their money. From 1602 to 1734, he remarks, they buried 150 millions of pounds sterling of silver, which originally came from America to Europe.⁸⁷ From 1856 to 1866, in other words in ten years, England exported to India (and China, but most of the silver exported to China makes its way to back India) £120,000,000 in silver, which had been received in exchange for Australian gold.

144:3/o Grade in den Anfängen der Warenzirkulation verwandelt sich nur der Überschuß an Gebrauchswerten in Geld. Gold und Silber werden so von selbst zu gesellschaftlichen Ausdrücken des Überflusses oder des Reichtums.

Diese naive Form der Schatzbildung verewigt sich bei Völkern, wo der traditionellen und auf Selbstbedarf gerichteten Produktionsweise ein fest abgeschlossener Kreis von Bedürfnissen entspricht. So bei den Asiaten, namentlich den Indern.

Vanderlint, der die Warenpreise durch die Masse des in einem Land befindlichen Goldes und Silbers bestimmt wähnt, fragt sich, warum die indischen Waren so wohlfeil? Antwort: Weil die Inder das Geld vergraben. Von 1602–1734, bemerkt er, vergruben sie 150 Millionen Pfd.St. Silber, die ursprünglich von Amerika nach Europa kamen.⁸⁷ Von 1856–1866, also in 10 Jahren, exportierte England nach Indien und China (das nach China exportierte Metall fließt größtenteils wieder nach Indien) 120 Millionen Pfd.St. in Silber, welches vorher gegen australisches Geld eingewechselt wurde.

Both English translations say

“Australian gold”, but my German

edition says “Australisches Geld.”

⁸⁷ “‘Tis by this practice they keep all their goods and manufactures at such low rates’ [Van34, p. 95, 96]

↓ (2) With the further development of commodity production, every commodity producer needs a reserve for his living while he produces his commodity, or for emergencies. Thus, at all points of commodity circulation, hoards are created:

228:2/oo As the production of commodities further develops, every producer of commodities is compelled to make sure of the nexus rerum or the social pledge.⁸⁸ His wants are constantly making themselves felt, and necessitate the continual purchase of other people’s commodities, while the production and sale of his own goods require time, and depend upon circumstances. In order then to be able to buy without selling, he must have sold previously without buying.

⁸⁸ “Money . . . is a pledge.” (John Bellers, *Essays about the Poor, Manufactures, Trade, Plantations, and Immorality*, Lond., 1699, p. 13.)

↓ Everywhere, the individuals are therefore motivated to accumulate hoards, but how are these hoards possible? How can everybody sell without buying? A brief digression clarifies this point:

This operation, conducted on a general scale, seems to contradict itself. The precious metals, at the sources of their production, however are directly exchanged for other commodities. Here we have sales (by the owners of commodities) without purchases (by the owners of gold or silver).⁸⁹

⁸⁷ „Durch diese Maßnahme halten sie all ihre Güter und Fabrikate so niedrig im Preis.“ [Van34, p. 95, 96]

145:1–2 Mit mehr entwickelter Warenproduktion muß jeder Warenproduzent sich den nervus rerum, das „gesellschaftliche Faustpfand“ sichern.⁸⁸ Seine Bedürfnisse erneuern sich unaufhörlich und gebieten unaufhörlichen Kauf fremder Ware, während Produktion und Verkauf seiner eignen Ware Zeit kosten und von Zufällen abhängen. Um zu kaufen, ohne zu verkaufen, muß er vorher verkauft haben, ohne zu kaufen.

⁸⁸ „Geld ist ein Pfand.“ (John Bellers, „Essays about the Poor, Manufactures, Trade, Plantations, and Immorality“, Lond. 1699, p. 13.)

Diese Operation, auf allgemeiner Stufenleiter ausgeführt, scheint sich selbst zu widersprechen. An ihren Produktionsquellen jedoch tauschen sich die edlen Metalle direkt mit andren Waren aus. Es findet hier Verkauf (auf Seite der Warenbesitzer) ohne Kauf (auf Seite der Gold- und Silberbesitzer) statt.⁸⁹

Exam Question 502 Give an example of a transaction between *P* and *Q* in which *P* sells to *Q* but *Q* does not purchase from *P*.

Any subsequent sales, by other producers, unfollowed by purchases, merely bring about the distribution of the newly produced precious metals among all the owners of

Und spätere Verkäufe ohne nachfolgende Käufe vermitteln bloß die weitere Verteilung der edlen Metalle unter alle Warenbesitzer. So entstehn auf allen Punkten des

commodities. In this way, all along the line of exchange, hoards of gold and silver of varied extent are accumulated.

⁸⁹ A purchase, in a categorical sense, implies that gold and silver are already the converted form of commodities, or the product of a sale.

The sales without subsequent purchases on the part of the hoarders are balanced by purchases without prior sales on the part of the gold producers (although Marx does not call it “purchase” but a “direct exchange of two commodities.”). Each commodity producer who builds up a hoard withdraws money from circulation and fails to buy after having sold. This missing gold is then supplied by the gold producers, who receive those commodities which the hoarders did not buy in exchange for their newly minted gold.

Question 503 *Is the transaction by which the gold producer trades his product for the use-values he needs a purchase or a barter?*

↓ (3) The development of commodity production not only requires the ubiquitous generation of hoards, but also increases the greed for gold:

With the possibility of holding and storing up exchange-value in the shape of a particular commodity, arises also the greed for gold. Along with the extension of circulation, increases the power of money, that absolute and ever ready social form of wealth.

“Gold is a wonderful thing! Whoever possesses it is lord of all he wants. By means of gold one can even get souls into Paradise.” (Columbus in his letter from Jamaica, 1503.)

The power of gold is increased here because it no longer represents luxury but *all* material wealth. The next step is: (4) gold represents more than material wealth:

229:0c/o Since gold does not disclose what has been transformed into it, everything, commodity or not, is convertible into gold. Everything becomes saleable and buyable. The circulation becomes the great social retort into which everything is thrown, to come out again as a gold-crystal. Nothing is immune to this alchemy; the bones of saints cannot withstand it, let alone

Verkehrs Gold- und Silberschätze vom verschiedensten Umfang.

⁸⁹ Kauf im kategorischen Sinn unterstellt nämlich Gold oder Silber schon als verwandelte Gestalt der Ware oder als Produkt des Verkaufs.

Mit der Möglichkeit, die Ware als Tauschwert oder den Tauschwert als Ware festzuhalten, erwacht die Goldgier. Mit der Ausdehnung der Warenzirkulation wächst die Macht des Geldes, der stets schlagfertigen, absolut gesellschaftlichen Form des Reichtums.

„Gold ist ein wunderbares Ding! Wer dasselbe besitzt, ist Herr von allem, was er wünscht. Durch Gold kann man sogar Seelen in das Paradies gelangen lassen.“ (Columbus, im Brief aus Jamaica, 1503.)

145:3/oo Da dem Geld nicht anzusehn, was in es verwandelt ist, verwandelt sich alles, Ware oder nicht, in Geld. Alles wird verkäuflich und kaufbar. Die Zirkulation wird die große gesellschaftliche Retorte, worin alles hineinfliegt, um als Geldkristall wieder herauszukommen. Dieser Alchimie widerstehn nicht einmal Heiligenknochen und noch viele minder grobe res sacrosanc-

certain other, more delicate, sacred things beyond human commerce.⁹⁰

In the German edition, Marx switched in this passage from “Gold” to “Geld”, i.e. he no longer speaks about gold but about money. The Moore-Aveling

translation still speaks about “gold” here and makes the switch to “money” only in the next passage. Presumably this switch was delayed because Marx uses

tae, extra commercium hominum.⁹⁰

“crystal” and “alchemy” as a metaphors here (“alchemy” refers to the attempts of early chemists to synthesize gold).

⁹⁰ Henry III., most Christian king of France, robbed cloisters of their relics, and turned them into money. It is well known what part the despoiling of the Delphic Temple, by the Phocians, played in the history of Greece. Temples with the ancients served as the dwellings of the gods of commodities. They were “sacred banks.” With the Phoenicians, a trading people par excellence, money was the transmuted shape of everything. It was, therefore, quite in order that the virgins, who, at the feast of the Goddess of Love, gave themselves up to strangers, should offer to the goddess the piece of money they received.

⁹⁰ Heinrich III., allerchristlichster König von Frankreich, raubt Klöstern usw. ihre Reliquien, um sie zu versilbern. Man weiß, welche Rolle der Raub der delphischen Tempelschätze durch die Phokäer in der griechischen Geschichte spielt. Dem Gott der Waren dienten bei den Alten bekanntlich die Tempel zum Wohnsitz. Sie waren „heilige Banken“. Den Phöniziern, einem Handelsvolke par excellence, galt Geld als die entäußerte Gestalt aller Dinge. Es war daher in der Ordnung, daß die Jungfrauen, die sich an den Festen der Liebesgöttin den Fremden hingaben, das zum Lohn empfangene Geldstück der Göttin opferten.

(5) The next step of Marx’s discussion of the social power of money is: Money not only conveys wealth and things other than wealth, but it also transforms its owner:

Just as every qualitative difference between commodities is extinguished in money, so money, on its side, like the radical leveller that it is, does away with all distinctions.⁹¹

⁹¹ “Gold, yellow, glittering, precious gold! Thus much of this, will make black white, foul, fair;

Wrong, right; base, noble; old, young; coward, valiant.

... What this, you gods? Why, this

Will lug your priests and servants from your sides;

Pluck stout men’s pillows from below their heads;

This yellow slave

Will knit and break religions; bless the accurs’d;

Make the hoar leprosy ador’d; place thieves,

And give them title, knee and approbation;

With senators on the bench, this is it;

Wie im Geld aller qualitative Unterschied der Waren ausgelöscht ist, löscht es seinerseits als radikaler Leveller alle Unterschiede aus.⁹¹

⁹¹ „Gold! kostbar, flimmernd, rotes Gold! Soviel hievon, macht schwarz weiß, häßlich schön

Schlecht gut, alt jung, feig tapfer, niedrig edel.

... Ihr Götter! warum dies? warum dies, Götter;

Ha! dies lockt Euch den Priester vom Altar;

Reißt Halbgenes’nen weg das Schlummerkissen;

Ja dieser rote Sklave löst und bindet

Geweihte Bande; segnet den Verfluchten;

Er macht den Aussatz lieblich; ehrt den Dieb,

Und gibt ihm Rang, gebeugtes Knie und Einfluß

Im Rat der Senatoren; dieser führt

Der überjäh’gen Witwe Freier zu;

... Verdammt Metall,

Gemeine Hure du der Menschen.“

That makes the wappen'd widow wed again:
... Come damned earth,
Though common whore of mankind."

⁹¹ *ctd* (Shakespeare, *Timon of Athens*, Act 4, Scene 3.)

All this social power is vested in an object, which can become the private property of anybody. Therefore money is denounced in antiquity, but revered in modern society:

But money itself is a commodity, an external object, capable of becoming the private property of any individual. Thus social power becomes the private power of private persons. The ancients therefore denounced money as subversive of the economic and moral order of things.⁹²

⁹² 'Nothing so evil as money ever grew to be current among men.

This lays cities low, this drives men from their homes,

this trains and warps honest souls
till they set themselves to works of shame—
this still teaches folk to practise villanies,
and to know every godless deed.'

(Sophocles, *Antigone*.)

↓(6) In modern capitalism, monetary hoards are not only an individual peculiarity, but the incarnation of a social principle:

Modern society, which, soon after its birth, pulled Plutus by the hair of his head from the bowels of the earth,⁹³ greets gold as its Holy Grail, as the glittering incarnation of the very principle of its own life.

⁹³ 'Avarice hopes to drag Pluto himself out of the bowels of the earth' (Athenaeus, *Deipnosophistae*).

This concludes Marx's discussion of the evolution of the social power of gold. Originally, gold only represented surplus and luxury consumption. With the development of commodity production, it comes to represent any material wealth. By extension, it represents also other things that are not commodities or not wealth. Since all this social power is wielded by a material object which can be owned by anyone, these social powers are reflected on the personality of the money owner. Finally, in modern capitalism, money not only represents

⁹¹ *ctd* (Shakespeare, „Timon of Athens“.)

Das Geld ist aber selbst Ware, ein äußerlich Ding, das Privateigentum eines jeden werden kann. Die gesellschaftliche Macht wird so zur Privatmacht der Privatperson. Die antike Gesellschaft denunziert es daher als die Scheidemünze ihrer ökonomischen und sittlichen Ordnung.⁹²

⁹² „Denn kein so schmachlich Übel, wie des Geldes Wert

Erwuchs den Menschen: dies vermag die Städte selbst

Zu brechen, dies treibt Männer aus von Hof und Herd;

Dies unterweist und verkehrt den edlen Sinn
Rechtschaff'ner Männer, nachzugeh'n ruchloser Tat,

Zeigt an die Wege böser List den Sterblichen
Und bildet sie zu jedem gottverhaßten Werk.“
(Sophokles, „Antigone“.)

Die moderne Gesellschaft, die schon in ihren Kinderjahren den Plutus an den Haaren aus den Eingeweiden der Erde herauszieht,⁹³ begrüßt im Goldgral die glänzende Inkarnation ihres eigensten Lebensprinzips.

⁹³ „Der Geiz hofft Pluton selbst aus dem Innern der Erde zu ziehen.“ (Athen[aeus], „Deipnosophistae“.)

personal power but also a social principle.

This survey of attitudes towards money over the centuries teaches us: individuals react to the fact that money not only represents material wealth but also social wealth.

After this survey of the different ways individuals conceived of and handled money over the millennia, Marx discusses now the structural reasons calling forth this individual reaction to money. This is an important passage introducing what might be called the “spell” implied in the money form. Although this spell is discussed here as the driving force behind the miser, we will see later that it is also the driving force behind the capitalist:

230:1/o The commodity, as a use-value, satisfies a particular need and forms a particular element of material wealth. But the value of a commodity measures the strength with which it attracts all other elements of material wealth, i.e., it measures the social wealth of its owner.

147:1 Die Ware als Gebrauchswert befriedigt ein besonderes Bedürfnis und bildet ein besonderes Element des stofflichen Reichtums. Aber der Wert der Ware mißt den Grad ihrer Attraktionskraft auf alle Elemente des stofflichen Reichtums, daher den gesellschaftlichen Reichtum ihres Besitzers.

Fowkes's “degree of attractiveness for” is an incorrect translation of “Grad ihrer Attraktionskraft auf” since it reverses the attractor and the attractee. It also suggests a

utility theory of value. The Moore-Aveling “degree of attraction for” is a little better, though I think it should have been “degree of attraction of.” I tried to

translate it in such a way that it is unambiguous' that the commodity attracts instead of being attracted by or attractive to social wealth.

Marx distinguishes here between material wealth and social wealth. Once this social wealth is available in the pure form of money, it overshadows material wealth:

To the commodity owner in primitive societies, and even to the peasant of Western Europe, value is inseparable from the value form, hence an increase of the hoard of gold and silver is an increase in value.

Dem barbarisch einfachen Warenbesitzer, selbst einem westeuropäischen Bauer, ist der Wert unzertrennlich von der Wertform, Vermehrung des Gold- und Silberschatzes daher Wertvermehrung.

But is this indirectness of money, which is one step removed from real wealth, since it first has to be exchanged into use-values, not an obstacle?

It is true that the value of money varies, whether as a result of a variation in its own value, or of a change in the values of commodities. But this on the one hand does not prevent 200 ounces of gold from continuing to contain more value than 100 ounces, nor on the other hand does it prevent the metallic natural form of this object from continuing to be the universal equivalent form of

Allerdings wechselt der Wert des Geldes, sei es infolge seines eignen Wertwechsels, sei es des Wertwechsels der Waren. Dies verhindert aber einerseits nicht, daß 200 Unzen Gold nach wie vor mehr Wert enthalten als 100, 300 mehr als 200 usw., noch andererseits, daß die metallne Naturalform dieses Dings die allgemeine Äquivalentform aller Waren bleibt, die unmittelbar gesellschaftli-

all other commodities, and the directly social incarnation of all human labor.

The indirectness of social wealth even becomes a practical advantage: since money is general equivalent, it allows to save for future use-values without having to commit to any particular use-value.

The drive to hoard is insatiable by its nature. Qualitatively or formally considered, money is unlimited: it is the universal representative of material wealth because it is directly convertible into any other commodity. But at the same time every actual sum of money is quantitatively limited, and therefore has only a limited efficacy as a means of purchase. This contradiction between the quantitative limitation and the qualitative unlimited character of money drives the miser again and again back to his Sisyphean task: accumulation. He is in the same situation as a world conqueror, who discovers a new boundary with each country he annexes.

The miser is driven to accumulate more and more money because qualitatively, money is universal, it can be converted into every use-value. But quantitatively it is limited, and in an effort to make its quantity as universal as its quality, the miser hoards more and more money. But however much money he has, it is never enough. Note that this is a non-psychological explanation of greed. The miser is trapped in a contradiction inherent in the social forms which organize production in a market economy. Since the miser has inherited his drive to accumulate from a contradiction, it is not surprising that the means by which he tries to reach his goal are riddled with contradictions as well:

231:1 In order that gold may be held as money, and made to form a hoard, it must be prevented from circulating, or from dissolving into the means of purchasing enjoyment. The miser therefore sacrifices the lusts of his flesh to the fetish of gold. He takes the gospel of abstinence very seriously. On the other hand, he cannot withdraw any more from circulation, in the shape of money, than he has thrown into it, in the shape of commodities. The more he produces, the more he can sell. Work, thrift and greed are

die Inkarnation aller menschlichen Arbeit.

Der Trieb der Schatzbildung ist von Natur maßlos. Qualitativ oder seiner Form nach ist das Geld schrankenlos, d.h. allgemeiner Repräsentant des stofflichen Reichtums, weil in jede Ware unmittelbar umsetzbar. Aber zugleich ist jede wirkliche Geldsumme quantitativ beschränkt, daher auch nur Kaufmittel von beschränkter Wirkung. Dieser Widerspruch zwischen der quantitativen Schranke und der qualitativen Schrankenlosigkeit des Geldes treibt den Schatzbildner stets zurück zur Sisyphusarbeit der Akkumulation. Es geht ihm wie dem Welteroberer, der mit jedem neuen Land nur eine neue Grenze erobert.

147:2 Um das Gold als Geld festzuhalten und daher als Element der Schatzbildung, muß es verhindert werden zu zirkulieren oder als Kaufmittel sich in Genußmittel aufzulösen. Der Schatzbildner opfert daher dem Goldfetisch seine Fleischeslust. Er macht Ernst mit dem Evangelium der Entsagung. Andererseits kann er der Zirkulation nur in Geld entziehen, was er ihr in Ware gibt. Je mehr er produziert, desto mehr kann er verkaufen. Arbeitsamkeit, Sparsamkeit und Geiz bilden daher seine Kardinaltugenden,

therefore his three cardinal virtues, and to sell much and buy little is the sum of his political economy.⁹⁴

⁹⁴ 'These are the pivots around which all the measures of political economy turn—the maximum possible increase in the number of sellers of each commodity, and the maximum possible decrease in the number of buyers.' Verri [Ver04, p. 52, 53].

Question 506 *What is the relation between Marx's theory of a miser and Keynes's "paradox of thrift"?*

The miser pursues his objectives in a ridiculous and contradictory way:

1. He has to renounce on consumption, i.e., has to make himself poor in order to get rich.
2. As long as he has wealth in the form of money, it is of as much use for him as if the gold were buried in the mountains. But if the miser wants to get wealth in its real form, he has to give away money, i.e., he will lose his hoard.

Question 507 *Describe the inner contradiction of monetary abstract wealth which determine the goals of a miser, and the ridiculous contradiction of the means by which he is trying to reach this goal.*

Gold and silver can be used to make beautiful things which display the wealth of their owner (and which are also more difficult to steal than anonymous gold coins).

231:2 Alongside the direct form of the hoard there runs its aesthetic form, the possession of commodities made out of gold and silver. This grows with the wealth of civil society. 'Let us be rich, or let us appear rich' (Diderot). In this way there is formed, on the one hand, a constantly expanding market for gold and silver which is independent of their monetary functions, and on the other hand a latent source of monetary inflow which is used particularly in periods of social storms.

The functions which hoards play for the circulation process are discussed at the very end, since these are by no means the only reason for the existence of these hoards. There is a clear divergence between individual motivation for hoarding, and its economic function.

viel verkaufen, wenig kaufen, die Summe seiner politischen Ökonomie.⁹⁴

⁹⁴ „Die Zahl der Verkäufer jeder Ware soweit wie möglich zu vermehren, die Zahl der Käufer soweit wie möglich zu vermindern, das sind die Angelpunkte, um die sich alle Maßnahmen der politischen Ökonomie drehen.“ Verri [Ver04, p. 52, 53].

147:3/o Neben der unmittelbaren Form des Schatzes läuft seine ästhetische Form, der Besitz von Gold- und Silberwaren. Er wächst mit dem Reichtum der bürgerlichen Gesellschaft. „Soyons riches ou paraissions riches.“ (Diderot.) Es bildet sich so teils ein stets ausgedehnter Markt für Gold und Silber, unabhängig von ihren Geldfunktionen, teils eine latente Zufuhrquelle des Geldes, die namentlich in gesellschaftlichen Sturmperioden fließt.

231:3/o Hoarding serves various functions in an economy where metallic circulation prevails. Its first function arises out of the conditions of the circulation of gold and silver coins. We have seen how, owing to the continual fluctuations in the extent and rapidity of the circulation of commodities and in their prices, the quantity of money in circulation unceasingly ebbs and flows. This quantity must therefore be capable of expansion and contraction. At one time money must be attracted as coin, at another time coin must be repelled as money. In order that the mass of money actually in circulation may always correspond to the saturation level of the sphere of circulation, it is necessary for the quantity of gold and silver available in a country to be greater than the quantity functioning as coin. This condition is fulfilled by money taking the form of hoards. The reserves created by hoarding serve as channels through which money may flow in and out of circulation, so that the circulation itself never overflows its banks.⁹⁶

⁹⁵ ‘There is required for carrying on the trade of the nation a determinate sum of specific money, which varies, and is sometimes more sometimes less as the circumstances we are in require ... This ebbing and flowing of money supplies and accommodates itself, without any aid of Politicians ... The buckets work alternately; when money is scarce, bullion is coined, when bullion is scarce, money is melted’ Sir D. North, [Nor91, Postscript, p. 3]. John Stuart Mill, who was for a long time an official of the East India Company, confirms that in India silver ornaments still continue to perform directly the functions of a hoard: ‘Silver ornaments are brought out and coined when there is a high rate of interest, and go back again when the rate of interest falls’ (J. S. Mill’s evidence, in Report from the Se-

148:1 Die Schatzbildung erfüllt verschiedene Funktionen in der Ökonomie der metallischen Zirkulation. Die nächste Funktion entspringt aus den Umlaufsbedingungen der Gold- oder Silbermünze. Man hat gesehen, wie mit den beständigen Schwankungen der Warenzirkulation in Umfang, Preisen und Geschwindigkeit die Umlaufmasse des Geldes rastlos ebbt und flutet. Sie muß also der Kontraktion und Expansion fähig sein. Bald muß Geld als Münze attrahiert, bald Münze als Geld repellierte werden. Damit die wirklich umlaufende Geldmasse dem Sättigungsgrad der Zirkulationssphäre stets entsprechen, muß das in einem Lande befindliche Gold- oder Silberquantum größer sein als das in Münzfunktion begriffene. Diese Bedingung wird erfüllt durch die Schatzform des Geldes. Die Schatzreservoirs dienen zugleich als Abfuhr- und Zufuhrkanäle des zirkulierenden Geldes, welches seine Umlaufkanäle daher nie überfüllt.⁹⁵

⁹⁵ „Um Handel zu treiben, bedarf jede Nation einer bestimmten Summe von spezifick money, die wechselt und manchmal größer, manchmal kleiner ist, so wie es die Verhältnisse fordern ... Diese Ebben und Fluten des Geldes regeln sich selbst ohne jede Hilfe der Politiker ... Die Eimer arbeiten abwechselnd: wenn das Geld knapp ist, werden Barren gemünzt; sind Barren knapp, werden Münzen eingeschmolzen.“ Sir D. North, [Nor91, Postscript, p. 3]. John Stuart Mill, lange Zeit Beamter der Ostindischen Kompanie, bestätigt, daß in Indien immer noch der Silberschmuck unmittelbar als Schatz funktioniert. Die „silbernen Schmuckstücke werden zum Ausmünzen gebracht, wenn ein hoher Zinssatz besteht; sie wandern zurück, wenn der Zinssatz fällt“. (J. St. Mills Evidence [in] „Repts.

lect Committee on the Bank Acts, 1857, n. 2084, 2101). According to a parliamentary document of 1864 on the gold and silver import and export of India, the import of gold and silver in 1863 exceeded the export by £19,367,764. During the eight years up to 1864, the excess of imports over exports of the precious metals amounted to £109,652,917. During this century far more than £200,000,000 has been coined in India.

Economic function of hoard: absorb the varying mass of gold required as means of circulation. In those countries which had metallic circulation this was an important phenomenon.

3.3.b. Means of Payment

Money can function as money even if it is not withdrawn from circulation. Marx brings two more forms in which money functions as money: means of payment (subsection 3.3.b) and world money (subsection 3.3.c). Money also functions as money when it is advanced as capital, but since capital has not yet been defined, this is not discussed here (compare the end of footnote 98 to paragraph 234:1 below).

Subsection 3.3.b, about means of payment, follows closely the longer explanation in *Contribution*, p. 370:1/o.

232:1/o In the direct form of commodity circulation hitherto considered, a given value was always present twice: as a commodity at one pole, and money at the opposite pole. The owners of commodities therefore came into contact only as the representatives of simultaneously present equivalents.

148:2/o In der bisher betrachteten unmittelbaren Form der Warenzirkulation war dieselbe Wertgröße stets doppelt vorhanden, Ware auf dem einen Pol, Geld auf dem Gegenpol. Die Warenbesitzer traten daher nur in Kontakt als Repräsentanten wechselseitig vorhandener Äquivalente.

Fowkes again puts an epistemic gloss on it: In the direct form of commodity circulation hitherto considered, we found a given

value always presented to us in a double shape, as a commodity at one pole, and money at the opposite pole.

He also mis-translates “*vorhandner*” as “existing” instead of “present.”

↑ Until now the assumption was made that all purchases are paid in cash. In such cash transactions, the equivalents *C* and *M* are present at the same place and time. This simultaneous presence was tacitly assumed until now. But it is not essential for commodity exchange: But with the development of circulation, conditions arise under which the alienation of the commodity becomes separated in time from the realization of its price. It will be sufficient to indicate the simplest

Mit der Entwicklung der Warenzirkulation entwickeln sich jedoch Verhältnisse, wodurch die Veräußerung der Ware von der Realisierung ihres Preises zeitlich getrennt wird. Es genügt, die einfachsten dieser Ver-

of these conditions. One sort of commodity requires a longer, another a shorter time for its production. The production of different commodities depends on different seasons of the year. One commodity may be born in the market place, another must travel to a distant market. One commodity owner may therefore step forth as a seller before the other is ready to buy.

↑ So far, Marx gave some illustrative examples where the commodity is ready to be transferred to the buyer, but the money to pay for it is not yet available—perhaps because the buyer has not yet sold his own commodity, which takes a long time to produce or only comes forward seasonally, or the buyer is far away and the commodity has to be transported, etc. ↓ Next Marx gives two more systematic criteria when this is the case:

When the same transactions are continually repeated between the same persons, the conditions of sale are regulated according to the conditions of production.

↑ First basic situation: if regularly the same transactions occur between the same transactors, then mutual trust develops, people co-operate directly. The synchronization in time between money and commodity turns out to be bothersome, and the terms of commodity circulation are instead governed by the conditions of production (and also, although Marx does not mention this, of the final sale) of the products.

On the other hand, the use of certain kinds of commodity (houses, for instance) is sold for a definite period. Only after the lease has expired has the buyer actually received the use-value of the commodity. He therefore buys it before he pays for it.

↑ The second basic situation does not have to do with technology of production but with the incentive structure. The modern economic term is “time inconsistency.” The seller will not get the money until he has delivered the goods. For instance, the worker will not get his wage until after he has finished working. Marx also brings the example of renting a house. This example does not apply in modern practice, since rent must be paid in advance — because otherwise the renter might skip out before the end of the month. The purchase of labor-power, by contrast, is the classic example in which the purchase price is paid *after* the commodity is fully delivered. ↓ These circumstances create new forms:

The seller sells an existing commodity, the buyer buys as the mere representative of money, or rather as the representative of future money. The seller becomes a creditor,

hältnisse hier anzudeuten. Die eine Warenart erheischt längere, die andere kürzere Zeitdauer zu ihrer Produktion. Die Produktion verschiedener Waren ist an verschiedene Jahreszeiten geknüpft. Die eine Ware wird auf ihrem Marktplatz geboren, die andere muß zu entferntem Markt reisen. Der eine Warenbesitzer kann daher als Verkäufer auftreten, bevor der andere als Käufer.

Bei steter Wiederkehr derselben Transaktionen unter denselben Personen regeln sich die Verkaufsbedingungen der Waren nach ihren Produktionsbedingungen.

Andrerseits wird die Benutzung gewisser Warenarten, z.B. eines Hauses, für einen bestimmten Zeitraum verkauft. Erst nach Ablauf des Termins hat der Käufer den Gebrauchswert der Ware wirklich erhalten. Er kauft sie daher, bevor er sie zahlt.

Der eine Warenbesitzer verkauft vorhandene Ware, der andere kauft als bloßer Repräsentant von Geld oder als Repräsentant von künftigem Gelde. Der Verkäufer wird

the buyer becomes a debtor. Since the metamorphosis of commodities, or the development of their form of value, has undergone a change here, money receives a new function as well. It becomes means of payment.⁹⁶

Note that interest or discount payments do not play a role in this derivation of the function of money as means of payment. The means of payment is not a capitalist function but flows from the exigencies of circulation alone.

⁹⁶ [Note by Engels to the fourth German edition:] Luther distinguishes between money as means of purchase and means of payment: ‘You have caused me to suffer two-fold damage, because I cannot pay on the one hand and cannot buy on the other’ (Martin Luther, *An die Pfarrherrn, wider den Wucher zu predigen*, Wittenberg, 1540 [without pagination]).

This modification of the relation between commodity owners occurs whether or not commodity circulation is highly developed. It is one of the reasons why commodity producers must build up hoards of money to tide them over these discrepancies in time (see 228:2/oo, where Marx also remarks that it is contradictory when everyone sells without buying).

Question 509 *Explain how, by the circumstances of commodity circulation, buyers and sellers may develop into debtors and creditors, and give examples.*

233:1 The role of creditor or of debtor results here from the simple circulation of commodities. The change in its form impresses this new stamp on seller and buyer. At first, therefore, these new roles are just as transient as those of seller and buyer, and are played alternately by the same actors. Nevertheless, this opposition now looks less pleasant from the very outset, and it is capable of a more rigid crystallization.⁹⁷

⁹⁷ The following shows the relations existing between debtors and creditors among English traders at the beginning of the eighteenth century: ‘Such a spirit of cruelty reigns here in England among the men of trade, that is not to be met with in any other society of men, nor in any other kingdom of the world’ (*An Essay on Credit and the Bankrupt Act*, London, 1707, p. 2).

Gläubiger, der Käufer Schuldner. Da die Metamorphose der Ware oder die Entwicklung ihrer Wertform sich hier verändert, erhält auch das Geld eine andere Funktion. Es wird Zahlungsmittel.⁹⁶

⁹⁶ Luther unterscheidet zwischen Geld als Kaufmittel und Zahlungsmittel. „Machest mir einen Zwilling aus dem Schadewacht, das ich hier nicht bezahlen und dort nicht kaufen kann.“ (Martin Luther, „An die Pfarrherrn, wider den Wucher zu predigen“, Wittenberg 1540.)

149:1/o Der Charakter von Gläubiger oder Schuldner entspringt hier aus der einfachen Warenzirkulation. Ihre Formveränderung drückt dem Verkäufer und Käufer diese neuen Stempel auf. Zunächst also sind es ebenso verschwindende und wechselweis von denselben Zirkulationsagenten gespielte Rollen wie die von Verkäufer und Käufer. Jedoch sieht der Gegensatz jetzt von Haus aus minder gemütlich aus und ist größerer Kristallisation fähig.⁹⁷

⁹⁷ Über die Schuldner- und Gläubigerverhältnisse unter den englischen Handelsleuten Anfang des 18. Jahrhunderts: „Unter den Handelsleuten herrscht hier in England ein solcher Geist der Grausamkeit, wie er in keiner anderen menschlichen Gesellschaft und in keinem anderen Land der Welt anzutreffen ist.“ („An Essay on Credit and the Bankrupt Act“, Lond. 1707, p. 2.)

Although the economic characters of debtor and creditor come here only from the circulation relations and not from any deeper relations of production, footnote 97 showed that they can be quite harsh. In the following historical examples, relations of debtors and creditors arise from deeper relations:

However, the same characteristics can emerge independently of the circulation of commodities. The class struggle in the ancient world, for instance, took the form mainly of a contest between debtors and creditors, and ended in Rome with the ruin of the plebeian debtors, who were replaced by slaves. In the Middle Ages the contest ended with the ruin of the feudal debtors, who lost their political power together with its economic basis. Here, indeed, the money-form—and the relation between creditor and debtor does have the form of a money-relation—was only the reflection of an antagonism which lay deeper, at the level of the economic conditions of existence.

Another example not mentioned by Marx is the modern credit system. The reason for capitalist credit is deeper than the reason for the function of means of payment discussed here.

Next Marx analyses the functions of money in the modified sale:

233:2/o Let us return to the sphere of circulation. The two equivalents, commodities and money, have ceased to appear simultaneously at the two poles of the process of sale. The money functions now, first as a measure of value in the determination of the price of the commodity sold; the price fixed by contract measures the obligation of the buyer, i.e. the sum of money he owes at a particular time. Secondly it serves as a notional means of purchase. Although it exists only in the promise of the buyer to pay, it causes the commodity to change hands. Not until payment falls due does the means of payment actually step into circulation, i.e. leave the hand of the buyer for that of the seller.

Dieselben Charaktere können aber auch von der Warenzirkulation unabhängig auftreten. Der Klassenkampf der antiken Welt z.B. bewegt sich hauptsächlich in der Form eines Kampfes zwischen Gläubiger und Schuldner und endet in Rom mit dem Untergang des plebejischen Schuldners, der durch den Sklaven ersetzt wird. Im Mittelalter endet der Kampf mit dem Untergang des feudalen Schuldners, der seine politische Macht mit ihrer ökonomischen Basis einbüßt. Indes spiegelt die Geldform—und das Verhältnis von Gläubiger und Schuldner besitzt die Form eines Geldverhältnisses—hier nur den Antagonismus tiefer liegender ökonomischer Lebensbedingungen wider.

150:1 Kehren wir zur Sphäre der Warenzirkulation zurück. Die gleichzeitige Erscheinung der Äquivalente Ware und Geld auf den beiden Polen des Verkaufsprozesses hat aufgehört. Das Geld funktioniert jetzt erstens als Wertmaß in der Preisbestimmung der verkauften Ware. Ihr kontraktlich festgesetzter Preis mißt die Obligation des Käufers, d.h. die Geldsumme, die er an bestimmtem Zeittermin schuldet. Es funktioniert zweitens als ideelles Kaufmittel. Obgleich es nur im Geldversprechen des Käufers existiert, bewirkt es den Händewechsel der Ware. Erst am fälligen Zahlungstermin tritt das Zahlungsmittel wirklich in Zirkulation, d.h. geht aus der Hand des Käufers in die des Verkäufers über.

In this third function, money functions as money. In order to develop this, Marx compares the means of payment with the hoard:

The circulating medium was transformed into a hoard because the process stopped short after the first phase, because the converted shape of the commodity was withdrawn from circulation. The means of payment does enter circulation, but only after the commodity has already left it. The money no longer mediates the process. It brings it to an end by an independent act, as the absolute form of existence of exchange-value, i.e., as the universal commodity.

Contribution 373:2/o adds: "in short, as money."

Question 511 *Explain how in the modified sale, in which the payment of money takes place a certain time after the commodity has changed hands, money first functions as measure of value, then as means of purchase, then as money.*

The seller turned his commodity into money in order to satisfy some need; the hoarder in order to preserve the monetary form of his commodity, and the indebted purchaser in order to be able to pay. If he does not pay, his goods will be sold compulsorily. The value form of the commodity, money, has now become the self-sufficient purpose of the sale, owing to a social necessity springing from the conditions of the process of circulation itself

Question 512 *Why does money function as money when it functions as hoard or as means of payment? Why does it not function as money when it functions as means of purchase or measure of value?*

234:1 The buyer converts money back into commodities before he has turned commodities into money: in other words, he achieves the second metamorphosis of commodities before the first. The seller's commodity circulates, but it realizes its price only as a title to money in civil law. It

Das Zirkulationsmittel verwandelte sich in Schatz, weil der Zirkulationsprozeß mit der ersten Phase abbrach oder die verwandelte Gestalt der Ware der Zirkulation entzogen wurde. Das Zahlungsmittel tritt in die Zirkulation hinein, aber nachdem die Ware bereits aus ihr ausgetreten ist. Das Geld vermittelt nicht mehr den Prozeß. Es schließt ihn selbständig ab, als absolutes Dasein des Tauscherts oder allgemeine Ware.

Der Verkäufer verwandelte Ware in Geld, um ein Bedürfnis durch das Geld zu befriedigen, der Schatzbildner, um die Ware in Geldform zu präservieren, der schuldige Käufer, um zahlen zu können. Zahlt er nicht, so finden Zwangsverkäufe seiner Habe statt. Die Wertgestalt der Ware, Geld, wird also jetzt zum Selbstzweck des Verkaufs durch eine den Verhältnissen des Zirkulationsprozesses selbst entspringende, gesellschaftliche Notwendigkeit.

150:2 Der Käufer verwandelt Geld zurück in Ware, bevor er Ware in Geld verwandelt hat, oder vollzieht die zweite Warenmetamorphose vor der ersten. Die Ware des Verkäufers zirkuliert, realisiert ihren Preis aber nur in einem privatrechtlichen Titel auf Geld. Sie verwandelt sich in Gebrauchs-

is converted into a use-value before it has been converted into money. The completion of its first metamorphosis occurs only subsequently.⁹⁸

⁹⁸ The reason why I take no notice in the text of an opposite form will be seen from the following quotation from my book which appeared in 1859: "Conversely, in the transaction $M - C$, money taking effect as a means of purchase may be alienated, and thus the price of the commodity may be realized, before the use-value of the money is realized, or before the commodity is handed over. This happens, for instance, in the well-known form of advance-payment. Or in the form of payment used by the English government to buy opium from Indian ryots ... In these cases, however, money functions only in the familiar form of means of purchase ... Of course capital, too, is advanced in the form of money ... but this aspect does not lie within the scope of simple circulation." *Zur Kritik, etc.*, pp. 119, 120.

wert, bevor sie sich in Geld verwandelt hat. Die Vollziehung ihrer ersten Metamorphose folgt erst nachträglich.⁹⁸

⁹⁸ Note zur 2. Ausg. Aus folgendem, meiner 1859 erschienenen Schrift entlehnten Zitat wird man sehn, warum ich im Text keine Rücksicht nehme auf eine entgegengesetzte Form: „Umgekehrt kann im Prozeß $G - W$ das Geld als wirkliches Kaufmittel entäußert und der Preis der Ware so realisiert werden, ehe der Gebrauchswert des Geldes realisiert oder die Ware veräußert wird. Dies findet z.B. statt in der alltäglichen Form der Pränumeration. Oder in der Form, worin die englische Regierung das Opium der Ryots in Indien ... kauft. So wirkt jedoch das Geld nur in der schon bekannten Form des Kaufmittels ... Kapital wird natürlich auch in der Form des Geldes avanciert ... Dieser Gesichtspunkt fällt aber nicht in den Horizont der einfachen Zirkulation.“ (*Zur Kritik etc.*, p. 119, 120.)

Question 513 Are there situations in which money is used in other functions than measure of value, means of circulation, or the independent incarnation of abstract wealth?

Now the two phases, the modified sale and the sale by the debtor, together (compare *Contribution* 374:2/o). From the point of view of the time when the commodity enters circulation, Marx goes over to the metamorphosis of the commodities of the two transactors. Originally, every commodity owner must sell his commodity first, and then buy another commodity with that money. In the modified sale, the order of these two phases is reversed for the buyer: he converts money back into a commodity before he converts his commodity into money.

Looking at the commodity entering circulation, it must first become exchange-value, money, for its seller, before it can become use-value for its buyer. In the modified sale, also these two phases are in reverse order: it first becomes use-value for its buyer, and the first phase, its becoming exchange-value for its seller, is delayed.

234:2–237:0 Mass of money required for the functions as means of payment, and the contradictions springing from the fact that in part money is not needed at all, in part it is needed as the absolute form of wealth!

234:2/o The obligations falling due within a given time period represent the sum of the prices of the commodities whose sale gave rise to these obligations. The quantity

151:1 In jedem bestimmten Zeitabschnitt des Zirkulationsprozesses repräsentieren die fälligen Obligationen die Preissumme der Waren, deren Verkauf sie hervorrief. Die

of money necessary to realize this sum depends in the first instance on the turnover speed of the means of payment. This speed is conditioned by two factors: first, the way in which relations between creditors and debtors interlock, as when A receives money from B , who is in debt to him, and then pays it out to his creditor C , and second, the length of time between the days in which the various obligations fall due.

The pronoun “sie” in “*sie ist bedingt durch zwei Umstände*” refers to turnover speed, not to the

mass of gold necessary, as both the Fowkes and the Moore-Aveling translations suggest. In

Contribution 376:2/o the wording is unambiguous.

The quantity of money is determined by the price sum and the turnover speed. The turnover speed depends on two factors:

- Concatenation of the debtor-creditor relations so that the same person A first receives a payment from B and then makes a payment to C .
- Length of time between the different due-dates of the obligations.

The discussion that follows focuses on the first of these two factors, the concatenation of payments. First Marx makes a very abstract observation about it:

The chain of successive payments, i.e., retarded first metamorphoses, differs essentially from the interlacing of the metamorphosis-sequences which we considered on a former page. The movement of the (money functioning as) means of circulation is more than a mere expression of the connection between buyers and sellers. This connection itself only originates by and together with the movement of money. Contrariwise, the movement of the means of payment is the expression of a social relation which is already complete and in existence before the money begins to move.

This observation already sets the stage for the discussion of crisis which coming up. The topic of discussion is: how does the structure of retarded first metamorphoses allow to economize the quantity of means of payment? The simultaneous occurrence of sales at the same

zur Realisierung dieser Preissumme nötige Geldmasse hängt zunächst ab von der Umlaufgeschwindigkeit der Zahlungsmittel. Sie ist bedingt durch zwei Umstände: die Verkettung der Verhältnisse von Gläubiger und Schuldner, so daß A , der Geld von seinem Schuldner B erhält, es an seinen Gläubiger C fortzahlt usw.—und die Zeitlänge zwischen den verschiedenen Zahlungsterminen.

Die prozessierende Kette von Zahlungen oder nachträgliche ersten Metamorphosen unterscheidet sich wesentlich von der früher betrachteten Verschlingung der Metamorphosenreihen. Im Umlauf des Zirkulationsmittels wird der Zusammenhang zwischen Verkäufern und Käufern nicht nur ausgedrückt. Der Zusammenhang selbst entsteht erst in und mit dem Geldumlauf. Dagegen drückt die Bewegung des Zahlungsmittels einen schon vor ihr fertig vorhandenen gesellschaftlichen Zusammenhang aus.

location is on the one hand a hindrance, but on the other allows the development of new techniques for economizing payments:

235:1 Since sales take place simultaneously and side by side, the extent to which the turnover speed can make up for the quantity of currency available is limited. On the other hand, this simultaneity gives a new impulse towards the economical use of the means of payment. With the concentration of payments in one place, special institutions and methods of liquidation develop spontaneously. For instance, the *virements* (clearing houses) in medieval Lyons. The debts due to *A* from *B*, to *B* from *C*, to *C* from *A*, and so on, have only to be brought face to face in order to cancel each other out, to a certain extent, as positive and negative amounts. There remains only a single debit balance to be settled. The greater the concentration of the payments, the less is this balance in relation to the total amount, hence the less is the mass of the means of payment in circulation.

↑ The amount of money required as means of payment is economized by the cancellation of obligations. This cancellation can either go in a circle: *A* owes *B*, *B* owes *C*, and *C* owes *A* the same amount, payable on the same day: they cancel each other out without any residue. Or you have a chain which is not a circle: *A* owes *B*, *B* owes *C* the same amount: then only a payment from *A* to *C* is necessary.

↓ If the system of mutual cancellations of payments is disturbed on a social scale, then more money is required to settle the obligations than is available: crisis.

235:2/oo The function of money as means of payment contains an unmediated contradiction. As long as the payments balance each other, money functions only notionally, as money of account or as measure of value. But if actual payments have to be made, money does not come onto the scene as a means of circulation, as a merely transient and intermediary form of the social metabolism, but as the individual incarnation of social labor, the independent exis-

151:2 Gleichzeitigkeit und Nebeneinander der Verkäufe beschränken den Ersatz der Münzmasse durch Umlaufgeschwindigkeit. Sie bilden umgekehrt einen neuen Hebel in der Ökonomie der Zahlungsmittel. Mit der Konzentration der Zahlungen an demselben Platz entwickeln sich naturwüchsig eigne Anstalten und Methoden ihrer Ausgleichung. So z.B. die *Virements* im mittelalterlichen Lyon. Die Schuldforderungen von *A* an *B*, *B* an *C*, *C* an *A* usw. brauchen bloß konfrontiert zu werden, um sich wechselseitig bis zu einem gewissen Belauf als positive und negative Größen aufzuheben. So bleibt nur eine Schuldbilanz zu saldieren. Je massenhafter die Konzentration der Zahlungen, desto kleiner relativ die Bilanz, also die Masse der zirkulierenden Zahlungsmittel.

151:3/152 Die Funktion des Geldes als Zahlungsmittel schließt einen unvermittelten Widerspruch ein. Soweit sich die Zahlungen ausgleichen, funktioniert es nur ideell als Rechengeld oder Maß der Werte. Soweit wirkliche Zahlung zu verrichten, tritt es nicht als Zirkulationsmittel auf, als nur verschwindende und vermittelnde Form des Stoffwechsels, sondern als die individuelle Inkarnation der gesellschaftlichen Arbeit, selbständiges Dasein des Tauscherts, ab-

tence of exchange-value, the absolute commodity.

Question 514 Explain how the function of money as means of payment contains an unmediated contradiction. What does the word “unmediated” mean here?

Now a famous passage about money crises:

This contradiction bursts forth in that aspect of an industrial and commercial crisis which is known as a monetary crisis.⁹⁹ Such a crisis occurs only where the ongoing chain of payments has been fully developed, along with an artificial system for settling them. Whenever there is a general disturbance of the mechanism, no matter what its cause, money suddenly and immediately changes over from its merely notional shape, money of account, into hard cash. Profane commodities can no longer replace it. The use-value of commodities becomes valueless, and their value vanishes in the face of its own value form. The bourgeois, drunk with prosperity and arrogantly certain of himself, has just declared that money is a purely imaginary creation. ‘Commodities alone are money,’ he said. But now the opposite cry resounds over the markets of the world: only money is a commodity. As the hart pants after fresh water, so pants the soul of the bourgeois after money, the only wealth.¹⁰⁰ In a crisis, the antithesis between commodities and their value form, money, is raised to the level of an absolute contradiction. Hence money’s form of appearance is here also a matter of indifference. The monetary famine remains whether payments have to be made in gold or in credit-money, such as bank-notes.¹⁰¹

⁹⁹ [Note by Engels to the third German edition:] The monetary crisis defined in the text as a particular phase of every general industrial and commercial crisis, must be clearly distinguished

solute Ware.

Dieser Widerspruch eklatiert in dem Moment der Produktions- und Handelskrisen, der Geldkrise heißt.⁹⁹ Sie ereignet sich nur, wo die prozessierende Kette der Zahlungen und ein künstliches System ihrer Ausgleichung völlig entwickelt sind. Mit allgemeineren Störungen dieses Mechanismus, woher sie immer entspringen mögen, schlägt das Geld plötzlich und unvermittelt um aus der nur ideellen Gestalt des Rechengeldes in hartes Geld. Es wird unersetzlich durch profane Waren. Der Gebrauchswert der Ware wird wertlos, und ihr Wert verschwindet vor seiner eignen Wertform. Eben noch erklärte der Bürger in prosperitätstrunknem Aufklärungsdünkel das Geld für leeren Wahn. Nur die Ware ist Geld. Nur das Geld ist Ware! gellt’s jetzt über den Weltmarkt. Wie der Hirsch schreit nach frischem Wasser, so schreit seine Seele nach Geld, dem einzigen Reichtum.¹⁰⁰ In der Krise wird der Gegensatz zwischen der Ware und ihrer Wertgestalt, dem Geld, bis zum absoluten Widerspruch gesteigert. Die Erscheinungsform des Geldes ist hier daher auch gleichgültig. Die Geldhungersnot bleibt dieselbe, ob in Gold oder Kreditgeld, Banknoten etwa, zu zahlen ist.¹⁰¹

⁹⁹ Die Geldkrise, wie im Text bestimmt als besondere Phase jeder allgemeinen Produktions- und Handelskrise, ist wohl zu unterscheiden von der speziellen Sorte der Krise, die man auch

from the special sort of crisis also called a monetary crisis, which may appear independently of the rest and only affects industry and commerce by its bachvash. The pivot of these crises is to be found in money capital, and their immediate sphere of impact is therefore banking, the stock exchange and finance.

¹⁰⁰ 'This sudden transformation of the credit system into a monetary system adds theoretical dismay to the actually existing panic, and the agents of the circulation process are overawed by the impenetrable mystery surrounding their own relations' (Karl Marx, *Zur Kritik*, etc., p. 126) [English edition, p. 146]. 'The poor stand still, because the rich have no money to employ them, though they have the same land and hands to provide victuals and clothes, as ever they had; ... which is the true Riches of a Nation, and not the money' (John Bellers, *Proposals for Raising a Colledge of Industry London*, 1696, pp. 3–4).

¹⁰¹ The following shows how such occasions are exploited by the 'friends of commerce': 'On one occasion (1839) an old, grasping banker (in the city) in his private room raised the lid of the desk he sat over, and displayed to a friend rolls of bank-notes, saying whh intense glee there were £600,000 of them, they were held to make money tight, and would all be let out after three o'clock on the same day' (The Theory of Exchange. The Bank Charter Act of 1844, London, 1864, p. 81) [by H. Roy]. The *Observer*, a semi-official government organ, remarked on 24 April 1864: 'Some very curious rumours are current of the means which have been resorted to in order to create a scarcity of bank-notes ... Questionable as it would seem, to suppose that any trick of the kind would be adopted, the report has been so universal that it really deserves mention.'

Geldkrise nennt, die aber selbständig auftreten kann, so daß sie auf Industrie und Handel nur rückschlagend wirkt. Es sind dies Krisen, deren Bewegungszentrum das Geld-Kapital ist, und daher Bank, Börse, Finanz ihre unmittelbare Sphäre. (Note von M. zur 3. Aufl.)

¹⁰⁰ „Dieses plötzliche Umschlagen aus dem Kreditsystem in das Monetarsystem fügt den theoretischen Schrecken zum praktischen Panik: und die Zirkulationsagenten schauern vor dem undurchdringlichen Geheimnis ihrer eignen Verhältnisse.“ (Karl Marx, l.c. p. 126.) „Die Armen haben keine Arbeit, weil die Reichen kein Geld haben um sie zu beschäftigen, obwohl sie die gleichen Ländereien und die gleichen Arbeitskräfte besitzen wie früher, um Lebensmittel und Kleider herstellen zu lassen, diese aber bilden den wahren Reichtum einer Nation und nicht das Geld.“ (John Bellers, „Proposals for raising a Colledge of Industry“, Lond. 1696, p. 3, 4.)

¹⁰¹ Wie solche Momente von den „amis du commerce“ ausgebeutet werden: „Bei einer Gelegenheit“ (1839) „hob ein alter habstüchtiger Bankier“ (der City) „in seinem Privatzimmer den Deckel des Schreibtisches, an dem er saß, und breitete vor einem Freunde Bündel von Banknoten aus; mit innigem Vergnügen sagte er, das seien 600 000 Pfd.St., die zurückgehalten worden wären, um das Geld knapp zu machen, und die alle in den Verkehr gebracht würden nach 3 Uhr desselben Tages.“ ([H. Roy,] „The Theory of the Exchanges. The Bank Charter Act of 1844“, Lond. 1864, p. 81.) Das halboffizielle Organ, „The Observer“, bemerkt am 24. April 1864: „Einige sehr eigenartige Gerüchte sind im Umlauf über die Mittel, die in der Absicht, eine Knappheit in Banknoten herbeizuführen, angewendet worden sind ... So fragwürdig es auch scheinen mag anzunehmen, daß irgendwelche derartige Tricks angewendet werden könnten, so war die Nachricht darüber doch so weit verbreitet, daß man sie in der Tat erwähnen muß.“

Geldkrise (i.e., the monetary aspect of general crises, *not* the independent crises of the

moneyed capitalists, see the footnote 99).

The periodic swings in the cycle, in one phase only commodity is money, in another only the money counts, indicate that the link of money to gold can be established only in crisis phases.

Question 516 Marx wrote in 233:2/o: "*The money is no longer the means that brings about the process. It only brings it to a close, by stepping in as the absolute form of existence of exchange-value, or as the universal commodity*": Describe a situation when this difference becomes practically relevant.

237:1 If we now consider the total amount of money in circulation during a given period, we find that, for any given turnover rate of the medium of circulation and the means of payment, it is equal to the sum of prices to be realized, plus the sum of the payments falling due, minus the payments which balance each other out, and, finally, minus the number of circuits in which the same piece of coin serves alternately as medium of circulation and means of payment. The farmer, for example, sells his wheat for £2, and this money serves thus as the medium of circulation. On the day when the payment falls due, he uses it to pay for linen which the weaver has delivered. The same £2 now serves as the means of payment. The weaver now buys a Bible for cash. This serves again as the medium of circulation, and so on. Therefore, even when prices, speed of monetary circulation and economies in the use of the means of payment are given, the quantity of money in circulation no longer corresponds with the mass of commodities in circulation during a given period, such as a day. Money which represents commodities long since withdrawn from circulation continues to circulate. Commodities circulate, but their equivalent in money does not appear until some future date. Moreover, the debts contracted each day, and the payments

153:1 Betrachten wir nun die Gesamtsumme des in einem gegebenen Zeitabschnitt umlaufenden Geldes, so ist sie, bei gegebener Umlaufgeschwindigkeit der Zirkulations- und Zahlungsmittel, gleich der Summe der zu realisierenden Warenpreise plus der Summe der fälligen Zahlungen, minus der sich ausgleichenden Zahlungen, minus endlich der Anzahl Umläufe worin dasselbe Geldstück abwechselnd bald als Zirkulations-, bald als Zahlungsmittel funktioniert. Z.B. der Bauer verkauft sein Getreide für 2 Pfd.St., die so als Zirkulationsmittel dienen. Am Verfalltag zahlt er damit Leinwand, die ihm der Weber geliefert hat. Dieselben 2 Pfd.St. funktionieren jetzt als Zahlungsmittel. Der Weber kauft nun eine Bibel gegen bar—sie funktionieren von neuem als Zirkulationsmittel—usw. Selbst Preise, Geschwindigkeit des Geldumlaufs und Ökonomie der Zahlungen gegeben, decken sich daher nicht länger die während einer Periode, eines Tags z.B. umlaufende Geldmasse und zirkulierende Warenmasse. Es läuft Geld um das der Zirkulation längst entzogene Waren repräsentiert. Es laufen Waren um, deren Geldäquivalent erst in der Zukunft erscheint. Andererseits sind die jeden Tag kontrahierten und die denselben Tag fälligen Zahlungen durchaus inkommensurable Größen.¹⁰²

falling due on the same day, are entirely incommensurable magnitudes.¹⁰²

¹⁰² 'The amount of purchases or contracts entered upon during the course of any given day, will not affect the quantity of money afloat on that particular day, but, in the vast majority of cases, will resolve themselves into multifarious drafts upon the quantity of money which may be afloat at subsequent dates more or less distant ... The bills granted or credits opened, today, need have no resemblance whatever, either in quantity, amount, or duration, to those granted or entered upon tomorrow or next day; nay, many of today's bills, and credits, when due, fall in with a mass of liabilities whose origins traverse a range of antecedent dates altogether indefinite, bills at 12, 6, 3 months or 1 often aggregating together to swell the common liabilities of one particular day ...' (The Currency Theory Reviewed: A Letter to the Scotch People. By a Banker in England, Edinburgh, 1845, pp. 29, 30 passim).

¹⁰² „Der Umfang der Verkäufe oder Verträge, die während eines bestimmten Tages abgeschlossen werden, beeinflusst nicht die Geldmenge, die an diesem Tage umläuft, aber in der großen Mehrzahl der Fälle wird sie sich auflösen in mannigfaltiges Ziehen von Wechseln auf die Geldmenge, die an späteren, mehr oder weniger fern Tagen im Umlauf sein mag ... Die heute gewährten Wechsel oder eröffneten Kredite brauchen weder in der Zahl noch in der Höhe noch in der Laufzeit irgendeine Ähnlichkeit zu haben mit denen, die auf morgen oder übermorgen gewährt oder aufgenommen wurden; vielmehr decken sich viele der heutigen Wechsel und Kredite, wenn fällig, mit einer Menge von Verbindlichkeiten, deren Ursprung sich über eine Reihe früherer, völlig unbestimmter Daten verteilt. Wechsel mit 12, 6, 3 oder 1 Monat Laufzeit treffen oft so zusammen, daß sie die an einem bestimmten Tage fälligen Verbindlichkeiten besonders anwachsen lassen ...“ („The Currency Theory Reviewed; a letter to the Scotch people. By a Banker in England“, Edinburgh 1845, p. 29, 30 passim.)

Now the *total* mass of circulating money is discussed, whether it circulates as means of payment or as means of purchase. In *Contribution* this case was left out, in which some money first functions as means of payment and then as means of purchase. If the turnover speed and economy of payments is given, the amount of money still depends on the price sum of commodities: but no longer of the commodities circulating the same day.

Question 517 *On what factors depends the mass of money required for*

- a) means of purchase
- b) means of payment
- c) means of purchase and means of payment
- d) means of purchase and means of payment including payments of taxes, rent, interest, etc.

238:1 Credit-money springs directly out of the function of money as a means of payment, in that certificates of debts owing for already purchased commodities them-

153:2/o Das Kreditgeld entspringt unmittelbar aus der Funktion des Geldes als Zahlungsmittel, indem Schuldzertifikate für die verkauften Waren selbst wieder zur Über-

selves circulate for the purpose of transferring those debts to others. On the other hand, the function of money as a means of payment undergoes expansion in proportion as the system of credit itself expands. As the means of payment money takes on its own peculiar forms of existence, in which it inhabits the sphere of large-scale commercial transactions. Gold and silver coin, on the other hand, are mostly relegated to the sphere of retail trade.¹⁰³

¹⁰³ As an example of how little real money enters into true commercial operations, I give below a statement by one of the largest London merchant banks (Morrison, Dillon & Co.) of its yearly receipts and payments. Its transactions during the year 1856, extending in fact to many millions of pounds are here reduced to the scale of one million.

tragung der Schuldforderungen zirkulieren. Andererseits, wie sich das Kreditwesen ausdehnt, so die Funktion des Geldes als Zahlungsmittel. Als solches erhält es eigne Existenzformen, worin es die Sphäre der großen Handelstransaktionen behaust, während die Gold- oder Silbermünze hauptsächlich in die Sphäre des Kleinhandels zurückgedrängt wird.¹⁰³

¹⁰³ Als Beispiel, wie wenig reelles Geld in die eigentlichen Handeloperationen eingeht, folgt hier das Schema eines der größten Londoner Handelshäuser (Morrison, Dillon & Co.) über seine jährlichen Geldeinnahmen und Zahlungen. Seine Transaktionen im Jahr 1856, die viele Millionen Pfd.St. umfassen, sind auf den Maßstab einer Million verkürzt.

Einnahmen	Pfd.St.
Wechsel von Bankiers und Kaufleuten nach Datum zahlbar	553 596
Cheques von Bankiers etc. bei Sicht zahlbar	357 715
Landbank-Noten	9 627
Noten der Bank von England	68 554
Gold	28 089
Silber und Kupfer	1 486
Post Office Orders	933
Totalsumme	1 000 000

Ausgaben	Pfd.St.

Total:	£1,000,000

(Report from the Select Committee on the Bank Acts, July 1858, p. lxxi)

Credit money *springs from* the function of money as means of payment, and on the other hand, the development of the credit system *increases* the function of money as means of payment. Existenzformen of money as means of payment are obviously: bills of exchange, cheques, country bank notes, etc., which develop because they are also forms of giving credit and earning interest.

238:2/o When the production of commodities has attained a certain level and extent, the function of money as means of payment begins to spread out beyond the sphere of the circulation of commodities. It becomes the universal material of contracts.¹⁰⁴ Rent, taxes and so on are transformed from payments in kind to payments in money. The great extent to which this transformation is conditioned by the total shape of the process of production is shown for example by the twice-repeated failure of the Roman Empire to levy all contributions in money. The unspeakable misery of the French agricultural population under Louis XIV, a misery so eloquently denounced by Boisguillebert, Marshall Vauban and others, was due not only to the weight of the taxes but also to the conversion of taxes in kind into taxes in money.¹⁰⁵ In Asia, on the other hand, the form of ground rent paid in kind, which is at the same time the main element in state taxation, is based on relations of production which reproduce themselves with the immutability of natural conditions. And this mode of payment in its turn acts to maintain the ancient form of production. It forms one of the secrets of the self-preservation of the

(„Report from the Select Committee on the Bank

kacts“, July 1858, p. LXXI.)

154:1/o Bei gewissem Höhegrad und Umfang der Warenproduktion greift die Funktion des Geldes als Zahlungsmittel über die Sphäre der Warenzirkulation hinaus. Es wird die allgemeine Ware der Kontrakte.¹⁰⁴ Renten, Steuern usw. verwandeln sich aus Naturallieferungen in Geldzahlungen. Wie sehr diese Umwandlung durch die Gesamtgestalt des Produktionsprozesses bedingt wird, beweist z.B. der zweimal gescheiterte Versuch des römischen Kaiserreichs, alle Abgaben in Geld zu erheben. Das ungeheure Elend des französischen Landvolks unter Ludwig XIV., das Boisguillebert, Marschall Vauban usw. so beredt denunzieren, war nicht nur der Steuererhöhung geschuldet, sondern auch der Verwandlung von Naturalsteuer in Geldsteuer.¹⁰⁵ Wenn andererseits die Naturalform der Grundrente, in Asien zugleich das Hauptelement der Staatssteuer, dort auf Produktionsverhältnissen beruht, welche sich mit der Unwandelbarkeit von Naturverhältnissen reproduzieren, erhält jene Zahlungsform rückwirkend die alte Produktionsform. Sie bildet eines der Selbsterhaltungsgeheimnisse des türkischen Reichs. Zieht der durch Europa aufoktroierte auswärtige Handel in

Ottoman Empire. If the foreign trade imposed on Japan by Europe brings with it the transformation of rents in kind into money rents, then the exemplary agriculture of that country will be done for. Its narrowly based economic conditions of existence will be swept away.

¹⁰⁴ ‘The course of trade being thus turned, from exchanging of goods for goods, or delivering and taking, to selling and paying, all the bargains are now stated upon the foot of a Price in money’ ([Daniel Defoe], An Essay upon Publick Credit, 3rd edn, London, 1710, p. 8).

¹⁰⁵ ‘Money ... has become the executioner of everything.’ Finance is ‘the alembic in which a frightful quantity of goods and commodities has been distilled in order to extract that unholy essence.’ ‘Money declares war on the whole of humanity’ (Boisguillebert, Dissertation sur la nature des richesses, de l’argent et des tributs, ed. Daire, Économistes Financiers, Paris, 1843, Vol. I, pp. 413, 419, 417, 418).

If production has become to a certain extent the production of *commodities*, the function of means of payment reaches beyond the circulation of commodities, for taxes, rent, etc. Transformation of taxes in kind into money taxes destroys the older modes of production.

239:1/o In every country, certain days become established as the dates on which general settlements are made. They depend in part, leaving aside other circular movements described by reproduction, upon the natural conditions of production, which are bound up with the alternation of the seasons. They also regulate the dates for payments which have no direct connection with the circulation of commodities, such as taxes, rents and so on. The fact that the quantity of money required to make these isolated payments over the whole surface of society falls due on certain days of the year causes periodic, but entirely superficial, perturbations in the

Japan die Verwandlung von Naturalrente in Geldrente nach sich, so ist es um seine musterhafte Agrikultur geschehn. Ihre engen ökonomischen Existenzbedingungen werden sich auflösen.

¹⁰⁴ „Der Charakter des Geschäftsverkehrs hat sich derartig gewandelt, daß statt Tausch von Gütern gegen Güter oder statt Lieferung und Abnahme, jetzt Verkauf und Bezahlung stattfindet und alle Geschäfte ... sich nunmehr als reine Geldgeschäfte darstellen.“ ([D. Defoe,] „An Essay upon Publick Credit“, 3. ed., Lond. 1710, p. 8.)

¹⁰⁵ „Das Geld ist der Henker aller Dinge geworden. Die Finanzkunst ist die Retorte, in der eine schreckenerregende Menge von Gütern und Waren verdampft worden ist, um diesen unheilvollen Extrakt zu gewinnen“. „Das Geld erklärt dem ganzen Menschengeschlecht den Krieg.“ (Boisguillebert, „Dissertation sur la nature des richesses, de l’argent et des tributs“, edit. Daire, „Économistes financiers“, Paris 1843, t. 1, p. 413, 419, 417, 418.)

155:1/o In jedem Land setzen sich gewisse allgemeine Zahlungstermine fest. Sie beruhen teilweis, von andren Zirkelläufen der Reproduktion abgesehen, auf den an Wechsel der Jahreszeit gebundenen Naturbedingungen der Produktion. Sie regeln ebenso Zahlungen, die nicht direkt der Warenzirkulation entspringen, wie Steuern, Renten usw. Die Geldmasse, die zu diesen über die ganze Oberfläche der Gesellschaft zersplitterten Zahlungen an gewissen Tagen des Jahres erheischt ist, verursacht periodische, aber ganz oberflächliche Perturbationen in der Ökonomie der Zahlungsmittel.¹⁰⁶

economy of the means of payment.¹⁰⁶

¹⁰⁶ 'On Whitsuntide, 1824,' said Mr Craig before the Commons Committee of 1826, 'there was such an immense demand for notes upon the banks of Edinburgh, that by 11 o'clock we had not a note left in our custody. We sent round to all the different banks to borrow, but could not get them, and many of the transactions were adjusted by slips of paper only; yet by three o'clock the whole of the notes were returned into the banks from which they had issued! It was a mere transfer from hand to hand.' Although the average effective circulation of bank-notes in Scotland is less than £3m., yet on certain settlement days in the year every single note in the possession of the bankers, amounting altogether to about £7m., is called into activity. On these occasions the notes have a single and specific function to perform, and as soon as they have performed it they flow back into the various banks from which they issued. (See John Fullarton, *Regulation of Currencies*, London 1845, p. 86, note.) In explanation it should be added that in Scotland, at the time of Fullarton's work, notes and not cheques were used to withdraw deposits.

In German MEW 23 it is ambiguous if there should be a paragraph break here or not. In

Volksausgabe there isn't, in Moore-Aveling there is, in Fowkes there isn't. Judged from the text,

what follows now is still part of the above paragraph. Therefore I treat it as one paragraph.

From the law of the rapidity of circulation of the means of payment, it follows that the quantity of the means of payment required for all periodic payments, whatever their source, is in direct proportion to the length of the periods.¹⁰⁷

¹⁰⁷ To the question 'if there were occasion to raise 40 millions p.a., whether the same 6 millions (gold) ... would suffice for such revolutions and circulations thereof, as trade requires,' Petty replies in his usual masterly manner, 'I an-

¹⁰⁶ „Pfungstmontag 1824“, erzählt Herr Craig dem parlamentarischen Untersuchungskomitee von 1826, „war eine solche ungeheure Nachfrage für Banknoten in Edinburgh, daß wir um 11 Uhr keine einzige Note mehr in unsrem Verwahrsam hatten. Wir sandten der Reihe nach zu den verschiedenen Banken, um welche zu borgen, konnten aber keine erhalten, und viele Transaktionen konnten nur durch slips of paper berichtet werden. Um 3 Uhr nachmittags jedoch waren bereits sämtliche Noten returniert zu den Banken, von denen sie ausliefen. Sie hatten nur die Hände gewechselt.“ Obgleich die effektive Durchschnittszirkulation der Banknoten in Schottland weniger als 3 Mill. Pfd.St. beträgt, wird dennoch, an verschiedenen Zahlungsterminen im Jahr, jede im Besitz der Bankiers befindliche Note, alles in allem ungefähr 7 Mill. Pfd.St., in Aktivität gerufen. Bei diesen Gelegenheiten haben die Noten eine einzige und spezifische Funktion zu vollziehen, und sobald sie vollzogen, fließen sie zu den respektiven Banken zurück, von denen sie ausliefen. John Fullarton, [Ful45, p. 86, Note]. Zum Verständnis ist hinzuzufügen, daß in Schottland zur Zeit von Fullartons Schrift nicht cheques, sondern nur Noten für die Deposits ausgegeben wurden.

Aus dem Gesetz über die Umlaufgeschwindigkeit der Zahlungsmittel folgt, daß für alle periodischen Zahlungen, welches immer ihre Quelle, die notwendige Masse der Zahlungsmittel in geradem Verhältnis zur Länge der Zahlungsperioden steht.¹⁰⁷

¹⁰⁷ Auf die Frage, „Ob, wenn die Notwendigkeit bestände, 40 Millionen im Jahre umzusetzen, dieselben 6 Millionen“ (Gold) „für die sich ergebenden Umläufe und Kreisläufe genügen würden, die der Handel erfordere?“ antwortet

swer yes: for the expense being 40 millions, if the revolutions were in such short circles, viz., weekly, as happens among poor artisans and laborers, who receive and pay every Saturday, then 40/52 parts of 1 million of money would answer these ends; but if the circles be quarterly, according to our custom of paying rent, and gathering taxes, then 10 million were requisite. Wherefore supposing payments in general to be of a mixed circle between one week and 13, then add 10 millions to 40/52, the half of which will be 5 1/2, so as if we have 5 1/2 millions we have enough' (William Petty, *Political Anatomy of Ireland*, 1672, London edition, 1691, pp. 13, 14) [what Marx cites here is Petty's essay *Verbum Sapienti*, which appeared as a supplement to the *Political Anatomy of Ireland*].

The quantitative aspect of money not only as means of purchase and payment for the movement of commodities, but also for other payments, and its seasonal fluctuations. The needed amount of money changes periodically, with the seasonal payment dates. Very superficial disturbances!

240:1 The development of money as a means of payment makes it necessary to accumulate it in preparation for the days when the sums which are owing fall due. While hoarding, considered as an independent form of self-enrichment, vanishes with the advance of bourgeois society, it grows at the same time in the form of the accumulation of a reserve fund of the means of payment.

Development of money as means of payment requires its development as a hoard, not as a form of enrichment, but for reserves.

3.3.c. World Money

This last section is very brief. The corresponding section in *Contribution* is a little more explicit. For instance, the first sentence in the first paragraph in *Capital* is only the last sentence in the corresponding first paragraph 381:1.

Although Marx does not often say so explicitly, it is apparently his understanding that the social metabolism with division of labor and abstract human labor takes place on a national scale. According to Marx's understanding, money has nationally the economic function to be standard of value, and from this follows also means of circulation and then

Petty mit seiner gewohnten Meisterschaft: „Ich antworte ja: für den Betrag von 40 Millionen würden schon 40/52 von 1 Million ausreichen, wenn die Umläufe so kurzfristige, d.h. wöchentliche wären, wie das unter armen Handwerkern und Arbeitern geschieht, die jeden Sonnabend erhalten und zahlen; wenn jedoch die Termine vierteljährlich sind, wie bei uns üblicherweise Pacht gezahlt und Steuern erhoben werden, dann benötigt man 10 Millionen. Wenn wir also annehmen, daß im allgemeinen die Zahlungen zu verschiedenen Terminen zwischen 1 und 13 Wochen erfolgen, muß man 10 Millionen zu 40/52 addieren, wovon die Hälfte ca. 5 1/2 Millionen beträgt, so daß also 5 1/2 Millionen ausreichen würden.“ (William Petty, „*Political Anatomy of Ireland*. 1672“, edit. Lond. 1691, p. 13, 14)

156:1 Die Entwicklung des Geldes als Zahlungsmittel ernötigt Geldakkumulationen für die Verfalltermine der geschuldeten Summen. Während die Schatzbildung als selbständige Bereicherungsform verschwindet mit dem Fortschritt der bürgerlichen Gesellschaft, wächst sie umgekehrt mit demselben in der Form von Reservefonds der Zahlungsmittel.

also the independent incarnation of abstract wealth. All this follows from its function for domestic production, namely, being the the appropriate surface expression of abstract human labor (in other words, money being the social institution which induces the producers to abide by the law of value). Domestically, money is general equivalent because it represents abstract human labor. Therefore it tries to be general equivalent also in international trade. Internationally, money assumes the role of general equivalent before the labors themselves have been equalized. This world-wide general equivalent has then the effect of melding the domestic labors into one world-wide human labor in the abstract.

240:2/o When money leaves the domestic sphere of circulation it strips off the local forms it has acquired domestically, as the standard of prices, gold coin, small change, and paper bills, and falls back into the original bullion form of the precious metals.

156:2 Mit dem Austritt aus der innern Zirkulation streift das Geld die dort aufschießenden Lokalformen von Maßstab der Preise, Münze, Scheidemünze und Wertzeichen, wieder ab und fällt in die ursprüngliche Barrenform der edlen Metalle zurück.

At Marx's time, the international monetary system was different than it is now. Each national currency was based on gold; gold therefore was the common denominator establishing the exchange rates between these currencies. The central banks did not hold each other's currencies but they held gold bullion. Therefore only gold could settle international balances. I.e., in order to perform its most advanced functions, money fell back into its most primitive form. Marx gives a very brief explanation why this is so:

In world trade, commodities unfold their values on a universal scale.

Im Welthandel entfalten die Waren ihren Wert universell.

Trade and commerce within a nation has a different character than world trade. The labor within every nation is drawn together into a developed system of division of labor, and it is equalized within the nation. But these systems of division of labor are only local; they interact with each other and there may be a world market with respect to certain commodities, but overall there is not one single system of division of labor which encompasses all labor on this planet, and the market has not yet equalized all the labor throughout the world. A Swedish krone represents labor of Sweden, it does not represent the labor of everybody in the world. Only the labor contained in those commodities which are traded internationally begin a process of international equalization. When such an internationally traded good enters the market, the labor contained in it tries out to what extent it is human labor in general, instead of merely to what extent it is human labor belonging to this or that local economy. This is what Marx means by "unfolding their value on a universal scale."

This is why their independent value form confronts them here as world money.

Ihre selbständige Wertgestalt tritt ihnen daher hier auch gegenüber als Weltgeld.

Fowkes misunderstands the "auch." He writes: "Their

independent value form thus confronts them here too as world money."

Here we come to a deeper definition of world money: it can circulate internationally only because it represents human labor in general, regardless of nationality. It is a more general

and simpler concept than the national moneys, and this simplicity of concept results in a simplicity of form:

Only on the world market, money fully functions as the commodity whose bodily form is at the same time the form in which human labor in the abstract becomes a social reality. Its mode of existence becomes adequate to its concept.

This is an enticing example of a Hegelian return to the beginning: that which is most developed turns into that which is most simple, and only in this way fully expresses the truth contained in this simplicity. But in my view, something less mysterious is going on here: the primitive form which world money took at Marx's time does not come from its generality, but from the fact that the institutions facilitating international trade and payments were not yet very well developed. The thing itself had to step in because the more refined forms of money were not yet in existence.

Next Marx discusses the *differences* between world money and the domestic moneys.

241:1 Within the sphere of domestic circulation, there can only be one commodity which by serving as a measure of value becomes money. On the world market a double standard prevails, both gold and silver.¹⁰⁸

¹⁰⁸ Hence the absurdity of all legislation laying down that the banks of a country should form reserves only of the particular precious metal circulating within the country as money. The 'pleasant difficulties' created in this way by the Bank of England for itself are a well-known example. On the subject of the major historical epochs in the relative value of gold and silver, see Karl Marx, op. cit., pp. 136 ff. [English edition, pp. 155 ff.]. Sir Robert Peel, by his Bank Act of 1844, sought to tide over the difficulty by allowing the Bank of England to issue notes against silver bullion, on condition that the reserve of silver should never exceed more than one fourth of the reserve of gold. For that purpose, the value of silver is estimated according to its market price (in gold) on the London market. [The following was added by Engels to the fourth German edition:] We find ourselves once more in a period of strong changes in the relative values of gold

Erst auf dem Weltmarkt funktioniert das Geld in vollem Umfange als die Ware, deren Naturalform zugleich unmittelbar gesellschaftliche Verwirklichungsform der menschlichen Arbeit in abstracto ist. Seine Daseinsweise wird seinem Begriff adäquat.

157:1 In der innern Zirkulationssphäre kann nur eine Ware zum Wertmaß und daher als Geld dienen. Auf dem Weltmarkt herrscht doppeltes Wertmaß, Gold und Silber.¹⁰⁸

¹⁰⁸ Daher die Abgeschmacktheit jeder Gesetzgebung, die den Nationalbanken vorschreibt, nur das edle Metall aufzuschätzen, das im Innern des Landes als Geld funktioniert. Die so selbstgeschaffnen „holden Hindernisse“ der Bank von England z.B. sind bekannt. Über die großen historischen Epochen des relativen Wertwechsels von Gold und Silber siehe Karl Marx, l.c. p. 136sq.—Zusatz zur 2. Ausgabe: Sir Robert Peel suchte in seinem Bankact von 1844 dem Mißstand dadurch abzuheben, daß er der Bank von England erlaubte, Noten auf Silberbullion auszugeben, so daß jedoch der Silbervorrat nie mehr als ein Viertel des Goldvorrats. Der Silberwert wird dabei geschätzt nach seinem Marktpreis (in Gold) auf dem Londoner Markt. {Zur 4. Auflage.—Wir befinden uns wieder in einer Epoche starken relativen Wertwechsels von Gold und Silber. Vor etwa 25 Jahren war das Wertverhältnis des Goldes zum Silber = 15 1/2:1, jetzt ist es

and silver. About twenty-five years ago the ratio expressing the relative value of gold and silver was 15 1/2:1; now it is approximately 22:1, and silver is still constantly falling as against gold. This is essentially the result of a revolution in the mode of production of both metals. Formerly gold was obtained almost exclusively by washing it out from gold-bearing alluvial deposits, products of the weathering of auriferous rocks. Now this method has become inadequate and has been forced into the background by the processing of quartz lodes themselves, a mode of extraction which formerly was only of secondary importance, although well known to the ancients (Diodorus, III, 12–14). Moreover, not only were huge new silver deposits discovered in North America in the western part of the Rocky Mountains, but these and the Mexican silver mines were really opened up by the laying of railways, which made possible the shipment of modern machinery and fuel and in consequence the mining of silver on a very large scale at low cost. However, there is a great difference in the way the two metals occur in the quartz lodes. The gold is mostly native, but disseminated throughout the quartz in minute quantities. The whole mass of the vein must therefore be crushed and the gold either washed out or extracted by means of mercury. Often 1,000,000 grammes of quartz barely yield 1–3 grammes of gold, and very seldom do they yield 30–60 grammes. Silver is seldom found native: however, it occurs in special quartz that is separated from the lode with comparative ease and contains mostly 40–90 per cent silver, and is also contained, in smaller quantities, in copper, lead and other ores which in themselves are worthwhile working. From this alone it is apparent that the labor expended on the production of gold is tending to increase, while that expended on silver production has decidedly decreased, which quite naturally explains the drop in the value of the latter. This fall in value would express itself in a still greater fall in price if the price of silver were not pegged even today by artificial means. But America's rich silver de-

ungefähr = 22:1, und Silber fällt noch fortwährend gegen Gold. Dies ist wesentlich Folge einer Umwälzung in der Produktionsweise beider Metalle. Früher wurde Gold fast nur durch Auswaschen goldhaltiger Alluvialschichten, der Verwitterungsprodukte goldhaltiger Gesteine, gewonnen. Jetzt reicht diese Methode nicht mehr aus und ist in den Hintergrund gedrängt durch die früher nur in zweiter Linie betriebene, obwohl schon den Alten (Diodor, III, 12–14) wohlbekannte Bearbeitung der goldhaltigen Quarzgänge selbst. Andererseits wurden nicht nur im Westen der amerikanischen Felsengebirge ungeheure neue Silberlager entdeckt, sondern diese und die mexikanischen Silbergruben durch Eisenbahnen erschlossen, die Zufuhr von moderner Maschinerie und von Brennstoff und dadurch Silbergewinnung auf größtem Maßstab und mit geringeren Kosten ermöglicht. Es besteht aber ein großer Unterschied in der Art, wie beide Metalle in den Erzgängen vorkommen. Das Gold ist meist gediegen, aber dafür in winzig kleinen Mengen im Quarz zerstreut; die ganze Gangart muß daher zerstampft und das Gold ausgewaschen, resp. durch Quecksilber ausgezogen werden. Auf 1 000 000 Gramm Quarz kommt dann oft kaum 1–3, sehr selten 30–60 Gramm Gold. Silber kommt selten gediegen, dafür aber in eignen, verhältnismäßig leicht von der Gangart zu trennenden Erzen vor, die meist von 40–90 Prozent Silber enthalten; oder aber es ist in geringeren Mengen enthalten in den an sich schon Bearbeitung lohnenden Erzen von Kupfer, Blei etc. Schon hieraus geht hervor, daß, während die Produktionsarbeit des Goldes sich eher vermehrt, die des Silbers sich entschieden vermindert hat, der Wertfall des letzteren sich also ganz natürlich erklärt. Dieser Wertfall würde sich in noch größerem Preisfall ausdrücken, würde nicht der Silberpreis auch jetzt noch durch künstliche Mittel hochgehalten. Die Silberschätze von Amerika sind aber erst zum kleinen Teil zugänglich gemacht, und so ist alle Aussicht vorhanden, daß der Silberwert noch längere Zeit am Sinken bleibt. Hierzu muß noch mehr beitra-

posits have so far barely been tapped, and thus the prospects are that the value of this metal will keep on dropping for rather a long time to come. A still greater contributing factor here is the relative decrease in the need for silver for articles of general use and for luxuries, that is its replacement by plated goods, aluminium, etc. One may thus gauge the utopianism of the bimetallist idea that compulsory international quotation will raise silver again to the old value ratio of 1:15 1/2. It is more likely that silver will forfeit its money function more and more in the world market.

Internationally double standard, even though in the domestic circulations, only one standard prevails. (Why can this violation against the concept of money persist internationally?) Due to this duplication, the two functions of money, the national and the international, can be seen to be different. Even in a country with gold standard, the central bank must have silver reserves for the trade with countries with silver standard.

World money has the same three functions as domestic money, but there is a shift in importance:

242/o World money serves as the universal means of payment, as the universal means of purchase, and as the absolute social materialization of wealth as such (UNIVERSAL WEALTH). Its predominant function is as means of payment in the settling of international balances. Hence the slogan of the Mercantile System: balance of trade.¹⁰⁹ Gold and silver serve as international means of purchase essentially only when the customary equilibrium in the interchange of products between different nations is suddenly disturbed. And, lastly, world money serves as the universally recognized social materialization of wealth, whenever it is not a matter of buying or paying, but of transferring wealth from one country to another, and whenever its transfer in the form of commodities is ruled out, either by the conjuncture of the market, or by the purpose of the transfer itself.¹¹⁰

gen die relative Abnahme des Silberbedarfs für Gebrauchs- und Luxusartikel, sein Ersatz durch plattierte Waren, Aluminium etc. Danach ermessen man den Utopismus der bimetallistischen Vorstellung, ein internationaler Zwangskurs werde das Silber auf das alte Wertverhältnis von 1:15 1/2 wieder hinaufschrauben. Eher dürfte das Silber auch auf dem Weltmarkt seine Geldqualität mehr und mehr einbüßen.—F. E.}

157:2/o Das Weltgeld funktioniert als allgemeines Zahlungsmittel, allgemeines Kaufmittel und absolut gesellschaftliche Materiatue des Reichtums überhaupt (universal wealth). Die Funktion als Zahlungsmittel, zur Ausgleichung internationaler Bilanzen, herrscht vor. Daher das Lösungswort des Merkantilsystems—Handelsbilanz!¹⁰⁹ Zum internationalen Kaufmittel dienen Gold und Silber wesentlich, sooft das herkömmliche Gleichgewicht des Stoffwechsels zwischen verschiedenen Nationen plötzlich gestört wird. Endlich als absolut gesellschaftliche Materiatue des Reichtums, wo es sich weder um Kauf noch Zahlung handelt, sondern um Übertragung des Reichtums von einem Land zum andren, und wo diese Übertragung in Warenform entweder durch die Konjunkturen des Warenmarkts oder den zu erfüllenden Zweck selbst ausgeschlossen wird.¹¹⁰

The German “wesentlich” is sometimes used for brief characterizations which capture

the essentials although they may not cover all the details or all the possibilities. I translated it here

with “essentially only.”

Footnote 109 is another polemic against the quantity theory of money.

¹⁰⁹ The opponents of the Mercantile System, a system which considered the settlement of surplus trade balances in gold and silver as the aim of international trade, were for their part entirely mistaken as to the function of world money. I have thoroughly demonstrated elsewhere, taking Ricardo as an example, the way in which a false conception of the laws which regulate the quantity of the circulating medium is reflected in a false conception of the international movement of the precious metals (*Contribution*, pp. 398:1/o sq.). Ricardo’s erroneous dogma: ‘An unfavourable balance of trade never arises but from a redundant currency ... The exportation of the coin is caused by its cheapness, and is not the effect, but the cause of an unfavourable balance,’ already occurs in Barbon: ‘The balance of Trade, if there be one, is not the cause of sending away the money out of a nation; but that proceeds from the difference of the value of bullion in every country’ (N. Barbon, [Bar96, pp. 59, 60]). MacCulloch, in *The Literature of Political Economy: A Classified Catalogue*, London, 1845, praises Barbon for this anticipation, but very wisely avoids even mentioning the naïve forms in which the absurd presuppositions of the ‘currency principle’ appear in Barbon’s work. The uncritical and even dishonest nature of MacCulloch’s catalogue reaches its summit in the sections devoted to the history of the theory of money, where he is flattering Lord Overstone (ex-banker Loyd), whom he describes as ‘facile princeps argentariorum’ [the recognized king of the money merchants].

¹¹⁰ For instance, in the case of subsidies, money loans for carrying on wars or for enabling banks to resume cash payments, etc., value may be required precisely in the form of money.

¹⁰⁹ Die Gegner des Merkantilsystems, welches die Saldierung überschüssiger Handelsbilanz durch Gold und Silber als Zweck des Welthandels behandelte, verkannten ihrerseits durchaus die Funktion des Weltgeldes. Wie die falsche Auffassung der Gesetze, welche die Masse der Zirkulationsmittel regeln, sich in der falschen Auffassung der internationalen Bewegung der edlen Metalle nur widerspiegelt, habe ich ausführlich an Ricardo nachgewiesen (l.c. p. 398:1/o sqq. Sein falsches Dogma: „Eine ungünstige Handelsbilanz kann nie anders als durch eine Überfülle von Zirkulationsmitteln entstehen ... Die Ausfuhr von Münzen ist ihrer Billigkeit geschuldet, und ist nicht die Folge, sondern die Ursache einer ungünstigen Bilanz“ findet man daher schon bei Barbon: „Die Handelsbilanz, wenn es eine solche gibt, ist nicht die Ursache dafür, daß das Geld aus einem Lande ausgeführt wird. Die Ausfuhr ergibt sich vielmehr aus dem Wertunterschied der Edelmetalle in jedem Land.“ N. Barbon [Bar96, p. 59]. MacCulloch in „The Literature of Political Economy: a classified Catalogue“, Lond. 1845, belobt Barbon für diese Antizipation, vermeidet aber wohlweislich die naiven Formen, worin bei B. die absurden Voraussetzungen des „currency principle“ noch erscheinen, auch nur zu erwähnen. Die Kritiklosigkeit und selbst Unehrllichkeit jenes Katalogs gipfeln in den Abschnitten über die Geschichte der Geldtheorie, weil MacCulloch hier als Sykophant des Lord Overstone (exbanker Loyd), den er „facile princeps argentariorum“ nennt, schwanzwedelt.

¹¹⁰ Z.B. bei Subsidien, Geldanleihen zur Kriegführung oder zur Wiederaufnahme der Barzahlungen von Banken usw. kann Wert grade in der Geldform erheischt sein.

Question 518 *Why is means of payment, and not means of purchase, the predominant function of international money?*

In 231:3/o, Marx had mentioned that the gold hoards so copiously created by private citizens at that time had the economic function of allowing the quantity of the circulating medium to ebb and flow. These hoards not only served as buffer stocks for the domestic circulation, but also for international payments:

243:1 Just as every country needs a reserve fund for its internal circulation, so too it requires one for circulation in the world market. The functions of hoards, therefore, arise in part out of the function of money as medium of payment and circulation internally, and in part out of its function as a world money.^{110a} In this latter role it is always the genuine money-commodity, gold and silver in their physical shape, which is required. For that reason Sir James Steuart expressly characterizes gold and silver as ‘money of the world’ in order to distinguish them from their merely local representatives.

^{110a} ‘I would desire, indeed, no more convincing evidence of the competency of the machinery of the hoards in specie-paying countries to perform every necessary office of international adjustment, without any sensible aid from the general circulation, than the facility with which France, when but just recovering from the shock of a destructive foreign invasion, completed within the space of 27 months the payment of her forced contribution of nearly 20 millions to the allied powers, and a considerable proportion of the sum in specie, without any perceptible contraction or derangement of her domestic currency, or even any alarming fluctuation of her exchanges’ (Fullarton, op. cit., p. 141). [Added by Engels to the fourth German edition:] We have a still more striking example in the facility with which the same France was able in 1871–3 to pay off within 30 months a forced contribution more than ten times as great, a considerable part of it likewise in specie.

158:1/o Wie für seine innere Zirkulation, braucht jedes Land für die Weltmarktzirkulation einen Reservefonds. Die Funktionen der Schätze entspringen also teils aus der Funktion des Geldes als inneres Zirkulations- und Zahlungsmittel, teils aus seiner Funktion als Weltgeld.^{110a} In der letzteren Rolle ist stets die wirkliche Geldware, leibhaftiges Gold und Silber, erheischt, weswegen James Steuart Gold und Silber, im Unterschied von ihren nur lokalen Stellvertretern, ausdrücklich als „money of the world“ charakterisiert.

^{110a} Note zur 2. Ausgabe: „Tatsächlich könnte ich mir keinen überzeugenderen Beweis dafür wünschen, daß der Mechanismus der Schatzbildung in Ländern mit Metallwährung imstande ist, jede notwendige Funktion bei Begleichung internationaler Verbindlichkeiten zu erfüllen, und zwar ohne wahrnehmbare Unterstützung durch die allgemeine Zirkulation, als die Leichtigkeit, mit der Frankreich, das erst im Begriffe war, sich von der Erschütterung durch eine zerstörende feindliche Invasion zu erholen, in einem Zeitraum von 27 Monaten die Zahlung der ihm auferlegten Kriegsentschädigung von fast 20 Millionen an die verbündeten Mächte leistete, und zwar einen beträchtlichen Teil dieser Summe in Metallgeld, ohne merkbare Einschränkung oder Störung des inländischen Geldumlaufs oder irgendwelche alarmierende Schwankungen seines Wechselkurses.“ Fullarton, [Ful45, p. 141]. {Zur 4. Auflage.—Ein noch schlagenderes Beispiel haben wir in der Leichtigkeit, womit dasselbe

Frankreich 1871–1873 in 30 Monaten eine mehr als zehnfach größere Kriegsentschädigung, ebenfalls zum bedeutenden Teil in Metallgeld, abzutragen imstande war.—F.E.}

Question 519 *How does the domestic functions of the gold reserves of a country differ from its international functions? Do these two functions come into conflict with each other?*

Next Marx discusses the international movements of gold and silver:

243:2/o The stream of gold and silver follows a twofold movement. On the one hand, it spreads out from its sources all over the world, and is absorbed to various extents into the different national spheres of circulation, where it enters into the various channels of internal circulation. There it replaces abraded gold and silver coins, supplies the material for articles of luxury, and petrifies into hoards.¹¹¹ This first movement is mediated through the direct exchange of the labor of individual countries which has been realized in commodities for the labor realized in the precious metals by the gold- and silver-producing countries. On the other hand, gold and silver continually flow back and forth between the different national spheres of circulation, and this movement follows the unceasing fluctuations of the rate of exchange.¹¹²

¹¹¹ ‘Money is shared among the nations in accordance with their need for it ... as it is always attracted by the products’ (Le Trosne, op. cit., p. 916). ‘The mines which are continually giving gold and silver, do give sufficient to supply such a needful balance to every nation’ (J. Vanderlint, [Van34, p. 40]).

¹¹² ‘Exchanges rise and fall every week, and at some particular times in the year run high against a nation, and at other times run as high on the contrary’ (N. Barbon, [Bar96, p. 39]).

159:1 Die Bewegung des Gold- und Silberstroms ist eine doppelte. Einerseits wälzt er sich von seinen Quellen über den ganzen Weltmarkt, wo er von den verschiedenen nationalen Zirkulationssphären in verschiedenem Umfang abgefangen wird, um in ihre inneren Umlaufkanäle einzugehen, verschlissene Gold- und Silbermünzen zu ersetzen, das Material von Luxuswaren zu liefern und zu Schätzen zu erstarren.¹¹¹ Diese erste Bewegung ist vermittelt durch direkten Austausch der in Waren realisierten Nationalarbeiten mit der in edlen Metallen realisierten Arbeit der Gold und Silber produzierenden Länder. Andererseits laufen Gold und Silber fortwährend hin und her zwischen den verschiedenen nationalen Zirkulationssphären, eine Bewegung, die den unaufhörlichen Oszillationen des Wechselkurses folgt.¹¹²

¹¹¹ „Das Geld verteilt sich auf die Nationen nach ihren Bedürfnissen ... indem es immer durch die Produkte angezogen wird.“ Le Trosne, [LT46, p. 916]. „Die Minen, die fortwährend Gold und Silber liefern, sind ergiebig genug, um jeder Nation dieses notwendige Quantum zu liefern.“ J. Vanderlint, [Van34, p. 40].

¹¹² „Die Wechselkurse steigen und fallen in jeder Woche, sie steigen zu bestimmten Zeiten des Jahres zuungunsten einer Nation in die Höhe und erreichen zu anderen Zeiten die gleiche Höhe zu deren Vorteil.“ N. Barbon, [Bar96, p. 39].

The very last paragraph of the chapter about Money discusses the modern dictates of

efficiency to reduce the stock of money to a minimum.

244:1 Countries with developed bourgeois production limit the hoards, which are concentrated in the strong rooms of the banks, to the minimum required for the performance of their specific functions.¹¹³

This increased efficiency however makes the system more vulnerable. The two functions of the money stock, for domestic or international circulation, come now in conflict. Footnote 113 is an argument against Peel’s 1844 Bank Act, which made the Bank of England’s ability to issue short term credit (by the conversion of bank notes of private issuers into its own notes) dependent on the level of gold reserves:

¹¹³ These different functions can come dangerously into conflict whenever gold and silver have also to serve as a fund for the conversion of bank notes.

This is very terse. Marx could have said much more about the contradictions between domestic money and international money. As long as private gold hoards were ample, they could easily satisfy their two different functions, for domestic and international circulation. However when hoards are minimized since they are considered an unprofitable dead weight, these two functions get into contradiction with each other. This contradiction persists even today. If international transactions create an unwanted increase in high-powered currency, then the central bank must “sterilize” these transactions. International currency movements may also make it difficult or impossible for the central bank to pursue the monetary policy indicated by the domestic economic conditions. In the world monetary system since World War II, the dollar and later a bundle of national currencies serve as world money. The fact that national currencies serve as world money is again a source of conflicts.

Marx’s final remark: under the modern dictates of efficiency, larger hoards are no longer a sign of more wealth but a sign of malfunction.

Whenever these hoards are strikingly above their average level, this is, with some exceptions, an indication of stagnation in the circulation of commodities, i.e. of an interruption in the flow of their metamorphoses.¹¹⁴

Marx is witnessing here a change in regime: the former regime in which numerous individual gold hoards formed an extremely elastic supply to the changing circulation needs was replaced by a regime with much more centralized and relatively much smaller currency reserves. The footnote illustrates the new-found sense of economy, which considered gold hoards as unproductive and according to which a country could also have too much money.

¹¹⁴ ‘What money is more than of absolute necessity for a Home Trade, is dead stock ... and brings no profit to that country it’s kept in, but

160:1 Länder entwickelter bürgerlicher Produktion beschränken die in Bankreservoirs massenhaft konzentrierten Schätze auf das zu ihren spezifischen Funktionen erheischte Minimum.¹¹³

¹¹³ Diese verschiedenen Funktionen können in gefährlichen Konflikt geraten sobald die Funktion eines Konversionsfonds für Banknoten hinzutritt.

Mit gewisser Ausnahme zeigt auffallendes Überfüllen der Schatzreservoirs über ihr Durchschnittsniveau Stockung der Warenzirkulation an oder unterbrochenen Fluß der Warenmetamorphose.¹¹⁴

¹¹⁴ „Was an Geld mehr vorhanden ist, als für den inländischen Handel unbedingt notwendig, stellt totes Kapital dar, und bringt dem Lande,

as it is transported in trade, as well as imported' (John Bellers, Essays, etc., p. 13). 'What if we have too much coin? We may melt down the heaviest and turn it into the splendour of plate, vessels or utensils of gold or silver; or send it out as a commodity, where the same is wanted or desired; or let it out at interest where interest is high' (W. Petty, Quantulumcunque, p. 39). 'Money is but the fat of the Body Politick, whereof too much doth as often hinder its agility, as too little makes it sick ... as fat lubricates the motion of the muscles, feeds in want of victuals, fills up the uneven cavities, and beautifies the body, so doth money in the state quicken its action, feeds from abroad in time of dearth at home; evens accounts ... and beautifies the whole; altho' more especially the particular persons that have it in plenty' (W. Petty, Political Anatomy of Ireland, pp. 14, 15) [in fact, this is again the supplement, Verbum Sapienti].

das es besitzt, keinen Gewinn, außer wenn es selbst exportiert bzw. importiert wird.“ (John Bellers, Essays etc., p. 13.) „Was aber, wenn wir nun zuviel gemünztes Geld haben? Wir können dann das vollwichtigste einschmelzen und es zu prächtigem Tischgerät, zu Gefäßen und Hausrat aus Gold und Silber umarbeiten; oder es als Ware dorthin schicken, wo Bedarf und Nachfrage danach besteht; oder es dort auf Zins ausleihen, wo man einen hohen Zinssatz zahlt.“ (W. Petty, „Quantulumcunque“ p. 39.) „Geld ist nur das Fett des Staatskörpers, weshalb zuviel davon ebenso seine Beweglichkeit behindert, wie zu wenig ihn krank macht ... wie Fett die Bewegung der Muskeln geschmeidig macht, fehlende Nahrungsmittel ersetzt, Unebenheiten ausfüllt und den Körper verschönt, so erleichtert das Geld die Bewegungen des Staates, bringt, wenn Teuerung im Inlande, vom Auslande Lebensmittel herein, begleicht Schuldenrechnungen ... und verschönt das Ganze; allerdings“, ironisch abschließend, „ganz besonders die einzelnen Personen, die viel davon haben.“ W. Petty, [Pet91, p. 14, 15 of the supplement].

Exam Question 520 *Bring two examples of situations where money functions as money and not merely as measure of value or means of circulation.*

Term Paper Topic 521 *Comparison of Chapter Three in Capital with Chapter Two in Marx's 1859 Contribution to the Critique of Political Economy.*

Part II.

The Transformation of Money into Capital

In the English version, part Two consists of three chapters. In all German editions, these three chapters formed three sections of one chapter. This is why there is a discrepancy of two for most of the remaining chapter numbers between the German and the English.

4. The General Formula of Capital

After the discussion of money and the circulation of commodities in chapter Three, Marx turns now to capital. The first four paragraphs make the transition from commodity circulation to capital. ↓ This transition can be summarized by the first sentence:

247:1 The circulation of commodities is the point of departure of capital.	161:1 Die Warenzirkulation ist der Ausgangspunkt des Kapitals.
--	--

(1) First of all, this sentence can be taken as a historical statement:

Commodity production and developed commodity circulation, trade, are the historical presuppositions under which capital originates.	Warenproduktion und entwickelte Warenzirkulation, Handel, bilden die historischen Voraussetzungen, unter denen es entsteht.
---	---

↑ (1a) Commodity production must exist and trade must be developed before capital can come into being. This tells us something about the pre-capitalist period, a historical period which is not yet subject to the logic of capital. Already before capitalism, commodity circulation must have reached a certain degree of development so that capitalism could take off.

World trade and the world market, in the sixteenth century, usher in the modern life-history of capital.	Welthandel und Weltmarkt eröffnen im 16. Jahrhundert die moderne Lebensgeschichte des Kapitals.
--	---

↑ (1b) The creation of world trade and the world market in the sixteenth century ushered in what Marx calls the “modern life-history of capital.” Here Marx speaks about the first period in the history of capital itself. The term *life-history* indicates that the history of modern capital, as opposed to scattered and transient prior forms of capital (usury and merchant capital), is the history of one persistent organism, which gradually spread over the whole world. Marx generally does not use the term “capitalism,” but here it would be appropriate.

↓ (2) It is not a coincidence that commodity circulation plays such an important role for the historical origin of capital. The element of circulation which drives towards the development of capital is *money*. Marx is about to show three things: (2a) circulation leads to money, (2b) money is the first form of appearance of capital, and (2c) money as capital distinguishes itself from money as money first only by its form of circulation.

(2a) The first step is: commodity circulation leads to money.

247:2 If we disregard the material content of commodity circulation, i.e., the exchange of the various use-values, and consider only the economic forms generated by	161:2 Sehn wir ab vom stofflichen Inhalt der Warenzirkulation, vom Austausch der verschiedenen Gebrauchswerte, und betrachten wir nur die ökonomischen Formen, die
--	--

this process, we find that its ultimate product is money.

↓ (2b) Money is one of the forms which capital can assume, and while it is arguably not the most important form of capital—this honor, or curse, belongs to the commodity labor-power—the money form nevertheless has special significance. Marx calls it the “first” form of capital:

This ultimate product of commodity circulation is the first form of appearance of capital.

↓ (2bA) On the one hand, this is true in history. At the present point, Marx remains a little vague about the historical transition between pre-capitalist commodity circulation and capital, for the following reason: Circulation alone does not generate capital. Circulation leads to money, which is the condition, the soil, from which a new process emerges. But soil alone is not enough, a seed is necessary as well. We will see later that the commodity labor-power is this seed. Labor-power as a commodity however implies the appropriation of the labor of others, and this brings in much deeper social relations than those studied in the first three chapters of *Capital*, namely, it brings in class relations. In chapter Six, p. 273:3/o, Marx is going to emphasize that we are entering here a new realm. This new realm is hinted at already here, in the next sentence, where Marx brings evidence that the statement “money is the first form of capital” is valid in *history*:

247:3 Historically speaking, capital invariably first confronts landed property in the form of money; as monetary wealth, merchants’ capital, and usurers’ capital.¹

↑ The historic confrontation of capital with landed property started with monetary wealth.

↓ Footnote 1 comments on the character of this confrontation:

¹ The contrast between the power of landed property, which based on personal relations of domination and servitude, and the impersonal power of money, is clearly expressed in the two French proverbs ‘No land without its lord’ and ‘Money has no master.’

Question 522 *Why is landed property associated with personal servitude and domination, while capital, which is equally exploitative, is antagonistic to such relations?*

↓ (2bB) Also in its daily practical functions, money is the “first form of appearance of capital.”

However, we do not need to look back at the history of capital’s origin in order to recognize that money is its first form of ap-

dieser Prozeß erzeugt, so finden wir als sein letztes Produkt das Geld.

Dies letzte Produkt der Warenzirkulation ist die erste Erscheinungsform des Kapitals.

161:3 Historisch tritt das Kapital dem Grundeigentum überall zunächst in der Form von Geld gegenüber, als Geldvermögen, Kaufmannskapital und Wucherkapital.¹

¹ Der Gegensatz zwischen der auf persönlichen Knechtschafts- und Herrschaftsverhältnissen beruhenden Macht des Grundeigentums und der unpersönlichen Macht des Geldes ist klar gefaßt in den zwei französischen Sprichworten: „Nulle terre sans seigneur,“ „L’argent n’a pas de maître.“

Jedoch bedarf es nicht des Rückblicks auf die Entstehungsgeschichte des Kapitals, um das Geld als seine erste Erscheinungsform

4. General Formula of Capital

pearance. Capital’s story is played out before our eyes every day. Every new capital makes its first appearance on the stage—i.e. the market, whether it is the commodity market, the labor market, or the money market—in the shape of money, money which has the vocation to transform itself into capital by certain specific processes.

The German text contains a pun which may not be recognizable in the translation: “history” and

“story” are in German the same word “Geschichte.” The translation “has the vocation

to” in the last sentence tried to capture the Hegelian meaning of “soll.”

(2bC) Later in this chapter, in 255:2/o, the structural or “logical” reasons will be given why money plays such a central role for capital.

Question 523 *Compare what Marx says in chapter Four of Capital, 247:2 and 247:3, about money being the “first form of appearance of capital” with what he says in Contribution 389/o about money being the “elementary form of exchange-value.”*

↓ (2c) The question “how does money as capital differ from money in its previously discussed functions?” leads us back to the circulation process.

247:4/o Money as capital distinguishes itself from money as money at first only by its different form of circulation.

161:4 Geld als Geld und Geld als Kapital unterscheiden sich zunächst nur durch ihre verschiedene Zirkulationsform.

↑ This formulation is a little misleading. Even if money is a form of capital, is still is also money in the sense that it still performs one of the functions as measure of value or means of circulation or independent incarnation of abstract wealth. The above sentence has to be read as “money as capital distinguishes itself from money which performs its monetary functions unrelated to the self-expansion of value at first only by its different form of circulation.”

Just a word about our numbering scheme. Marx started the chapter with the historical link between circulation and capital, which we called here point (1). This led him to the special role which money plays for capital, called here point (2). The discovery that money is the bridge between circulation and capital allows him to take a second, deeper look at the link between circulation and capital, which will be called point (3).

(3) In order to tell whether a given amount of money is capital or not, one has to look at the *movement* in which it is engaged. ↓ (3a) We know what the movement of money looks like which is *not* capital:

The immediate form of the circulation of commodities is $C - M - C$, transformation of commodities into money and reconversion of money into commodities; selling in order to buy.

162:1 Die unmittelbare Form der Warenzirkulation ist $W - G - W$, Verwandlung von Ware in Geld und Rückverwandlung von Geld in Ware, verkaufen, um zu kaufen.

↑ Here it might be useful to recapitulate $C - M - C$. The direct barter is a transaction in which each participant pursues two different goals: realizing the value of the product given in exchange, and selecting the use-value of the product received. These two goals are so much in conflict with each other that the direct barter breaks into two halves, sale and purchase. $C - C$ becomes $C - M - C$. The first transaction $C - M$ specializes on the realization of value, and the second transaction $M - C$ on the selection of use-values. All this was discussed at length in chapters Two and Three. ↓ (3b) New in chapter Four is the observation that these two fragments, sale and purchase, can also be put together in the reverse order: $M - C - M$. But alongside this form we find a second, specifically different form: $M - C - M$, transformation of money into commodities and reconversion of commodities into money; buying in order to sell.

↑ With the words: “we *find* a second form” Marx indicates that this is not merely an abstract possibility. Many people in modern capitalism pursue circulation in this reverse order. $M - C - M$ is, of course, the form of circulation of capital. Marx will derive what capital is from looking at its form of circulation. A delicate bootstrapping act.

↓ But instead of saying “we will infer the essence of capital from its form of circulation,” Marx says that money itself *becomes* capital if it goes through this form of circulation. I.e., Marx announces it not as an epistemological process of learning about social relations, but an ontological transition of these social relations themselves. The researcher only watches the development of money itself.

Money, which follows this latter course in its movement, converts itself into capital, becomes capital, and, according to its determination, already is capital.

The details of this will be developed next.

Question 524 In 247:4/o, Marx makes three statements about money engaged in $M - C - M$: (1) this money converts itself into capital, (2) this money becomes capital, and (3) according to its determination, this money already is capital. What is the difference between these three statements? Why does Marx not say that this money is capital?

4.1. [M–C–M: Acts in Circulation and Motivation of the Agents]

Since money is the first form of capital, it makes sense to begin the systematic discussion of capital with money. And since money as capital differs from money as money at first only in its form of circulation, it makes sense to look at this form of circulation $M - C - M$.

Marx’s goal is to explore the relations of production whose surface mediation is $M - C - M$. This exploration consists of inferences on three different levels: (1) Marx describes

Neben dieser Form finden wir aber eine zweite, spezifisch unterschiedne vor, die Form $G - W - G$, Verwandlung von Geld in Ware und Rückverwandlung von Ware in Geld, kaufen, um zu verkaufen.

Geld, das in seiner Bewegung diese letztere Zirkulation beschreibt, verwandelt sich in Kapital, wird Kapital und ist schon seiner Bestimmung nach Kapital.

certain circulation phenomena visible on the surface of the economy, usually with the words that he is looking at the “form” of circulation; (2) from these circulation phenomena he draws conclusions about the activities and motivations of the persons performing these circulation acts, sometimes with the words that he is exploring the “purpose” or “aim” of the circulation phenomena; and (3) he looks at the social relations which make these individual activities possible and are at the same time sustained by them. This he calls the “content” of the circulation process.

Marx begins with a thorough *description* of the circulation process, which stays on level (1) in our classification. This is followed by inferences on levels (2) and (3); however Marx runs into an impasse and has to go back to level (1) and re-describe certain aspects of the circulation process in order to take in additional aspects of this process. Only after this can he draw his inferences on levels (2) and (3) to a conclusion.

4.1.a. [Description of M–C–M]

↓ The first paragraph is a description of the circulation act $M - C - M$.

248:1 Let us examine the circular movement $M - C - M$ a little more closely. Like the simple circulation of commodities, it passes through two opposite phases. In the first phase, $M - C$ (the purchase), the money is changed into a commodity. In the second phase, $C - M$ (the sale), the commodity is changed back into money.

↑ If one looks at the two acts separately, one sees that the first act is a purchase and the second a sale. But this is not the only thing that is visible. ↓ If one looks at the two acts as a unity, one sees their connection: the commodity acquired by the purchase is given away again, i.e., the first act is only the preparatory act for the second, it is a purchase *in order to* sell.

The unity of these two phases, however, is the movement as a whole, which exchanges money for a commodity and the same commodity back for money, which buys a commodity in order to sell it, or, if one neglects the formal differences between buying and selling, buys a commodity with money and then buys money with a commodity.²

↓ Footnote 2 gives the origin of this memorable formulation:

² ‘With money one buys commodities, and with commodities one buys money.’ Mercier de la Rivière, [MdlR46, p. 543].

162:2 Sehn wir uns die Zirkulation $G - W - G$ näher an. Sie durchläuft, gleich der einfachen Warenzirkulation, zwei entgegengesetzte Phasen. In der ersten Phase, $G - W$, Kauf, wird das Geld in Ware verwandelt. In der zweiten Phase, $W - G$, Verkauf, wird die Ware in Geld rückverwandelt.

Die Einheit beider Phasen aber ist die Gesamtbewegung, welche Geld gegen Ware und dieselbe Ware wieder gegen Geld austauscht, Ware kauft, um sie zu verkaufen, oder wenn man die formellen Unterschiede von Kauf und Verkauf vernachlässigt, mit dem Geld Ware und mit der Ware Geld kauft.²

² „Mit Geld kauft man Waren, und mit Waren kauft man Geld.“ Mercier de la Rivière, [MdlR46, p. 543].

After looking at the two elements of the process *separately* and at their *unity*, Marx also looks at the *result* of this process. This triad (separately, unity, result) will be repeated two more times in the discussion that follows; it is the rhythm in the background which gives structure to Marx's prose. ↓ What follows now is only the first formulation of this result:

The result which remains after completion of the process is the exchange of money for money, $M - M$.

↓ Although the empirical $M - C - M$ which we see happening in capitalism are usually exchange of money against *more* money, Marx stresses that qualitatively, beginning and end of the transaction are the same, namely, money:

If I purchase 2000 lb. cotton for £100, and resell them for £110, I have, in the end, exchanged £100 for £110, money for money.

Das Resultat, worin der ganze Prozeß erlischt, ist Austausch von Geld gegen Geld, $G - G$.

Wenn ich für 100 Pfd.St. 2000 Pfd. Baumwolle kaufe und die 2000 Pfd. Baumwolle wieder für 110 Pfd.St. verkaufe, so habe ich schließlich 100 Pfd.St. gegen 110 Pfd.St. ausgetauscht, Geld gegen Geld.

Already when investigating the Simple form of value, in 140:3/o, Marx said that qualities have to be investigated before quantities. ↓ The next paragraph argues that the investigation of $M - C - M$ also should at first abstract from quantities, i.e., one should look at $M - C - M$ with the first and last M quantitatively equal, despite the fact that the intention behind $M - C - M$ is always to get a bigger M than the one one started with:

248:2 Now it is evident that the circulatory process $M - C - M$ would be absurd and devoid of content if the intention were, by using this roundabout route, to exchange two equal sums of money, £100 for £100. The miser's plan would be far simpler and surer: he holds on to his £100 instead of exposing it to the dangers of circulation.

162:3 Es ist nun zwar augenscheinlich, daß der Zirkulationsprozeß $G - W - G$ abgeschmackt und inhaltslos wäre, wollte man vermittelt seines Umwegs denselben Geldwert gegen denselben Geldwert, also z.B. 100 Pfd.St. gegen 100 Pfd.St. austauschen. Ungleich einfacher und sichrer bliebe die Methode des Schatzbildners, der seine 100 Pfd.St. festhält, statt sie der Zirkulationsgefahr preiszugeben.

Question 525 At the beginning of 248:2 Marx says that $M - C - M$ in which the second M is intended to be equal to the first is "absurd" and "devoid of content." Nevertheless, later in the same paragraph he says that the quantitative differences should be disregarded, and proceeds to investigate $M - C - M$. Why does he insist on investigating a possibility which he just called "absurd" and "devoid of content"?

↓ The abstraction from the quantities can be defended on the grounds that $M - C - M$ has a special character even if the intended quantitative increase is not achieved:

And yet, whether the merchant who has paid £100 for his cotton sells it for £110, or lets it go for £100, or even £50, in each of these

Andrerseits, ob der Kaufmann die mit 100 Pfd.St. gekaufte Baumwolle wieder verkauft zu 110 Pfd.St., oder ob er sie zu 100

cases his money has described a characteristic and original path, quite different in kind from the path of simple circulation, as for instance in the case of the peasant who sells corn, and with the money thus garnered buys clothes.

↑ Even if a merchant loses money in one of his transactions, he is still engaged in a very specific circuit, which starts with money and ends with money. I.e., form and quantity are two different aspects: a change in quantity does not change the form. In the first stage of the investigation of this circuit, which concentrates on this form, Marx disregards therefore its quantitative aspect. ↓ In addition, Marx takes it as granted that this research must be a *comparison* of $M - C - M$ with $C - M - C$.

It is therefore first necessary to characterize the differences in form between the two circular paths $M - C - M$ and $C - M - C$. This will provide us at the same time with the difference in content lurking behind these differences in form.

He does not justify why it should be a comparison, presumably this is the case because $C - M - C$ is the normal form of the process, from which the inverted or perverted $M - C - M$ takes off.

The next phase in Marx's investigation is therefore a comparison between $M - C - M$ and $C - M - C$.

Pfd.St. und selbst zu 50 Pfd.St. losschlagen muß, unter allen Umständen hat sein Geld eine eigentümliche und originelle Bewegung beschrieben, durchaus anderer Art als in der einfachen Warenzirkulation, z.B. in der Hand des Bauern, der Korn verkauft und mit dem so gelösten Geld Kleider kauft.

Es gilt also zunächst die Charakteristik der Formunterschiede zwischen den Kreisläufen $G - W - G$ und $W - G - W$. Damit wird sich zugleich der inhaltliche Unterschied ergeben, der hinter diesen Formunterschieden lauert.

4.1.b. [What M–C–M and C–M–C Have in Common]

248:3 Let us first see what the two forms have in common.

↓ In order to see what the two circuits have in common, Marx describes the two circuits in as much detail as possible with words ambiguous enough that the same description applies to both circuits:

248:4/o Both circular paths are composed of the same two opposite phases, $C - M$, sale, and $M - C$, purchase. In each phase the same material elements confront each other, namely a commodity and money, and the same economic character masks, a buyer and a seller. Each circular path is the unity of the same two opposite phases, and in each case this unity is mediated through the

162:4 Sehn wir zunächst, was beiden Formen gemeinsam.

163:1 Beide Kreisläufe zerfallen in dieselben zwei entgegengesetzten Phasen, $W - G$, Verkauf, und $G - W$, Kauf. In jeder der beiden Phasen stehn sich dieselben zwei sachlichen Elemente gegenüber, Ware und Geld—und zwei Personen in denselben ökonomischen Charaktermasken, ein Käufer und ein Verkäufer. Jeder der beiden Kreisläufe ist die Einheit derselben ent-

participation of three contractual agents, of whom one only sells, another only buys, and the third both buys and sells.

gegengesetzten Phasen, und beidmal wird diese Einheit vermittelt durch das Auftreten von drei Kontrahenten, wovon der eine nur verkauft, der andre nur kauft, der dritte aber abwechselnd kauft und verkauft.

4.1.c. [How M–C–M and C–M–C Differ]

If quantities are abstracted from, the most striking difference between $C - M - C$ and $M - C - M$ is the inverted order of sale and purchase. Marx's analysis of the differences begins therefore with a look at the process as a unity. Marx needs to see what this inversion means for the overall process, before he can ask how this changes the character of the individual acts. Then he will point out that the purchase, as an individual act, has a different character in $C - M - C$ than in $M - C - M$. After this, he looks at the result of the processes, and at the end, he also notes an important difference when $C - M - C$ and $M - C - M$ are looked at as continuous processes.

[Looking at the Process as a Unity]

249:1 However the two circular paths $C - M - C$ and $M - C - M$ differ, obviously, by the inverted order in which the same two opposite phases of circulation are traversed. The simple circulation of commodities begins with a sale and ends with a purchase, while the circulation of money as capital begins with a purchase and ends with a sale.

163:2 Was jedoch die beiden Kreisläufe $W - G - W$ und $G - W - G$ von vornherein scheidet, ist die umgekehrte Reihenfolge derselben entgegengesetzten Zirkulationsphasen. Die einfache Warenzirkulation beginnt mit dem Verkauf und endet mit dem Kauf, die Zirkulation des Geldes als Kapital beginnt mit dem Kauf und endet mit dem Verkauf.

↓ If one looks at both phases as a unity, as Marx already did in 248:1 when looking at $M - C - M$ alone, the difference can be formulated as follows: In the one case, starting point and end point of the movement are commodities, in the other, money. The whole process is mediated in the first form by money, while in the second, inversely, by the commodity.

Dort bildet die Ware, hier das Geld den Ausgangspunkt und Schlußpunkt der Bewegung. In der ersten Form vermittelt das Geld, in der andren umgekehrt die Ware den Gesamtverlauf.

↑ The money in $C - M - C$, and the commodity in $M - C - M$, are held temporarily and then traded away again. As an act of circulation, holding something temporarily and then trading it away again satisfies the definition of "mediation." It is also mediation for the circulation agents, because they will go through this detour only if it helps them to reach their goal, i.e., if they hold the money or commodity in order to get the commodity or money which concludes the transaction.

[The Purchase Considered Separately: Spending versus Advancing]

↓ The act $M - C$, the purchase, is different when it is part of $M - C - M$ than when it is part of $C - M - C$:

249:2 In the circulation $C - M - C$, money is in the end converted into a commodity which serves as a use-value; it has therefore been spent once and for all. In the inverted form $M - C - M$, on the contrary, the buyer lays out money in order that, as a seller, he may recover money. By his purchase of a commodity he throws money into circulation, in order to withdraw it again by the sale of the same commodity. He releases the money, but only with the cunning intention of getting it back again.

163:3 In der Zirkulation $W - G - W$ wird das Geld schließlich in Ware verwandelt, die als Gebrauchswert dient. Das Geld ist also definitiv ausgegeben. In der umgekehrten Form $G - W - G$ gibt der Käufer dagegen Geld aus, um als Verkäufer Geld einzunehmen. Er wirft beim Kauf der Ware Geld in die Zirkulation, um es ihr wieder zu entziehen durch den Verkauf derselben Ware. Er entläßt das Geld nur mit der hinterlistigen Absicht, seiner wieder habhaft zu werden.

↓ The difference is so striking that these two types of spending money even have different names:

The money therefore is not spent, it is merely advanced.³

Es wird daher nur vorgeschossen.³

³ 'When a thing is bought in order to be sold again, the sum employed is called money advanced; when it is bought not to be sold, it may be said to be expended' (James Steuart, Works, etc., edited by General Sir James Steuart, his son, London, 1805, Vol. 1, p. 274).

³ „Wenn ein Ding gekauft wird, um wieder verkauft zu werden, nennt man die hierzu verwendete Summe vorgeschossenes Geld; wird es gekauft, um nicht wieder verkauft zu werden, so kann man sie als verausgabt bezeichnen.“ (James Steuart, „Works etc.“, edited by General Sir James Steuart, his son, Lond. 1805, v. 1, p. 274.)

Exam Question 527 Give examples for “advancing” and “expending” money.

Question 528 If someone first buys a car, and after two years trades it in for a new car, is that $C - M - C$ or $M - C - M$?

If someone first buys a house, then after ten years decides to move and sells his house for a profit, is this $C - M - C$ or $M - C - M$?

If a farmer raises wheat, then at the end of the year sells his crop and with the proceeds buys the materials to raise next year's wheat, is that $C - M - C$ or $M - C - M$?

↑ Since language has reserved two different words for the act $M - C$, according to whether it is part of $C - M - C$ or $M - C - M$, the inference from the form of circulation to individual motivations simply consists in looking up the meaning of these two words. The existence of these two words also confirms that Marx is justified in concluding from the form of circulation to individual motivations.

[Result of M–C–M: The Reflux]

↓ Here Marx argues on level (1), the level of the surface events in circulation, but instead of staying on the microeconomic level he takes a macroeconomic look at the circulation phenomena:

249:3 In the form $C - M - C$, the same piece of money is displaced twice. The seller gets it from the buyer and pays it away to another seller. The whole process, which begins with the receipt of money in return for commodities, comes to an end with the relinquishing of money in return for commodities.

In chapter Three, p. 210:1, Marx emphasizes that the circulation process of the commodity $C - M - C$ “sweats out” money, it pushes money through the economy, but that the money itself does not go in a circle. He calls it the “flow” of money, not its “circuit.” In $M - C - M$, the situation is different:

In the form $M - C - M$ this process is inverted. Here it is not the piece of money which is displaced twice, but the commodity. The buyer takes it from the hands of the seller and passes it into the hands of another buyer. Whilst in the simple circulation of commodities the twofold displacement of the same piece of money effects its definitive transfer from one hand into another, here the twofold displacement of the same commodity causes the money to flow back to its initial point of departure.

↓ This reflux plays an important role in Marx’s theory. $M - C - M$ is only possible if the overall circulation has such a structure that the money flows back to the person who has originally spent it. Apparently Marx argues here: since $M - C - M$ is happening, we know that the overall circulation process must have a structure which provides for this reflux. The next paragraph give the following clarifications:

- That *there is* a reflux is not a question of the quantity of the reflux.
- The fact that the money flows back is a “palpable difference,” one which one can see by a mere observation of the circulation phenomena without having to “interpret” the agents.

250:1 This reflux of money to its starting-point does not depend on the commodity’s

163:4 In der Form $W - G - W$ wechselt dasselbe Geldstück zweimal die Stelle. Der Verkäufer erhält es vom Käufer und zahlt es weg an einen andren Verkäufer. Der Gesamtprozeß, der mit der Einnahme von Geld für Ware beginnt, schließt ab mit der Weggabe von Geld für Ware.

Umgekehrt in der Form $G - W - G$. Nicht dasselbe Geldstück wechselt hier zweimal die Stelle, sondern dieselbe Ware. Der Käufer erhält sie aus der Hand des Verkäufers und gibt sie weg in die Hand eines andren Käufers. Wie in der einfachen Warenzirkulation der zweimalige Stellenwechsel desselben Geldstücks sein definitives Übergehn aus einer Hand in die andre bewirkt, so hier der zweimalige Stellenwechsel derselben Ware den Rückfluß des Geldes zu seinem ersten Ausgangspunkt.

164:1 Der Rückfluß des Geldes zu seinem Ausgangspunkt hängt nicht davon ab,

being sold for more than was paid for it. That only has a bearing on the amount of money which flows back. The phenomenon of reflux itself takes place as soon as the purchased commodity is resold, i.e., as soon as the cycle $M - C - M$ has been traversed in its entirety. This is, therefore, a palpable difference between the circulation of money as capital, and its circulation as mere money.

ob die Ware teurer verkauft wird, als sie gekauft war. Dieser Umstand beeinflusst nur die Größe der rückfließenden Geldsumme. Das Phänomen des Rückflusses selbst findet statt, sobald die gekaufte Ware wieder verkauft, also der Kreislauf $G - W - G$ vollständig beschrieben wird. Es ist dies also ein sinnlich wahrnehmbarer Unterschied zwischen der Zirkulation des Geldes als Kapital und seiner Zirkulation als bloßem Geld.

↑ The agent engaged in $M - C - M$ never really gives up the money; like a yo-yo, the money keeps returning to the same person again and again. The different order of $M - C$ and $C - M$ has therefore spawned an important qualitative difference between $C - M - C$ and $M - C - M$. The sustained repetition of $M - C - M$ is only possible if the overall flow of money through the economy is such that the money indeed returns. Marx has written about this in volume II of *Capital*, and also in his study of banking capital in volume III. The macroeconomic “law of reflux” also played a big role in the monetary economics of his time. [Gre87], in the Palgrave dictionary, says that this law of reflux is a rehabilitation of the real bills doctrine. The reflux is known also today in the aphorism “capitalists get what they spend, and workers spend what they get.”

Question 530 In 208:1, Marx says that the circulation process $C - M - C$ “sweats money from every pore.” Would he say the same thing about $M - C - M$, or would he characterize the flow of money generated by $M - C - M$ in a different way?

Question 531 Why does Marx place so much emphasis on the “reflux” of money implied in the form $M - C - M$?

[Repetition of C–M–C Versus Repetition of M–C–M]

↓ If one looks at $C - M - C$ and $M - C - M$ as continuous processes, this reflux makes an important difference.

- In $C - M - C$ there is no reflux, but there can be repetition.
- The reflux allows the person doing $M - C - M$ to continue this process indefinitely.

250:2 The cycle $C - M - C$ is fully traversed when the money brought in by the sale of one commodity is withdrawn again by the purchase of another. If nevertheless a reflux of money to its starting-point occurs,

164:2 Der Kreislauf $W - G - W$ ist vollständig zurückgelegt, sobald der Verkauf einer Ware Geld bringt, welches der Kauf andrer Ware wieder entzieht. Erfolgt dennoch Rückfluß des Geldes zu seinem Aus-

this can happen only through a renewal or repetition of the whole course of the movement. If I sell a quarter of corn for £3, and with this £3 buy clothes, the money, so far as I am concerned, is irreversibly spent. I have nothing more to do with it. It belongs to the clothes merchant. If I now sell a second quarter of corn, money indeed flows back to me—not however as a result of the first transaction, but due to its repetition. The money again leaves me as soon as I complete this second transaction by a fresh purchase. In the cycle $C - M - C$, therefore, there is no connection between the expenditure of money and its reflux.

The phrase “*hat nichts damit zu schaffen*” (“has nothing to do with”) is an unfortunate choice of words by Marx, because the word “*schaffen*” (which is meant here colloquially and has the connotation of “labor” and

“create” instead of simply “do”) suggests that the alternative rejected by Marx would be the outflow of money *creating* the conditions for its backflow. This is untrue in $C - M - C$ but it is also untrue in $M - C - M$: even in

In chapter Three, 210:1, this lack of connection between expenditure and reflux was Marx’s starting point for the discussion of the flow of money, which is not a circular flow although the metamorphosis of the commodity is a circular movement (it starts with C and returns to C . Here in chapter Four, however, the fact is relevant that the circular movement $C - M - C$ dies down after one turnover. This distinguishes it from $M - C - M$, a circular movement which does not die down: In $M - C - M$, on the other hand, the very manner in which the money is expended relies on its reflux. Without this reflux, the operation fails, or the process is interrupted and incomplete, since its complementary final phase, the sale, is missing.

The word translated here with “relies” is the German word “*bedingt*”—a more literal translation would be “presupposes.” A presupposes B means: A can happen only if B

happens. This is not meant as a condition in every single case: it is certainly possible that individual capitalists advance their money without ever getting it back. Presumably Marx means to say

gangspunkt, so nur durch die Erneuerung oder Wiederholung des ganzen Kursus. Wenn ich ein Quarter Korn verkaufe für 3 Pfd.St. und mit diesen 3 Pfd.St. Kleider kaufe, sind die 3 Pfd.St. für mich definitiv verausgabt. Ich habe nichts mehr mit ihnen zu schaffen. Sie sind des Kleiderhändlers. Verkaufe ich nun ein zweites Quarter Korn, so fließt Geld zu mir zurück, aber nicht infolge der ersten Transaktion, sondern nur infolge ihrer Wiederholung. Es entfernt sich wieder von mir, sobald ich die zweite Transaktion zu Ende führe und von neuem kaufe. In der Zirkulation $W - G - W$ hat also die Verausgabung des Geldes nichts mit seinem Rückfluß zu schaffen.

$M - C - M$ the reflux is not facilitated by the expenditure. So where is the difference between $C - M - C$ and $M - C - M$? Marx’s next sentence will explain.

In $G - W - G$ dagegen ist der Rückfluß des Geldes durch die Art seiner Verausgabung selbst bedingt. Ohne diesen Rückfluß ist die Operation mißglückt oder der Prozeß unterbrochen und noch nicht fertig, weil seine zweite Phase, der den Kauf ergänzende und abschließende Verkauf, fehlt.

here: Had the macro structure of the flow of money not allowed for the reflux of money, then $M - C - M$ could never have evolved as a socially common way of doing things.

4.1.d. [Purposes of C–M–C and M–C–M]

This detailed comparative analysis of the circulation processes $C - M - C$ and $M - C - M$ enables us to infer the purposes of the agents. Since Marx and his readers live in the society investigated here, he can draw on the common knowledge about what goes on in the heads of the persons performing $C - M - C$ and $M - C - M$. ↓ The purposes of the agents performing $C - M - C$ are easy to see:

250:3 The circuit $C - M - C$ issues from the extreme constituted by one commodity, and concludes with the extreme constituted by another commodity, which falls out of circulation and into consumption. Consumption, the satisfaction of needs, in short use-value, is therefore the final purpose of this circuit.

164:3 Der Kreislauf $W - G - W$ geht aus von dem Extrem einer Ware und schließt ab mit dem Extrem einer andren Ware, die aus der Zirkulation heraus und der Konsumtion anheimfällt. Konsumtion, Befriedigung von Bedürfnissen, mit einem Wort, Gebrauchswert ist daher sein Endzweck.

↑ Marx infers the purposes of $C - M - C$ and $M - C - M$ from comparing the beginning point with the end point—because this tells us the effect of this transaction for the main agent. $C - M - C$ begins with a commodity, and ends with a commodity that has a different use-value. Therefore its purpose must be use-value. ↓ $M - C - M$ by contrast goes from money to money. By the same logic we can conclude that its purpose is exchange-value.

The circuit $M - C - M$, however, issues from the extreme of money and finally returns to that same extreme. Its driving motive and determining purpose is therefore exchange-value itself.

Der Kreislauf $G - W - G$ geht dagegen aus von dem Extrem des Geldes und kehrt schließlich zurück zu demselben Extrem. Sein treibendes Motiv und bestimmender Zweck ist daher der Tauschwert selbst.

↑ In fact, we know that the purpose of the individual performing $M - C - M$ can only be to get *more* exchange-value than he previously had. But since we are not looking at quantities right now, but only the qualitative aspect of the movement, we can only say here that the concern of the transactors revolves around the exchange-value, not the use-value of the product.

4.1.e. [The Social Content Behind C–M–C and M–C–M]

Until now, Marx looked at the circulation forms, i.e., level (1) as defined above, and the purposes of the agents, i.e., level (2). Now, he goes down to level (3) of his investigation and draws conclusions about the social content. (This social content is not dependent on the purposes themselves, but on what the agents *do* while pursuing their purposes.)

250:4/oo In the simple circulation of commodities the two extremes have the same economic form. They are both commodities, and commodities of equal value.

164:4/o In der einfachen Warenzirkulation haben beide Extreme dieselbe ökonomische Form. Sie sind beide Ware. Sie sind auch Waren von derselben Wertgröße.

↑ Of course, individuals not only have to acquire the use-values they need, but in the process they also wish to get as good a bargain as possible. But since everybody has this goal, competition sees to it that on average the commodities which change hands have equal values. ↓ The content of the movement therefore does not have to do with value, but with use-value only:

But they are qualitatively different use-values, as for example corn and clothes. The exchange of products, the metabolism between the various physical objects in which social labor represents itself, constitutes here the content of the movement.

↑ The social function which the agents fulfill while satisfying their private needs through commodity exchange is the transfer of the goods from those who produce them to those who use them, see also 726:2. ↓ Next Marx looks at the content of $M - C - M$:

It is otherwise in the cycle $M - C - M$. At first sight it seems to lack any content, to be tautological. Both extremes have the same economic form. Instead of being qualitatively different use-values they are both money—precisely the transmuted form of commodities in which their particular use-values are extinguished. To exchange £100 for cotton, and then to exchange this same cotton again for £100, is merely a roundabout way of exchanging money for money, the same for the same, and seems to be an operation as purposeless as it is absurd.⁴

↑ $M - C - M$ doesn't seem to have a social content, since the transaction ends up at the same place where it began. What social function can this have? As in several other instances before, we have arrived at an impasse.

↓ Footnote 4 documents how the social benefits (as opposed to the private advantage) of $M - C - M$ are discussed in the literature:

⁴ 'One does not exchange money for money', exclaims Mercier de la Rivière to the mercantilists [MdlR46, p. 486]. In a work which professes to deal with 'trade' and 'speculation' there occurs the following: 'All trade consists in the exchange of things of different kinds; and the advantage' (to the merchant?) 'arises out of this difference. To exchange a pound of bread against a pound of bread . . . would be attended with no ad-

Aber sie sind qualitativ verschiedene Gebrauchswerte, z.B. Korn und Kleider. Der Produktaustausch, der Wechsel der verschiedenen Stoffe, worin sich die gesellschaftliche Arbeit darstellt, bildet hier den Inhalt der Bewegung.

Anders in der Zirkulation $G - W - G$. Sie scheint auf den ersten Blick inhaltslos, weil tautologisch. Beide Extreme haben dieselbe ökonomische Form. Sie sind beide Geld, also keine qualitativ unterschiedene Gebrauchswerte, denn Geld ist eben die verwandelte Gestalt der Waren, worin ihre besondern Gebrauchswerte ausgelöscht sind. Erst 100 Pfd.St. gegen Baumwolle und dann wieder dieselbe Baumwolle gegen 100 Pfd.St. austauschen, also auf einem Umweg Geld gegen Geld, dasselbe gegen dasselbe, scheint eine ebenso zwecklose als abgeschmackte Operation.⁴

⁴ „Man tauscht nicht Geld gegen Geld aus,“ ruft Mercier de la Rivière den Mercantilisten zu. [MdlR46, p. 486]. In einem Werke, welches ex professo vom „Handel“ und der „Spekulation“ handelt, liest man: „Aller Handel besteht im Austausch von Dingen verschiedener Art; und der Vorteil“ (für den Kaufmann?) „entspringt eben aus dieser Verschiedenheit. Ein Pfund Brot gegen ein Pfund Brot austauschen wäre ohne allen

vantage; . . . hence trade is advantageously contrasted with gambling, which consists in a mere exchange of money for money' (Th. Corbet, *An Inquiry into the Causes and Modes of the Wealth of Individuals; or the Principles of Trade and Speculation Explained*, London, 1841, p. 5). Although Corbet overlooks that $M - M$, the exchange of money for money, is the characteristic form of circulation, not only of merchants' capital, but of all capital, he at least acknowledges that this form is common to gambling and to one species of trade, namely speculation. Then, however, MacCulloch comes on the scene, and asserts that to buy in order to sell is to speculate, and thus the distinction between speculation and trade vanishes. 'Every transaction in which an individual buys produce in order to sell it again is in fact a speculation' (MacCulloch, *A Dictionary, Practical etc., of Commerce*, London, 1847, p. 1009). With much more naïveté, Pinto, the Pindar of the Amsterdam Stock Exchange, remarks: 'Trade is a game' (this phrase is borrowed from Locke) 'and nothing can be won from beggars. If one won everything from everybody for long, it would be necessary to give back voluntarily the greater part of the profit in order to begin the game again' (Pinto, *Traité de la circulation et du crédit*, Amsterdam, 1771, p. 231).

↑ Overall, the conclusions are the same as that drawn by Marx in the main text: $M - C - M$ does not seem to serve a useful social purpose.

4.2. [The Definition of Capital]

$M - C - M$ is much too prevalent *not* to have a social content (or to merely have the content of gambling, as suggested in the footnote). The resolution of this impasse gives us the definition of Capital.

4.2.a. [Not M–C–M but M–C–M']

In order to prepare for the resolution of this impasse, Marx takes the quantity of value into consideration. While Marx was investigating the form of the circulation, the quantity would have been distracting and had to be disregarded, but in order to get down to the content,

Vorteil . . . daher der vorteilhafte Kontrast zwischen Handel und Spiel, welches nur Austausch von Geld gegen Geld ist.“ (Th. Corbet, „An Inquiry into the Causes and Modes of the Wealth of Individuals; or the Principles of Trade and Speculation explained“, London 1841, p. 5.) Obgleich Corbet nicht sieht, daß $G - G$, Geld gegen Geld austauschen, die charakteristische Zirkulationsform, nicht nur des Handelskapitals, sondern alles Kapitals ist, gibt er wenigstens zu, daß diese Form einer Art des Handels, der Spekulation, mit dem Spiel gemein sei, aber dann kommt MacCulloch und findet, daß Kaufen, um zu verkaufen, Spekulieren ist, und der Unterschied zwischen Spekulation und Handel also wegfällt. „Jedes Geschäft, bei dem eine Person ein Erzeugnis kauft, um es wieder zu verkaufen, ist tatsächlich eine Spekulation.“ (MacCulloch, „A Dictionary, practical etc. of Commerce“, London 1847, p. 1009.) Ungleich naiver Pinto, der Pindar der Amsterdamer Börse: „Der Handel ist ein Spiel“ (dieser Satz entlehnt aus Locke), „und an Bettlern kann man nichts gewinnen. Wenn man lange Zeit hindurch allen alles abgenommen hätte, so müßte man in gütlichem Übereinkommen den größten Teil des Gewinns wieder zurückgeben, um das Spiel von neuem anzufangen.“ (Pinto, „Traité de la Circulation et du Crédit“, Amsterdam 1771, p. 231.)

it turns out that Marx not only needs the form but also the quantity. Marx has already remarked in 248:2 that individuals would never engage in $M - C - M$ would they not get more money back than they spend. These quantitative differences must also be considered if one is interested in the overall social impact of the activity of many capitalists:

One sum of money is distinguishable from another only by its quantity. The process $M - C - M$ therefore owes its content not to any qualitative difference between its extremes, for they are both money, but solely to their quantitative difference. More money is withdrawn from circulation at the end than was thrown into it at the beginning. The cotton originally bought for £100 is for example re-sold at £100 + £10, i.e., £110. The complete form of this process is therefore $M - C - M'$, where $M' = M + \Delta M$, i.e., the original sum advanced plus an increment.

Eine Geldsumme kann sich von der andren Geldsumme überhaupt nur durch ihre Größe unterscheiden. Der Prozeß $G - W - G$ schuldet seinen Inhalt daher keinem qualitativen Unterschied seiner Extreme, denn sie sind beide Geld, sondern nur ihrer quantitativen Verschiedenheit. Schließlich wird der Zirkulation mehr Geld entzogen, als anfangs hineingeworfen ward. Die zu 100 Pfd.St. gekaufte Baumwolle wird z.B. wieder verkauft zu 100 + 10 Pfd.St. oder 110 Pfd.St. Die vollständige Form dieses Prozesses ist daher $G - W - G'$, wo $G' = G + \Delta G$, d.h. gleich der ursprünglich vorgeschossenen Geldsumme plus einem Inkrement.

The phrase “complete form of this process” is presumably short for “complete description of the form of this process.” (The word “complete” is also used in 256:3/o.) Earlier in the chapter we have made abstraction of the quantities involved, in order to see the characteristic activities of the agents performing these circulation acts. But now we discover that we cannot keep the quantity separate from the qualitative aspects of the form if we want to understand the social relations which make these circulation acts possible and necessary. The abstraction from quantities, which served us well earlier, has become a hindrance at the present stage of the investigation.

Question 534 In 248:2 Marx argues that one should disregard the quantitative difference, i.e., only look at the form $M - C - M$ without paying attention to quantitative difference between the second M and the first, while two pages later, in 250:4/oo, Marx says that it is important to look at the quantities. What made him change his mind?

In his second attempt below, Marx will therefore search for the social content behind $M - C - M'$, not $M - C - M$. Before doing this, Marx defines his terminology:

This increment or excess over the original value I call—surplus-value.

Dieses Inkrement oder den Überschuß über den ursprünglichen Wert nenne ich—Mehrwert (surplus-value).

↑ The existence of a name for this quantitative difference is additional confirmation that this quantitative difference matters. ↓ The full description of the circulation of capital is therefore:

The value originally advanced, therefore, not only remains intact while in circulation, but it increases its magnitude, adds to itself a surplus-value, or is valorized. And this movement converts this value into capital.

Der ursprünglich vorgeschosne Wert erhält sich daher nicht nur in der Zirkulation, sondern in ihr verändert er seine Wertgröße, setzt einen Mehrwert zu oder verwertet sich. Und diese Bewegung verwandelt ihn in Kapital.

We have arrived at a very general definition of capital: capital is value in motion. Marx is taking his time to unpack what this means. He makes several points:

(a) Value differences in $C - M - C$ are possible as well but here they are irrelevant.

(b) In $M - C - M'$, the end is qualitatively equal to the beginning but it is bigger. This leads to an insatiable spiral.

(c) due to the “reflux,” the same individual (the capitalist) performs this movement over and over again, and since the capitalist identifies with the unbounded increase in value and makes it his personal motive, it becomes an especially powerful social force.

Question 535 What is capital?

↓ (a) If we need to look at the quantities in order to understand the social content of $M - C - M'$, does this mean we should also look at the quantities involved in $C - M - C'$? The next paragraph explains why this is not necessary:

252:1 Of course, it is also possible that in $C - M - C$ the two extremes C and C , say corn and clothes, may represent quantitatively different magnitudes of value. The peasant may sell his corn above its value, or may buy the clothes at less than their value. He may, on the other hand, be cheated by the clothes merchant. Yet, for this particular form of circulation, such differences in value are purely accidental.

165:1/o Es ist zwar auch möglich, daß in $W - G - W$ die beiden Extreme, W , W , z.B. Korn und Kleider, quantitativ verschiedene Wertgrößen sind. Der Bauer kann sein Korn über dem Wert verkaufen oder die Kleider unter ihrem Wert kaufen. Solche Wertverschiedenheit bleibt jedoch für diese Zirkulationsform selbst rein zufällig.

↓ Marx gives two different reasons why for $C - M - C$, value differences between the first and second C are not relevant:

The fact that the corn and the clothes are equivalents does not deprive the process of all sense and meaning, as it does in $M - C - M$. The equality of their values is rather the condition under which it can take its normal course.

Sinn und Verstand verliert sie nicht schier, wie der Prozeß $G - W - G$, wenn die beiden Extreme, Korn und Kleider z.B., Äquivalente sind. Ihr Gleichwert ist hier vielmehr Bedingung des normalen Verlaufs.

↑ First reason: While a capitalist who does $M - C - M'$ with $M = M'$ would have been better off not traversing the circuit at all, a $C - M - C'$ in which C' has a different value than C may still be necessary because of the use-value of C' . Second reason: Although it is possible that the values of the two extremes in $C - M - C$ have different magnitudes, this

would be only an accident, an irregularity, which will be ironed out over time in the normal course of things. Because of this, there is no need to introduce quantitative differences into the form $C - M - C$ in order to uncover its social content.

Question 537 *In the exchange process, it is clearly the objective of the traders to get as much in return for their commodity as possible. Likewise, it is clearly the objective of the capitalists to get as much return on their capital as possible. Nevertheless Marx analyzes the exchange as an equalization and abstracts from the quantitative differences, while his analysis of the circuit of capital explicitly takes the quantitative differences into consideration. Is this unequal methodology justified, or does it bias Marx's results?*

4.2.b. [C–M–C and M–C–M' as Ongoing Processes]

(b) After revisiting the form in the sphere of circulation order to introduce the quantitative dimension into it, Marx investigates once more the purposes of the agents, and the social content behind both $C - M - C$ and $M - C - M'$. But Marx makes two additional changes compared with his first attempt: he looks at these processes not as one-time processes but as repeated processes. And since he brought the quantity in, he is not only interested in the quality of the content driving these processes but also in its *measure*.

252:2/o The repetition or renewal of the process of selling in order to buy finds its measure and its goal (as does the process itself) in a final purpose which lies outside it, namely consumption, the satisfaction of certain specific needs.

↑ The repetition of $C - M - C$ does not alter the conclusion obtained in 250:4/oo. It finds its measure in the satisfaction of the needs, which are themselves regenerated over time. ↓ But $M - C - M'$ has only itself as measure and is therefore *insatiable*.

In buying in order to sell, by contrast, the end and the beginning are the same, money or exchange-value. Already because of this, the movement is endless.

↑ Marx says here “endless” (*endlos*), not yet “insatiable” (*maßlos*). The movement is endless because beginning and end point coincide. This is a *condition* for the insatiability of capital, but the insatiability itself is driven by other mechanisms, which will be developed later. ↓ After saying that beginning and end coincide, Marx says in the very next sentence that there is a difference after all:

Certainly, M has become $M + \Delta M$, £100 turned into £100 + £10. But, considered qualitatively, £110 is the same as £100, namely money; while, from the quantita-

166:1/o Die Wiederholung oder Erneuerung des Verkaufs, um zu kaufen, findet, wie dieser Prozeß selbst, Maß und Ziel an einem außer ihm liegenden Endzwecke, der Konsumtion, der Befriedigung bestimmter Bedürfnisse.

Im Kauf für den Verkauf dagegen sind Anfang und Ende dasselbe, Geld, Tauschwert, und schon dadurch ist die Bewegung endlos.

Allerdings ist aus G , $G + \Delta G$ geworden, aus den 100 Pfd.St., 100 + 10. Aber bloß qualitativ betrachtet, sind 110 Pfd.St. dasselbe wie 100 Pfd.St., nämlich Geld. Und quan-

tative point of view, £110 is, like £100, a sum of definite and limited value.

↑ Although there is a difference, the difference between M and M' is *slight*. Both have the same quality, they are money, and quantitatively both are limited—this is a brief allusion to the curse of money which will be made more explicit in the third sentence after this. ↓ M' is not qualitatively different from M and therefore must also do the same thing as M , namely, re-enter the process. Marx argues this by ruling out possible alternative uses of this backflow of capital:

If the £110 were spent as money they would fall out of character, they would cease to be capital. Withdrawn from circulation, they petrify into a hoard, and even if they were to endure in this position until the Last Judgment, not a single farthing would accrue to them.

↑ Marx rules out two possible uses of M' , either spending it, or hoarding it miser-like as in 231:1. In the first alternative, money leaves the circuit $M - C - M'$ and enters $C - M - C$, and in the second it is unable to achieve any further increments M' after the original $M - C - M'$. ↓ Therefore no other possibility is left than re-entering the circuit.

As long as, therefore, valorization of value is the purpose, £110 have the same need for valorization as £100. Both are bounded expressions of exchange-value, and therefore both have the same calling, to approach, by quantitative expansion, as near as possible to absolute wealth.

titativ betrachtet, sind 110 Pfd.St. eine beschränkte Wertsumme wie 100 Pfd.St.

Würden die 110 Pfd.St. als Geld verausgabt, so fielen sie aus ihrer Rolle. Sie hörten auf, Kapital zu sein. Der Zirkulation entzogen, versteinern sie zum Schatz, und kein Farthing wächst ihnen an, ob sie bis zum Jüngsten Tage fortlagern.

Handelt es sich also einmal um Verwertung des Werts, so besteht dasselbe Bedürfnis für die Verwertung von 110 Pfd.St. wie für die von 100 Pfd.St., da beide beschränkte Ausdrücke des Tauschwerts sind, beide also denselben Beruf haben, sich dem Reichtum schlechthin durch Größenausdehnung anzunähern.

Question 538 *Is it right to say that $M - C - M$ is incomplete because it ends with money, and the money is nothing by itself but must be spent?*

4.2.c. [Digression: The Curse of Money]

This last paragraph contained a very brief introduction of what we are calling here, in these Annotations, the “curse of money,” namely, the need for self-expansion which is implied in the nature of money. The “curse” was also briefly mentioned in chapter Three, 230:1/o, during the discussion of the miser. Since it is an important subject I will bring here a passage from *Grundrisse*, 269:2/oo, where Marx discusses it in more detail.

↓ First Marx's argument is very similar to the argument given here in chapter Four of *Capital*, in the first sentence of 250:4/oo:

We have already seen, in the case of money, how value, after assuming the independent form of money—or the general form of wealth—is capable of no other motion than a quantitative one; to increase itself.

↓ But then Marx goes on to explain that besides being the only *possibility*, this quantitative expansion is also a *necessity* rooted in the money form:

According to its concept, money is the quintessence of all use-values; but since it is always only a given amount of money (here, capital), its quantitative boundedness stands in contradiction to its quality. The constant drive beyond its own boundedness is therefore inherent in its nature.

↑ In other words: qualitatively, money gives access to all use-values, i.e., qualitatively it is universal. This qualitative universality comes in conflict with its quantitative boundedness, since money always only exists as a finite (Marx would say “bounded”) sum of money. This conflict tries to come to a resolution by quantitative expansion. The drive for quantitative expansion belongs therefore to the nature of money. This is often not recognized. A few sentences after the above quotes, in the same long paragraph in *Grundrisse*, Marx writes:

It is damned difficult for Messrs the economists to make the theoretical transition from the self-preservation of capital to its multiplication, not merely as a contingent feature or a result, but belonging its fundamental character.

There is evidence that Marx was thinking along the same lines when he wrote *Capital*. Chapter Three, 230:1/o, contains a similar allusion as part of the discussion of the miser, which applies not only to the miser but also to the capitalist. Also the last sentence which we just read, here in chapter Four, namely 252:2/o, gives a shorthand version of the argument. It reads more like a brief allusion to an argument developed elsewhere, than such an argument itself. Marx seems unaware that he never developed this argument in sufficient detail in *Capital*. Marx is writing as if something corresponding to the above *Grundrisse* passage had been included somewhere in *Capital*, while in fact it never was.

Question 542 *Why does monetary wealth have the urge to multiply itself? (Do not describe at this point how it does it but why in modern society the unlimited accumulation of wealth is such an overriding and powerful objective.)*

Question 543 *Bring everyday examples illustrating the drive for self-expansion inherent in the nature of money.*

Wir haben schon gesehen beim Geld, wie der als solches verselbständigte Wert—oder die allgemeine Form des Reichtums—keiner andren Bewegung fähig ist, als einer quantitativen; sich zu vermehren.

Seinem Begriff nach ist er der Inbegriff aller Gebrauchswerte; aber als immer nur ein bestimmtes Quantum Geld (hier Kapital) ist seine quantitative Schranke im Widerspruch zu seiner Qualität. Es liegt daher in seiner Natur beständig über seine eigne Schranke hinauszutreiben.

Den Herren Ökonomen wird es verdammt schwer, theoretisch fortzukommen von der Selbsterhaltung des Werts im Kapital zu seiner Vervielfältigung; nämlich diese in seiner Grundbestimmung, nicht nur als Akzidens oder nur als Resultat.

4.2.d. [The Measure of $M-C-M'$]

From this discussion of the curse of money it becomes clear that the agents who perform $M - C - M'$ can never get enough—because the increased amount of money suffers from the same contradiction as the original amount: both would be able to buy *everything* were they not eventually exhausted. Through the never-ending expansion of the magnitude of its value, capital tries to capture the infinite variety of use-values in which value can represent itself.

After arguing that there is no essential difference between M and M' (this is Hegel’s definition of a quantitative difference, it is a difference with nothing to distinguish the differing elements), the next step of the argument is that the receipt of M' automatically puts the capitalist in the position to begin the circle again. This is not the case with $C - M - C$. The second commodity C “falls out of circulation,” and in order to restart the process one has to come up with a new first commodity C . In *Grundrisse*, Marx writes that $C - M - C$ is like a fire which can only keep burning if fuel is continually added to it from the outside. $M - C - M'$ might perhaps be compared with a nuclear breeder reactor that generates its own fuel.

↓ The argument begins with the observation that the absence of a difference between M and M' is not just a matter of theoretical description. Also in the practical turnover, this difference does not persist:

For a moment, it is true, the value originally advanced, the £100, distinguishes itself from the surplus-value of £10 added to it during circulation. But in an instant, this distinction dissipates again. At the end of the process, we do not receive on the one hand the original £100, and on the other surplus-value of £10. What emerges is rather a value of £110, which is exactly in the same form, appropriate for commencing the valorization process, as the original £100. At the end of the movement, money re-emerges in order to begin it again.⁵

⁵ ‘Capital is divided ... into the original capital and profit—the increment of capital ... although practice itself immediately lumps this gain together with capital and sets it in motion with it’ (F. Engels, *Umriss zu einer Kritik der Nationalökonomie*, in *Deutsch-Französische Jahrbücher*, edited by Arnold Ruge and Karl

Zwar unterscheidet sich für einen Augenblick der ursprünglich vorgeschossene Wert 100 Pfd.St. von dem in der Zirkulation ihm zuwachsenden Mehrwert von 10 Pfd.St., aber dieser Unterschied zerfließt sofort wieder. Es kommt am Ende des Prozesses nicht auf der einen Seite der Originalwert von 100 Pfd.St. und auf der andren Seite der Mehrwert von 10 Pfd.St. heraus. Was herauskommt, ist ein Wert von 110 Pfd.St., der sich ganz in derselben entsprechenden Form befindet, um den Verwertungsprozeß zu beginnen, wie die ursprünglichen 100 Pfd.St. Geld kommt am Ende der Bewegung wieder als ihr Anfang heraus.⁵

⁵ „Das Kapital teilt sich ... in das ursprüngliche Kapital und den Gewinn, den Zuwachs des Kapitals ... obwohl die Praxis selbst diesen Gewinn sogleich wieder zum Kapital schlägt und mit diesem in Fluß setzt.“ F. Engels, „Umriss zu einer Kritik der Nationalökonomie“, in „Deutsch-Französische Jahrbücher“, herausge-

Marx, Paris, 1844, p. 99)

↑ Footnote 5 quotes Engels that “practice itself” lumps original capital and profit together and renews the motion. ↓ The renewal of the process does not require additional initiative or intervention. It is automatic.

The final result of every single cycle of purchasing for the purpose of consequent sale constitutes therefore, by itself, the starting-point of a new cycle.

↓ The last two sentences of this paragraph take another shot at the transition from the motives of the individuals to the general social content of their activity.

The simple circulation of commodities—selling in order to buy—is a means to a final goal which lies outside circulation, namely the appropriation of use-values, the satisfaction of needs. As against this, the circulation of money as capital is an end in itself, for the valorization of value takes place only within this constantly renewed movement. The movement of capital is therefore insatiable.⁶

Fowkes’s “limitless” is not a good translation for “*maBlos*.”

Moore-Aveling’s “has no limits” is a little better.

↑ The last sentence echoes the first sentence of this paragraph, but now with the word insatiable (*maBlos*) instead of endless. And instead of having no purpose at all, as in 250:4/oo, it now has itself as purpose. ↓ Footnote 6 documents that Aristotle had said exactly the same thing:

⁶ Aristotle contrasts economics with ‘chrematistics’. He starts with economics. So far as it is the art of acquisition, it is limited to procuring the articles necessary to existence and useful either to a household or the state. “True wealth (ὁ ἀλθδινὸς πλοῦτος) consists of such use-values; for the amount of property which is needed for a good life is not unlimited ... There is, however, a second mode of acquiring things, to which we may by preference and with correctness give the name of chrematistics, and in this case there appear to be no limits to riches and property. Trade (“ἡ καπηλική”) is literally retail trade, and Aristotle chooses this form be-

geben von Arnold Ruge and Karl Marx, Paris 1844, p. 99.

Das Ende jedes einzelnen Kreislaufs, worin sich der Kauf für den Verkauf vollzieht, bildet daher von selbst den Anfang eines neuen Kreislaufs.

Die einfache Warenzirkulation—der Verkauf für den Kauf—dient zum Mittel für einen außerhalb der Zirkulation liegenden Endzweck, die Aneignung von Gebrauchswerten, die Befriedigung von Bedürfnissen. Die Zirkulation des Geldes als Kapital ist dagegen Selbstzweck, denn die Verwertung des Werts existiert nur innerhalb dieser stets erneuerten Bewegung. Die Bewegung des Kapitals ist daher maßlos.⁶

⁶ Aristoteles stellt der Chrematistik die Ökonomik entgegen. Er geht von der Ökonomik aus. Soweit sie Erwerbskunst, beschränkt sie sich auf die Verschaffung der zum Leben notwendigen und für das Haus oder den Staat nützlichen Güter. „Der wahre Reichtum (ὁ ἀλθδινὸς πλοῦτος) besteht aus solchen Gebrauchswerten; denn das zum guten Leben genügende Maß dieser Art von Besitz ist nicht unbegrenzt. Es gibt aber eine zweite Erwerbskunst, die vorzugsweise und mit Recht Chrematistik heißt, infolge deren keine Grenze des Reichtums und Besitzes zu existieren scheint. Der Warenhandel („ἡ καπηλική“) heißt wörtlich Kramhandel, und Ari-

cause use-values predominate in it) does not in its nature belong to chrematistics, for here the exchange only has reference to what is necessary for (the buyer or the seller) themselves.’ Therefore, as he goes on to show, the original form of trade was barter, but with the extension of the latter there arose the necessity for money. With the discovery of money, barter of necessity developed into καπηλική, into trading in commodities, and this again, in contradiction with its original tendency, grew into chrematistics, the art of making money. Now chrematistics can be distinguished from economics in that ‘for chrematistics, circulation is the source of riches (ποιητικὴ χρημάτων ... διὰ χρημάτων μεταβολῆς). And it appears to revolve around money, for money is the beginning and the end of this kind of exchange (τὸ γὰρ νόμισμα στοιχεῖον καὶ πέρας τῆς ἀλλαγῆς ἐστίν). Therefore also riches, such as chrematistics strives for, are unlimited. Just as every art which is not a means to an end, but an end in itself, has no limit to its aims, because it seeks constantly to approach nearer and nearer to that end, while those arts which pursue means to an end are not boundless, since the goal itself imposes a limit on them, so with chrematistics there are no bounds to its aims, these aims being absolute wealth. Economics, unlike chrematistics, has a limit ... for the object of the former is something different from money, of the latter the augmentation of money ... By confusing these two forms, which overlap each other, some people have been led to look upon the preservation and increase of money *ad infinitum* as the final goal of economics.’ (Aristotle, *De Republica*, edit. Bekker, lib. I, c. 8, 9, passim.)

stoteles nimmt diese Form, weil in ihr der Gebrauchswert vorherrscht) gehört von Natur nicht zur Chrematistik, denn hier bezieht sich der Austausch nur auf das für sie selbst (Käufer und Verkäufer) Nötige.“ Daher, entwickelt er weiter, war auch die ursprüngliche Form des Warenhandels der Tauschhandel, aber mit seiner Ausdehnung entstand notwendig das Geld. Mit der Erfindung des Geldes mußte sich der Tauschhandel notwendig zur καπηλική, zum Warenhandel entwickeln, und dieser, im Widerspruch zu seiner ursprünglichen Tendenz, bildete sich zur Chrematistik aus, zur Kunst, Geld zu machen. Die Chrematistik nun unterscheidet sich von der Ökonomik dadurch, daß „für sie die Zirkulation die Quelle des Reichtums ist (ποιητικὴ χρημάτων ... διὰ χρημάτων μεταβολῆς). Und um das Geld scheint sie sich zu drehen, denn das Geld ist der Anfang und das Ende dieser Art von Austausch (τὸ γὰρ νόμισμα στοιχεῖον καὶ πέρας τῆς ἀλλαγῆς ἐστίν). Daher ist auch der Reichtum, wie ihn die Chrematistik anstrebt, unbegrenzt. Wie nämlich jede Kunst, der ihr Ziel nicht als Mittel, sondern als letzter Endzweck gilt, unbegrenzt in ihrem Streben ist, denn sie sucht sich ihm stets mehr zu nähern, während die Künste, die nur Mittel zum Zwecke verfolgen, nicht unbegrenzt sind, da der Zweck selbst ihnen die Grenze setzt, so gibt es auch für diese Chrematistik keine Schranke ihres Ziels, sondern ihr Ziel ist absolute Bereicherung. Die Ökonomik, nicht die Chrematistik, hat eine Grenze ... die erstere bezweckt ein vom Gelde selbst Verschiedenes, die andere seine Vermehrung ... Die Verwechslung beider Formen, die ineinander überspielen, veranlaßt einige, die Erhaltung und Vermehrung des Geldes ins Unendliche als Endziel der Ökonomik zu betrachten.“ (Aristoteles, „De Rep.“, edit. Bekker, lib. I, c. 8 und 9 passim.)

This is still not a full formulation of the social forces underlying $M - C - M'$. In his earlier attempt in 250:4/oo Marx had come to the conclusion that it has *no* social purpose at all—but this was before looking at the quantitative differences. With the quantitative differences taken into consideration, the result is that it has *itself* as purpose. In $M - C - M'$, the social relation of value has come into motion, as Marx says in 255:1, it is the valorization of value,

value grows, it turns itself into more value. On the other hand, due to the backflow of money in $M - C - M'$, the individuals who are engaged in $M - C - M'$ remain engaged in it. These are the capitalists. They are motivated to pursue $M - C - M'$, because the curse of money has them under its spell. As the combination of a social tendency with individual greed, capital is a strong force. Marx therefore takes a look at the capitalists, and will only afterwards say more about the social forces for which the capitalists are the instruments.

4.3. [The Capitalist]

(c) Because of the backflow (reflux) discussed above, it is easy for someone who is engaged in $M - C - M$ today to do it again tomorrow. This social form therefore does not define a fleeting character mask like being buyer or seller, see 178:1/o. Everyone in society is sometimes buyer and sometimes seller, but the role of performing $M - C - M$ is permanently attached to the same persons, the *capitalists*. Marx says this also very clearly in chapter Twenty-Three, p. 711:3/o.

254:1 As the conscious carrier of this movement, the money owner becomes a capitalist. His person, or rather his pocket, is the point from which the money starts, and to which it returns. The objective content of the circulation we have been discussing—the valorization of value—is his subjective purpose, and it is only in so far as the appropriation of ever more wealth in the abstract is the sole driving force behind his operations that he functions as a capitalist, i.e., as a capital personified and endowed with consciousness and a will. Use-values must therefore never be treated as the immediate aim of the capitalist;⁷ nor must the profit on any single transaction. His aim is rather the unceasing movement of profit-making.⁸

The formulation “only in so far as the appropriation of ever more wealth in the abstract is the sole driving force” indicates that the economic category “capitalist” does not capture the full depth of individual agency. And in the Preface to *Capital I*, 92:1, Marx concedes that it is a limited view of the *individuals* to define them only by their economic roles.

The two footnotes emphasize once more: the purpose of capital is not *use-value*, and also not *one-time profit*.

⁷ ‘Commodities’ (here used in the sense of use-values) ‘are not the terminating object of the

167:1/o Als bewußter Träger dieser Bewegung wird der Geldbesitzer Kapitalist. Seine Person, oder vielmehr seine Tasche, ist der Ausgangspunkt und der Rückkehrpunkt des Geldes. Der objektive Inhalt jener Zirkulation—die Verwertung des Werts—ist sein subjektiver Zweck, und nur soweit wachsende Aneignung des abstrakten Reichtums das allein treibende Motiv seiner Operationen, funktioniert er als Kapitalist oder personifiziertes, mit Willen und Bewußtsein begabtes Kapital. Der Gebrauchswert ist also nie als unmittelbarer Zweck des Kapitalisten zu behandeln.⁷ Auch nicht der einzelne Gewinn, sondern nur die rastlose Bewegung des Gewinnens.⁸

⁷ „Waren“ (Hier im Sinn von Gebrauchswerten) „sind nicht der Endzweck des handeltrei-

trading capitalist, money is his terminating object.’ [Cha32, pp. 165–6]

⁸ ‘Though the merchant does not count the profit he has just made as nothing, he nevertheless always has his eye on his future profit’ [Gen03, vol. 8, p. 139]

In order to gain a correct perspective on this brief introduction of the capitalist note also that Marx characterizes here only what *makes* a capitalist (and capitalists were frugal only in the early times); *being* a capitalist implies more, just as the function of measure of value *makes* money what it is, but once this function has been attached to a specific use-value, many additional functions accrue to it. In money, it was the coalescence, by social custom, of a value form with a specific use-value which generated these new determinations; in the case of a capitalist it is the coming together of individual willful activity, driven by the “curse of money,” with a social determination. ↓ The following comparison between capitalist and miser indicates that the capitalist is driven by the “curse of money.”

This boundless drive for enrichment, this passionate chase after value,⁹ is common to the capitalist and the miser; but while the miser is merely a clumsy capitalist, the capitalist is the rational miser.

According to footnote 9, the classical economists knew that the capitalists, like misers, were driven by money, not by use-values. But the economists quickly forgot this again when confronted with the consequences of this drive (overproduction):

⁹ ‘The inextinguishable passion for gain, the “accursed hunger for gold,” will always lead capitalists.’ (MacCulloch, *The Principles of Polit. Econ.*, London 1830, p. 179.) This insight does not, of course, prevent the same MacCulloch and his associates, when they are in theoretical difficulties, as for instance in the treatment of overproduction, from transforming the same capitalist into a good citizen whose sole concern is for use-values, and who even develops an insatiable hunger for boots, hats, eggs, calico, and other such mundane every-day use-values.

The ceaseless augmentation of value, which the miser seeks to attain by saving his money from circulation,¹⁰ is achieved by the more cunning capitalist by means of throwing his money again and again into

benden Kapitalisten ... sein Endzweck ist Geld.“ [Cha32, pp. 165–6]

⁸ „Wenn der Kaufmann den bereits erzielten Gewinn auch nicht geringschätzt, so ist sein Blick doch immer auf den zukünftigen Gewinn gerichtet.“ [Gen03, t. VIII, p. 139]

Dieser absolute Bereicherungstrieb, diese leidenschaftliche Jagd auf den Wert⁹ ist dem Kapitalisten mit dem Schatzbildner gemein, aber während der Schatzbildner nur der verrückte Kapitalist, ist der Kapitalist der rationelle Schatzbildner.

⁹ „Die unauslöschliche Leidenschaft für den Gewinn, die auri sacra fames bestimmt stets den Kapitalisten.“ (MacCulloch, „The Principles of Polit. Econ.“, London 1830, p. 179.) Diese Einsicht verhindert denselben MacCulloch und Konsorten natürlich nicht, in theoretischen Verlegenheiten, z.B. bei Behandlung der Überproduktion, denselben Kapitalisten in einen guten Bürger zu verwandeln, dem es sich nur um den Gebrauchswert handelt und der sogar einen wahren Werwolfshunger entwickelt für Stiefel, Hüte, Eier, Kattune und andere höchst familiäre Sorten von Gebrauchswert.

Die rastlose Vermehrung des Werts, die der Schatzbildner anstrebt, indem er das Geld vor der Zirkulation zu retten sucht,¹⁰ erreicht der klügere Kapitalist, indem er es stets von neuem der Zirkulation preisgibt.^{10a}

circulation.^{10a}

In the comparison capitalist—miser, Marx used the word “to save” in two meanings. Although Marx wrote in German, he was aware of this English pun. He mentions it in footnote 10.

¹⁰ “Σώζειν” is a characteristic Greek expression for hoarding. So in English the word “TO SAVE” means both “to rescue” and “to save money.”

¹⁰ „Σώζειν“ ist einer der charakteristischen Ausdrücke der Griechen für das Schatzbilden. Ebenso bedeutet „to save“ zugleich retten und sparen.

Footnote 10a gives an interesting philosophical commentary:

^{10a} ‘Things possess an infinite quality when moving in a circle which they lack when advancing in a straight line’ [Gal03, p. 156]

^{10a} „Das Unendliche, das die Dinge im Fortschreiten nicht haben, haben sie im Kreislauf.“ [Gal03, p. 156]

The social function of the capitalist is described in *Capital*, 738:2–741:1.

As to what being a capitalist implies see the following quote from *Capital II*, chapter Two, p. 149:1: “(T)he purpose of the whole process, enrichment (the production of surplus-value) does not by any means exclude increasing consumption on the part of the capitalist as his surplus-value (and hence his capital) increases; on the contrary, it emphatically includes it.”

Later, in 739:1, Marx points out another difference between capitalist and miser: the capitalist represents a social force, while in the miser the curse of money shows itself as an individual mania.

Question 546 *Marx is very critical of the “miser” and then he says the capitalist is the “rational” miser. I.e., some, but not all of the criticism of the miser also applies to the capitalist. What does Marx criticize the miser for, and which part of this criticism also applies to the capitalist?*

Marx compares here the capitalist with the miser. With the miser it is obvious that he is a victim who got stuck in the contradiction between real wealth and its social representation in money. With the capitalist this is less obvious, since he is more successful than the miser. But for instance in *Results*, 988:1/oo, Marx emphasizes how much the capitalist is impoverished and enslaved by the social relation that seems to serve him so well:

The self-valorization of capital—the creation of surplus-value—is therefore the determining, dominating, and overarching purpose of the capitalist; it is the absolute motive and content of his activity. And in fact it is no more than the rationalized motive and aim of the miser—a highly impoverished and abstract content which makes the capitalist appear, from a different side, just as enslaved by the relations of capitalism, even if it is from the other side, on the

Die Selbstverwertung des Kapitals—die Schöpfung von Mehrwert—ist also der bestimmende, beherrschende und übergreifende Zweck des Kapitalisten, der absolute Trieb und Inhalt seines Tuns, der in der Tat nur der rationalisierte Trieb und Zweck des Schatzbildners,—ein durchaus armseliger und abstrakter Inhalt, der den Kapitalisten von der andern Seite ganz ebenso sehr unter der Knechtschaft des Kapitalverhältnisses erscheinen läßt, wenn auch von anderer Sei-

opposite pole, as the worker.

The difference between capitalist and laborer is described here as follows:

What we are confronted by here is the *process of alienation* of his own labor. The worker stands on a higher plane than the capitalist from the outset, to the extent that the latter has his roots in the process of alienation and finds his absolute satisfaction in it, whereas right from the start the worker is a victim who confronts it as a rebel and experiences it as a process of enslavement.

te her, auf dem entgegengesetzten Pol, als den Arbeiter.

Es ist der *Entfremdungsprozeß* seiner eigenen Arbeit. Insofern steht hier der Arbeiter von vorne herein höher als der Kapitalist, als der letztere in jenem Entfremdungsprozeß wurzelt und in ihm seine absolute Befriedigung findet, während der Arbeiter als sein Opfer von vorn herein dagegen in einem rebellischen Verhältnis steht und ihn als Knechtungsprozeß empfindet.

Objectively, capitalists are just as enslaved as the workers by the impoverished and abstract drive of self-valorization of capital. What distinguishes the workers and raises them to a higher level is that they experience their objective enslavement as enslavement, while the capitalists find subjective satisfaction in it.

Question 547 *Can a situation which gives you subjective satisfaction be a situation of “enslavement”? Are there other examples for this than the capitalist?*

Marx never points out explicitly that the combination of individual motivation with social forces makes the capitalist drive to self-expansion of value especially irresistible. But this combination is implicit in many things Marx writes, for instance in 258:2/o.

Question 548 *Can one say that the capitalists are addicted to making money?*

4.4. [Capital as Self-Expanding Value]

Animated with the will of the capitalist, $M - C - M'$ becomes a powerful process in which value, as subject, expands itself. These are the relations of production of which the capitalists are only the unconscious executors. The remainder of chapter Four is devoted to their description:

4.4.a. [Capital as Value in Motion]

⇓ In $C - M - C$, the value of the first C obtains independent form in M , but it stays in this form only for an instant, and after completion of the circulation, the value is forgotten, i.e., the second commodity no longer counts as value but only as use-value for its owner.

255:1 The independent form, i.e., the monetary form, taken by the value of commodities in simple circulation, merely medi-

168:1/o Die selbständigen Formen, die Geldformen, welche der Wert der Waren in der einfachen Zirkulation annimmt, ver-

ates the exchange of commodities, and vanishes again in the final result of the movement.

↓ In $M - C - M$, by contrast, the value is never forgotten. The entire movement is a movement of the value through its different modes of existence:

In the circulation $M - C - M$, however, both money and commodity function as only two different modes of existence of value itself—the money as its general and the commodity as its particular or, so to speak, disguised mode of existence.¹¹

↓ Say formulated this succinctly:

¹¹ ‘It is not the material which forms capital, but the value of that material’ (J. B. Say, *Traité d’Économie Politique*, 3rd edn, Paris, 1817, Vol. 2, p. 429).

↓ In its movement through these phases, capital maintains its identity:

It is continually changing from one form into the other, without losing itself in this movement; it thus transforms itself into an automatic subject.

↑ What is remarkable about capital is not that it undergoes changes. Everything in the world changes. What is peculiar about capital is that it maintains its identity through these changes. If an elementary particle decays, it no longer exists but something else took its place. If capital changes from the money form to the commodity form, it still consists of the same value. This value changed its form but maintains its identity through these changes. The form change of value between commodity and money can be seen in analogy to the biological metabolism every living organism must go through. (And maintaining identity with oneself is a nontrivial issue for biological organisms, as the many auto-immunity disorders show.)

Since capital maintains its identity through the process it is going through, Marx calls it a subject. The movement of capital becomes the action of that which persists through this movement. See [Pos96, p. 269] and also [Alb95]. However it is not a deliberate, conscious, but an automatic action. In the next sentence, Marx talks about the “life” of capital. This is an appropriate metaphor, as long as one keeps in mind that it is not a conscious life but has a “circular” course.

Question 550 In Notes about Wagner, [mecw24]534:1, Marx says: “Mr. Wagner forgets that neither value nor exchange-value are the subjects of my book, but the commodity is.” Is this in contradiction to his statement in chapter Four of Capital that value “transforms itself into an automatic subject”?

mitteln nur den Warenaustausch und verschwinden im Endresultat der Bewegung.

In der Zirkulation $G - W - G$ funktionieren dagegen beide, Ware und Geld, nur als verschiedene Existenzweisen des Werts selbst, das Geld seine allgemeine, die Ware seine besondere, sozusagen nur verkleidete Existenzweise.¹¹

¹¹ „Nicht der Stoff bildet das Kapital, sondern der Wert dieser Stoffe.“ (J. B. Say, „*Traité d’Écon. Polit.*“, 3ème éd., Paris 1817, t. II, p. 429.)

Er geht beständig aus der einen Form in die andre über, ohne sich in dieser Bewegung zu verlieren, und verwandelt sich so in ein automatisches Subjekt.

Es geht beständig aus der einen Form in die andre über, ohne sich in dieser Bewegung zu verlieren, und verwandelt sich so in ein automatisches Subjekt.

Question 551 Lipietz [Lip83, p. 29] writes: *Value and value-in-process are two separate phenomena. The first is essentially social and synchronic; it is an instantaneous ‘map’ of the social division of labor in the form of quantitative relations between products. The other is individual and diachronic: we talk about ‘a’ value which is preserved through time, or which grows, is wasted, and so on.* Comment.

Question 552 What does Marx mean by an “automatic subject”?

If one fixes the specific forms of appearance assumed in turn by self-valorizing value in the circular course of its life, one arrives at the explanations: capital is money, capital is commodities.¹²

¹² ‘Currency (!) employed in producing articles ... is capital’ (Macleod, *The Theory and Practice of Banking*, London, 1855, Vol. I, Ch. 1, p. 55). ‘Capital is commodities’ (James Mill, *Elements of Political Economy*, London, 1821, p. 74).

Macleod’s *The Theory and Practice of Banking* is critiqued much more thoroughly in footnote * to 375:1/o in *Contribution*. This theory-critical remark serves only as a point of entry for Marx’s own description of the process as a whole:

In truth, however, value is here the subject of a process in which, while constantly alternating between the forms of money and commodities, it changes its own magnitude, repels itself as surplus-value from itself as original value, and thus valorizes itself. The movement in the course of which it adds surplus-value is its own movement, its valorization is therefore self-valorization. It has acquired the occult ability to add value to itself, by virtue of being value. It brings forth living offspring, or at least lays golden eggs.

Capital is not money or commodity but *value* as subject. Valorization is its own movement, not something which is done with it.

Question 553 Which goose is more miraculous to Marx: the one which lays golden eggs, or the one which brings forth living offspring? Which goose should capital be compared with?

This concludes the description of the development of capital out of money, so to say, of the birth of capital. The next paragraph describes the relationship of capital with its logical parent, money:

Fixiert man die besondern Erscheinungsformen, welche der sich verwertende Wert im Kreislauf seines Lebens abwechselnd annimmt, so erhält man die Erklärungen: Kapital ist Geld, Kapital ist Ware.¹²

¹² „Das Zirkulationsmittel (!), das zu produktiven Zwecken verwendet wird, ist Kapital.“ (Macleod, „*The Theory and Practice of Banking*“, London 1855, v. I, c. 1, p. 55.) „Kapital ist gleich Waren.“ (James Mill, „*Elements of Pol. Econ.*“, Lond. 1821, p. 74.)

In der Tat aber wird der Wert hier das Subjekt eines Prozesses, worin er unter dem beständigen Wechsel der Formen von Geld und Ware seine Größe selbst verändert, sich als Mehrwert von sich selbst als ursprünglichem Wert abstößt, sich selbst verwertet. Denn die Bewegung, worin er Mehrwert zusetzt, ist seine eigne Bewegung, seine Verwertung also Selbstverwertung. Er hat die okkulte Qualität erhalten, Wert zu setzen, weil er Wert ist. Er wirft lebendige Junge oder legt wenigstens goldne Eier.

4.4.b. [Money: Point of Reference in the Movement of Capital]

255:2/o As the overarching subject of such a process, in which it alternately assumes and discards the forms of money and commodities, but preserves and expands itself through all these changes, value is above all in need of an independent form by means of which its identity with itself is asserted. Only in the shape of money does it possess this form. Money is therefore the starting point and the conclusion of every valorization process. It was £100, and now it is £110, etc.

Übergreifendes Subject translated by Moore/Aveling with “active factor” (i.e., only the word “subject” is translated, the

attribute “übergreifend” is left to the context). Fowkes translates it with “dominant subject.” This is not quite precise; “übergreifend”

means: common to all the particular forms.

In order to define a metabolism, a fixed point is necessary, which defines the identity in this turnover of materials. (This is one of the many examples that everything contains its opposite: metabolism, i.e., *change* of materials, cannot be conceived without the identity of the changing subject!) This fixed point is money. Here we have the explanation of the fact which had been the starting point of chapter Four. Money is the “first” form of capital because it is the form which represents the unity of the process.

But the money itself counts here only as one of the two forms of value. Unless it takes the form of some commodity, money does not become capital. Money does not polemicize here against commodities, as in hoarding. The capitalist knows that all commodities, however tattered their looks, or however foul their smell, are by faith and in truth money, are deep inside circumcised Jews, and in addition are miraculous means for making more money out of money.

169:1 Als das übergreifende Subjekt eines solchen Prozesses, worin er Geldform und Warenform bald annimmt, bald abstreift, sich aber in diesem Wechsel erhält und ausreckt, bedarf der Wert vor allem einer selbständigen Form, worin seine Identität mit sich selbst konstatiert wird. Und diese Form besitzt er nur im Gelde. Dies bildet daher Ausgangspunkt und Schlußpunkt jedes Verwertungsprozesses. Er war 100 Pfd.St., er ist jetzt 110 Pfd.St. usw.

Aber das Geld selbst gilt hier nur als eine Form des Werts, denn er hat deren zwei. Ohne die Annahme der Warenform wird das Geld nicht Kapital. Das Geld tritt hier also nicht polemisch gegen die Ware auf, wie in der Schatzbildung. Der Kapitalist weiß, daß alle Waren, wie lumpig sie immer aussehen oder wie schlecht sie immer riechen, im Glauben und in der Wahrheit Geld, innerlich beschnittene Juden sind und zudem wunderwürdige Mittel, um aus Geld mehr Geld zu machen.

Question 555 Explain the following aphorism about money as capital: “Money does not polemicize here against commodities, as in hoarding.” 255:2/o

The foul smell of the commodities is an allusion to the proverb that money does not smell, which Marx uses in 205:1.

“Miraculous means”: the capitalist often does not know why the process he is going through results in more money.

4.4.c. [Capital as Self-Referencing Value]

With money as point of reference and comparison, self-expanding value is no longer only a relation between commodities, but enters a relation to itself.

The self-activity of capital goes even further. Capital is not only an automatic subject; it is a subject which has a relation to itself (value for itself). Value no longer relates commodities, and in the final analysis commodity producers, to each other, but enters a relation to itself.

256:1 In simple circulation, the highest achievement of the value of the commodities was to attain a form independent of their use-values, namely, the form of money. By contrast, in the circulation $M - C - M$, value suddenly presents itself as a self-moving substance, which passes through a process of its own, and for which commodities and money are both mere forms. Even more: instead of simply representing the relations of commodities, value now enters into a private relationship with itself, as it were.

↓ Marx describes capital’s private relationship with itself in Hegelian terms: the difference between originally advanced capital and surplus-value disappears as soon as it arises, but capital is what it is, namely capital, only due to this difference.

It differentiates itself as original value from itself as surplus-value, just as God the Father differentiates himself from himself as God the Son, although both are of the same age and form, in fact one single person; for only by the surplus-value of £10 does the £100 originally advanced become capital, and as soon as this has happened, as soon as the son has been created and, through the son, the father, their difference vanishes again, and both become one, £110.

169:2/o Wenn in der einfachen Zirkulation der Wert der Waren ihrem Gebrauchswert gegenüber höchstens die selbständige Form des Geldes erhält, so stellt er sich hier plötzlich dar als eine prozessierende, sich selbst bewegende Substanz, für welche Ware und Geld beide bloße Formen. Aber noch mehr. Statt Warenverhältnisse darzustellen, tritt er jetzt sozusagen in eine Privatverhältnis zu sich selbst.

Er unterscheidet sich als ursprünglicher Wert von sich als Mehrwert, als Gott Vater von sich selbst als Gott Sohn, und beide sind vom selben Alter und bilden in der Tat nur eine Person, denn nur durch den Mehrwert von 10 Pfd.St. werden die vorgeschossenen 100 Pfd.St. Kapital, und sobald sie dies geworden, sobald der Sohn und durch den Sohn der Vater erzeugt, verschwindet ihr Unterschied wieder und sind beide Eins, 110 Pfd.St.

Question 556 Why does Marx say that the surplus-value has the same age than the capital from which it springs?

This self-referencing aspect of the profit criterion gives stability to capital accumulation. Capital stays its course and pulls the other spheres of society along. There are no similar

mechanisms monitoring whether a democracy is democratic enough, etc.

⇓ Marx summarizes the above dialectical relationship between capital and surplus-value with the words that capital is “value in proces,” and Marx shows that a similar dialectical relationship holds between capital in money form outside circulation, and capital thrown into circulation:

256:2 Value therefore now becomes value in process, money in process and, as such, capital. It comes out of circulation, enters into it again, preserves and multiplies itself within circulation, emerges from it with an increased size, and starts the same cycle again and again.¹³

↑ All money originates in circulation. If it is capital, it re-enters circulation in order to re-emerge from it with increased quantity, and keeps repeating this process. The chapter began with the one-sentence paragraph that the circulation of commodities is the point of departure for capital. The sentence which we just read says what capital does after this point of departure.

$M - M'$, ‘money which begets money’, such is the description of capital given by its first interpreters, the mercantilists.

↑ The word “interpreter” (in German “*Dolmetscher*”) does not mean someone who gives an interpretation, but someone who translates from one language into another, here, from the commodity language into the human language.

¹³ ‘Capital ... permanent self-multiplying value’ (Sismondi, *Nouveaux principes d’économie politique*, Vol. 1, p. 89)

The mercantilist phrase “money which begets money” is testimony that the mercantilists have understood something about capital, despite their confusion of value with its independent form.

Question 557 *What is mercantilism? In which way are mercantilists similar to misers?*

4.4.d. [$M - C - M'$ and Other Forms of Capital]

The last two paragraphs of the chapter lead from this most general definition of capital back to $M - C - M'$. $M - C - M'$ is not only the form of merchant capital; it is the *general* form of capital as long as we look at it only in *circulation*:

256:3/o It may seem that buying in order to sell (or, to give a more complete description, buying in order to sell dearer, $M - C - M'$), is the form peculiar to only one kind

170:1 Der Wert wird also prozessieren-der Wert, prozessierendes Geld und als solches Kapital. Er kommt aus der Zirkulation her, geht wieder in sie ein, erhält und vervielfältigt sich in ihr, kehrt vergrößert aus ihr zurück und beginnt denselben Kreislauf stets wieder von neuem.¹³

$G - G'$, geldheckendes Geld—money which begets money—lautet die Beschreibung des Kapitals im Munde seiner ersten Dolmetscher, der Merkantilisten.

¹³ „Kapital ... permanenter sich vervielfältigender Wert.“ (Sismondi, „Nouveaux Principes d’Écon. Polit.“, t. 1, p. 89.)

170:2 Kaufen, um zu verkaufen, oder vollständiger, kaufen, um teurer zu verkaufen, $G - W - G'$, scheint zwar nur einer Art des Kapitals, dem Kaufmannskapital, eigen-

of capital, namely, merchant capital. But also industrial capital is money which has been changed into commodities, and reconverted into more money by the sale of these commodities. Events which take place outside the sphere of circulation, in the interval between buying and selling, do not affect the form of this movement. Lastly, in the case of interest-bearing capital, the circulation $M - C - M'$ presents itself in abridged form, in its final result and without any intermediate stage, in a concise style, so to speak, as $M - M'$, i.e., money which is worth more money, value which is greater than itself.

Question 558 *What is merchants’ capital? industrial capital? interest-bearing capital? What is the difference between a merchant and a mercantilist?*

The formula $M - C - M'$ is therefore not just the form of circulation of merchant capital but the *general* formula of capital, as the title of the chapter says.

257:1 $M - C - M'$ is therefore in fact the general formula of capital, as it immediately appears in the sphere of circulation.

tümliche Form. Aber auch das industrielle Kapital ist Geld, das sich in Ware verwandelt und durch den Verkauf der Ware in mehr Geld rückverwandelt. Akte, die etwa zwischen dem Kauf und dem Verkaufe, außerhalb der Zirkulationssphäre, vorgehn, ändern nichts an dieser Form der Bewegung. In dem zinstragenden Kapital endlich stellt sich die Zirkulation $G - W - G'$ abgekürzt dar, in ihrem Resultat ohne die Vermittlung, sozusagen im Lapidarstil, als $G - G'$, Geld, das gleich mehr Geld, Wert, der größer als er selbst ist.

170:3 In der Tat also ist $G - W - G'$ die allgemeine Formel des Kapitals, wie es unmittelbar in der Zirkulationssphäre erscheint.

↑ This is the “immediate” appearance of capital in circulation because it does not show the mediations which make this circuit possible. In the next chapter Marx will show that capital can only beget surplus-value if it does not stay in circulation but spends part of its life outside circulation.

5. Contradictions of the General Formula

According to Chapter Four, capital has the purpose to turn value into more value. But we do not yet know *how* capital does this. Chapter Four began with the general empirical observation that many people in capitalism successfully perform $M - C - M'$, and inferred the motivations of the agents and the underlying social content of this movement. It was an almost hypothetical argument of the kind: we see that $M - C - M'$ is happening, and assuming that we can trust our eyes and this is what is indeed happening, what are the purposes of the agents and their social roles in doing this? To use a term from Critical Realism, it was a big second-order conclusion. Chapter Five continues on this hypothetical level, but this time with a conflicting result. Namely, chapter Five shows that $M - C - M'$ seems *impossible*—unless certain conditions are satisfied which one would never expect to hold because they are so contradictory. The resolution will be given in chapter Six, which shows how these contradictory conditions can be satisfied, and that they are indeed satisfied under contemporary capitalism.

258:1 The form of circulation in which capital emerges from its monetary pupa contradicts all the previously developed laws bearing on the nature of commodities, value, money and of circulation itself.

170:4 Die Zirkulationsform, worin sich das Geld zum Kapital entpuppt, widerspricht allen früher entwickelten Gesetzen über die Natur der Ware, des Werts, des Geldes und der Zirkulation selbst.

The Moore-Aveling formulation “is opposed to all the laws” is misleading: one might think it

means that a capitalist must cheat or otherwise break the laws of circulation. Fowkes has

“contradicts” which is better since it has more the connotation of an internal contradiction.

Question 559 *In what respects does $M - C - M$ “contradict all the previously developed laws bearing on the nature of commodities, value, money, and of circulation itself”?*

The only thing that distinguishes this form from the simple circulation of commodities is the inverted order in which the same two opposite processes, sale and purchase, take place. How should such a purely formal difference be able to magically change the nature of these processes?

Was sie von der einfachen Warenzirkulation unterscheidet, ist die umgekehrte Reihenfolge derselben zwei entgegengesetzten Prozesse, Verkauf und Kauf. Und wie sollte solcher rein formelle Unterschied die Natur dieser Prozesse umzaubern?

5. Contradictions of $M - C - M$

It is ok to translate the first “*unterscheidet*” with “distinguishes,” but “*Unterschied*” is, in the above translation, not translated with “distinction” but with “difference.” Here is why. “Distinguishes” means: this is a

difference which allows us to tell them apart, i.e., distinguish them. But the noun “distinction” is the act of distinguishing, maybe the German counterpart would be “*Unterscheidung*.” The German “*Unterschied*,” on the other hand,

is not the distinction made by the observer but a difference in the object. The translation of “*Unterschied*” with “distinction” commits the epistemic fallacy.

This chapter gives a critical reassessment of the results of the preceding chapter. Marx throws doubt on his earlier findings with two questions.

1. ↑ How can it be that a simple change in *form*, a merely inverted order of two actions, can make such a *radical* difference in the nature of the process?
2. ↓ Moreover, this change seems to be only subjective, it exists only for the capitalist. His business partners cannot tell whether he does $M - C - M$ or $C - M - C$:

258:2/o But that is not all. This inversion has no existence for two of the three persons transacting business with each other.

170:5/o Noch mehr. Diese Umkehrung existiert nur für einen der drei Geschäftsfreunde, die miteinander handeln.

Only the capitalist K knows that he first buys from A and then sells to B . Neither A nor B know and care. To show this, Marx argues: if the capitalist K were to switch from $M - C - M$ to $C - M - C$, i.e., if K were to first sell to B and then buy from A , neither A nor B would see a difference.

As a capitalist, I buy commodities from A and sell them again to B , but as a simple owner of commodities I sell commodities to B and then purchase further commodities from A . For A and B this difference does not exist. They step forth only as buyers or sellers of commodities. I myself confront them each time as a mere owner of either money or commodities, as a buyer or a seller. Whether I do $M - C - M$ or $C - M - C$, I confront A only as a buyer and B only as a seller, I confront the one only as money, the other only as commodities, but neither of them as capital or a capitalist or a representative of anything more than money or commodities, or of anything which might produce any effect beyond that produced by money or commodities.

Als Kapitalist kaufe ich Ware von A und verkaufe sie wieder an B , während ich als einfacher Warenbesitzer Ware an B verkaufe und dann Ware von A kaufe. Für die Geschäftsfreunde A und B existiert dieser Unterschied nicht. Sie treten nur als Käufer oder Verkäufer von Waren auf. Ich selbst stehe ihnen jedesmal gegenüber als einfacher Geldbesitzer oder Warenbesitzer, Käufer oder Verkäufer, und zwar trete ich in beiden Reihenfolgen der einen Person nur als Käufer und der andren nur als Verkäufer gegenüber, der einen als nur Geld, der andren als nur Ware, keiner von beiden als Kapital oder Kapitalist oder Repräsentant von irgend etwas, das mehr als Geld oder Ware wäre oder eine andre Wirkung außer der des Geldes oder der Ware ausüben könnte.

↑ Neither A nor B know that the capitalist K is trying to act as a capitalist instead of a simple commodity owner, and therefore K will get no different treatment from them than

any other commodity owner. \Downarrow Finally, the connection between purchase and subsequent sale exists only for the capitalist, not for anybody else:

For me the purchase from *A* and the sale to *B* are part of a sequence. But the connection between these two acts exists only for me. *A* does not trouble himself about my transaction with *B*, nor does *B* about my business with *A*.

\Uparrow In other words, the inversion from $C - M - C$ to $M - C - M$ does not remove the capitalist from simple circulation. The capitalist doing $M - C - M$ cannot expect to be treated differently than the simple commodity producer doing $C - M - C$. \Downarrow This is all Marx wants to show now, but he cannot resist giving a comical ending to his counterfactual story. He imagines now that *K* implores *A* and *B* to please treat him as a capitalist! Instead of giving respect and recognition, *A* and *B* first pretend not to understand what *K* is talking about, and after *K* insists, they unceremoniously kick him off the stage and *A* starts selling directly to *B*.

And if I offered to explain to them the meritorious nature of my inversion of the order of sale and purchase, they would probably point out to me that I was mistaken as to that order, and that the whole transaction, instead of beginning with a purchase and ending with a sale, began, on the contrary, with a sale and was concluded with a purchase. In truth, my first act, the purchase, was from the standpoint of *A* a sale, and my second act, the sale, was from the standpoint of *B* a purchase. Not content with that, *A* and *B* would declare that the whole series was superfluous and nothing but hocus-pocus; that for the future *A* would buy direct from *B*, and *B* sell direct to *A*. With this the whole transaction would shrink down to a single, one-sided phase of the ordinary circulation of commodities, a mere sale from *A*'s point of view, and from *B*'s, a mere purchase.

\Uparrow In other words, the capitalist's individual interest, his desire to turn money into more money, seems to have little chance of gaining social recognition.

Question 560 *Does Marx argue in 258:2/o that capitalist profits are middleman's profits, and if buyer and seller sold directly to each other, there would be no profit?*

Für mich bilden Kauf von *A* und Verkauf an *B* eine Reihenfolge. Aber der Zusammenhang zwischen diesen beiden Akten existiert nur für mich. *A* schert sich nicht um meine Transaktion mit *B*, und *B* nicht um meine Transaktion mit *A*.

Wollte ich ihnen etwa das besondere Verdienst klarmachen, das ich mir durch die Umkehrung der Reihenfolge erwerbe, so würden sie mir beweisen, daß ich mich in der Reihenfolge selbst irre und daß die Gesamttransaktion nicht mit einem Kauf begann und einem Verkauf endete, sondern umgekehrt mit einem Verkauf begann und mit einem Kauf abschloß. In der Tat, mein erster Akt, der Kauf, war von *A*'s Standpunkt ein Verkauf, und mein zweiter Akt, der Verkauf, war von *B*'s Standpunkt ein Kauf. Nicht zufrieden damit, werden *A* und *B* erklären, daß die ganze Reihenfolge überflüssig und Hokusfokus war. *A* wird die Ware direkt an *B* verkaufen und *B* sie direkt von *A* kaufen. Damit verschrumpft die ganze Transaktion in einen einseitigen Akt der gewöhnlichen Warenzirkulation, vom Standpunkt *A*'s bloßer Verkauf und vom Standpunkt *B*'s bloßer Kauf.

5. Contradictions of $M - C - M$

Question 561 *Marx does not really answer the objection that $M - C - M$ is only subjective for the capitalist. Can this objection be refuted?*

\Downarrow Serious again, Marx takes stock: obviously, the inversion from $C - M - C$ to $M - C - M$ does not take us outside of simple commodity circulation. Therefore his next question is: is there any way to make profits in simple circulation?

Thus the inversion of the order of succession does not take us outside the sphere of the simple circulation of commodities, and we must rather look to see whether this simple circulation, by its nature, might permit the valorization of the values entering into it and consequently the formation of surplus-value.

\Uparrow Marx's formulation "we must rather look to see" is a variation of the usual announcement "let us look at it more closely" whenever Marx takes a step back in order to question his own argument. Since the formula $M - C - M$ does not go beyond circulation, and since there is no *obvious* way to generate surplus-value in circulation, Marx is going to look systematically at every conceivable possibility of creating surplus-value in the sphere of circulation.

Wir sind also durch die Umkehrung der Reihenfolge nicht über die Sphäre der einfachen Warenzirkulation hinausgekommen und müssen vielmehr zusehn, ob sie ihrer Natur nach Verwertung der in sie eingehenden Werte und daher Bildung von Mehrwert gestattet.

5.1. [Creation of Surplus-Value in Circulation]

Marx first asks whether surplus-value can be generated in circulation if equivalents are exchanged, then he looks at the exchange of non-equivalents, then he asks whether individual differences between the exchanger could lead to profits. In all these cases, the answer is "no," this cannot be the mechanism generating the profits which we see in capitalism.

The first part, that surplus-value cannot spring from circulation alone, is trivial in the paradigm of an objective theory of value. The main difficulty is to explain why so many people think surplus-value *can* be generated in circulation. Marx brings here an immanent critique of the subjective theory of value.

5.1.a. [Exchange of Equivalents]

First step: Can surplus-value be created in circulation if prices are equal to values? In order to avoid the complications brought into this question by money, Marx first looks at a situation in which commodity is exchanged against commodity, and money is used only afterwards in order to settle the balances—and he looks at a situation in which those balances happen to be zero, so that money, physically, does not change hands at all:

259:1/o Let us take the process of circulation in a form in which it looks like a simple barter of commodities. Circulation presents

171:1–172:1 Nehmen wir den Zirkulationsprozeß in einer Form, worin er sich als bloßer Warenaustausch darstellt. Dies

itself in the form of simple barter whenever two owners of commodities buy from each other, and on the date of settlement the amounts they owe to each other balance out equally. Money serves here as money of account, and expresses the values of the commodities in their prices, but does not itself confront the commodities as a thing.

↑ Such a transaction may have many advantages for the trading partners, but is the creation of surplus-value one of these advantages? ↓ Marx looks at the advantages in turn. First advantage: both exchangers may gain in terms of use-value:

In so far as use-values are concerned, it is clear that both parties may gain. Both of them part with commodities which are of no service to them as use-values, and receive others they need to use.

↓ Second advantage: in the presence of exchange, the producers can be more productive than without exchange, since they can specialize on those things in which they are better. Marx uses here Ricardo's famous example with corn (England) and wine (Portugal):

And this may not be the only advantage gained. *A*, who sells wine and buys corn, possibly produces more wine in the same labor-time than *B*, the corn farmer, could produce, and *B*, on the other hand, may produce more corn than *A*, the wine grower, could produce. *A* may therefore get more corn for the same exchange-value, and *B* more wine, than each would respectively get without any exchange if they had to produce their own corn and wine. With reference to use-value, it can therefore indeed be said that 'exchange is a transaction by which both sides gain'.¹⁴

¹⁴ 'Exchange is an admirable transaction by which both sides gain—always (!)' (Destutt de Tracy, *Traité de la volonté et de ses effets*, Paris, 1826, p. 68). This same book also appeared under the title *Traité d'économie politique*.

↑ Higher productivity means: more use-value is produced in the same time. Each party trades that commodity which they can produce more efficiently, but in terms of labor-time it

ist stets der Fall, wenn beide Warenbesitzer Waren voneinander kaufen und die Bilanz ihrer wechselseitigen Geldforderungen sich am Zahlungstag ausgleicht. Das Geld dient hier als Rechengeld, um die Werte der Waren in ihren Preisen auszudrücken, tritt aber nicht den Waren selbst dinglich gegenüber.

Soweit es sich um den Gebrauchswert handelt, ist es klar, daß beide Austauscher gewinnen können. Beide veräußern Waren, die ihnen als Gebrauchswert nutzlos, und erhalten Waren, deren sie zum Gebrauch bedürfen.

Und dieser Nutzen mag nicht der einzige sein. *A*, der Wein verkauft und Getreide kauft, produziert vielleicht mehr Wein, als Getreidebauer *B* in derselben Arbeitszeit produzieren könnte, und Getreidebauer *B* in derselben Arbeitszeit mehr Getreide, als Weinbauer *A* produzieren könnte. *A* erhält also für denselben Tauschwert mehr Getreide und *B* mehr Wein, als wenn jeder von den beiden, ohne Austausch, Wein und Getreide für sich selbst produzieren müßte. Mit Bezug auf den Gebrauchswert also kann gesagt werden, daß „der Austausch eine Transaktion ist, worin beide Seiten gewinnen“¹⁴.

¹⁴ „L'échange est une transaction admirable dans laquelle les deux contractants gagnent—toujours (!)“ (Destutt de Tracy, *Traité de la Volonté et de ses effets* Paris 1826, p. 68.) Dasselbe Buch erschien auch als „Traité d'Éc. Pol.“

is still an equal trade. Also this second example illustrates therefore gains in use-value, not gains in value. ↓ Now Marx looks at exchange-value: there is equality, no advantage:

It is otherwise with exchange-value.

'A man who has plenty of wine and no corn treats with a man who has plenty of corn and no wine; an exchange takes place between them of corn to the value of 50, for wine of the same value. This act produces no increase of exchange-value either for the one or the other; for each of them already possessed, before the exchange, a value equal to that which he acquired by means of that operation.'¹⁵

¹⁵ Mercier de la Rivière, op. cit., p. 544.

↑ If commodities are exchanged against commodities without money changing hands at the same time, both sides may gain with respect to use-value, but the values are not increased. ↓ The result will be the same if the commodity is sold for money:

260:1 This situation is not altered when money, as a medium of circulation, steps between the commodities, and when sale and the purchase become two physically distinct acts.¹⁶

↑ Marx defends this claim with an argument of the form: it cannot be otherwise, since money is only an intermediary which only *physically* splits up sale and purchase. This physical presence cannot add anything new.

¹⁶ 'Whether one of these two values is money, or whether they are both ordinary commodities, is in itself a matter of complete indifference' (Mercier de la Rivière, op. cit., p. 543).

↓ The next sentence, that value is not determined in circulation but already exists before circulation, is additional corroboration:

The value of a commodity is expressed in its price before it enters into circulation, and is therefore a precondition of circulation, not its result.¹⁷

¹⁷ 'It is not the parties to a contract who decide on the value; that has been decided before the contract' (Le Trosne, op. cit., p. 906).

But this last sentence is also the opening for quite abstract positive argument in which Marx scrutinizes his earlier abstract analysis of $C-M-C$ (from chapter Three) to see if there is an opening for the creation of surplus-value in circulation:

Anders mit dem Tauschwert.

„Ein Mann, der viel Wein und kein Getreide besitzt, handelt mit einem Mann, der viel Getreide und keinen Wein besitzt, und zwischen ihnen wird ausgetauscht Weizen zum Wert von 50 gegen einen Wert von 50 in Wein. Dieser Austausch ist keine Vermehrung des Tauschwerts weder für den einen noch für den andren; denn bereits vor dem Austausch besaß jeder von ihnen einen Wert gleich dem, den er sich vermittelt dieser Operation verschafft hat.“¹⁵

¹⁵ Mercier de la Rivière, l.c. p. 544.

172:2 Es ändert nichts an der Sache, wenn das Geld als Zirkulationsmittel zwischen die Waren tritt und die Akte des Kaufs und Verkaufs sinnlich auseinanderfallen.¹⁶

¹⁶ „Ob einer dieser beiden Werte Geld ist oder beide gewöhnliche Waren sind, nichts kann an sich gleichgültiger sein.“ (Mercier de la Rivière, l.c. p. 543.)

Der Wert der Waren ist in ihren Preisen dargestellt bevor sie in die Zirkulation treten, also Voraussetzung und nicht Resultat derselben.¹⁷

¹⁷ „Über den Wert entscheiden nicht die Vertragspartner; er steht schon vor der Übereinkunft fest.“ (Le Trosne, l.c. p. 906.)

260:2/o If considered in the abstract, i.e. disregarding any circumstances that do not flow from the immanent laws of simple commodity circulation, all that happens in exchange (if we leave aside the replacement of one use-value by another) is a metamorphosis, a mere change in the form of the commodity.

Question 563 *How does the abstraction Marx makes in the first sentence of 260:2/o differ from the ceteris paribus assumptions of modern economics?*

Two things are going on in the circulation process if one disregards all other mechanisms: replacement of one use-value by another, and a form change of the commodity. Marx concentrates now on the latter.

The same value, i.e. the same quantity of objectified social labor, remains throughout in the hands of the same commodity-owner, first in the shape of his own commodity, then in the shape of the money into which the commodity has been transformed, and finally in the shape of the commodity into which this money has been re-converted. This change of form does not imply any change in the magnitude of the value.

↓ The commodity's value goes through a change analogous to the situation where a dollar bill is exchanged for four quarters:

But the change which the value of the commodity undergoes in this process is limited to a change in its money-form. This form exists first as the price of the commodity offered for sale, then as an actual sum of money, which was, however, already expressed in the price, and lastly as the price of an equivalent commodity. This change of form no more implies, taken alone, a change in the quantity of value than does the changing of a £ 5 note into sovereigns, half-sovereigns and shillings.

If you "make change," i.e., exchange dollar bills for smaller bills or coins, you don't think you have different money now. It is the same money in a different form. Now if you *buy* something with your money you of course no longer have the same money, but you still have

172:3/o Abstrakt betrachtet, d.h. abgesehen von Umständen, die nicht aus den immanenten Gesetzen der einfachen Warenzirkulation hervorgehen, geht außer dem Ersatz eines Gebrauchswerts durch einen andern nichts in ihr vor als eine Metamorphose, ein bloßer Formwechsel der Ware.

Derselbe Wert, d.h. dasselbe Quantum gegenständlicher gesellschaftlicher Arbeit, bleibt in der Hand desselben Warenbesitzers in Gestalt erst seiner Ware, dann des Geldes, worin sie sich verwandelt, endlich der Ware, worin sich dies Geld rückverwandelt. Dieser Formwechsel schließt keine Änderung der Wertgröße ein.

Der Wechsel aber, den der Wert der Ware selbst in diesem Prozeß durchläuft, beschränkt sich auf einen Wechsel seiner Geldform. Sie existiert erst als Preis der zum Verkauf angebotenen Ware, dann als eine Geldsumme, die aber schon im Preise ausgedrückt war, endlich als der Preis einer äquivalenten Ware. Dieser Formwechsel schließt an und für sich ebensowenig eine Änderung der Wertgröße ein wie das Auswechseln einer Fünfpfundnote gegen Sovereigns, halbe Sovereigns und Schillinge.

the same *value*, just in a different form. This form change does not affect the quantity of your value.

As long as the circulation of commodities is nothing but the vehicle for the form change of its value, it involves therefore, if the phenomenon occurs in its purity, the exchange of equivalents.

↑ Since it is a change the possibility exists that the quantity changes as well. But there is no reason for it; a form change does not imply a change in quantity. ↓ Even the vulgar economists impose such a condition whenever they assume away imbalances between demand and supply:

Even the vulgar economists, who have no inkling of the nature of value, assume therefore that supply and demand are equal, i.e. that supply and demand cease to have any effect at all, whenever they wish to consider, after their fashion, the phenomenon in its purity.

↓ The lesson to be drawn from this abstract argument is that circulation cannot be the source of value.

With respect to the use-values exchanged, therefore, both buyer and seller may possibly gain something, but this is not the case with respect to exchange-values. Here we must rather say: 'Where there is equality there is no gain.'¹⁸ It is true that commodities may be sold at prices which diverge from their values, but this divergence appears as a violation of the laws governing the exchange of commodities.¹⁹ In its pure form, the exchange of commodities is an exchange of equivalents, and thus it is not a method of increasing value.²⁰

¹⁸ Dove è egualità non è lucro. (Galiani, Della Moneta, in Custodi, Parte moderna, Vol. 4, p. 244).

¹⁹ 'The exchange becomes unfavorable for one of the parties when some external circumstance comes to lessen or increase the price; then equality is infringed; but this infringement arises from that cause and not from the exchange itself'

Sofern also die Zirkulation der Ware nur einen Formwechsel ihres Werts bedingt, bedingt sie, wenn das Phänomen rein vorgeht, Austausch von Äquivalenten.

Die Vulgärökonomie selbst, so wenig sie ahnt, was der Wert ist, unterstellt daher, so oft sie in ihrer Art das Phänomen rein betrachten will, daß Nachfrage und Zufuhr sich decken, d.h., daß ihre Wirkung überhaupt aufhört.

Wenn also mit Bezug auf den Gebrauchswert beide Austauscher gewinnen können, können sie nicht beide gewinnen an Tauschwert. Hier heißt es vielmehr: „Wo Gleichheit ist, ist kein Gewinn.“¹⁸ Waren können zwar zu Preisen verkauft werden, die von ihren Werten abweichen, aber diese Abweichung erscheint als Verletzung des Gesetzes des Warenaustausches.¹⁹ In seiner reinen Gestalt ist er ein Austausch von Äquivalenten, also kein Mittel, sich an Wert zu bereichern.²⁰

¹⁸ „Dove è egualità non è lucro.“ (Galiani, „Della Moneta“, in Custodi, Parte Moderna, t. IV, p. 244.)

¹⁹ „Der Austausch wird für eine der beiden Parteien ungünstig, wenn irgendein fremder Umstand den Preis vermindert oder erhöht: dann ist die Gleichheit verletzt; aber diese Verletzung ist durch jene Ursache hervorgerufen und nicht

(Le Trosne, op. cit., p. 904).

²⁰ 'Exchange is by its nature a contract which rests on equality, i.e. it takes place between two equal values. It is therefore not a means of self-enrichment, since as much is given as is received' (Le Trosne, op. cit., p. 903).

durch den Austausch.“ (Le Trosne, l.c. p. 904.)

²⁰ „Der Austausch ist seiner Natur nach ein Vertrag, der auf Gleichheit aufbaut, d.h. zwischen zwei gleichen Werten zustande kommt. Er ist also kein Mittel, sich zu bereichern, da man ebensoviel gibt wie empfängt.“ (Le Trosne, l.c. p. 903, 904.)

Exam Question 564 *Is exchange (direct barter) a transaction in which both sides gain more than they give up?*

Next Marx takes a look at the many false theories about this matter. He begins with a summary judgment which will then be backed up by quotes from Condillac, LeTrosne, and Neumann:

261:1/o Hence we see that behind all attempts to represent the circulation of commodities as a source of surplus-value, there lurks an inadvertent substitution, a confusion of use-value and exchange-value.

The distinction between exchange-value and use-value is one of the first observations Marx makes about the commodity (and is literally *the* first thing he says in *Contribution* 269:1). Rightly so, because nothing useful can be said about the commodity if this distinction is not made. Let's see how Condillac conflates these two concepts in the following quote:

In Condillac, for instance:

'It is not true that in an exchange of commodities we give value for value. On the contrary, each of the two contracting parties in every case gives a less for a greater value ... If we really exchanged equal values, neither party could make a profit. And yet they both gain, or ought to gain. Why? The value of a thing consists solely in its relation to our needs. What is more to the one is less to the other, and vice versa ... It is not to be assumed that we offer for sale articles essential for our own consumption ... We wish to part with a useless thing, in order to get one that we need; we want to give less for more ... It was natural to think that, in an exchange, one value was given for another equal to it whenever each of the articles exchanged was of equal value with the same quantity of gold ... But there is another point to be considered in our calcu-

173:1–174:3 Hinter den Versuchen, die Warenzirkulation als Quelle von Mehrwert darzustellen, lauert daher meist ein Quid-proquo, eine Verwechslung von Gebrauchswert und Tauschwert.

So z.B. bei Condillac:

„Es ist falsch, daß man im Warenaustausch gleichen Wert gegen gleichen Wert austauscht. Umgekehrt. Jeder der beiden Kontrahenten gibt immer einen kleineren für einen größeren Wert ... Tauschte man in der Tat immer gleiche Werte aus, so wäre kein Gewinn zu machen für irgendeinen Kontrahenten. Aber alle beide gewinnen oder sollten doch gewinnen. Warum? Der Wert der Dinge besteht bloß in ihrer Beziehung auf unsre Bedürfnisse. Was für den einen mehr, ist für den andren weniger, und umgekehrt ... Man setzt nicht voraus, daß wir für unsre Konsumtion unentbehrliche Dinge zum Verkauf ausbieten ... Wir wollen eine uns nutzlose Sache weggeben, um eine uns notwendige zu erhalten; wir wollen weniger für mehr geben ... Es war natürlich, zu urteilen, daß man im Austausch gleichen Wert für gleichen Wert gebe, sooft jedes der ausge-

lation. The question is, whether we both exchange something superfluous for something necessary.'²¹

²¹ Condillac, *Le Commerce et le gouvernement* (1776), éd. Daire and Molinari, in the *Mélanges d'économie politique*, Paris, 1847, pp. 267, 291.

tauschten Dinge an Wert demselben Quantum Geld gleich war ... Aber eine andre Betrachtung muß noch in die Rechnung eingehn; es fragt sich, ob wir beide einen Überfluß gegen etwas Notwendiges austauschen.“²¹

²¹ Condillac, „*Le Commerce et le Gouvernement*“ (1776), Édité. Daire et Molinari in den „*Mélanges d'Économie Politique*“, Paris 1847, p. 267, 291.

Question 565 *Condillac writes: “It is not true that in an exchange of commodities we give value for value. On the contrary, each of the two contracting parties in every case gives a less for a greater value ... If we really exchanged equal values, neither party could make a profit. And yet they both gain, or ought to gain.” Show exactly where Condillac, in this passage, conflates use-value and exchange-value.*

↑ The unspoken implication here is that the markup over the cost price, which one observes in capitalism, is the remuneration for the productive services which commodity trade performs by moving the goods into the hands of those who have more use-value for them. ↓ The conflation of use-value and exchange-value however is not the only error in the quote from Condillac.

We see in this passage how Condillac not only throws together use-value and exchange-value, but in a really childish manner assumes that, in a society in which the production of commodities is well developed, each producer produces his own means of subsistence, and throws into circulation only what is superfluous, the excess over his own requirements.²²

Already Condillac's friend Le Trosne gave some good critiques here:

²² Le Trosne therefore answers his friend Condillac quite correctly as follows: 'In a developed society absolutely nothing is superfluous.' At the same time he pokes fun at him with the remark, that, 'if both the persons who exchange receive more in return for an equal amount, and part with less in return for an equal amount, they both get the same.'

Man sieht, wie Condillac nicht nur Gebrauchswert und Tauschwert durcheinanderwirft, sondern wahrhaft kindlich einer Gesellschaft mit entwickelter Warenproduktion einen Zustand unterschiebt, worin der Produzent seine Subsistenzmittel selbst produziert und nur den Überschuß über den eigenen Bedarf, den Überfluß, in die Zirkulation wirft.²²

²² Le Trosne antwortet daher seinem Freunde Condillac sehr richtig: „In der entwickelten Gesellschaft gibt es überhaupt nichts Überflüssiges.“ Zugleich neckt er ihn mit der Glosse, daß, „wenn beide Austauscher gleich viel mehr für gleich viel weniger erhalten, sie beide gleich viel erhalten“.

Le Trosne's "tease" from footnote 22 can be found in [LT46, pp. 907, 904].

Question 566 *In what way does the following remark poke fun at Condillac? “If both the persons who exchange receive more in return for an equal amount, and part with less in return for an equal amount, then they both get the same.”*

Despite Le Trosne’s critique of Condillac, Condillac is cited by Roscher as his authority:

^{22 ctd} It is because Condillac has not the remotest idea of the nature of exchange-value that he has been chosen by Herr Professor Wilhelm Roscher as a suitable guarantor of the soundness of his own childish notions. See Roscher’s *Die Grundlagen der Nationalökonomie*, 3rd edn, 1858.

Still, Condillac’s argument is frequently repeated by modern economists, especially when the point is to show that the exchange of commodities in its developed form, commerce, is productive of surplus-value. For instance,

‘Commerce . . . adds value to products, for the same products in the hands of consumers are worth more than in the hands of producers, and it may strictly be considered an act of production.’²³

²³ S. P. Newman, *Elements of Political Economy*, Andover and New York, 1835, p. 175.

If a merchant were to justify his markup by his services of bringing the use-values together with those who need them, a Marxist would answer: you are trying to charge me twice for the same merchandise:

But commodities are not paid for twice over, once on account of their use-value, and a second time on account of their value.

↑ According to the labor theory of value, the price of commodities does not depend on their use-values but only on their values. In other words, the buyer only has to pay for their value, i.e., he has to compensate the seller for the labor put into the commodity. What the buyer does with the commodity and how much use-value he derives from it is his private affair; he does not have to pay the seller once more when he gets a lot of use-value out of it. The fact that the buyer gains use-value is not reflected in the price of the commodity, and can therefore not be a source of surplus-value.

Question 567 *What does Marx mean when he says “commodities are not paid for twice over, once on account of their use-value, and a second time on account of their value”?*

^{22 ctd} Weil Condillac noch nicht die geringste Ahnung von der Natur des Tauscherts besitzt, ist er der passende Gewährsmann des Herrn Prof. Wilhelm Roscher für seine eignen Kinderbegriffe. Sieh dessen: „*Die Grundlagen der Nationalökonomie*“, Dritte Auflage, 1858.

Dennoch wird Condillacs Argument häufig bei modernen Ökonomen wiederholt, namentlich wenn es gilt, die entwickelte Gestalt des Warenaustausches, den Handel, als produktiv von Mehrwert darzustellen.

„Der Handel“ heißt es z.B. „fügt den Produkten Wert zu, denn dieselben Produkte haben mehr Wert in den Händen des Konsumenten als in den Händen des Produzenten, und er muß daher wörtlich (strictly) als Produktionsakt betrachtet werden.“²³

²³ S. P. Newman, „*Elements of Polit. Econ.*“, Andover and New York 1835, p. 175.

Aber man zahlt die Waren nicht doppelt, das eine Mal ihren Gebrauchswert und das andere Mal ihren Wert.

↑ This redescription of Newman’s theory from the point of view of the labor theory of value shows strikingly what is wrong with it *if* the labor theory is right, but it is not an immanent critique. It only proves that Newman’s theory *differs* from the labor theory of value; it is not yet proof that Newman’s theory is false. In order to show that Newman’s theory cannot be right Marx comes with a second argument, namely, he tries to show that Newman’s theory is internally inconsistent:

And though the use-value of a commodity is more serviceable to the buyer than to the seller, its money-form is more so to the seller. Would he sell it otherwise? We might therefore just as well say that the buyer performs what is ‘strictly’ an ‘act of production’ by converting stockings, for example, into money.

Und wenn der Gebrauchswert der Ware dem Käufer nützlicher als dem Verkäufer, ist ihre Geldform dem Verkäufer nützlicher als dem Käufer. Würde er sie sonst verkaufen? Und so könnte ebensowohl gesagt werden, daß der Käufer wörtlich (strictly) einen „Produktionsakt“ vollbringt, indem er z.B. die Strümpfe des Kaufmanns in Geld verwandelt.

Marx ends his argument here, but the implication is clear: the merchant’s activity of converting the buyer’s money into stockings and the buyer’s activity of converting the merchant’s stockings into money cannot both be considered production, because each of these activities exactly undoes the other. It is a good thing that the buyer gets his socks and the merchant his money, and everybody is happier for it, but production it is not.

Question 568 *How does Marx rebut the argument that exchange should be considered an act of production because the same products in the hands of consumers are worth more than in the hands of producers?*

Question 569 *If you exchange risky assets with complementary profiles, so that both parties have the same expected value but lower variance after the exchange, is this an example of value created from exchange?*

5.1.b. [Exchange of Nonequivalents]

After it has been shown impossible to create surplus-value through the exchange of equivalents, Marx asks now: is it possible to create surplus-value in circulation with the exchange of non-equivalents?

262:1 If commodities, or commodities and money, of equal exchange-value, and consequently equivalents, are exchanged, it is plain that no one extracts more value from circulation than he throws into it. There is no creation of surplus-value. In its pure form, the circulation process necessitates

174:4 Werden Waren oder Waren und Geld von gleichem Tauschwert, also Äquivalente ausgetauscht, so zieht offenbar keiner mehr Wert aus der Zirkulation heraus, als er in sie hineinwirft. Es findet dann keine Bildung von Mehrwert statt. In seiner reinen Form aber bedingt der Zirkulations-

the exchange of equivalents, but in reality processes do not take place in their pure form. Let us therefore assume an exchange of non-equivalents.

Whenever nonequivalents are exchanged, the question is: *who* must buy above value and/or is forced to sell below value? Here Marx tries two different assumptions.

[Different Economic Roles]

First assumption: the distinction is drawn according to economic categories.

262:2/o In any case the market for commodities is frequented only by owners of commodities, and the power which these persons exercise over each other is no other than the power of their commodities. The bodily difference of the commodities is the bodily driving force behind their exchange, and it makes buyers and sellers mutually dependent, because none of them possesses the object of his own need, and each holds in his own hand the object of another's need. Apart from this bodily difference in their use-values, there is only one other mark of distinction between commodities, the distinction between their natural form and their converted form, between commodities and money. Consequently, the owners of commodities can be differentiated only into sellers, those who own commodities, and buyers, those who own money.

Marx first tries to use as criteria who can sell above or buy below value the distinctions provided by commodity-exchange itself. The only possible distinction between commodity owners is either the use-value they produce, or the distinction between buyer and seller. However, he rules out the distinction of use-values, apparently because it is a symmetric relationship, everyone depends on everyone else, and asks:

263:1 Suppose then that some inexplicable privilege allows the seller to sell his commodities above their value, to sell what is worth 100 for 110, therefore with a nominal price increase of 10 per cent. In this case the seller pockets a surplus-value of

prozeß der Waren Austausch von Äquivalenten. Jedoch geht die Dinge in der Wirklichkeit nicht rein zu. Unterstellen wir daher Austausch von Nicht-Äquivalenten.

174:5/o Jedenfalls steht auf dem Warenmarkt nur Warenbesitzer dem Warenbesitzer gegenüber, und die Macht, die diese Personen über einander ausüben, ist nur die Macht ihrer Waren. Die stoffliche Verschiedenheit der Waren ist das stoffliche Motiv des Austausches und macht die Warenbesitzer wechselseitig voneinander abhängig, indem keiner von ihnen den Gegenstand seines eignen Bedürfnisses und jeder von ihnen den Gegenstand des Bedürfnisses des andern in seiner Hand hält. Außer dieser stofflichen Verschiedenheit ihrer Gebrauchswerte besteht nur noch ein Unterschied unter den Waren, der Unterschied zwischen ihrer Naturalform und ihrer verwandelten Form, zwischen Ware und Geld. Und so unterscheiden sich die Warenbesitzer nur als Verkäufer, Besitzer von Ware, und als Käufer, Besitzer von Geld.

175:1 Gesetzt nun, es sei durch irgendein unerklärliches Privilegium dem Verkäufer gegeben, die Ware über ihrem Werte zu verkaufen, zu 110, wenn sie 100 wert ist, also mit einem nominellen Preisaufschlage von 10%. Der Verkäufer kassiert also

10. But after he has sold he becomes a buyer. A third owner of commodities now comes to him as a seller, and he too, for his part, enjoys the privilege of selling his commodities 10 per cent too dear. Our friend gained 10 as a seller only to lose it again as a buyer.²⁴ In fact the net result is that all owners of commodities sell their goods to each other at 10 per cent above their value, which is exactly the same as if they sold them at their true value. A universal and nominal price increase of this kind has the same effect as if the values of commodities had been expressed for example in silver instead of in gold. The money-names or prices of the commodities would rise, but the relations between their values would remain unchanged.

²⁴ 'By the augmentation of the nominal value of the produce ... sellers [are] not enriched ... since what they gain as sellers, they precisely expend in the quality of buyers' ([J. Gray], *The Essential Principles of the Wealth of Nations etc.*, London, 1797, p. 66).

What if all sellers can sell at too high prices? This makes no difference, since everybody becomes a buyer after he is a seller. Value *proportions* remain the same, although the absolute price level increases. The opposite assumption that the sellers sell too cheaply comes to the same result.

263:2 Let us make the opposite assumption, that the buyer has the privilege of purchasing commodities below their value. In this case we do not even need to recall that he is his turn will become a seller. He was a seller before he became a buyer; he had already lost 10 per cent as a seller before he gained 10 per cent as a buyer.²⁵ Everything remains as it was before.

²⁵ 'If one is compelled to sell a quantity of a certain product for 18 livres when it has a value of 24 livres, then, when one employs the same

einen Mehrwert von 10 ein. Aber nachdem er Verkäufer war, wird er Käufer. Ein dritter Warenbesitzer begegnet ihm jetzt als Verkäufer und genießt seinerseits das Privilegium, die Ware 10% zu teuer zu verkaufen. Unser Mann hat als Verkäufer 10 gewonnen, um als Käufer 10 zu verlieren.²⁴ Das Ganze kommt in der Tat darauf hinaus daß alle Warenbesitzer ihre Waren einander 10% über dem Wert verkaufen, was durchaus dasselbe ist, als ob sie die Waren zu ihren Werten verkauften. Ein solcher allgemeiner nomineller Preisaufschlag der Waren bringt dieselbe Wirkung hervor, als ob die Warenwerte z.B. in Silber statt in Gold geschätzt würden. Die Geldnamen, d.h. die Preise der Waren würden anschwellen, aber ihre Wertverhältnisse unverändert bleiben.

²⁴ „Durch die Heraufsetzung des nominellen Werts des Produkts ... werden die Verkäufer nicht reicher ... da sie genau das, was sie als Verkäufer gewinnen, in ihrer Eigenschaft als Käufer wieder ausgeben.“ ([J. Gray] *„The Essential Principles of the Wealth of Nations etc.“*, London 1797, p. 66.)

175:2 Unterstellen wir umgekehrt, es sei das Privilegium des Käufers, die Waren unter ihrem Wert zu kaufen. Hier ist es nicht einmal nötig zu erinnern, daß der Käufer wieder Verkäufer wird. Er war Verkäufer, bevor er Käufer ward. Er hat bereits 10% als Verkäufer verloren, bevor er 10% als Käufer gewinnt.²⁵ Alles bleibt wieder beim alten.

²⁵ „Wenn man für 18 Livres eine Menge eines bestimmten Erzeugnisses verkaufen muß, die 24 Livres wert ist, wird man, wenn man die gleiche

amount of money in buying, one will receive for 18 livres the same quantity of the product as 24 livres would have bought otherwise' (Le Trosne, op. cit., p. 897).

263:3 The formation of surplus-value, and therefore the transformation of money into capital, can consequently be explained neither by assuming that commodities are sold above their value, nor by assuming that they are bought at less than their value.²⁶

²⁶ 'A seller can normally only succeed in raising the prices of his commodities if he agrees to pay, by and large, more for the commodities of the other sellers; and for the same reason a consumer can normally only pay less for his purchases if he submits to a similar reduction in the prices of the things he sells' (Mercier de la Rivière, op. cit., p. 555).

↑ This cannot be the explanation of capitalism. ↓ It is also of no avail to distinguish along economic criteria *outside circulation*, e.g., to distinguish between producers and consumers. In circulation, producers are sellers and consumers are buyers, i.e., we have the same case as before.

264:1a The problem is in no way simplified if extraneous matters are smuggled in, as with Colonel Torrens:

'Effectual demand consists in the power and inclination (!), on the part of consumers, to give for commodities, either by immediate or circuitous barter, some greater portion of ... capital than their production costs.'²⁷

²⁷ R. Torrens, *An Essay on the Production of Wealth*, London, 1821, p. 349.

264:1b In circulation, producers and consumers confront each other only as buyers and sellers. To assert that the surplus-value acquired by the producer has its origin in the fact that consumers pay for commodities more than their value is only to disguise the following simple phrase: the owner of commodities possesses, as a seller, the priv-

Geldsumme zum Kauf verwendet, für 18 Livres ebenfalls so viel wie für 24 Livres erhalten." (Le Trosne, l.c. p. 897.)

175:3 Die Bildung von Mehrwert und daher die Verwandlung von Geld in Kapital, kann also weder dadurch erklärt werden, daß die Verkäufer die Waren über ihrem Werte verkaufen, noch dadurch, daß die Käufer sie unter ihrem Werte kaufen.²⁶

²⁶ „Kein Verkäufer kann daher gewöhnlich seine Waren im Preis heraufsetzen, ohne ebenso die Waren der anderen Verkäufer teurer bezahlen zu müssen; und aus dem gleichen Grunde kann kein Verbraucher gewöhnlich billiger einkaufen, ohne ebenso die Waren, die er verkauft, im Preise herabsetzen zu müssen.“ (Mercier de la Rivière, l.c. p. 555.)

176:1–2 Das Problem wird in keiner Weise dadurch vereinfacht, daß man fremde Beziehungen einschmuggelt, also etwa mit Oberst Torrens sagt:

„Die effektive Nachfrage besteht in dem Vermögen und der Neigung (!) der Konsumenten, sei es durch unmittelbaren oder vermittelten Austausch, für Waren eine gewisse größere Portion von allen Ingredienzien des Kapitals zu geben, als ihre Produktion kostet.“²⁷

²⁷ R. Torrens, „*An Essay on the Production of Wealth*“, London 1821, p. 349.

176:3 In der Zirkulation stehn sich Produzenten und Konsumenten nur als Verkäufer und Käufer gegenüber. Behaupten, der Mehrwert für den Produzenten entspringe daraus, daß die Konsumenten die Ware über den Wert zahlen, heißt nur den einfachen Satz maskieren: Der Warenbesitzer besitzt als Verkäufer das Privilegium, zu teuer zu

ilege of selling too dear. The seller is either the producer or the representative of the producer of his commodities, but the buyer is no less either the producer or the representative of the producer of the commodities represented by his money. One producer is therefore confronted with another producer. The distinction between them is that one buys and the other sells. One does not throw any light on the origin of surplus-value if one says that the owner of the commodities sells them at more than their value, under the designation of producer, and pays too much for them, under the designation of consumer.²⁸

The footnote makes the same point:

²⁸ 'The idea of profits being paid by the consumers, is, assuredly, very absurd. Who are the consumers?' (G. Ramsay, *An Essay on the Distribution of Wealth*, Edinburgh, 1836, p. 183).

Question 571 Ramsay asks: "who are the consumers?" This is a rhetorical question, obviously he had an answer in mind. Which answer?

↑ Marx makes here explicitly the assumption of Simple commodity production. (He will say this again in 266:3/o.) ↓ If one comes to other conclusions than he one must have a different social structure in mind.

264:2 Those who most consistently uphold the illusion that surplus-value has its origin in a nominal rise of prices, or in the privilege which the seller has of selling too dear, assume therefore that there exists a class of buyers who do not sell, i.e. a class of consumers who do not produce.

Can the theory that profits come from inflated prices be salvaged by the assumption that there is a class which consumes but does not produce? Marx says no. These nonproducers must have stolen their money. Selling to them at an inflated price simply recaptures part of this theft.

The existence of such a class cannot yet be explained from the standpoint we have

verkaufen. Der Verkäufer hat die Ware selbst produziert oder vertritt ihren Produzenten, aber der Käufer hat nicht minder die in seinem Gelde dargestellte Ware selbst produziert oder vertritt ihren Produzenten. Es steht also Produzent dem Produzenten gegenüber. Was sie unterscheidet, ist, daß der eine kauft und der andre verkauft. Es bringt uns keinen Schritt weiter, daß der Warenbesitzer unter dem Namen Produzent die Ware über ihrem Werte verkauft und unter dem Namen Konsument sie zu teuer zahlt.²⁸

²⁸ „Der Gedanke, daß die Profite von den Konsumenten gezahlt werden, ist sicher völlig absurd. Wer sind die Konsumenten?“ (G. Ramsay, „*An Essay on the Distribution of Wealth*“, Edinburgh 1836, p. 183.)

176:4/o Die konsequenten Vertreter der Illusion, daß der Mehrwert aus einem nominellen Preiszuschlag entspringt oder aus dem Privilegium des Verkäufers, die Ware zu teuer zu verkaufen, unterstellen daher eine Klasse, die nur kauft, ohne zu verkaufen, also auch nur konsumiert ohne zu produzieren.

Die Existenz einer solchen Klasse ist von unsrem bisher erreichten Standpunkt, dem

reached at present, that of simple circulation. But let us anticipate. The money with which such a class is constantly making purchases must constantly flow into its coffers without any exchange, gratis, whether by might or by right, from the pockets of the commodity-owners themselves. To sell commodities at more than their value to such a class is only to get back again, by swindling, a part of the money previously handed over for nothing.²⁹

²⁹ ‘When a man is in want of a demand, does Mr Malthus recommend him to pay some other person to take off his goods?’ is a question put by an infuriated Ricardian to Malthus, who, like his disciple Parson Chalmers, economically glorifies this class of simple buyers or consumers. See *An Inquiry into Those Principles, Respecting the Nature of Demand and the Necessity of Consumption, Lately Advocated by Mr. Malthus etc.*, London, 1821, p. 55.

There is only one way that sellers can gain over the buyers by selling too expensively: if they do not become buyers afterwards. But this means, they must be giving their money away to the buyers without getting something in exchange. In this case, their gains in selling too expensively only mean that they gain some money back which they had to give away before. This is not merely a theoretical possibility but has a fitting historical example with the towns in Asia Minor (Turkey).

Thus, the towns of Asia Minor paid a yearly money tribute to ancient Rome. With this money Rome bought commodities from them and bought them too expensively. The provincials cheated the Romans, and in this way swindled back from their conquerors a portion of the tribute in the course of trade. Yet, for all that, the provincials remained the ones who were cheated. Their commodities were paid to them with their own money.

This is not the same mechanism that we see today.

That is not the way to get rich or to create surplus-value.

der einfachen Zirkulation, noch unerklärlich. Aber greifen wir vor. Das Geld, womit eine solche Klasse beständig kauft, muß ihr beständig, ohne Austausch, umsonst, auf beliebige Rechts- und Gewaltstitel hin, von den Warenbesitzern selbst zufließen. Dieser Klasse die Waren über dem Wert verkaufen, heißt nur, umsonst weggegebenes Geld sich zum Teil wieder zurückschwindeln.²⁹

²⁹ „Wenn es jemand an Nachfrage mangelt, rät ihm dann Herr Malthus, eine andre Person zu bezahlen. damit diese ihm seine Waren abnehme?“ fragt ein entrüsteter Ricardianer den Malthus, der wie sein Schüler, der Pfaffe Chalmers, die Klasse von bloßen Käufern oder Konsumenten ökonomisch verherrlicht. Sieh: „An Inquiry into those principles, respecting the Nature of Demand and the Necessity of Consumption, lately advocated by Mr. Malthus etc.“, London 1821, p. 55.

So zahlten die kleinasiatischen Städte jährlichen Geldtribut an das alte Rom. Mit diesem Geld kaufte Rom Waren von ihnen und kaufte sie zu teuer. Die Kleinasiaten prellten die Römer, indem sie den Eroberern einen Teil des Tributs wieder abluchsten auf dem Wege des Handels. Aber dennoch blieben die Kleinasiaten die Geprellten. Ihre Waren wurden ihnen nach wie vor mit ihrem eigenen Gelde gezahlt.

Es ist dies keine Methode der Bereicherung oder der Bildung von Mehrwert.

Question 572 *Can capitalism be explained by the workers not being able to sell their commodity, namely labor, at its value?*

[Differences Between Individuals]

Next the distinction is drawn not along economic categories but simply between different individuals.

265:1 Let us therefore keep within the limits of the exchange of commodities, where sellers are buyers, and buyers are sellers. Our perplexity may perhaps have arisen from conceiving people merely as personified categories, instead of as individuals.

265:2 A may be clever enough to get the advantage of B and C without their being able to take their revenge. A sells wine worth £40 to B, and obtains from him in exchange corn to the value of £50. A has converted his £40 into £50, has made more money out of less, and has transformed his commodities into capital.

177:1 Halten wir uns also innerhalb der Schranken des Warenaustausches, wo Verkäufer Käufer und Käufer Verkäufer sind. Unsre Verlegenheit stammt vielleicht daher, daß wir die Personen nur als personifizierte Kategorien, nicht individuell, gefaßt haben.

177:2 Warenbesitzer A mag so pffiffig sein, seine Kollegen B oder C übers Ohr zu hauen, während sie trotz des besten Willens die Revanche schuldig bleiben. A verkauft Wein zum Wert von 40 Pfd.St. an B und erwirbt im Austausch Getreide zum Wert von 50 Pfd.St. A hat seine 40 Pfd.St. in 50 Pfd. St. verwandelt, mehr Geld aus weniger Geld gemacht und seine Ware in Kapital verwandelt.

↑ This seems to be a situation in which surplus-value is generated in circulation. ↓ But it is a zero-sum game, i.e., only the redistribution of already existing value, not the generation of new surplus-value:

Let us examine this a little more closely. Before the exchange we had £40 of wine in the hands of A, and £50 worth of corn in those of B, a total value of £90. After the exchange we still have the same total value of £90. The value in circulation has not increased by one iota; all that has changed is its distribution between A and B. What appears on one side as a loss of value, appears on the other side as surplus-value; what appears on one side as a minus appears on the other side as a plus. The same change would have taken place if A, without the disguise provided by the exchange, had directly stolen the £10 from B. The sum of

Sehn wir näher zu. Vor dem Austausch hatten wir für 40 Pfd.St. Wein in der Hand von A und für 50 Pfd.St. Getreide in der Hand von B, Gesamtwert von 90 Pfd.St. Nach dem Austausch haben wir denselben Gesamtwert von 90 Pfd.St. Der zirkulierende Wert hat sich um kein Atom vergrößert, seine Verteilung zwischen A und B hat sich verändert. Auf der einen Seite erscheint als Mehrwert, was auf der andren Minderwert ist, auf der einen Seite als Plus, was auf der andren als Minus. Derselbe Wechsel hätte sich ereignet, wenn A, ohne die verhüllende Form des Austausches, dem B 10 Pfd.St. direkt gestohlen hätte. Die Sum-

the values in circulation can clearly not be augmented by any change in their distribution, any more than a Jew can increase the quantity of the precious metals in a country by selling a farthing from the time of Queen Anne for a guinea. The capitalist class of a given country, taken as a whole, cannot defraud itself.³⁰

³⁰ Destutt de Tracy, although, or perhaps because, he was a Membre de l'Institut, held the opposite view. The industrial capitalists, he says, make profits because 'they all sell for more than it has cost to produce. And to whom do they sell? In the first instance to one another' (op. cit., p. 239).

Summary:

266:1 However much we twist and turn, the final conclusion remains the same. If equivalents are exchanged, no surplus-value results, and if non-equivalents are exchanged, we still have no surplus-value.³¹ Circulation, or the exchange of commodities, creates no value.³²

³¹ 'The exchange of two equal values neither increases nor diminishes the amount of the values present in society. Equally, the exchange of two unequal values... effects no change in the sum of social values, although it adds to the wealth of one person what it removes from the wealth of another' (J. B. Say, op. cit., Vol. 2, pp. 443–4). Say, who is of course untroubled by the consequences of this statement, borrows it almost word for word from the Physiocrats. The following example will show how Monsieur Say exploited the writings of the Physiocrats, in his day quite forgotten, for the purpose of increasing the 'value' of his own. His 'most celebrated' saying, 'Products can only be bought with products' (op. cit., Vol. 2, p. 441), runs as follows in the original Physiocratic work: 'Products can only be paid for with products' (Le Trosne, op. cit., p. 899).

me der zirkulierenden Werte kann offenbar durch keinen Wechsel in ihrer Verteilung vermehrt werden, sowenig wie ein Jude die Masse der edlen Metalle in einem Lande dadurch vermehrt, daß er einen Farthing aus der Zeit der Königin Anna für eine Guinee verkauft. Die Gesamtheit der Kapitalistenklasse eines Landes kann sich nicht selbst übervorteilen.³⁰

³⁰ Destutt de Tracy, obgleich—vielleicht weil—Membre de l'Institut, war umgekehrter Ansicht. Die industriellen Kapitalisten, sagt er, machen dadurch ihre Profite, daß „sie alles teurer verkaufen, als es gekostet hat zu produzieren. Und an wen verkaufen sie? Erstens aneinander.“ (l.c. p. 239.)

177:3/o Man mag sich also drehen und wenden, wie man will, das Fazit bleibt dasselbe. Werden Äquivalente ausgetauscht, so entsteht kein Mehrwert, und werden Nicht-Äquivalente ausgetauscht, so entsteht auch kein Mehrwert.³¹ Die Zirkulation oder der Warenaustausch schafft keinen Wert.³²

³¹ „Der Austausch von zwei gleichen Werten vermehrt weder die Masse der in der Gesellschaft vorhandenen Werte, noch vermindert er sie. Der Austausch zweier ungleicher Werte... ändert ebenfalls nichts an der Summe der gesellschaftlichen Werte, da er dem Vermögen des einen zufügt, was er dem Vermögen des anderen wegnimmt.“ (J. B. Say, l.c., t. II, p. 443, 444.) Say, natürlich unbekümmert um die Konsequenzen dieses Satzes, entlehnt ihn ziemlich wörtlich den Physiokraten. Die Art, wie er ihre zu seiner Zeit verschollenen Schriften zur Vermehrung seines eigenen „Wertes“ ausgebeutet hat, zeige folgendes Beispiel. Der „berühmteste“ Satz des Monsieur Say: „Man kann Produkte nur mit Produkten kaufen“ (l.c., t. II, p. 438), lautet im physiokratischen Original: „Erzeugnisse lassen sich nur mit Erzeugnissen bezahlen.“ (Le Trosne, l.c.

³² 'Exchange confers no value at all upon products' (F. Wayland, *The Elements of Political Economy*, Boston, 1843, p. 169).

p. 899.)

³² „Der Austausch überträgt keinerlei Wert auf die Produkte.“ (F. Wayland, „*The Elements of Pol. Econ.*“, Boston 1843, p. 168.)

Question 573 *Why can surplus-value not be explained by the fact that the capitalists sell their product at inflated prices? Does this mean that it is not in the interest of the capitalists to violate the law of value?*

This argument has another implication which Marx does not point out here explicitly, but which he is going to use later: Deviations of values from prices cannot turn a static situation into a dynamic one. Equally, it cannot turn a dynamic system into a static one. The dynamic must therefore be explainable even if the assumption is made that prices are strictly proportional to values.

5.1.c. [Methodological Remark]

This concludes Marx's extended argument that value cannot be created in circulation. Next comes a methodological interlude: this is why we cannot begin our investigation of capitalism with the historically earliest forms of capital, merchant capital or usury capital:

266:2 It can be understood, therefore, why, in our analysis of the primary form of capital, the form in which it determines the economic organization of modern society, we have entirely left out of consideration its well-known and so to speak antediluvian forms, merchants' capital and usurers' capital.

Although merchant's capital is the purest form of $M-C-M'$, it cannot be Marx's point of departure when he investigates the general formula of capital.

266:3/o The form $M-C-M$, buying in order to sell dearer, is at its purest in genuine merchants' capital. But the whole of this movement takes place within the sphere of circulation. Since, however, it is impossible, by circulation alone, to explain the transformation of money into capital, and the formation of surplus-value, merchants' capital appears to be an impossibility, as long as equivalents are exchanged;³³ it appears, therefore, that it can only be derived from the twofold advantage gained, over

178:1 Man versteht daher, warum in unserer Analyse der Grundform des Kapitals, der Form, worin es die ökonomische Organisation der modernen Gesellschaft bestimmt, seine populären und sozusagen antediluvianischen Gestalten, Handelskapital und Wucherkapital, zunächst gänzlich unberücksichtigt bleiben.

178:2/o Im eigentlichen Handelskapital erscheint die Form $G-W-G'$, kaufen, um teurer zu verkaufen, am reinsten. Andererseits geht seine ganze Bewegung innerhalb der Zirkulationssphäre vor. Da es aber unmöglich ist, aus der Zirkulation selbst die Verwandlung von Geld in Kapital, die Bildung von Mehrwert zu erklären, erscheint das Handelskapital unmöglich, sobald Äquivalente ausgetauscht werden,³³ daher nur ableitbar aus der doppelseitigen Übervorteilung der kaufenden und verkau-

both the selling and the buying producers, by the merchant who parasitically inserts himself between them. It is in this sense that Franklin says 'war is robbery, commerce is cheating'.³⁴

³³ 'Under the rule of invariable equivalents commerce would be impossible' (G. Opdyke, *A Treatise on Political Economy*, New York, 1851, pp. 66–9). 'The difference between real value and exchange-value is based on one fact—namely, that the value of a thing differs from the so-called equivalent given for it in trade, i.e. that the equivalent is not an equivalent' (F. Engels, op. cit., p. 96) [English translation, p. 427].

³⁴ Benjamin Franklin, *Positions to be Examined, Concerning National Wealth*, in *Works*, Vol. 2, ed. Sparks, p. 376.

Question 574 *Although commercial capital is $M - C - M'$ in its purest form, it does not have a central place in Marx's derivation of capital. Why not?*

↓ Modern commercial capital is a different matter: its profits do not derive from buying below and selling above value. Marx will explain in volume 3 of *Capital* where its profits come from. Right now, the basis for such an explanation has not yet been laid:

If the valorization of merchants' capital is not to be explained merely by frauds practised on the producers of commodities, a long series of intermediate steps would be necessary, which are as yet entirely absent, since here our only assumption is the circulation of commodities and its simple elements.

↓ What Marx said about merchant capital applies even more to usurer's capital:

267:1 What we have said with reference to merchants' capital applies still more to usurers' capital. In merchants' capital the two extremes, the money which is thrown upon the market and the augmented money which is withdrawn from the market, are mediated through a purchase and a sale, through the movement of circulation. In

fenden Warenproduzenten durch den sich parasitisch zwischen sie schiebenden Kaufmann. In diesem Sinn sagt Franklin: „Krieg ist Raub, Handel ist Prellerei.“³⁴

³³ „Unter der Herrschaft unveränderlicher Äquivalente würde der Handel unmöglich sein.“ (G. Opdyke, „A Treatise on polit. Economy“, New York 1852, p. 66 bis 69.) „Dem Unterschiede zwischen Realwert und Tauschwert liegt eine Tatsache zum Grunde—nämlich daß der Wert einer Sache verschieden ist von dem im Handel für sie gegebenen sogenannten Äquivalent, d.h., daß dies Äquivalent kein Äquivalent ist.“ (F. Engels, l.c. p. 95, 96.)

³⁴ Benjamin Franklin, „Works“, vol. II, edit. Sparks in „Positions to be examined concerning National Wealth“, [p. 376.]

Soll die Verwertung des Handelskapitals nicht aus bloßer Prellerei der Warenproduzenten erklärt werden, so gehört dazu eine lange Reihe von Mittelgliedern, die hier, wo die Warenzirkulation und ihre einfachen Momente unsere einzige Voraussetzung bilden, noch gänzlich fehlt.

179:1 Was vom Handelskapital, gilt noch mehr vom Wucherkapital. Im Handelskapital sind die Extreme, das Geld, das auf den Markt geworfen, und das vermehrte Geld, das dem Markt entzogen wird, wenigstens vermittelt durch Kauf und Verkauf, durch die Bewegung der Zirkulation. Im Wucherkapital ist die Form $G - W - G'$

usurers' capital, this mediation is missing. The form $M - C - M'$ is shortened so that only the unmediated extremes $M - M'$ remain, money which is exchanged for more money—a form which contradicts the nature of money and therefore cannot be explained from the standpoint of the exchange of commodities. This is why Aristotle says:

'Since chrematistics is a double science, one part belonging to commerce, the other to economics, the latter being necessary and praiseworthy, the former based on circulation and with justice disapproved (for it is not based on Nature, but on mutual cheating), the usurer is most rightly hated, because money itself is the source of his gain, and is not used for the purposes for which it was invented. For it originated for the exchange of commodities, but interest makes out of money, more money. Hence its name.' (τόκος, interest and offspring.) 'For the offspring resembles the parent. But interest is money, so that of all modes of making a living, this is the most contrary to Nature.'³⁵

³⁵ Aristotle, op. cit., c. 10 [english translation, para. 1258b].

267:2 In the course of our investigation, we shall find that both merchants' capital and interest-bearing capital are derivative forms, and at the same time it will become clear why, historically, these two forms appear before the modern primary form of capital.

Question 575 *Why are the ancient merchant capitalists and usurers not useful examples for understanding modern capitalism?*

Question 576 *Why did merchant's capital and interest-bearing capital appear, historically, before the modern primary form of capital?*

abgekürzt auf die unvermittelten Extreme $G - G'$, Geld, das sich gegen mehr Geld austauscht, eine der Natur des Geldes widersprechende und daher vom Standpunkt des Warenaustausches unerklärliche Form. Daher Aristoteles:

„Da die Chrematistik eine doppelte ist, die eine zum Handel, die andre zur Ökonomik gehörig, die letztere notwendig und lobenswert, die erstere auf die Zirkulation gegründet und mit Recht getadelt (denn sie beruht nicht auf der Natur, sondern auf wechselseitiger Prellerei), so ist der Wucher mit vollstem Recht verhaßt, weil das Geld selbst hier die Quelle des Erwerbs und nicht dazu gebraucht wird, wozu es erfunden ward. Denn für den Warenaustausch entstand es, der Zins aber macht aus Geld mehr Geld. Daher auch sein Name“ (τόκος Zins und Geborenes). „Denn die Geborenen sind den Erzeugern ähnlich. Der Zins aber ist Geld von Geld, so daß von allen Erwerbszweigen dieser der naturwidrigste.“³⁵

³⁵ Arist[oteles], l.c., c. 10, [p. 17].

179:3 Wie das Handelskapital werden wir das zinstragende Kapital im Verlauf unsrer Untersuchung als abgeleitete Formen vorfinden und zugleich sehen, warum sie historisch vor der modernen Grundform des Kapitals erscheinen.

5.2. [Surplus-Value Outside Circulation]

Can surplus-value be created outside circulation? Marx argues that this too is impossible.

268:1 We have shown that surplus-value cannot arise from circulation. For surplus-value to be formed, something must take place behind the back of circulation which is not visible in the circulation itself.³⁶ But can surplus-value originate anywhere other than in circulation?

In the next sentence, Marx reiterates that no relations between people are admitted other than those of commodity-owners. E.g., people are not allowed to take things away directly from others. What remains is the relation of everybody to his own commodity:

Circulation is the sum total of all the mutual relations of commodity-owners. Outside it, the commodity-owner only stands in a relation to his own commodity. As far as the value of that commodity is concerned, the relation is limited to this, that the commodity contains a quantity of his own labor which is measured according to definite social laws. This quantity of labor is expressed by the magnitude of the value of his commodity, and since the value is reckoned in money of account, this quantity is also expressed by the price, £ 10 for instance. But his labor does not receive a double representation: it is not represented both in the value of the commodity and in an excess quantity over and above that value, it is not represented in a price of 10 which is simultaneously a price of 11, i.e. in a value which is greater than itself. The commodity-owner can create value by his labor, but he cannot create values which can valorize themselves. He can increase the value of his commodity by adding fresh labor, and therefore more value, to the value in hand, by making leather into boots, for instance. The same material now has more value, because it contains a greater quantity of labor. The

179:4/o Es hat sich gezeigt, daß der Mehrwert nicht aus der Zirkulation entspringen kann, bei seiner Bildung also etwas hinter ihrem Rücken vorgehen muß, das in ihr selbst unsichtbar ist.³⁶ Kann aber der Mehrwert anderswoher entspringen als aus der Zirkulation?

Die Zirkulation ist die Summe aller Wechselbeziehungen der Warenbesitzer. Außerhalb derselben steht der Warenbesitzer nur noch in Beziehung zu seiner eignen Ware. Was ihren Wert angeht, beschränkt sich das Verhältnis darauf, daß sie ein nach bestimmten gesellschaftlichen Gesetzen gemessenes Quantum seiner eignen Arbeit enthält. Dies Quantum Arbeit drückt sich aus in der Wertgröße seiner Ware, und, da sich Wertgröße in Rechengeld darstellt, in einem Preise von z.B. 10 Pfd.St. Aber seine Arbeit stellt sich nicht dar im Werte der Ware und einem Überschuß über ihrem eignen Wert, nicht in einem Preise von 10, der zugleich ein Preis von 11, nicht in einem Wert, der größer als er selbst ist. Der Warenbesitzer kann durch seine Arbeit Werte bilden, aber keine sich verwertenden Werte. Er kann den Wert einer Ware erhöhen, indem er vorhandnem Wert neuen Wert durch neue Arbeit zusetzt, z.B. aus Leder Stiefel macht. Derselbe Stoff hat jetzt mehr Wert, weil er ein größeres Arbeitsquantum enthält. Der Stiefel hat daher mehr Wert als das Leder, aber der Wert des Leders ist geblieben, was er war. Er hat sich nicht verwertet, nicht während der Stiefelfabrikation einen Mehrwert angesetzt. Es

boots have therefore more value than the leather, but the value of the leather remains what it was. It has not valorized itself, it has not annexed surplus-value during the making of the boots. It is therefore impossible that, outside the sphere of circulation, a producer of commodities can, without coming into contact with other commodity-owners, valorize value, and consequently transform money or commodities into capital.

³⁶ 'Profit, in the usual condition of the market, is not made by exchanging. Had it not existed before, neither could it after that transaction' (Ramsay, op. cit., p. 184).

If someone adds value to an object through his own labor, then this is not *self*-expansion of the value that is already there, because the value is not the subject. Self-expansion of value takes place only if the value itself increases itself.

Question 577 *What is the difference between a shoemaker, who adds to the value of his leather by turning the leather into shoes, and a capitalist, who adds to the value of his money by investing it?*

Question 578 *A baker producing for the market, who owns his own tools and works alone, buys flour and sells bread at a price higher than the flour, is he performing the act $M-C-M'$ which valorizes his capital?*

Question 579 *Does surplus-value come from the capitalist working "smarter" than the simple commodity producer?*

5.3. [Both in and outside Circulation]

Since both possibilities are ruled out—surplus-value cannot be created inside circulation, and also not outside circulation, one should expect the conclusion to be: surplus-value cannot be created at all on the basis of commodity production. However Marx surprises us with a third alternative:

268:2 Capital cannot therefore arise from circulation, and it is equally impossible for it to arise apart from circulation. It must have its origin both in circulation and not in circulation.

ist also unmöglich, daß der Warenproduzent außerhalb der Zirkulationssphäre, ohne mit andren Warenbesitzern in Berührung zu treten, Wert verwerte und daher Geld oder Ware in Kapital verwandle.

³⁶ „Unter den üblichen Bedingungen des Marktes wird Profit nicht durch Austausch gemacht. Wäre er nicht vorher vorhanden gewesen, so könnte er es auch nicht nach dieser Transaktion sein.“

180:1 Kapital kann also nicht aus der Zirkulation entspringen, und es kann ebenso wenig aus der Zirkulation nicht entspringen. Es muß zugleich in ihr und nicht in ihr entspringen.

↑ Earlier in this chapter, Marx showed that surplus-value cannot have its origin in circulation *alone*, and it cannot have its origin *completely* outside of circulation. Any process creating surplus-value must therefore be in part inside and in part outside circulation.

268:3 We therefore have a double result.

180:2 Ein doppeltes Resultat hat sich also ergeben.

The condition “in and outside circulation” is only one of the two results of this chapter. The other result is that surplus-value is not a violation of the laws of the commodity, i.e., it must be explainable even if all prices are equal to values.

268:4/o The transformation of money into capital has to be developed on the basis of the laws immanent to the exchange of commodities, in such a way that the exchange of equivalents is taken as starting point.³⁷

180:3/o Die Verwandlung des Geldes in Kapital ist auf Grundlage dem Warenaustausch immanenter Gesetze zu entwickeln, so daß der Austausch von Äquivalenten als Ausgangspunkt gilt.³⁷

↑ This requirement can be justified by Marx’s earlier arguments that the exchange of equivalents is the “pure” form of the commodity circulation. For instance, in 260:2/o Marx argues that circulation is in essence a change of form which in its pure state does not entail a change in quantity; in 260:2/o he remarks that even vulgar economy usually assumes, in order to consider the phenomena in their pure form, that demand and supply coincide; and both 260:2/o and 262:1 reiterate that in its pure form commodity exchange is the exchange of equivalents. In his Notes to Wagner, [mecw24]536:3–5, Marx says that this assumption is a scientific necessity. ↓ Besides, footnote 37 brings some good additional arguments:

³⁷ The reader will see from the foregoing discussion that the meaning of this statement is only as follows: the formation of capital must be possible even though the price and the value of a commodity be the same, for it cannot be explained by referring to any divergence between price and value. If prices actually differ from values, we must first reduce the former to the latter, i.e. disregard this situation as an accidental one in order to observe the phenomenon of the formation of capital on the basis of the exchange of commodities in its purity, and to prevent our observations from being interfered with by disturbing incidental circumstances which are irrelevant to the actual course of the process. We know moreover that this reduction is not limited to the field of science. The continual oscillations in prices, their rise and fall, compensate each other, cancel each other out, and carry out their own reduction to an average price which is their internal regulator. This average price is the guiding light of the merchant or the manufacturer in every un-

³⁷ Nach der gegebenen Auseinandersetzung versteht der Leser, daß dies nur heißt: Die Kapitalbildung muß möglich sein, auch wenn der Warenpreis gleich dem Warenwert. Sie kann nicht aus der Abweichung der Warenpreise von den Warenwerten erklärt werden. Weichen die Preise von den Werten wirklich ab, so muß man sie erst auf die letzteren reduzieren, d.h. von diesem Umstande als einem zufälligen absehn, um das Phänomen der Kapitalbildung auf Grundlage des Warenaustauschs rein vor sich zu haben und in seiner Beobachtung nicht durch störende und dem eigentlichen Verlauf fremde Nebenumstände verwirrt zu werden. Man weiß übrigens, daß diese Reduktion keineswegs eine bloß wissenschaftliche Prozedur ist. Die beständigen Oszillationen der Marktpreise, ihr Steigen und Sinken, kompensieren sich, heben sich wechselseitig auf und reduzieren sich selbst zum Durchschnittspreis als ihrer inneren Regel. Diese bildet den Leitstern z.B. des Kaufmanns oder des Industriellen in jeder Unternehmung, die längeren

dertaking of a lengthy nature. The manufacturer knows that if a long period of time is considered, commodities are sold neither over nor under, but at, their average price. If, therefore, he were at all interested in disinterested thinking, he would formulate the problem of the formation of capital as follows: How can we account for the origin of capital on the assumption that prices are regulated by the average price i.e. ultimately by the value of the commodities? I say ‘ultimately’ because average prices do not directly coincide with the values of commodities, as Adam Smith, Ricardo, and others believe.

↑ The equality of prices and values is an important assumption which will come up again and again; 430:1/o is perhaps the most prominent place, other places are 655:2, 671:2/o, and 729:2/o.

Question 580 Why does Marx make the assumption throughout Volume I of Capital that the prices of all commodities are quantitatively equal to their values?

↓ The process under investigation, by which value is turned into more value, must therefore satisfy the following conditions:

The money-owner, who is as yet only a capitalist in larval form, must buy his commodities at their value, sell them at their value, and yet at the end of the process withdraw more value from circulation than he threw into it at the beginning. His emergence as a butterfly must, and yet must not, take place in the sphere of circulation. These are the conditions of the problem. Hic Rhodus, hic salta!

Zeitraum umfaßt. Er weiß also, daß, eine längere Periode im ganzen betrachtet, die Waren wirklich weder unter noch über, sondern zu ihrem Durchschnittspreis verkauft werden. Wäre interesseloses Denken also überhaupt sein Interesse, so müßte er sich das Problem der Kapitalbildung so stellen: Wie kann Kapital entstehen bei der Regelung der Preise durch den Durchschnittspreis, d.h. in letzter Instanz durch den Wert der Ware? Ich sage „in letzter Instanz“, weil die Durchschnittspreise nicht direkt mit den Wertgrößen der Waren zusammenfallen, wie A. Smith, Ricardo usw. glauben.

Unser nur noch als Kapitalistenraupe vorhandener Geldbesitzer muß die Waren zu ihrem Wert kaufen, zu ihrem Wert verkaufen und dennoch am Ende des Prozesses mehr Wert herausziehen, als er hineinwarf. Seine Schmetterlingsentfaltung muß in der Zirkulationssphäre und muß nicht in der Zirkulationssphäre vorgehn. Dies sind die Bedingungen des Problems. Hic Rhodus, hic salta!

“Hic Rhodus hic salta” (Rhodes is here, jump here) is the reply made, in one of Aesop’s fables, to a braggart who claimed he had once made an immense jump in Rhodes, and that he could produce witnesses. Someone replied that there was no need for witnesses, since the athlete could demonstrate the jump here and now. Marx gives his own nuance to this punchline. He does not compare the capitalist to a braggart who *pretends* to be able to do something which he cannot do. On the contrary, it is obvious that the capitalist is able to jump. We see the results of his jumps all around us—but he makes his jumps in a secret place, in “Rhodes,” so that we do not know *how* the results are generated which we see. “Hic Rhodus, hic salta” means that we want the capitalist to perform his athletics before our eyes, so that we can see how he does it. Of course, we are not asking the capitalist to do things differently; the challenge is on us to *see* how the capitalist does it.

The transition from simple circulation to capital in chapters Four and Five was based on a second-order argument. Marx started with the general observation that there are people in a capitalist society who do $M - C - M'$, and from this Marx could derive that in this activity, capitalists are presiding over the self-valorization process of value, and they have made this process also their individual motive. Value, therefore, in capitalism, is not a static but a dynamic substance, it moves, it increases itself. But we have not yet figured out *how* value increases itself. Chapter Five has given some indirect and mainly negative clues about it: it cannot happen in circulation alone, and it cannot be based on unequal exchange. This is how far we got with second-order arguments, i.e., with asking what must be the case for a large scale $M - C - M'$ to be possible scale as we see it in capitalism. Now we have to look around and see whether we can find a mechanism that generates the phenomena which we see. This is the “hic Rhodus hic salta” moment for us. We are already halfway there with our search; the criteria laid out in the last passage we read have narrowed down our search considerably. The next chapter will show that the availability on the market of the commodity labor-power is necessary to make this result possible, and in chapter Seven, 301:2/o, a detailed answer of the above problem is given.

Question 581 Why does Marx say at the end of chapter Five: “hic Rhodus, hic salta”?

Question 582 How does Marx come to the conclusion that “capital must originate within circulation and not within it”? How does he resolve this seeming paradox?

Question 583 “In chapter Five, Marx recognizes that the general laws of the commodity cannot explain $M - C - M'$, therefore he gives up on explaining it and resigns himself to the fact that the concept of value is not the right paradigm to explain capitalism.” Right or wrong?

6. Sale and Purchase of Labor-Power

“The Buying and Selling of Labor-Power” is not a good

translation, because Marx’s emphasis is not on the transaction

itself but on the fact that labor-power is a commodity.

6.1. [How to Achieve $M - C - M'$?]

According to the reasoning presented in chapter Five, $M - C - M'$ seems almost impossible to achieve, although we see it happening every day. At the end of chapter Five, Marx concludes that the missing link responsible for the self-expansion of capital must act both inside *and* outside circulation. Marx begins chapter Six with a systematic search for the part of this missing link that takes place in circulation. He examines every phase of the circuit $M - C - M'$ in order to see whether it can be associated with the creation of surplus-value.

Marx begins with the money form, which plays a pivotal role in the movement of capital. Money is the first form of capital 247:2, and it remains an indispensable point of reference in the self-expansion of capital 255:2/o. Nevertheless it is clear that capital must *leave* the money form if it wants to self-expand:

270:1 The change of value, by which money transforms itself into capital, cannot take place as long as it remains in the form of money. As means of purchase and payment, money merely realizes the price of the commodity it buys or pays for, and if it retains the form of money, it petrifies into a mass of value of unchanging magnitude.³⁸

³⁸ ‘In the form of money . . . capital is productive of no profit’ (Ricardo, Principles of Political Economy, p. 267).

181:1 Die Wertveränderung des Geldes, das sich in Kapital verwandeln soll, kann nicht an diesem Geld selbst vorgehen, denn als Kaufmittel und als Zahlungsmittel realisiert es nur den Preis der Ware, die es kauft oder zahlt, während es, in seiner eigenen Form verharrend, zum Petrefakt von gleichbleibender Wertgröße erstarrt.³⁸

³⁸ „In der Form von Geld . . . erzeugt das Kapital keinen Profit.“ (Ricardo, „Princ. of Pol. Econ.“, p. 267.)

↑ It is obvious that the self-expansion does not take place while capital remains in the form of money, or in the transaction in which this money buys a commodity. ↓ One might think that this self-expansion takes place in the second market transaction, in which the commodity is converted back into money, because at this point more money flows back than was advanced as cost. But Marx denies this possibility as well:

Neither can this change originate in the second act of circulation, the resale of the com-

Ebensowenig kann die Veränderung aus dem zweiten Zirkulationsakt, dem Wieder-

commodity, for this act merely converts the commodity from its bodily form back into its money form.

↑ The exchange of equivalents is one of the conditions of the search, see 268:4/o.

Question 585 *In chapter Five, Marx argued that the exchange of nonequivalents must be ruled out as a source of surplus-value. Briefly summarize his argument.*

If the change of value cannot happen when the capital is in money form, and also not in the acts of selling and buying, then the consumption of commodity C is the only possible place where value can change, i.e., where surplus-value can be created. The involvement of consumption would at the same time take us outside the circulation process, as predicted in chapter Five:

The change must therefore take place in the commodity which is bought in the first act of circulation, $M-C$. But its value remains unchanged, because it is equivalents which are being exchanged and the commodity is paid for at its full value. The change can therefore only originate in its use-value as such, i.e. in the consumption of the commodity.

This is again a retrodution by elimination: There is no other place where the self-expansion of value is possible. By ruling out all other alternatives, the following specific scenario remains as the only possibility to sustain the self-expansion $M-C-M'$.

In order to extract value out of the consumption of a commodity, our friend the money-owner must be lucky enough to find within the sphere of circulation, on the market, a commodity whose use-value possesses the peculiar property of being a source of value, whose actual consumption is therefore itself an objectification of labor, hence a creation of value.

Marx's abstract second-order deliberations lead him therefore to predict that labor-power is a commodity:

And indeed, the money-owner does find such a special commodity on the market: the capacity for labor, in other words labor-power.

Question 588 *Is it surprising, in the context of chapter Six, that the money-owner finds a commodity on the market "whose use-value possesses the peculiar property of being a*

verkauf der Ware, entspringen, denn dieser Akt verwandelt die Ware bloß aus der Naturalform zurück in die Geldform.

Die Veränderung muß sich also zutragen mit der Ware, die im ersten Akt $G-W$ gekauft wird, aber nicht mit ihrem Wert, denn es werden Äquivalente ausgetauscht, die Ware wird zu ihrem Werte bezahlt. Die Veränderung kann also nur entspringen aus ihrem Gebrauchswert als solchem, d.h. aus ihrem Verbrauch.

Um aus dem Verbrauch einer Ware Wert herauszuziehen, müßte unser Geldbesitzer so glücklich sein, innerhalb der Zirkulations-sphäre, auf dem Markt, eine Ware zu entdecken, deren Gebrauchswert selbst die eigentümliche Beschaffenheit besäße, Quelle von Wert zu sein, deren wirklicher Verbrauch also selbst Vergegenständlichung von Arbeit wäre, daher Wertschöpfung.

Und der Geldbesitzer findet auf dem Markt eine solche spezifische Ware vor—das Arbeitsvermögen oder die Arbeitskraft.

source of value, whose actual consumption is therefore itself an objectification of labor, hence a creation of value"?

The rest of this chapter will discuss the commodity labor-power, and how its value is determined, and chapter Seven will look at the consumption of this labor-power which creates more value than the value that had to be paid for labor-power.

6.2. [Labor-Power as a Commodity]

270:2 We mean by labor-power, or labor-capacity, the aggregate of those mental and physical capabilities existing in the physical body, the living personality, of a human being, capabilities which he sets in motion whenever he produces a use-value of any kind.

181:2 Unter Arbeitskraft oder Arbeitsvermögen verstehen wir den Inbegriff der physischen und geistigen Fähigkeiten, die in der Leiblichkeit, der lebendigen Persönlichkeit eines Menschen existieren und die er in Bewegung setzt, sooft er Gebrauchswerte irgendeiner Art produziert.

This definition of labor-power as the human capacity to perform various kinds of labor is valid in all history. But the expression of this capacity is socially recognized as the value of the product only under commodity production. And even in today's commodity society, not all labor creates value. Homemakers use their labor-power to produce for the family and to bring up children, without this labor being socially recognized in the value of a marketable good.

Exam Question 589 *Chapter Six is not the first place where labor-power is discussed. Where was labor-power introduced first, and which role did it play then? But the discussion of labor-power in chapter Six introduces one fundamental new aspect of it which was not discussed before. What is it?*

Even if labor-power produces value, this does not automatically make labor-power itself a commodity. Labor-power becomes a commodity only under very specific historical conditions. Before listing these conditions, the following clarification is in order: Whenever Marx speaks of labor-power as a commodity, he assumes that not only the worker's ability to work, but also his willingness to work can be bought—so that the consumption of the labor-power by the buyer does not require any other coercion than that given by market forces. The justification for this stronger requirement is that any dependencies between the commodity producers which do not spring from the commodity relation itself are incompatible with the nature of the commodity relation.

The following two sets of conditions, listed by Marx in the remainder of what is called here section 6.2, are necessary for labor-power to be a commodity in the sense that both capability and consent of the laborer can be bought:

(1) Freedom of the laborer to sell his or her labor-power.

- (1a) The laborer himself must be the one who sells the labor-power.
- (1b) The laborer must have free disposal over his or her person.
- (1c) Since the price of labor-power is to be determined by market forces, seller and buyer of labor-power must be legally equal.
- (1d) For the freedom and equality of points (1b) and (1c) to endure, the worker must be prevented from selling himself or herself once and for all. The worker can sell himself or herself only temporarily.
- (2) If the laborer were able to sell a finished product instead of her labor-power, she would never sell her labor-power, since it is much more lucrative to sell the finished product. She will therefore only sell her labor-power if she is deprived of the following necessary conditions for doing the production herself:
- (2a) For any production, the worker needs access to pre-existing products.
- (2b) Workers must have things to consume before producing.
- (2c) If the product is a commodity, the producer not only has to wait until it is produced, but until it is sold, before he or she can benefit from the labor in that product.

Marx ends with the remark that conditions (1) and (2) represent the two meanings of free: free to and free from.

After this overview, let us look at Marx's argument in detail. ↓ All conditions for labor-power being a commodity enumerated in the next paragraph fall under point (1):

270:3/o But in order that the owner of money may find labor-power on the market as a commodity, various conditions must first be fulfilled.

↓ (1a) Labor-power must be sold by the laborer himself, because otherwise coercive relations would be necessary that are incompatible with the free exchange of commodities.

In and for itself, the exchange of commodities requires that there be no other relations of dependence than those resulting from its own nature. On this presupposition, labor-power can appear on the market as a commodity only if its possessor, the individual whose labor-power it is, is also the one who offers it for sale.

181:3/o Damit jedoch der Geldbesitzer die Arbeitskraft als Ware auf dem Markt vorfinde, müssen verschiedene Bedingungen erfüllt sein.

Der Warenaustausch schließt an und für sich keine andren Abhängigkeitsverhältnisse ein als die aus seiner eignen Natur entspringenden. Unter dieser Voraussetzung kann die Arbeitskraft als Ware nur auf dem Markt erscheinen, sofern und weil sie von ihrem eignen Besitzer, der Person, deren Arbeitskraft sie ist, als Ware feilgeboten oder verkauft wird.

Fowkes translates
"Voraussetzung" (presupposition)

with "assumption." This
introduces the epistemic fallacy.

After having clarified that the laborer must be the seller, freedom and equality of the seller on the market become freedom and equality of the laborer: ↓ First (1b), the market freedom of the seller to decide whether or not to sell becomes freedom of the laborer:

In order that its possessor may sell it as a commodity, he must have it at his disposal, he must be the free proprietor of his own labor-capacity, i.e., of his person.³⁹

Damit ihr Besitzer sie als Ware verkaufe, muß er über sie verfügen können, also freier Eigentümer seines Arbeitsvermögens, seiner Person sein.³⁹

Note here the distinction between
proprietor and possessor: a slave is

possessor of his labor-power but
not its proprietor.

↑ The above implicitly rules out slave labor as the basis for capitalism because both sale and labor of the slave presuppose direct coercion of the slave. "Accumulation of slaves and land necessitates relations of domination and servitude" (*Contribution*, 366:1). Capital can only then fully develop if all relations that are not based on commodity exchange are removed or, at least, marginalized.

Question 592 *One of the conditions under which the money owner can purchase labor-power in order to do $M - C - M'$ is, according to Marx, that the labor-power must be sold by the worker him- or herself. Why this latter requirement?*

³⁹ In encyclopedias about classical antiquity one can read such nonsense as this: In the ancient world capital was fully developed, 'except for the absence of the free worker and of a system of credit'. Mommsen too, in his *History of Rome*, commits one blunder after another in this respect.

³⁹ In Realenzyklopädien des klassischen Altertums kann man den Unsinn lesen, daß in der antiken Welt das Kapital völlig entwickelt war, „außer daß der freie Arbeiter und das Kreditwesen fehlten“. Auch Herr Mommsen in seiner „Römischen Geschichte“ begeht ein Quidproquo über das andre.

↓ Now (1c), equality of buyer and seller: He and the owner of money meet in the market and enter a relation with each other as equally empowered commodity owners. The only difference between them is that one is a buyer, the other a seller; both are therefore equal in the eyes of the law.

This necessitates (1d), that the sale of labor-power must always be only temporary: For this relation to continue, the proprietor of labor-power must always sell it only for a limited period, for if he were to sell it in a lump, once and for all, he would be sell-

Er und der Geldbesitzer begegnen sich auf dem Markt und treten in Verhältnis zueinander als ebenbürtige Warenbesitzer, nur dadurch unterschieden, daß der eine Käufer, der andre Verkäufer, beide also juristisch gleiche Personen sind.

Die Fortdauer dieses Verhältnisses erheischt, daß der Eigentümer der Arbeitskraft sie stets nur für bestimmte Zeit verkaufe, denn verkauft er sie in Bausch und Bogen, ein für

ing himself, converting himself from a free man into a slave, from an owner of a commodity into a commodity. He must continually treat his labor-power as his own property, his own commodity, and he can do this only by placing it at the disposal of the buyer only temporarily, i.e. by handing it over to the buyer for him to consume only for a specific period of time. The alienation of his labor-power must not be the renunciation of his rights of ownership over it.⁴⁰

The state intervenes here and regulates the sale and purchase of labor-power by law, so that the worker's dependence on the sale of his or her labor-power does not lead to the sale of labor-power once and for all:

⁴⁰ Hence legislation in various countries fixes a maximum length for labor contracts. Wherever free labor is the rule, the law regulates the conditions for terminating this contract.

Question 593 *Why are the conditions for terminating employment regulated by law instead of being left to the free market? Does this mean that the state protects the workers against the capitalists?*

The next part of the footnote discusses "hidden forms of slavery."

^{40 ctd} In some countries, particularly in Mexico (and before the American Civil War in the territories taken by the United States from Mexico, as also in practice in the Danubian Principalities until Cuza's coup d'état), slavery is hidden under the form of peonage. By means of advances repayable in labor, which are handed down from generation to generation, not only the individual worker, but also his family, become in fact the property of other persons and their families. Juárez abolished peonage, but the so-called Emperor Maximilian re-established it by a decree which was aptly denounced in the House of Representatives in Washington as a decree for the re-introduction of slavery into Mexico.

The rest of the footnote is taken up by a Hegel quote in which Hegel tries to argue why slavery is bad but wage labor good:

allemaal, so verkauft er sich selbst, verwandelt sich aus einem Freien in einen Sklaven, aus einem Warenbesitzer in eine Ware. Er als Person muß sich beständig zu seiner Arbeitskraft als seinem Eigentum und daher seiner eignen Ware verhalten, und das kann er nur, soweit er sie dem Käufer stets nur vorübergehend, für einen bestimmten Zeittermin, zur Verfügung stellt, zum Verbrauch überläßt, also durch ihre Veräußerung nicht auf sein Eigentum an ihr verzichtet.⁴⁰

⁴⁰ Verschiedne Gesetzgebungen setzen daher ein Maximum für den Arbeitskontrakt fest. Alle Gesetzbücher bei Völkern freier Arbeit regeln Kündigungsbedingungen des Kontrakts.

^{40 ctd} In verschiedenen Ländern, namentlich in Mexiko (vor dem Amerikanischen Bürgerkrieg auch in den von Mexiko losgerissenen Territorien, und der Sache nach bis zu Kusas Umwälzung in den Donauprovinzen), ist die Sklaverei unter der Form von Peonage versteckt. Durch Vorschüsse, die in Arbeit abzutragen und sich von Generation zu Generation fortwälzen, wird nicht nur der einzelne Arbeiter, sondern seine Familie tatsächlich das Eigentum anderer Personen und ihrer Familien. Juárez hatte die Peonage abgeschafft. Der sogenannte Kaiser Maximilian führte sie wieder ein durch ein Dekret, das im Repräsentantenhaus zu Washington treffend als Dekret zur Wiedereinführung der Sklaverei in Mexiko denunziert ward.

^{40 ctd} 'Single products of my particular physical and mental skill and of my power to act I can alienate to someone else and I can give him the use of my abilities for a restricted period, because, on the strength of this restriction, my abilities acquire an external relation to the totality and universality of my being. By alienating the whole of my time, as crystallized in my work, and everything I produced, I would be making into another's property the substance of my being, my universal activity and actuality, my personality' (Hegel, Philosophie des Rechts, Berlin, 1840, p. 104, para. 67) [English translation, p. 54].

Question 596 *The purchase of slaves and sale of their product is the purchase of a commodity which has the use-value of creating more value than it contains. Why is capitalism not based on slavery?*

Now Argument (2), the laborer must be forced to sell his or her labor-power instead of selling his or her product. Marx tacitly uses here an argument which will explicitly be made only later in this chapter: selling a commodity produced by the labor-power would be much more lucrative than selling the labor-power itself, since the seller would get reimbursed for all the labor in the product instead of only the value of his or her labor-power.

272:1 The second essential condition which allows the money owner to find labor-power in the market as a commodity is this, that the owner of labor-power, instead of being able to sell commodities in which his labor has been objectified, must rather be compelled to offer for sale as a commodity that very labor-power which exists only in his living body.

"Possessor" is a more precise translation of "Besitzer" than "owner." However Marx is apparently not distinguishing here

between possession and ownership; in colloquial German, "Besitzer" is often used to mean "owner." Fowkes is therefore right

to translate, in the above sentence, Marx's "Geldbesitzer" as "owner of money."

Marx gives now a counterfactual argument, enumerating all the things which would be necessary for the worker to sell a product instead of labor: (2a) For production, pre-existing products are necessary:

272:2 In order that a man may be able to sell commodities other than his labor-power, he must of course possess means of produc-

^{40 ctd} „Von meinen besondern körperlichen und geistigen Geschicklichkeiten und Möglichkeiten der Tätigkeit kann ich ... einen in der Zeit beschränkten Gebrauch an einen andren veräußern, weil sie nach dieser Beschränkung ein äußerliches Verhältnis zu meiner Totalität und Allgemeinheit erhalten. Durch die Veräußerung meiner ganzen durch die Arbeit konkreten Zeit und der Totalität meiner Produktion würde ich das Substantielle derselben, meine allgemeine Tätigkeit und Wirklichkeit, meine Persönlichkeit zum Eigentum eines andren machen.“ (Hegel, „Philosophie des Rechts“, Berlin 1840, p. 104, §67.)

183:1 Die zweite wesentliche Bedingung, damit der Geldbesitzer die Arbeitskraft auf dem Markt als Ware vorfinde, ist die, daß ihr Besitzer, statt Waren verkaufen zu können, worin sich seine Arbeit vergegenständlicht hat, vielmehr seine Arbeitskraft selbst, die nur in seiner lebendigen Leiblichkeit existiert, als Ware feilbieten muß.

183:2 Damit jemand von seiner Arbeitskraft unterschiedne Waren verkaufe, muß er natürlich Produktionsmittel besitzen, z.B.

tion, such as raw materials, instruments of labor, etc. No boots can be made without leather.

(2b) ↓ The laborer needs to consume before and during production: He requires also the means of subsistence. Nobody, not even a builder of castles in the air, can live on the products of the future, or on use-values whose production has not yet been completed; just as on the first day of his appearance on the world's stage, man must still consume every day, before and while he produces.

(2c) ↓ If the product is a commodity, then not only its production time but also its circulation time must be bridged by the consumption of pre-existing products. If products are produced as commodities, they must be sold after they have been produced and they can only satisfy the producer's needs after they have been sold. The time necessary for sale must be added to the time of production.

↓ If the worker lacks the above, then he or she cannot sell products but must sell labor-power. This lack is again freedom—not “freedom to,” as in condition (1a), but “freedom from.”

272:3/o For the transformation of money into capital, therefore, the owner of money must find the free worker available on the commodity-market; and this worker must be free in the double sense that as a free individual he can dispose of his labor-power as his own commodity, and that, on the other hand, he has no other commodity for sale, i.e. he is rid of them, he is free of all the objects needed for the realization of his labor-power.

Rohstoffe, Arbeitsinstrumente usw. Er kann keine Stiefel machen ohne Leder.

and during production:

Er bedarf außerdem Lebensmittel. Niemand, selbst kein Zukunftsmusikant, kann von Produkten der Zukunft zehren, also auch nicht von Gebrauchswerten, deren Produktion noch unfertig, und wie am ersten Tage seiner Erscheinung auf der Erdbühne, muß der Mensch noch jeden Tag konsumieren, bevor und während er produziert.

Werden die Produkte als Waren produziert, so müssen sie verkauft werden, nachdem sie produziert sind, und können die Bedürfnisse des Produzenten erst nach dem Verkauf befriedigen. Zur Produktionszeit kommt die für den Verkauf nötige Zeit hinzu.

183:3 Zur Verwandlung von Geld in Kapital muß der Geldbesitzer also den freien Arbeiter auf dem Warenmarkt vorfinden, frei in dem Doppelsinn, daß er als freie Person über seine Arbeitskraft als seine Ware verfügt, daß er andererseits andere Waren nicht zu verkaufen hat, los und ledig, frei ist von allen zur Verwirklichung seiner Arbeitskraft nötigen Sachen.

Question 599 a. What is labor-power?

b. Which conditions must be met for labor-power to be a commodity sold by the laborer him- or herself?

c. Which historical developments must therefore have taken place before the beginning of capitalism?

Question 600 Which two sets of conditions must be satisfied for labor-power to be a commodity?

6.3. [Historical Preconditions of Economic Forms]

273:1 Why this free worker confronts him in the sphere of circulation is a question which does not interest the owner of money, for he finds the labor market in existence as a particular branch of the commodity market. And for the present it interests us just as little. We take this fact for granted theoretically, as he does practically.

Due to its qualities, labor-power stands out against all the other commodities like a single black sheep against a herd of white sheep. This throws up two questions, one historical, the other logical. The *historical* question is: under which conditions did this black sheep arise? The *logical* question is: are there some deeper reasons why money bags, whose appetite has been whetted by the abstract and one-dimensional nature of monetary wealth, is so lucky to find on the market exactly that commodity labor-power which allows him to fulfill his dreams of enrichment?

It is not clear whether Marx's question “why the free worker confronts the money owner in the sphere of circulation” refers to the historical or the logical dimension. If it is the historical question, the answer can be found in the chapters on “primitive accumulation” at the end of *Capital I*, which describe the forcible expropriation of the direct producers. If it is the logical question, an answer would require an investigation of the anatomy of the black sheep, i.e., of the relationship between labor-power, the ordinary commodities, money, and capital.

The black sheep has intricate connections with the white sheep: “Only when and where wage labor is its basis does commodity production impose itself upon the whole society” (*Capital I*, 733:4/o; similar remarks e.g. in *Resultate*). It is therefore not an extraneous accident or even an adulteration of commodity circulation that the black sheep labor-power runs around among the ordinary commodities. Nevertheless, Marx does not give a derivation of the commodity labor-power in *Capital* comparable to his derivation of capital progressing from value to money and on to capital. However in *Grundrisse*, elements of a parallel progression, from use-value to the commodity to wage labor, can be found. Marx compares the relation between use-value and exchange-value in the pair commodity–money and in the pair wage labor–capital (266:1–273).

Why not in *Capital*? Perhaps Marx changed his mind about the merits of reducing everything to the basic contradiction between use-value and value. Another possibility would be that Marx did not think that such a derivation belonged into *Capital*. Perhaps he wanted to include it into the book about wage labor, which Marx had planned to write. (He refers to it in chapter Twenty, p. 683:1. However there is a hot debate whether Marx really wanted to write a book about wage labor.)

The phrase “we take this fact for granted theoretically” might therefore mean that Marx

183:4 Die Frage, warum dieser freie Arbeiter ihm in der Zirkulationssphäre gegenübertritt, interessiert den Geldbesitzer nicht, der den Arbeitsmarkt als eine besondere Abteilung des Warenmarkts vorfindet. Und einstweilen interessiert sie uns ebensowenig. Wir halten theoretisch an der Tatsache fest, wie der Geldbesitzer praktisch.

postpones this part of the derivation, since it belongs into the book on wage labor and would lead us too far afield. Just as the capitalist can make his profits without knowing why he finds labor-power on the market, so can we gain an understanding of the capital relation even if some foundational issues regarding the wage labor remain unresolved. A similar argument is also made in 710:2.

Question 604 *Why does the money-owner find wage-labor on the market—exactly the commodity he needs to become a capitalist?*

↓ The discussion which follows now does *not* tell us why labor-power has become a commodity, but remarks in general that such things do not happen naturally but have their specific historical conditions:

One thing, however, is clear: nature does not produce owners of money or commodities on the one side, and men possessing nothing but their own labor-power on the other. This relation has no basis in natural history, nor is it a social relation common to all periods of human history. It is obviously the result of a past historical development, the product of many economic revolutions, of the demise of a whole series of older formations of social production.

Eins jedoch ist klar. Die Natur produziert nicht auf der einen Seite Geld- oder Warenbesitzer und auf der andren bloße Besitzer der eignen Arbeitskräfte. Dies Verhältnis ist kein naturgeschichtliches und ebenso wenig ein gesellschaftliches, das allen Geschichtsperioden gemein wäre. Es ist offenbar selbst das Resultat einer vorhergegangenen historischen Entwicklung, das Produkt vieler ökonomischen Umwälzungen, des Untergangs einer ganzen Reihe älterer Formationen der gesellschaftlichen Produktion.

Question 606 *Why is the wage labor relation the result of the demise of older formations of social production, and not the result of these formations themselves? (What is the difference anyway?)*

Labor-power is not unique in this respect. ↓ Also the other economic categories bear the stamp of history.

273:2 The economic categories which we discussed earlier bear a historical imprint as well.

183:5/o Auch die ökonomischen Kategorien, die wir früher betrachtet, tragen ihre geschichtliche Spur.

Marx gives now the historical conditions for the emergence of commodity and money, and then contrasts this with the historical conditions of capital. Regarding the commodity, Marx asks two questions: what are the conditions for *some* of the products to be produced as commodities, and what are the conditions for the *overwhelming majority* of products to be produced as commodities?

Specific historical conditions must be satisfied for the existence of commodities. In

Im Dasein des Produkts als Ware sind bestimmte historische Bedingungen ein-

order to become a commodity, the product must not be produced as the immediate means of subsistence of the producer himself. Had we gone further, and inquired under what circumstances all, or even the majority of products take the form of commodities, we should have found that this happens only on the basis of one particular mode of production, the capitalist one. Such an investigation, however, would have been foreign to the analysis of commodities. Production and circulation of commodities can take place even if the great mass of the objects produced are intended for the immediate needs of their producers, and are not turned into commodities, so that the process of social production is by far not dominated in its length and breadth by exchange-value.

↑ The question under what conditions all or most products become commodities has not yet come up, because commodities can also exist in a society in which most products are produced for home consumption. ↓ The conditions necessary for at least *some* products to become commodities have been discussed in more detail in chapter Two, 181:3/o.

The conversion of the product into a commodity requires a level of development of the division of labor within society such that the separation of use-value from exchange-value, a separation which first begins with barter, has already been completed. But such a degree of development is common to many economic formations of society, with the most diverse historical characteristics.

gehüllt. Um Ware zu werden, darf das Produkt nicht als unmittelbares Subsistenzmittel für den Produzenten selbst produziert werden. Hätten wir weiter geforscht: Unter welchen Umständen nehmen alle oder nimmt auch nur die Mehrzahl der Produkte die Form der Ware an, so hätte sich gefunden, daß dies nur auf Grundlage einer ganz spezifischen, der kapitalistischen Produktionsweise, geschieht. Eine solche Untersuchung lag jedoch der Analyse der Ware fern. Warenproduktion und Warenzirkulation können stattfinden, obgleich die weit überwiegende Produktenmasse, unmittelbar auf den Selbstbedarf gerichtet, sich nicht in Ware verwandelt, der gesellschaftliche Produktionsprozeß also noch lange nicht in seiner ganzen Breite und Tiefe vom Tauschwert beherrscht ist.

Die Darstellung des Produkts als Ware bedingt eine so weit entwickelte Teilung der Arbeit innerhalb der Gesellschaft, daß die Scheidung zwischen Gebrauchswert und Tauschwert, die im unmittelbaren Tauschhandel erst beginnt, bereits vollzogen ist. Eine solche Entwicklungsstufe ist aber den geschichtlich verschiedensten ökonomischen Gesellschaftsformationen gemein.

Question 607 *Which historical conditions must be satisfied that some products can take the form of commodities?*

Question 609 *Which historical conditions must be satisfied that all or at least a majority of the products can take the form of commodities?*

After the conditions for commodity production now the conditions for money.

273:3/o If we go on to consider money, its existence requires that the development

184:1 Oder betrachten wir das Geld, so setzt es eine gewisse Höhe des Warenaus-

of commodity exchange has reached a certain height. The various forms of money (money as the mere equivalent of commodities, money as means of circulation, money as means of payment, money as hoard, or money as world money) are evidence of very different levels of the process of social production, according to the extent and relative preponderance of one function or the other. Yet experience shows that a relatively feeble development of commodity circulation suffices for the creation of all these forms.

Commodity production must have reached a certain height for money to exist. The question “which height” depends on the form of money whose existence is to be explained. The development of the various forms of money follows the development of commodity production so closely that the forms of money can be used as historical or archeological evidence for these forms of commerce. Overall, the required level of development for all these forms is “relatively feeble.”

The conditions for the emergence of capital are different than those discussed so far:

Not so with capital. The historical conditions of its existence are by no means fulfilled with the mere circulation of money and commodities. Capital only arises when the owner of the means of production and subsistence finds the free worker selling his own labor-power on the market. This one historical precondition comprises a world’s history. Capital, therefore, ushers in from the outset a new epoch in the process of social production.⁴¹

Question 610 *What does Marx mean by: “Capital ushers in a new epoch in the process of social production,” and how does capital do this?*

⁴¹ The capitalist epoch is therefore characterized by the fact that labor-power, for the worker himself, takes on the form of a commodity which is his property—and thus his labor takes on the form of wage labor. On the other hand, it is only from this moment that the products of labor generally take the form of commodities.

tauschtes voraus. Die besondern Geldformen, bloßes Warenäquivalent oder Zirkulationsmittel oder Zahlungsmittel, Schatz und Weltgeld, deuten, je nach dem verschiedenen Umfang und dem relativen Vorwiegen einer oder der andren Funktion, auf sehr verschiedene Stufen des gesellschaftlichen Produktionsprozesses. Dennoch genügt erfahrungsmäßig eine relativ schwach entwickelte Warenzirkulation zur Bildung aller dieser Formen.

Anders mit dem Kapital. Seine historischen Existenzbedingungen sind durchaus nicht da mit der Waren- und Geldzirkulation. Es entsteht nur, wo der Besitzer von Produktions- und Lebensmitteln den freien Arbeiter als Verkäufer seiner Arbeitskraft auf dem Markt vorfindet, und diese eine historische Bedingung umschließt eine Weltgeschichte. Das Kapital kündigt daher von vornherein eine Epoche des gesellschaftlichen Produktionsprozesses an.⁴¹

⁴¹ Was also die kapitalistische Epoche charakterisiert, ist, daß die Arbeitskraft für den Arbeiter selbst die Form einer ihm gehörigen Ware, seine Arbeit daher die Form der Lohnarbeit erhält. Andererseits verallgemeinert sich erst von diesem Augenblick die Warenform der Arbeitsprodukte.

Moore Aveling has: in the eyes of the laborer himself, which is wrong. It is not a matter of how he perceives it, the laborer will often not even be aware that he is selling

his labor-power and not his labor. It is a matter of whether it is a commodity for the laborer, i.e., whether the laborer himself is the one who has the authority to buy

and sell this commodity (his own labor-power). French edition has it right: pour le travailleur lui-même.

Money develops wherever there are commodities, but capital, by contrast, does not immediately follow from the existence of commodities and money. It depends on the availability of labor-power as a commodity, which is a very basic relation of production. Marx writes “capital ushers in a new epoch in the process of social production” because the development of capital will lead to epochal changes, and it does so “from the outset” because one can see this from a very basic first logical facts about it, namely, from its dependence on wage labor.

Question 612 *What are the historical conditions for commodity production, what are those for the development of money, and what are those for the development of capital?*

6.4. [Value of Labor-Power]

274:1 This peculiar commodity, labor-power, must now be examined more closely. Like all other commodities it has a value.⁴²

184:2 Diese eigentümliche Ware, die Arbeitskraft, ist nun näher zu betrachten. Gleich allen andren Waren besitzt sie einen Wert.⁴²

↓ Hobbes takes it so much for granted that labor-power is a commodity that he conflates the value of labor-power with the value of the worker himself:

⁴² ‘The value or worth of a man, is as of all other things his price—that is to say, so much as would be given for the use of his power’ (T. Hobbes, *Leviathan*, in *Works*, ed. Molesworth, London, 1839–44, Vol. 3, p. 76).

⁴² „Der Wert eines Mannes ist wie der aller anderen Dinge gleich seinem Preis: das will besagen, so viel, wie für den Gebrauch seiner Kraft gezahlt wird.“ (Th. Hobbes, „*Leviathan*“, in „*Works*“, edit. Molesworth, London 1839–1844, v. III, p. 76.)

↓ The question: “how is this value determined?” is short for: “how is the magnitude of this value determined?”

How is that value determined?

Wie wird er bestimmt?

↓ One might think the value of labor-power is the same as the value created by labor-power. This is wrong. In order to determine the value of labor-power, we must forget the value-creating capabilities which make labor-power a special commodity. We must simply apply the general laws of the commodity developed earlier.

274:2/o The value of labor-power is determined, as in the case of every other commodity, by the labor-time necessary for the production, and consequently also the reproduction, of this specific article.

184:3/o Der Wert der Arbeitskraft, gleich dem jeder andren Ware, ist bestimmt durch die zur Produktion, also auch Reproduktion, dieses spezifischen Artikels notwendige Arbeitszeit.

Just as with every other commodity, we must look at the labor materialized in labor-power in abstraction from the use-value of labor-power.

In so far as it is value, labor-power itself represents nothing other than a definite quantity of the average social labor objectified in it.

↓ Now Marx discusses the labor objectified in labor-power:

Labor-power exists only as a capacity of the living individual. Its production consequently presupposes his existence. Given the existence of the individual, the production of labor-power consists in his own reproduction or maintenance. For his maintenance he requires a certain quantity of means of subsistence. Therefore the labor-time necessary for the production of labor-power resolves itself into that necessary for the production of those means of subsistence; in other words, the value of labor-power is the value of the means of subsistence necessary for the maintenance of the owner of the labor-power.

↑ The reproduction of labor-power also requires a lot of living labor: cooking, cleaning, raising children, etc. This labor is not reflected in the value of labor-power. Only the worker's expenses are counted here. ↓ This definition will now be filled out with more precise specifications of how much consumption is necessary for the preservation of its owner. Marx gives five such additional details. The first specification ties into the sentence "labor-power exists only as a capacity of the living individual." Mere existence is not enough, labor-power must also be actualized:

However, labor-power becomes actuality only by being applied; it is activated only through labor. In the course of this activation, which is labor, a certain quantity of human muscle, nerve, brain, etc. is expended, and these things must be replaced. If more is expended, more must be received.⁴³

The formulation of the first of these specifications is very terse. But footnote 43 gives the required clarification: harder workers need more food, therefore higher wages.

⁴³ In ancient Rome, therefore, the villicus, as the overseer of the agricultural slaves, received

Soweit sie Wert, repräsentiert die Arbeitskraft selbst nur ein bestimmtes Quantum in ihr vergegenständlichter gesellschaftlicher Durchschnittsarbeit.

Die Arbeitskraft existiert nur als Anlage des lebendigen Individuums. Ihre Produktion setzt also seine Existenz voraus. Die Existenz des Individuums gegeben, besteht die Produktion der Arbeitskraft in seiner eigenen Reproduktion oder Erhaltung. Zu seiner Erhaltung bedarf das lebendige Individuum einer gewissen Summe von Lebensmitteln. Die zur Produktion der Arbeitskraft notwendige Arbeitszeit löst sich also auf in die zur Produktion dieser Lebensmittel notwendige Arbeitszeit, oder der Wert der Arbeitskraft ist der Wert der zur Erhaltung ihres Besitzers notwendigen Lebensmittel.

Die Arbeitskraft verwirklicht sich jedoch nur durch ihre Äußerung, betätigt sich nur in der Arbeit. Durch ihre Betätigung, die Arbeit, wird aber ein bestimmtes Quantum von menschlichem Muskel, Nerv, Hirn usw. verausgabt, das wieder ersetzt werden muß. Diese vermehrte Ausgabe bedingt eine vermehrte Einnahme.⁴³

⁴³ Der altrömische villicus, als Wirtschaftler an der Spitze der Ackerbausklaven, empfing da-

'more meagre fare than working slaves, because his work was lighter' (T. Mommsen, *Römische Geschichte*, 1856, p. 810).

Second specification: maintenance of labor-power is a continuous and cumulative process in which the worker must not fall behind:

After having worked today, the owner of labor-power must be able to repeat the same process tomorrow in the same conditions as regards health and strength. His means of subsistence must therefore be sufficient to maintain him in his normal state as a working individual.

This will be amended by the fourth specification below, see 276:3/o.

Third: the needs may vary according to the climate, and are also determined by culture and past class struggles:

His natural needs, such as food, clothing, fuel and housing, vary according to the climatic and other physical peculiarities of his country. On the other hand, the number and extent of his so-called necessary requirements, as also the manner in which they are satisfied, are themselves products of history, and depend therefore to a great extent on the level of civilization attained by a country; in particular they depend on the conditions in which, and consequently on the habits and expectations with which, the class of free workers has been formed.⁴⁴

⁴⁴ Cf. [Tho46].

In contrast, therefore, with other commodities, the determination of the value of labor-power contains a historical and moral element. Nevertheless, in a given country at a given period, the average amount of the means of subsistence necessary for the worker is a known datum.

At Marx's time, the word "moral" was often used for something nonphysical. For instance, Marx calls technical obsolescence of means of production "moral depreciation." The last sentence says that such variations have no bearing as long as one looks at one country

her, „weil er leichtere Arbeit hat als die Knechte, knapperes Maß als diese“. (Th. Mommsen, *„Röm. Geschichte“*, 1856, p. 810.)

Wenn der Eigentümer der Arbeitskraft heute gearbeitet hat, muß er denselben Prozeß morgen unter denselben Bedingungen von Kraft und Gesundheit wiederholen können. Die Summe der Lebensmittel muß also hinreichen, das arbeitende Individuum als arbeitendes Individuum in seinem normalen Lebenszustand zu erhalten.

Die natürlichen Bedürfnisse selbst, wie Nahrung, Kleidung, Heizung, Wohnung usw., sind verschieden je nach den klimatischen und andren natürlichen Eigentümlichkeiten eines Landes. Andererseits ist der Umfang sog. notwendiger Bedürfnisse, wie die Art ihrer Befriedigung, selbst ein historisches Produkt und hängt daher großenteils von der Kulturstufe eines Landes, unter andrem auch wesentlich davon ab, unter welchen Bedingungen, und daher mit welchen Gewohnheiten und Lebensansprüchen die Klasse der freien Arbeiter sich gebildet hat.⁴⁴

⁴⁴ Vgl. [Tho46].

Im Gegensatz zu den andren Waren enthält also die Wertbestimmung der Arbeitskraft ein historisches und moralisches Element. Für ein bestimmtes Land, zu einer bestimmten Periode jedoch, ist der Durchschnittsumkreis der notwendigen Lebensmittel gegeben.

during one period only.

Question 615 *How is the value of labor-power determined? Explain what it means that “the determination of the value of labor-power contains a historical and moral element.” What does the word “moral” mean here? Doesn’t Marx imply with this that the value of labor-power can be just about anything? Is there any scientific insight in this?*

The fourth specific point amends the second: value of labor-power must be sufficient not only to allow the worker to reproduce himself, but also for his offspring.

275:1 The owner of labor-power is mortal. If then his appearance in the market is to be continuous, and the continuous transformation of money into capital assumes this, the seller of labor-power must perpetuate himself ‘in the way that every living individual perpetuates himself, by procreation’.⁴⁵ The labor-power removed from the market by wear and tear, and by death, must be continually replaced by, at the very least, an equal amount of fresh labor-power. Hence the sum of means of subsistence necessary for the production of labor-power must include the means necessary for the worker’s replacements, i.e. his children, in order that this race of peculiar commodity-owners may perpetuate its presence on the market.⁴⁶

⁴⁵ Petty.

⁴⁶ ‘Its’ (labor’s) ‘natural price ... consists in such a quantity of necessities and comforts of life, as, from the nature of the climate, and the habits of the country, are necessary to support the laborer, and to enable him to rear such a family as may preserve, in the market, an undiminished supply of labor’ (R. Torrens, *An Essay on the External Corn Trade*, London, 1815, p. 62). The word labor is here wrongly used for labor-power.

Young workers without family often do not realize how low their wage really is, because they have lower expenses than workers with families.

The fifth point is important as well: the cost of schooling enters the value of labor-power.

185:1/o Der Eigentümer der Arbeitskraft ist sterblich. Soll also seine Erscheinung auf dem Markt eine kontinuierliche sein, wie die kontinuierliche Verwandlung von Geld in Kapital voraussetzt, so muß der Verkäufer der Arbeitskraft sich verewigen, „wie jedes lebendige Individuum sich verewigt, durch Fortpflanzung“⁴⁵. Die durch Abnutzung und Tod dem Markt entzogenen Arbeitskräfte müssen zum allermindesten durch eine gleiche Zahl neuer Arbeitskräfte beständig ersetzt werden. Die Summe der zur Produktion der Arbeitskraft notwendigen Lebensmittel schließt also die Lebensmittel der Ersatzmänner ein, d.h. der Kinder der Arbeiter, so daß sich diese Race eigentümlicher Warenbesitzer auf dem Warenmarkte verewigt.⁴⁶

⁴⁵ Petty.

⁴⁶ „Ihr“ (der Arbeit) „natürlicher Preis ... besteht in einer solchen Menge von Subsistenzmitteln und Dingen der Bequemlichkeit, wie sie entsprechend dem Klima und den Gewohnheiten eines Landes notwendig sind, um den Arbeiter zu erhalten und es ihm zu ermöglichen, eine Familie aufzuziehen, die auf dem Markt ein unvermindertes Angebot von Arbeit zu sichern vermag.“ (R. Torrens, *„An Essay on the external Corn Trade“*, London 1815, p. 62.) Das Wort Arbeit steht hier fälschlich für Arbeitskraft.

275:2/o In order to modify the general nature of the human organism in such a way that it acquires skill and dexterity in a given branch of industry, and becomes labor-power of a developed and specific kind, a special education or training is needed, and this in turn costs an equivalent in commodities of a greater or lesser amount. The costs of education vary according to the degree of complexity of the labor-power required. These expenses (exceedingly small in the case of ordinary labor-power) form a part of the total value spent in producing it.

Marx’s sixth point is an important implication of the indirect method of determining the magnitude of value: the value of labor-power is variable.

276:1 The value of labor-power can be resolved into the value of a definite quantity of the means of subsistence. It therefore varies with the value of the means of subsistence, i.e. with the quantity of labor-time required to produce them.

The value of labor-power is therefore determined by many different factors. These factors also have different time dimensions, which requires that the value of a day’s labor-power is determined by an averaging method.

276:2 A part of the means of subsistence, such as food and fuel, are consumed every day, and must therefore be replaced every day. Others, such as clothes and furniture, last for longer periods and need to be replaced only at longer intervals. Some articles must be bought or paid for every day, others every week, others every quarter and so on. But in whatever way the sum total of these outlays may be spread out over the year, they must be covered by the average daily income. If the total of the commodities required every day for the production of labor-power = A, and of those required every week = B, and of those required every quarter = C, and so on, the daily average of

186:1 Um die allgemein menschliche Natur so zu modifizieren, daß sie Geschick und Fertigkeit in einem bestimmten Arbeitszweig erlangt, entwickelte und spezifische Arbeitskraft wird, bedarf es einer bestimmten Bildung oder Erziehung, welche ihrerseits eine größere oder geringere Summe von Warenäquivalenten kostet. Je nach dem mehr oder minder vermittelten Charakter der Arbeitskraft sind ihre Bildungskosten verschieden. Diese Erlernungskosten, verschwindend klein für die gewöhnliche Arbeitskraft, gehn also ein in den Umkreis der zu ihrer Produktion verausgabten Werte.

186:2 Der Wert der Arbeitskraft löst sich auf in den Wert einer bestimmten Summe von Lebensmitteln. Er wechselt daher auch mit dem Wert dieser Lebensmittel, d.h. der Größe der zu ihrer Produktion erheischten Arbeitszeit.

186:3/o Ein Teil der Lebensmittel, z.B. Nahrungsmittel, Heizungsmittel usw., werden täglich neu verzehrt und müssen täglich neu ersetzt werden. Andre Lebensmittel, wie Kleider, Möbel usw., verbrauchen sich in längeren Zeiträumen und sind daher nur in längeren Zeiträumen zu ersetzen. Waren einer Art müssen täglich, andre wöchentlich, vierteljährlich usf. gekauft oder gezahlt werden. Wie sich die Summe dieser Ausgaben aber immer während eines Jahres z.B. verteilen möge, sie muß gedeckt sein durch die Durchschnittseinnahme tagein, tagaus. Wäre die Masse der täglich zur Produktion der Arbeitskraft erheischten Waren = A, die der wöchentlich erheischten = B, die

these commodities = $\frac{365A+52B+4C+\dots}{365}$. Assuming that this mass of commodities required for the average day contains 6 hours of social labor, then during every day, half a day of average social labor is objectified in labor-power. In other words, half a day of labor is required to produce labor-power for one day. This quantity of labor constituted the value of a day's labor-power, or the value of the labor-power reproduced every day. If half a day of average social labor is also represented in a mass of gold amounting to 3 shillings, then 3 shillings is the price which corresponds to the value of a day's labor-power. If its owner therefore offers it for sale at 3 shillings a day, its selling price is equal to its value, and according to our original assumption, the owner of money, who is intent on transforming his 3 shillings into capital, pays this value.

In this calculation, Marx assumes (without saying so explicitly) that a normal working day is 12 hours long. 6 hours of social labor are objectified in the means of consumption necessary to maintain labor-power for one day, and these 6 hours are represented by 3 shillings. A wage of 3 shillings represents therefore only half a day's labor. Although the worker must work a full day to get a wage representing only half a day's labor, he is selling his labor-power at its value and not below its value.

↑ This completes the calculation of the value. We have seen that the value of labor-power is conditional and variable and depends on complex calculations which may not have a unique determinate outcome. ↓ But the range of this indeterminacy and variability is constrained by what Marx calls the *minimum limit* of this value.

276:3/o The ultimate or minimum limit of the value of labor-power is formed by the value of the commodities which have to be supplied every day to the bearer of labor-power, to the human, so that he can renew his life-process. That is to say, the limit is formed by the value of the physi-

der vierteljährlich erheischten = C usw., so wäre der tägliche Durchschnitt dieser Waren = $\frac{365A+52B+4C+usw.}{365}$. Gesetzt, in dieser für den Durchschnittstag nötigen Warenmasse steckten 6 Stunden gesellschaftlicher Arbeit, so vergegenständlicht sich in der Arbeitskraft täglich ein halber Tag gesellschaftlicher Durchschnittsarbeit, oder ein halber Arbeitstag ist zur täglichen Produktion der Arbeitskraft erheischt. Dies zu ihrer täglichen Produktion erheischte Arbeitsquantum bildet den Tageswert der Arbeitskraft oder den Wert der täglich reproduzierten Arbeitskraft. Wenn sich ein halber Tag gesellschaftlicher Durchschnittsarbeit ebenfalls in einer Goldmasse von 3 sh. oder einem Taler darstellt, so ist ein Taler der dem Tageswert der Arbeitskraft entsprechende Preis. Bietet der Besitzer der Arbeitskraft sie feil für einen Taler täglich, so ist ihr Verkaufspreis gleich ihrem Wert und, nach unserer Voraussetzung, zahlt der auf Verwandlung seiner Taler in Kapital erpichte Geldbesitzer diesen Wert.

187:1 Die letzte Grenze oder Minimalgrenze des Werts der Arbeitskraft wird gebildet durch den Wert einer Warenmasse, ohne deren tägliche Zufuhr der Träger der Arbeitskraft, der Mensch, seinen Lebensprozeß nicht erneuern kann, also durch den Wert der physisch unentbehrlichen Le-

cally indispensable means of subsistence. If the price of labor-power falls to this minimum, it falls below its value, since under such circumstances it can be maintained and developed only in a crippled state, and the value of every commodity is determined by the labor-time required to provide it in its normal quality.

The *price* of labor-power cannot fall below this limit but it can hover at this limit. In this situation, however, the price is below the value. A wage which meets only the survival needs of the laborer is a wage below the value of labor-power. The capitalists nevertheless have the incentive to depress wages to this minimum limit, since this is the minimum wage which allows the worker to show up for work. Laborers are often forced to accept such a wage, but since this wage is below the value of labor-power, the market is on their side when they fight to restore the wages to the value of labor-power. This is one of the reasons why, as Marx says in *Value, Price and Profit*, p. [mecw20]148:2, "the necessity of debating their price with the capitalist is inherent to their condition of having to sell themselves as commodities."

Question 620 *Marx says elsewhere that labor unions are necessary for workers to be able to receive a wage which corresponds to the value of their labor-power and is not below it. Can you bring arguments from chapter Six to support this?*

Question 621 *How is the magnitude of the value of labor-power determined? Be very specific about the different factors that must be taken into consideration. How does this determination differ from that of the value of other commodities?*

Marx's distinction between the value created by labor and the value of labor-power draws a sharp dividing line between labor and labor-power. Now one might argue that these two cannot really be separated, that one cannot exist without the other, and that therefore any theoretical categories based on their difference are mere mental constructs without significance in the real world. Marx concludes his discussion of the value of labor-power with a paragraph addressing this objection:

277:1 It is an extraordinarily cheap kind of sentimentality which declares that this method of determining the value of labor-power, a method prescribed by the very nature of the case, is brutal, and which laments with Rossi in this matter:

To conceive capacity for labor in abstraction from the workers' means of subsistence during the production process is to conceive a phantom. When we speak of labor, or capac-

bensmittel. Sinkt der Preis der Arbeitskraft auf dieses Minimum, so sinkt er unter ihren Wert, denn sie kann sich so nur in verkümmelter Form erhalten und entwickeln. Der Wert jeder Ware ist aber bestimmt durch die Arbeitszeit, erfordert, um sie in normaler Güte zu liefern.

187:2–4 Es ist eine außerordentlich wohlfeile Sentimentalität, diese aus der Natur der Sache fließende Wertbestimmung der Arbeitskraft grob zu finden und etwa mit Rossi zu jammern:

„Das Arbeitsvermögen (puissance de travail) begreifen, während man von den Subsistenzmitteln der Arbeit während des Produktionsprozesses abstrahiert, heißt ein Hirngespinnst

ity for labor, we speak at the same time of the worker and his means of subsistence, of the worker and his wages.⁴⁷

⁴⁷ [Ros43, p. 370, 371]

When we speak of capacity for labor, we do not speak of labor, any more than we speak of digestion when we speak of capacity for digestion. As is well known, the latter process requires something more than a good stomach. When we speak of capacity for labor, we do not abstract from the necessary means of subsistence. On the contrary their value is expressed in its value. If his capacity for labor remains unsold, this is of no advantage to the worker. He will rather feel it to be a cruel nature-imposed necessity that his capacity for labor has required for its production a definite quantity of the means of subsistence, and will continue to require this for its reproduction. Then he will make the same discovery as Sismondi, that 'the capacity for labor ... is nothing unless it is sold'.⁴⁸

⁴⁸ [[Si19, p. 113]

Marx agrees with Rossi that the means of subsistence of the workers are implicit in the concept of labor-power. But he disagrees with Rossi's conflation of labor-power and labor. There is an important practical difference between labor-power and labor, because labor-power cannot produce without means of production. A laborer who is unable to sell his labor-power experiences both of these aspects: the difference between labor-power and labor, and the connection between labor-power and means of subsistence. Although Marx does not say it here explicitly, this scenario makes it clear why labor-power cannot command a price of the market which reimburses the full value produced by the labor.

Question 622 *Argue why the commodity the worker sells is labor-power, and not labor.*

Question 624 *Labor-power creates products. The value of the products comes from the value of labor-power, and the use-value from the use-value of labor-power. Is this a correct rendering of Marx's theory?*

(être de raison) begreifen. Wer Arbeit sagt, wer Arbeitsvermögen sagt, sagt zugleich Arbeiter und Subsistenzmittel, Arbeiter und Arbeitslohn.⁴⁷

⁴⁷ [Ros43, p. 370, 371]

Wer Arbeitsvermögen sagt, sagt nicht Arbeit, so wenig als wer Verdauungsvermögen sagt, Verdauen sagt. Zum letzteren Prozeß ist bekanntlich mehr als ein guter Magen erforderlich. Wer Arbeitsvermögen sagt, abstrahiert nicht von den zu seiner Subsistenz notwendigen Lebensmitteln. Ihr Wert ist vielmehr ausgedrückt in seinem Wert. Wird es nicht verkauft, so nützt es dem Arbeiter nichts, so empfindet er es vielmehr als eine grausame Notwendigkeit, daß sein Arbeitsvermögen ein bestimmtes Quantum Subsistenzmittel zu seiner Produktion erheischt hat und stets wieder von neuem zu seiner Reproduktion erheischt. Er entdeckt dann mit Sismondi: „Das Arbeitsvermögen ... ist nichts, wenn es nicht verkauft wird“⁴⁸

⁴⁸ [[Si19, p. 113]

6.5. [The Worker as Creditor]

Since the use-value of labor-power consists in the manifestation of this power *after* it is sold, the capitalist pays the laborer after he has worked, in order to ensure delivery of the commodity labor-power he has bought. In effect, the worker gives a forced credit to the capitalist. Instead of earning interest on this credit, the worker is economically penalized for it: loss of wages in bankruptcy, bread undersellers, higher prices in company shops which sell for credit.

277:2 One consequence of the peculiar nature of labor-power as a commodity is this, that it does not in reality pass straight away into the hands of the buyer on the conclusion of the contract between buyer and seller. Its value, like that of every other commodity, was determined before it enters into circulation, because the production of the labor-power required a specific quantity of social labor. But its use-value only consists in the subsequent exercise of that power. The alienation of labor-power and its actual manifestation, when it takes effect as a use-value, do not coincide in time. In those cases, however, in which the formal alienation by sale of the use-value of a commodity does not coincide with its actual transfer to the buyer, the money of the buyer usually serves as means of payment.⁴⁹

188:1 Die eigentümliche Natur dieser spezifischen Ware, der Arbeitskraft, bringt es mit sich, daß mit der Abschließung des Kontrakts zwischen Käufer und Verkäufer ihr Gebrauchswert noch nicht wirklich in die Hand des Käufers übergegangen ist. Ihr Wert, gleich dem jeder andren Ware, war bestimmt, bevor sie in die Zirkulation trat, denn ein bestimmtes Quantum gesellschaftlicher Arbeit ward zur Produktion der Arbeitskraft verausgabt. Aber ihr Gebrauchswert besteht erst in der nachträglichen Kraftäußerung. Die Veräußerung der Kraft und ihre wirkliche Äußerung, d.h. ihr Dasein als Gebrauchswert, fallen daher der Zeit nach auseinander. Bei solchen Waren aber,⁴⁹ wo die formelle Veräußerung des Gebrauchswerts durch den Verkauf und seine wirkliche Überlassung an den Käufer der Zeit nach auseinanderfallen, funktioniert das Geld des Käufers meist als Zahlungsmittel.

Money serves as means of payment means: the payment takes place a certain time period after the goods have changed hands.

⁴⁹ 'All labor is paid after it has ceased' (An Inquiry into Those Principles, Respecting the Nature of Demand, etc., p. 104). 'The system of commercial credit had to start at the moment when the worker, the prime creator of products, could, thanks to his savings, wait for his wages until the end of the week, the fortnight, the month, the quarter, etc.' (C. Ganilh, Des systèmes de l'économie politique, 2nd edn, Paris, 1821, Vol. 2, p. 150).

⁴⁹ „Alle Arbeit wird bezahlt, nachdem sie beendet ist.“ („An Inquiry into those Principles, respecting the Nature of Demand etc.“, p. 104.) „Der kaufmännische Kredit mußte in dem Moment anfangen, in dem der Arbeiter, der erste Schöpfer der Produktion, auf Grund seiner Ersparnisse in der Lage war, auf den Lohn seiner Arbeit bis zum Ende von ein bis zwei Wochen, eines Monats, eines Vierteljahres usw. zu warten.“ (Ch. Ganilh. „Des Systèmes d'Écon. Po-

With an ordinary commodity, it does not matter when the buyer uses it, because he has full control over it and he can use it whenever he likes. Not so with the labor-power.

In every country where the capitalist mode of production prevails, it is the custom not to pay for labor-power until it has been exercised for the period fixed by the contract, for example, at the end of each week. In all cases, therefore, the worker advances the use-value of his labor-power to the capitalist. He lets the buyer consume it before he receives payment of the price. Everywhere the worker allows credit to the capitalist.

This credit by the worker to the capitalist is not an empty imagination or fiction, but it is part of the reality in which the worker lives. It has a number of very real consequences:

That this credit is no mere fiction is shown not only by the occasional loss of the wages the worker has already advanced, when a capitalist goes bankrupt,⁵⁰ but also by a series of more permanent consequences.⁵¹

Storch in footnote 50 excuses the defrauding of the worker with the pun that only material things are considered “substantial.”

⁵⁰ “The worker lends his industry,” says Storch. But he slyly adds to this the statement that the worker ‘risks nothing’, except ‘the loss of his wages ... The worker does not hand over anything of a material nature’. (Storch, *Cours d’économie politique*, St Petersburg, 1815, Vol. 2, pp. 36–7).

One implication of this forced lending by the worker is described in footnote 51. Since the workers do not have cash, they are forced to buy in stores which give them credit. (Often these stores are owned by the employer.) Since these stores do not have to fear competition (the worker cannot go elsewhere), they either sell inferior merchandise or charge exorbitant prices:

⁵¹ One example. In London there are two sorts of bakers, the ‘full priced’, who sell bread at its full value, and the ‘undersellers’, who sell it at less than its value. The latter class comprises more than three-quarters of the total number of bakers (p. xxxii in the Report of H. S. Tremeneheere, the commissioner appointed to examine

lit.“, 2ème édit., Paris 1821, t. II, p. 150.)

In allen Ländern kapitalistischer Produktionsweise wird die Arbeitskraft erst gezahlt, nachdem sie bereits während des im Kaufkontrakt festgesetzten Termins funktioniert hat, z.B. am Ende jeder Woche. Überall schießt daher der Arbeiter dem Kapitalisten den Gebrauchswert der Arbeitskraft vor; er läßt sie vom Käufer konsumieren, bevor er ihren Preis bezahlt erhält, überall kreditiert daher der Arbeiter dem Kapitalisten.

Daß dies Kreditieren kein leerer Wahn ist, zeigt nicht nur der gelegentliche Verlust des kreditierten Lohns beim Bankrott des Kapitalisten,⁵⁰ sondern auch eine Reihe mehr nachhaltiger Wirkungen.⁵¹

⁵⁰ „Der Arbeiter leiht seinen Fleiß,“ aber, setzt Storch schlaue hinzu: er „riskiert nichts“, außer „seinen Lohn zu verlieren ... der Arbeiter überträgt nichts Materielles“. (Storch, *Cours d’Écon. Polit.*, Petersburg 1815, t. II, p. 36, 37.)

⁵¹ Ein Beispiel. In London existieren zweierlei Sorten von Bäckern, die „full priced“, die das Brot zu seinem vollen Werte verkaufen, und die „undersellers“, die es unter diesem Werte verkaufen. Letztere Klasse bildet über 3/4 der Gesamtzahl der Bäcker (p. XXXII im „Report“ des Regierungskommissärs H. S. Tremeneheere über die

the grievances complained of by the journeymen bakers’, etc., London, 1862). The undersellers, almost without exception, sell bread adulterated with alum, soap, pearl-ash, chalk, Derbyshire stonedust and other similar agreeable, nourishing and wholesome ingredients. (See the above-cited Blue Book, as also the report of the select committee of 1855 on the adulteration of food, and Dr. Hassall’s *Adulterations Detected*, 2nd edn, London, 1861.) Sir John Gordon stated before the committee of 1855 that ‘in consequence of these adulterations, the poor man, who lives on two pounds of bread a day, does not now get one-fourth part of nourishing matter, let alone the deleterious effects on his health’. Tremeneheere states (op. cit., p. xlviii) as the reason why a ‘very large part of the working class’, although well aware of this adulteration, nevertheless accept the alum, stone-dust, etc. as part of their purchase, that it is for them ‘a matter of necessity to take from their baker or from the chandler’s shop such bread as they choose to supply’. As they are not paid their wages before the end of the week, they in their turn are unable ‘to pay for the bread consumed by their families during the week, before the end of the week’, and Tremeneheere adds on the evidence of witnesses, ‘it is notorious that bread composed of those mixtures is made expressly for sale in this manner’. ‘In many English agricultural districts’ (and still more in Scottish) ‘wages are paid fortnightly and even monthly; with such long intervals between the payments, the agricultural laborer is obliged to buy on credit ... He must pay higher prices, and is in fact tied to the shop which gives him credit. Thus at Horn- ington in Wilts., for example, where the wages are monthly, the same flour that he could buy elsewhere at 1s. 10d. per stone, costs him 2s. 4d. per stone’ (Public Health, Sixth Report of the Medical Officer of the Privy Council, etc., 1864, p. 264). ‘The block-printers of Paisley and Kilmarnock’ (Western Scotland) ‘enforced in 1833 by a strike the reduction of the period of payments from monthly to fortnightly’ (Reports of the Inspectors of Factories ... 31 October 1853,

„Grievances complained of by the journeymen bakers etc.“, London 1862). Diese undersellers verkaufen, fast ausnahmslos, Brot, das verfälscht ist durch Beimischung von Alaun, Seife, Perl- asche, Kalk, Derbyshire-Steinmehl und ähnlichen angenehmen, nahrhaften und gesunden Ingredi- enzien. (Sieh das oben zitierte Blaubuch, eben- so den Bericht des „Committee of 1855 on the Adulteration of Bread“ und Dr. Hassalls, „Adul- terations Detected“, 2nd. edit., London 1861.) Sir John Gordon erklärte vor dem Komitee von 1855, daß „infolge dieser Fälschungen der Arme, der von zwei Pfund Brot täglich lebt, jetzt nicht den vierten Teil des Nahrungsstoffes wirklich erhält, abgesehen von den schädlichen Wirkun- gen auf seine Gesundheit“. Als Grund, warum „ein sehr großer Teil der Arbeiterklasse“, ob- gleich wohl unterrichtet über die Fälschungen, dennoch Alaun, Steinmehl etc. mit in den Kauf nimmt, führt Tremeneheere (l.c. p. XLVIII) an, daß es für sie „ein Ding der Notwendigkeit ist, von ihrem Bäcker oder dem chandler’s shop das Brot zu nehmen, wie man es ihnen zu geben be- liebt“. Da sie erst Ende der Arbeitswoche bezahlt werden, können sie auch „das während der Wo- che von ihren Familien verzehrte Brot erst En- de der Woche zahlen“; und, fügt Tremeneheere mit Anführung der Zeugenaussagen hinzu: „Es ist notorisch, daß mit solchen Mixturen bereite- tes Brot expreß für diese Art Kunden gemacht wird.“ („It is notorious that bread composed of those mixtures, is made expressly for sale in this manner.“) „In vielen englischen Agrikulturdi- strikten“ (aber noch mehr in schottischen) „wird der Arbeitslohn vierzehntägig und selbst monat- lich gezahlt. Mit diesen langen Zahlungsfristen muß der Agrikulturarbeiter seine Waren auf Kre- dit kaufen ... Er hat höhere Preise zu zahlen und ist tatsächlich an die Boutique gebunden, die ihm pumpt. So kostet ihm z.B. zu Horningsham in Wilts, wo die Löhnung monatlich, dasselbe Mehl 2 sh. 4 d. per stone, das er sonstwo mit 1 sh. 10 d. zahlt.“ („Sixth Report“ on „Public Health“ by „The Medical Officer of the Privy Council etc.“, 1864, p. 264.) „Die Kattun Handdrucker

p. 34). As a further nice development from the credit given by the workers to the capitalist, we may refer to the method adopted by many English coal-owners whereby the worker is not paid till the end of the month, and in the meantime receives sums on account from the capitalist, often in goods for which the miner is obliged to pay more than the market price (truck system). 'It is a common practice with the coal masters to pay once a month, and advance cash to their workmen at the end of each intermediate week. The cash is given in the shop' (i.e. the tommy-shop which belongs to the master); 'the men take it on one side and lay it out on the other' (Children's Employment Commission, Third Report, London, 1864, p. 38, n. 192).

von Paisley und Kilmarnock“ (Westschottland) „erzwangen 1853 durch einen strike die Herabsetzung des Zahlungstermins von einem Monat auf 14 Tage.“ („Reports of the Inspectors of Factories for 31st Oct. 1853“, p. 34.) Als eine weitere artige Entwicklung des Kredits, den der Arbeiter dem Kapitalisten gibt, kann man die Methode vieler englischer Kohlenbergwerksbesitzer betrachten, wonach der Arbeiter erst Ende des Monats bezahlt wird und in der Zwischenzeit Vorschüsse vom Kapitalisten erhält, oft in Waren, die er über ihren Marktpreis zahlen muß (Trucksystem). „Es ist eine übliche Praxis der Kohlenherren, einmal im Monat auszuzahlen und ihren Arbeitern am Ende jeder dazwischenliegenden Woche Vorschuß zu geben. Dieser Vorschuß wird im Laden gegeben“ (nämlich dem tommy-shop oder dem Meister selbst gehörigen Kramladen). „Die Männer nehmen ihn auf der einen Seite des Ladens in Empfang und geben ihn auf der anderen wieder aus.“ („Children's Employment Commission, III. Report“, Lond. 1864, p. 38, n. 192.)

Question 625 Which “permanent consequences” of the laborer’s forced lending to the capitalist does Marx describe in chapter Six? Are Marx’s arguments still valid today?

Question 626 What do bread undersellers have to do with the fact that wages are paid after the labor is performed?

Question 627 If the worker gives credit to the capitalist, what is the reason that he is penalized for it instead of being rewarded?

Marx concludes this section about the worker’s forced lending by saying that he will ignore these effects henceforth:

Whether money serves as a means of purchase or a means of payment, this does not alter the nature of the exchange of commodities. The price of the labor-power is fixed by the contract, although it is not realized till later, like the rent of a house. The labor-power is sold, although it is paid for only at a later period. It will therefore be useful, if we want to conceive the relation in

Indes ändert es an der Natur des Warenaustausches selbst nichts, ob das Geld als Kaufmittel oder als Zahlungsmittel funktioniert. Der Preis der Arbeitskraft ist kontraktlich festgesetzt, obgleich er erst hinterher realisiert wird, wie der Mietpreis eines Hauses. Die Arbeitskraft ist verkauft, obgleich sie erst hinterher bezahlt wird. Für die reine Auffassung des Verhältnisses ist

its pure form, to presuppose for the moment that the owner of labor-power, on the occasion of each sale, immediately receives the price stipulated in the contract.

es jedoch nützlich, einstweilen vorauszusetzen, daß der Besitzer der Arbeitskraft mit ihrem Verkauf jedesmal auch sogleich den kontraktlich stipulierten Preis erhält.

Question 628 It is often argued that labor-power is not really a commodity. Does labor-power meet the following criteria for being a commodity?

- (a) It is a non-use-value for its producer.
- (b) It is a use-value for the buyer.
- (c) Its use-value and its value are two quite different things.
- (d) It is produced for the exchange.
- (e) Seller and buyer only meet on the market; the consumption of the commodity is a matter which does not concern the seller.

6.6. [From the Sphere of Circulation to Production]

279:2 We now know the modalities of the determination of the value paid by the owner of money to the owner of this peculiar commodity, labor-power.

189:1 Wir kennen nun die Art und Weise der Bestimmung des Werts, welcher dem Besitzer dieser eigentümlichen Ware, der Arbeitskraft, vom Geldbesitzer gezahlt wird.

⇓ However the money owner buys labor-power only because its *consumption* creates more value than the value incorporated in the labor-power itself. We are therefore also interested in the *use-value* of the commodity labor-power.

The use-value which the former gets in exchange will only become apparent in the actual utilization, in the process of the consumption of the labor-power.

Der Gebrauchswert, den letzterer seinerseits im Austausch erhält, zeigt sich erst im wirklichen Verbrauch, im Konsumtionsprozeß der Arbeitskraft.

This last sentence is an echo of 126:1. Generally, use-values are not part of the subject-matter of political economy. We are looking here at the use-value of labor-power only because labor-power is an exception. Its use-value is economically relevant because the use of labor-power creates value. In order to understand *how* the commodity labor-power obtains its miraculous ability to create surplus-value, we must look at the process in which the commodity labor-power is consumed.

The money-owner buys everything necessary for this process, such as raw material, in the market, and pays the full price for it. The process of consumption of labor-power is at the same time the process of production of commodities and of surplus-value.

Alle zu diesem Prozeß nötigen Dinge, wie Rohmaterial usw., kauft der Geldbesitzer auf dem Warenmarkt und zahlt sie zum vollen Preis. Der Konsumtionsprozeß der Arbeitskraft ist zugleich der Produktionsprozeß von Ware und von Mehrwert.

↓ What happens next will be described in the next chapter, 291:1. This is the part of the creation of surplus-value which does *not* take place in the sphere of circulation. The rest of the current chapter gives some concluding remarks before we leave circulation behind in order to enter the sphere of production.

The consumption of labor-power, as that of every other commodity, takes place outside the market or the sphere of circulation. Let us therefore, in company with the owner of money and the owner of labor-power, leave this noisy sphere, which occupies the surface, and is in full view of everyone, and follow them into the hidden abode of production, on whose threshold there hangs the notice 'No admittance except on business'. Here it will turn out, not only how capital produces, but how capital itself is produced. The secret of profit-making must at last be laid bare.

In this chapter, we have made good progress towards the explanation how profits can be made if all commodities are sold at their values. By an elimination argument we have arrived at the commodity labor-power as our only candidate through which this is possible. We know now under which conditions labor-power is a commodity, and how the value of this commodity is determined. The only remaining step is to verify that the consumption of labor-power creates more value than labor-power itself costs. For this, a detailed look at the consumption of the commodity labor-power has become necessary. This will not be done here but in chapter Seven. Here, at the end of chapter Six, Marx throws a last look back at the sphere of circulation:

280:1 The sphere of circulation or commodity exchange, within whose boundaries the sale and purchase of labor-power goes on, is in fact a very Eden of the innate rights of man. It is the exclusive realm of Freedom, Equality, Property and Bentham. Freedom, because both buyer and seller of a commodity, let us say of labor-power, are determined only by their own free will. They contract as free persons, who are equal before the law. Their contract is the final result in which their joint will finds a common legal expression. Equal-

Die Konsumtion der Arbeitskraft, gleich der Konsumtion jeder andren Ware, vollzieht sich außerhalb des Markts oder der Zirkulationssphäre. Diese geräuschvolle, auf der Oberfläche hausende und aller Augen zugängliche Sphäre verlassen wir daher, zusammen mit Geldbesitzer und Arbeitskraftbesitzer, um beiden nachzufolgen in die verborgne Stätte der Produktion, an deren Schwelle zu lesen steht: No admittance except on business. Hier wird sich zeigen, nicht nur wie das Kapital produziert, sondern auch wie man es selbst produziert, das Kapital. Das Geheimnis der Plusmacherei muß sich endlich enthüllen.

189:2/o Die Sphäre der Zirkulation oder des Warenaustausches, innerhalb deren Schranken Kauf und Verkauf der Arbeitskraft sich bewegt, war in der Tat ein wahres Eden der angeborenen Menschenrechte. Was allein hier herrscht, ist Freiheit, Gleichheit, Eigentum und Bentham. Freiheit! Denn Käufer und Verkäufer einer Ware, z.B. der Arbeitskraft, sind nur durch ihren freien Willen bestimmt. Sie kontrahieren als freie, rechtlich ebenbürtige Personen. Der Kontrakt ist das Endresultat, worin sich ihre Willen einen gemeinsamen Rechtsausdruck ge-

ity, because each enters into relation with the other, as with a simple owner of commodities, and they exchange equivalent for equivalent. Property, because each disposes only of what is his own. And Bentham, because each looks only to his own advantage. The only force bringing them together, and putting them into relation with each other, is the selfishness, the gain and the private interest of each. Each pays heed to himself only, and no one worries about the others. And precisely for that reason, either in accordance with the pre-established harmony of things, or under the auspices of an all-cunning providence, they all work together to their mutual advantage, for the common weal, and in the common interest.

Illusions of the sphere of circulation: Freedom, Equality, Property, Bentham (Theoretician of utilitarianism, the doctrine that the private interests of the individuals automatically combine to the general interest). More about Bentham on p. 758:1/oo.

Question 630 *Does the sphere of commodity circulation contradict the principles of freedom and equality? Are these principles violated under capitalism?*

↓ A look at the faces of capitalist and worker shows us that Bentham cannot be right.

280:2 When we leave this sphere of simple circulation or the exchange of commodities, which provides the 'free-trader vulgaris' with his views, his concepts, and the standard, by which he judges the society of capital and wage-labor, a certain change seems to take place in the physiognomy of our dramatis personae. He who was previously the money-owner now strides out in front as a capitalist; the possessor of labor-power follows as his worker. The one smirks self-importantly and is intent on business; the other is timid and holds back, like a sheep bringing his own wool to market which now has nothing else to expect but—a good fleecing.

ben. Gleichheit! Denn sie beziehen sich nur als Warenbesitzer aufeinander und tauschen Äquivalent für Äquivalent. Eigentum! Denn jeder verfügt nur über das Seine. Bentham! Denn jedem von den beiden ist es nur um sich zu tun. Die einzige Macht, die sie zusammen und in ein Verhältnis bringt, ist die ihres Eigennutzes, ihres Sondervorteils, ihrer Privatinteressen. Und eben weil so jeder nur für sich und keiner für den andren kehrt, vollbringen alle, infolge einer prästabilierten Harmonie der Dinge oder unter den Auspizien einer allpfliffigen Vorsehung, nur das Werk ihres wechselseitigen Vorteils, des Gemeinnutzens, des Gesamtinteresses.

190:1/o Beim Scheiden von dieser Sphäre der einfachen Zirkulation oder des Warenaustausches, woraus der Freihändler vulgaris Anschauungen, Begriffe und Maßstab für sein Urteil über die Gesellschaft des Kapitals und der Lohnarbeit entlehnt, verwandelt sich, so scheint es, schon in etwas die Physiognomie unsrer dramatis personae. Der ehemalige Geldbesitzer schreitet voran als Kapitalist, der Arbeitskraftbesitzer folgt ihm nach als sein Arbeiter; der eine bedeutungsvoll schmunzelnd und geschäftseifrig, der andre scheu, widerstrebsam, wie jemand, der seine eigne Haut zu Markt tragen und nun nichts andres zu erwarten hat als die—Gerberei.

I substituted the sheep metaphor
for Marx's tanning metaphor:
"like someone who has brought

his own hide to market and now
has nothing else to expect but—a
tanning." "Tanning" nowadays

means: getting a sun-tanned skin.

↑ One has to be intimately familiar with capitalist society—a familiarity which usually only comes with living in this society—in order to know, or to be able to imagine, the facial expressions of capitalist and newly-hired worker as they walk together to the workshop. Marx appeals here to the tacit knowledge of the members of capitalist society in order to call the surface appearance into question that the sale of labor-power is an equitable exchange. The distraught look of the worker betrays the premonition that selling one's own skin may not be a favorable bargain.

Term Paper Topic 634 *Essay about Chapter Nine: The Rate of Surplus Value*

Part III.

The Production of Absolute Surplus-Value

7. Labor Process and Valorization Process

Humans have the ability to change the world around them in such a way that it serves their purposes. The exercise of this miraculous power is called “labor,” a word which connotes that this is often a strenuous effort. For humans, the exercise of this ability is not only possible but also necessary, because they need the fruits of their labor in order to survive. Chapter Seven analyzes this process and its social form under capitalism.

7.1. Labor Process

As announced at the end of chapter Six, we are leaving circulation behind in order to witness the consumption of the commodity labor-power. Throughout this chapter, the money owner from the end of chapter Six, 279:2, is with us. He has bought the commodity labor-power and is about to consume it. We are observing him closely, because we have to solve the final part of the riddle how surplus-value is made. As Marx said at the end of chapter Five, 268:4/o, the solution of the riddle must lie both in circulation and not in circulation. The present chapter looks at the part *not* in circulation.

The Moore-Aveling translation reminds the reader of the presence of the capitalist in the first sentence of the chapter, which reads: “The capitalist buys labor-power in order to use it; and the utilization of labor-power is labor itself.” However the text below follows here the German 4th edition, which does not mention the capitalist in the first sentence:

283:1 The utilization of labor-power is labor itself. The buyer of labor-power consumes it by setting the seller of labor-power to work. Thereby the latter becomes in actuality what he was previously only potentially, namely a worker, labor-power in action.

↓ The purpose of the consumption of labor-power by the capitalist is not labor itself, but the representation of this labor in a commodity:

In order to represent his labor in commodities, the worker must, above all, represent it in use-values, in things which aid the sat-

192:1 Der Gebrauch der Arbeitskraft ist die Arbeit selbst. Der Käufer der Arbeitskraft konsumiert sie, indem er ihren Verkäufer arbeiten läßt. Letzterer wird hierdurch actu sich betätigende Arbeitskraft, Arbeiter, was er früher nur potentia war.

Um seine Arbeit in Waren darzustellen, muß er sie vor allem in Gebrauchswerten darstellen, Sachen, die zur Befriedigung von Be-

7. Labor Process and Valorization Process

isfaction of needs of one kind or another. Hence what the capitalist sets the worker to produce is a particular use-value, a specific article.

The capitalist is not interested in use-value of this commodity, but in its value. He hires the worker in order to produce commodities which contain value. A use-value must be produced only because the commodity’s value needs a use-value as its carrier. ↓ Nevertheless, this production of use-values must follow certain general characteristics which are independent of the social relations.

The fact that the production of use-values, or goods, is carried out under the control of a capitalist and on his behalf, does not alter the general character of that production. The labor process must therefore at first be considered independently of any specific social form.

↑ Obviously, the labor process is very much influenced by society. Why does Marx then say that its *general* nature is independent of social relations? Because besides all its social determinations, the labor process also has to contend with natural forces and natural constraints which are independent of society. Marx says more about this in 290:4/o.

7.1.a. [The General Nature of Labor, Independently of its Social Form]

[Labor as a Process Between Man and Nature]

283:2/o Labor is at first a process between man and nature, a process by which man mediates, regulates and controls his metabolism with nature through his own actions.

Marx says “at first” because much more could be said about the labor process, even at this level of generality; for instance one could say that production is necessarily a co-operative process and that almost all inputs to labor are the products of past labor. Marx begins here with a bare-bones definition, in order to work out some important defining characteristics of the labor process.

He confronts the natural materials as a force of nature. He sets in motion the natural forces that belong to his own body, his arms and legs, head and hands, in order to appropriate the natural materials in a form useful for his own life.

dürfnissen irgendeiner Art dienen. Es ist also ein besondrer Gebrauchswert, ein bestimmter Artikel, den der Kapitalist vom Arbeiter anfertigen läßt.

Die Produktion von Gebrauchswerten oder Gütern ändert ihre allgemeine Natur nicht dadurch, daß sie für den Kapitalisten und unter seiner Kontrolle vorgeht. Der Arbeitsprozeß ist daher zunächst unabhängig von jeder bestimmten gesellschaftlichen Form zu betrachten.

192:2/o Die Arbeit ist zunächst ein Prozeß zwischen Mensch und Natur, ein Prozeß, worin der Mensch seinen Stoffwechsel mit der Natur durch seine eigne Tat vermittelt, regelt und kontrolliert.

Er tritt dem Naturstoff selbst als eine Naturmacht gegenüber. Die seiner Leiblichkeit angehörigen Naturkräfte, Arme und Beine, Kopf und Hand, setzt er in Bewegung, um sich den Naturstoff in einer für sein eignes Leben brauchbaren Form anzueignen.

↑ In the labor process, humans act as a natural force on the nature around them, but from this interaction of natural forces emerges a result which does not depend on nature but on the intentions of the humans. ↓ This is why Marx says that the labor process *changes the nature* external to the worker.

While acting upon external nature and changing it, he also changes his own nature. He develops the potentialities slumbering within his nature, and subordinates the play of its powers to his command.

Indem er durch diese Bewegung auf die Natur außer ihm wirkt und sie verändert, verändert er zugleich seine eigne Natur. Er entwickelt die in ihr schlummernden Potenzen und unterwirft das Spiel ihrer Kräfte seiner eignen Botmäßigkeit.

↑ An additional effect of the labor process, often overlooked, is that in this process, humans also change their *own* nature. Labor not only creates novelty in outside nature, but also novelty in the nature of the producer.

Question 635 *Is it true that the labor process changes nature? It certainly changes natural things into other natural things, but it only uses the forces of nature to do this. Which arguments can be given to support Marx's claim that it changes nature itself?*

Question 636 *Give examples how humans change nature by labor, and how they change their own nature by labor.*

↓ Some of the characteristics of the human labor process are shared by certain activities of animals. Bees, for instance, effect a change of form in the materials of nature when they construct their honeycomb. But the human labor process has one important aspect which is not shared by animals.

We are not dealing here with those first instinctive forms of labor which remain on the animal level. An immense interval of time separates the state of things in which a man brings his labor-power to market for sale as a commodity from the situation when human labor had not yet cast off its first instinctive form. We presuppose labor in a form in which it is an exclusively human characteristic. A spider conducts operations which resemble those of the weaver, and a bee would put many a human architect to shame by the construction of its honeycomb cells.

Wir haben es hier nicht mit den ersten tierartig instinktmäßigen Formen der Arbeit zu tun. Dem Zustand, worin der Arbeiter als Verkäufer seiner eignen Arbeitskraft auf dem Warenmarkt auftritt, ist in urzeitlichen Hintergrund der Zustand entrückt, worin die menschliche Arbeit ihre erste instinktartige Form noch nicht abgestreift hatte. Wir unterstellen die Arbeit in einer Form, worin sie dem Menschen ausschließlich angehört. Eine Spinne verrichtet Operationen, die denen des Webers ähneln, und eine Biene beschämt durch den Bau ihrer Wachszellen manchen menschlichen Baumeister.

↓ After the similarities between human labor and the activities of animals, Marx brings, in a famous passage, the difference between human labor and the activities of bees and spiders.

But what distinguishes the worst architect from the best of bees is that the architect builds the cell in his mind before he constructs it in wax. At the end of every labor process, a result emerges which had already been conceived by the worker at the beginning, hence already existed notionally. Man not only effects a change of form in the materials of nature; while doing this he realizes his own purpose in the natural realm. It is a purpose he is conscious of, it determines the mode of his activity as a law, and he must subordinate his will to this purpose.

↑ In production, humans know and intend the effects of their actions. This intended effect is called here the *purpose*. Production is governed by purpose. In the *Philosophy of Right*, § 117, Hegel discusses unintentional consequences of volitional activity. In the Hegelian paradigm, humans are free to pursue their wills. If their actions have consequences which the humans could not know, i.e., which are not included in their purpose, then they are not liable for them. I.e., in Hegel's moral and legal framework, the will matters, while the actual consequences of the willful acts are secondary. In production the relationship is reversed: what matters is the actual effect, and the worker has to subordinate his or her will to the achievement of this effect. The worker has to subordinate his will to his purpose—but on the other hand he also has to *want* his purpose. ↓ The contradictory unity between will and purpose is called, in the next passage, the purposeful will.

Question 637 *What distinguishes human labor from the labor of an animal or a machine?*

Question 638 *What purpose does man realize in the labor process? Does this purpose depend on his will? Give examples where someone fulfils a purpose which does not depend on his will.*

This subordination is no mere momentary act. Apart from the exertion of his organs, a purposeful will is required for the entire duration of the labor process, which manifests itself as the worker's attention. The less the worker is swept along by the work's own content and the mode how it is carried out, the less, therefore, he enjoys it as the spontaneous play of his physical and mental powers, the closer his attention is forced to be.

Was aber von vornherein den schlechtesten Baumeister vor der besten Biene auszeichnet, ist, daß er die Zelle in seinem Kopf gebaut hat, bevor er sie in Wachs baut. Am Ende des Arbeitsprozesses kommt ein Resultat heraus, das beim Beginn desselben schon in der Vorstellung des Arbeiters, also schon ideell vorhanden war. Nicht daß er nur eine Formveränderung des Natürlichen bewirkt; er verwirklicht im Natürlichen zugleich seinen Zweck, den er weiß, der die Art und Weise seines Tuns als Gesetz bestimmt und dem er seinen Willen unterordnen muß.

Und diese Unterordnung ist kein einzelner Akt. Außer der Anstrengung der Organe, die arbeiten, ist der zweckmäßige Wille, der sich als Aufmerksamkeit äußert, für die ganze Dauer der Arbeit erheischt, und um so mehr, je weniger sie durch den eignen Inhalt und die Art und Weise ihrer Ausführung den Arbeiter mit sich fortreißt, je weniger er sie daher als Spiel seiner eignen körperlichen und geistigen Kräfte genießt.

I am inserting “spontaneous” in front of “play,” where the

translations had written “free,” but Marx’s German edition had not

used an attribute at all.

Question 639 *What distinguishes human labor from play?*

↑ This concludes Marx’s characterization of the essence of the human labor-process. Marx does not even begin to explain *how* humans manage to subordinate nature to their wills. Although we are doing it every day, we don’t know how we are doing it. ↓ All that Marx can do it enumerate general characteristics which most labor processes have in common.

284:1 The simple moments of the labor process are (1) purposeful activity, that is work itself, (2) the object on which that work is performed, and (3) the instruments of that work.

193:1 Die einfachen Momente des Arbeitsprozesses sind die zweckmäßige Tätigkeit oder die Arbeit selbst, ihr Gegenstand und ihr Mittel.

Question 640 *What does Marx understand by a “moment”? What are the simple moments of the commodity? What are the simple moments of the labor process?*

↑ Earlier, in 133:2/o, Marx had said that labor needs nature to produce its product. Now, he gives a rough classification of the natural ingredients of most labor processes.

[Object of Labor]

Marx first discusses the object of labor, then the instruments of labor, and then the conditions of the labor process (premises etc.). Among the objects of labor, Marx distinguishes between two kinds, those filtered through earlier labor, and those directly furnished by nature:

284:2/o The land (and this, economically speaking, includes water) in its original state in which it supplies man with necessities or means of subsistence ready to hand¹ is available without any effort on his part as the universal object of human labor. All those things which labor merely separates from immediate connection with their environment are objects of labor spontaneously provided by nature, such as fish caught and separated from water, their natural element, timber felled in virgin forests, and ores extracted from their veins. If, on the other hand, the object of labor has, so to speak, been filtered through previous labor, we call

193:2 Die Erde (worunter ökonomisch auch das Wasser einbegriffen), wie sie den Menschen ursprünglich mit Proviant, fertigen Lebensmitteln ausrüstet,¹ findet sich ohne sein Zutun als der allgemeine Gegenstand der menschlichen Arbeit vor. Alle Dinge, welche die Arbeit nur von ihrem unmittelbaren Zusammenhang mit dem Erdganzen loslöst, sind von Natur vorgefundene Arbeitsgegenstände. So der Fisch, der von seinem Lebensselement, dem Wasser, getrennt, gefangen wird, das Holz, das im Urwald gefällt, das Erz, das aus seiner Ader losgebrochen wird. Ist der Arbeitsgegenstand dagegen selbst schon sozusagen durch

it raw material. For example, ore already extracted and ready for washing. All raw material is an object of labor, but not every object of labor is raw material; the object of labor counts as raw material only when it has already undergone some alteration mediated by labor.

frühere Arbeit filtriert, so nennen wir ihn Rohmaterial. Z.B. das bereits losgebrochene Erz, das nun ausgewaschen wird. Alles Rohmaterial ist Arbeitsgegenstand, aber nicht jeder Arbeitsgegenstand ist Rohmaterial. Rohmaterial ist der Arbeitsgegenstand nur, sobald er bereits eine durch Arbeit vermittelte Veränderung erfahren hat.

Objects of labor “spontaneously provided by nature” (fish, timber from virgin forests) are here distinguished from “raw materials” (which are already improved, iron ore which already passed through an enrichment process). Cohen in [Coh80, p. 39] criticizes this definition of raw materials. Cohen says: “Something is raw material in a labor process if and only if it is the purpose of the process to transform it ... Its previous history, and in particular whether labor has already been spent on it, are irrelevant.” Whether or not something is relevant depends on the context. As a process between humankind and nature, the distinction between objects directly furnished by nature and objects already filtered through prior labor is relevant. For the mechanics of the individual production processes, this distinction is irrelevant.

It is remarkable that almost all means and objects of labor are already filtered by labor. This will become important in the further development of the argument, but right now Marx mentions it only through the Stuart quote in footnote 1:

¹ ‘The earth’s spontaneous productions being in small quantity, quite independent of man, appear, as it were, to be furnished by Nature, in the same way as a small sum is given to a young man, in order to put him in a way of industry and of making his fortune’ (James Stuart, *Principles of Political Economy*, Dublin, 1770, Vol. I, p. 116).

¹ „Die naturwüchsigen Erzeugnisse der Erde, die in geringen Mengen und ganz unabhängig vom Menschen vorkommen, scheinen von der Natur in der gleichen Art gegeben zu sein, wie man einem jungen Mann eine knappe Summe gibt, um ihn auf den Weg des Fleißes und des Reichwerdens zu führen.“ James Stuart, *Principles of Political Economy*, edit. Dublin 1770, v. I, p. 116.

[Means or Instruments of Labor]

The words “means of labor” and “instruments of labor” will be used here interchangeably. The first paragraph brings their definition:

285:1/o An instrument of labor is a thing, or a complex of things, which the laborer interposes between himself and the object of labor, and which serves as the conductor of his activity. He makes use of the mechanical, physical, and chemical properties of some things in order to force, according

194:1/o Das Arbeitsmittel ist ein Ding oder ein Komplex von Dingen, die der Arbeiter zwischen sich und den Arbeitsgegenstand schiebt und die ihm als Leiter seiner Tätigkeit auf diesen Gegenstand dienen. Er benutzt die mechanischen, physikalischen, chemischen Eigenschaften der Dinge, um

to his purpose, an effect on other things.²

↑ The interjection of these physical things between the laborer and the object of labor makes the paradox more clearly visible which was already addressed in the earlier formulation that humans *change nature* through the labor process: although the instruments of labor act on the objects of labor according to natural laws, the end effect is not determined by nature but follows human intentions. ↓ The footnote compares this with Hegel's "cunning of reason."

² "Reason is just as cunning as she is powerful. Her cunning consists principally in her mediating activity, which, by causing objects to act and re-act on each other in accordance with their own nature, in this way, without any direct interference in the process, carries out reason's intentions." (Hegel: "Enzyklopädie, Erster Theil, Die Logik," Berlin, 1840, p. 382.)

↓ The laborer handles the instruments of labor directly, but most of the object of labor only indirectly, through the instruments of labor.

Leaving out of consideration such ready-made means of subsistence as fruits, in gathering which a man's own limbs serve as the instruments of his labor, the thing of which the laborer possesses himself directly is not the object of labor but its instrument.

↑ This observation will be relevant for the development of machinery, in which human holding tools are replaced by mechanical frames holding very similar tools, see 494:2/o. ↓ Marx continues to say that the instruments of labor can be considered an extension of the laborer's body:

Thus Nature itself becomes one of the organs of his activity, one that he annexes to his own bodily organs, adding stature to himself in spite of the Bible.

Question 641 *Is it correct to say that nature is the ultimate producer, and man only manipulates nature for his own benefit? Compare this with the parallel statement: the worker is the ultimate producer, and the capitalist only manipulates the worker to take advantage of him.*

↓ Now a listing of the instruments of labor, again distinguishing those directly given by nature from those produced by earlier labor.

sie als Machtmittel auf andre Dinge, seinem Zweck gemäß, wirken zu lassen.²

² „Die Vernunft ist ebenso listig als mächtig. Die List besteht überhaupt in der vermittelnden Tätigkeit, welche, indem sie die Objekte ihrer eigenen Natur gemäß aufeinander einwirken und sich aneinander abarbeiten läßt, ohne sich unmittelbar in diesem Prozeß einzumischen, gleichwohl nur ihren Zweck zur Ausführung bringt.“ (Hegel, „Enzyklopädie“, Erster Teil, „Die Logik“, Berlin 1840, p. 382.)

Der Gegenstand, dessen sich der Arbeiter unmittelbar bemächtigt—abgesehen von der Ergreifung fertiger Lebensmittel, der Früchte z.B., wobei seine eignen Leibesorgane allein als Arbeitsmittel dienen—ist nicht der Arbeitsgegenstand, sondern das Arbeitsmittel.

So wird das Natürliche selbst zum Organ seiner Tätigkeit, ein Organ, das er seinen eignen Leibesorganen hinzufügt, seine natürliche Gestalt verlängernd, trotz der Bibel.

As the earth is his original larder, so too it is his original tool shed. It supplies him, for instance, with stones for throwing, grinding, pressing, cutting, etc. The earth itself is an instrument of labor, but its use as such in agriculture implies a whole series of other instruments and a comparatively high development of labor.³ No sooner does labor undergo the least development, than it requires instruments which are themselves prepared by labor.

³ In his otherwise miserable work ("Théorie de l'Écon. Polit." Paris, 1815), Ganilh enumerates in a striking manner in opposition to the "Physiocrats" the long series of previous processes necessary before agriculture properly so called can commence.

↑ Even the most primitive labor processes need specially produced means of labor. ↓ This gives the transition to a discussion of the role of instruments of labor in the evolution of human history:

Thus in the oldest caves we find stone implements and weapons. In the earliest period of human history domesticated animals, *i.e.*, animals which have been bred for the purpose, and have undergone modifications by means of labor, play the chief part as instruments of labor along with specially prepared stones, wood, bones, and shells.⁴ The use and fabrication of instruments of labor, although existing in the germ among certain species of animals, is specifically characteristic of the human labor-process, and Franklin therefore defines man as a tool-making animal.

⁴ Turgot in his "Réflexions sur la Formation et la Distribution des Richesses" (1766) brings well into prominence the importance of domesticated animals to early civilisation.

Question 642 *Is the soil into which the farmer puts his seeds an instrument of labor or the object of labor?*

Wie die Erde seine ursprüngliche Proviantkammer, ist sie sein ursprüngliche Arsenal von Arbeitsmitteln. Sie liefert ihm z.B. den Stein, womit er wirft, reibt, drückt, schneidet usw. Die Erde selbst ist ein Arbeitsmittel, setzt jedoch zu ihrem Dienst als Arbeitsmittel in der Agrikultur wieder eine ganze Reihe anderer Arbeitsmittel und eine schon relativ hohe Entwicklung der Arbeitskraft voraus.³ Sobald überhaupt der Arbeitsprozeß nur einigermaßen entwickelt ist, bedarf er bereits bearbeiteter Arbeitsmittel.

³ In der sonst elenden Schrift: „Théorie de l'Écon. Polit.“, Paris 1815, zählt Ganilh den Physiokraten gegenüber treffend die große Reihe von Arbeitsprozessen auf, welche die Voraussetzung der eigentlichen Agrikultur bilden.

In den ältesten Menschenhöhlen finden wir Steinwerkzeuge und Steinwaffen. Neben bearbeitetem Stein, Holz, Knochen und Muscheln spielt im Anfang der Menschengeschichte das gezähmte, also selbst schon durch Arbeit veränderte, gezüchtete Tier die Hauptrolle als Arbeitsmittel.⁴ Der Gebrauch und die Schöpfung von Arbeitsmitteln, obgleich im Keim schon gewissen Tierarten eigen, charakterisieren den spezifisch menschlichen Arbeitsprozeß, und Franklin definiert daher den Menschen als „a tool-making animal“, ein Werkzeug fabrizierendes Tier.

⁴ In den „Réflexions sur la Formation et la Distribution des Richesses“ (1766) entwickelt Turgot gut die Wichtigkeit des gezähmten Tiers für die Anfänge der Kultur.

⇓ The means of labor are central for the historical epoch. Not what is produced but how it is produced is distinctive.

Relics of bygone instruments of labor possess the same importance for the investigation of extinct economic forms of society, as do fossil bones for the determination of extinct species of animals. It is not the articles made, but how they are made, and by what instruments, that enables us to distinguish different economic epochs.⁵

⁵ The least important commodities of all for the technological comparison of different epochs of production are articles of luxury, in the strict meaning of the term.

Instruments of labor not only supply a standard of the degree of development to which human labor has attained, but they are also indicators of the social conditions under which that labor is carried on. Among the instruments of labor, those of a mechanical nature, which, taken as a whole, we may call the bone and muscles of production, offer much more decided characteristics of a given epoch of production, than those which, like pipes, tubs, baskets, jars, etc., serve only to hold the materials for labor, which latter class, we may in a general way, call the vascular system of production. The latter first begins to play an important part in the chemical industries.^{5a}

^{5a} However little our written histories up to this time notice the development of material production, which is the basis of all social life, and therefore of all real history, yet prehistoric times have been classified in accordance with the results, not of so-called historical, but of materialistic investigations. These periods have been divided, to correspond with the materials from

Dieselbe Wichtigkeit, welche der Bau von Knochenreliquien für die Erkenntnis der Organisation untergegangener Tiergeschlechter, haben Reliquien von Arbeitsmitteln für die Beurteilung untergegangener ökonomischer Gesellschaftsformationen. Nicht was gemacht wird, sondern wie, mit welchen Arbeitsmitteln gemacht wird, unterscheidet die ökonomischen Epochen.⁵

⁵ Von allen Waren sind eigentliche Luxuswaren die unbedeutendsten für die technologische Vergleichung verschiedener Produktionsepochen.

Die Arbeitsmittel sind nicht nur Gradmesser der Entwicklung der menschlichen Arbeitskraft, sondern auch Anzeiger der gesellschaftlichen Verhältnisse, worin gearbeitet wird. Unter den Arbeitsmitteln selbst bieten die mechanischen Arbeitsmittel, deren Gesamtheit man das Knochen und Muskelsystem der Produktion nennen kann, viel entscheidendere Charaktermerkmale einer gesellschaftlichen Produktions-epoche als solche Arbeitsmittel, die nur zu Behältern des Arbeitsgegenstandes dienen und deren Gesamtheit ganz allgemein als das Gefäßsystem der Produktion bezeichnet werden kann, wie z.B. Röhren, Fässer, Körbe, Krüge usw. Erst in der chemischen Fabrikation spielen sie eine bedeutungsvolle Rolle.^{5a}

^{5a} Note zur 2. Ausg. So wenig die bisherige Geschichtsschreibung die Entwicklung der materiellen Produktion, also die Grundlage alles gesellschaftlichen Lebens und daher aller wirklichen Geschichte kennt, hat man wenigstens die vorhistorische Zeit auf Grundlage naturwissenschaftlicher, nicht sog. historischer Forschungen nach dem Material der Werkzeuge und Waffen in

which their implements and weapons were made, viz., into the stone, the bronze, and the iron ages.

Steinalter, Bronzealter und Eisenalter abgeteilt.

[Means of Labor Defined More Broadly]

⇓ In *Results*, Marx calls them “conditions of labor.”

286:1/o In a wider sense we may include among the instruments of labor, in addition to those things that are used for directly transferring labor to its object, and which therefore, in one way or another, serve as conductors of the activity, all such objects as are necessary for carrying on the labor-process. These do not enter directly into the process, but without them it is either impossible for it to take place at all, or possible only to a partial extent. Once more we find the earth to be a universal instrument of this sort, for it furnishes a locus standi to the laborer and a field of employment for his activity. Among instruments that are the result of previous labor and also belong to this class, we find workshops, canals, roads, and so forth.

195:1 Im weitren Sinn zählt der Arbeitsprozeß unter seine Mittel außer den Dingen, welche die Wirkung der Arbeit auf ihren Gegenstand vermitteln und daher in einer oder der andren Weise als Leiter der Tätigkeit dienen, alle gegenständlichen Bedingungen, die überhaupt erheischt sind, damit der Prozeß stattfindet. Sie geht nicht direkt in ihn ein, aber er kann ohne sie gar nicht oder nur unvollkommen vorgehn. Das allgemeine Arbeitsmittel dieser Art ist wieder die Erde selbst, denn sie gibt dem Arbeiter den locus standi und seinem Prozeß den Wirkungsraum (field of employment). Durch die Arbeit schon vermittelte Arbeitsmittel dieser Art sind z.B. Arbeitsgebäude, Kanäle, Straßen usw.

↑ These are the “premises” which Cohen [Coh80] lists separately.

This concludes the discussion of the material ingredients entering the labor process. Why does Marx go into all this detail? He does not claim to be able to explain how the miraculous effects of the labor process come about. It is general knowledge that people can change nature through their work, that people need the fruits of their labor in order to survive, and historical experience shows that each labor-process roughly has the above ingredients: labor itself, the object of labor, the instruments of labor, and the broader conditions of labor. In capitalism, control over these different ingredients of the labor process falls to different classes: labor itself is controlled by the working class, the produced instruments and object of labor by the capitalist class, and those instruments and objects furnished by nature by the land-owning class.

Question 643 *Where are the telephone, clocks, measuring systems and norms, etc. in this classification?*

7.1.b. [The Product]

↓ After this review of the ingredients of the labor process, Marx looks now at the product emerging from it:

[The Product as Objectification of the Labor Process]

287:1 In the labor-process, therefore, human activity, through the instruments of labor, effects an alteration in the material worked upon which was intended from the outset. The process extinguishes itself in the product.

↑ “The process extinguishes itself in the product” is a Hegelian formulation, see [Heg69b, p. 435] and elsewhere. It means first of all that the process stops after the product is made. The product is not the excrement of a process which keeps going for reasons other than the product, but the process only continues if more product is needed. Furthermore it means that the desired effect of the product, for consumption or for further stages of production, only depends on the physical makeup of the product itself, not on the labor process.

The product is a use-value, a natural material adapted to human needs by a change of form. Labor has become bound up in its object: labor has been objectified, the object processed by labor.

↑ The end product is the combination of materials and labor in which both are still recognizable. Typically, the materials are easily recognizable; they only changed their shape. ↓ But the labor is still recognizable as well: a thread reveals spinning labor, etc.

That which in the laborer appeared as movement, now appears in the product as a fixed quality without motion. The blacksmith forges and the product is a forging.

Since the product is the objectification of the labor process, it makes sense to look at everything that was said so far about the labor process also from the point of view of the product.

↓ After his earlier classification of the material ingredients needed by labor to produce its product, Marx takes now the product as given and looks back at the labor process which produced it:

287:2 If one views the whole process from the point of view of its result, the product, then both the instruments and the object

195:2 Im Arbeitsprozeß bewirkt also die Tätigkeit des Menschen durch das Arbeitsmittel eine von vornherein bezweckte Veränderung des Arbeitsgegenstandes. Der Prozeß erlischt im Produkt.

Sein Produkt ist ein Gebrauchswert, ein durch Formveränderung menschlichen Bedürfnissen angeeigneter Naturstoff. Die Arbeit hat sich mit ihrem Gegenstand verbunden. Sie ist vergegenständlicht, und der Gegenstand ist verarbeitet.

Was auf seiten des Arbeiters in der Form der Unruhe erschien, erscheint nun als ruhende Eigenschaft, in der Form des Seins, auf seiten des Produkts. Er hat gesponnen, und das Produkt ist ein Gespinnst.

196:1 Betrachtet man den ganzen Prozeß vom Standpunkt seines Resultats, des Produkts, so erscheinen beide, Arbeitsmittel

of labor appear as means of production,⁶ and the labor itself as productive labor.⁷

↑ The difference between instruments and object of labor is only relevant in their relation to labor; in relation to the end product they are both means of production. ↓ The example in footnote 6 illustrates that this look backward at the labor process from its product is an unintuitive point of view, since we are used to looking at the labor process from the point of view of the laborer, not from that of the product:

⁶ It seems paradoxical to assert that uncaught fish, for instance, are a means of production in the fishing industry. But hitherto no one has discovered the art of catching fish in waters that contain none.

↑ Cohen [Coh80, p. 40] criticizes footnote 6: “Marx’s quip is misjudged. Not every necessary condition of a productive activity qualifies as a means of producing what that activity produces.” Cohen considers fishing not as a process of transforming living fish in the waters into edible fish in freezer pouches, but as the new creation of edible fish, one condition for which happens to be the prior existence of living fish in the water.

Note that Marx uses different words for the same real entity according to the context under which it is regarded: regarded as part of the labor process it is an object of labor, it is the thing on which the labor process operates, but regarded as a part of the production process it is a means of production. A similar double terminology will also be used for the value composition/organic composition of capital, and others.

↓ Footnote 7 announces that the concept of “productive labor” will have a different meaning when capitalist production is considered.

⁷ This method of determining, from the standpoint of the labor-process alone, what is productive labor, is by no means directly applicable to the case of the capitalist process of production.

↑ This remark will be the starting point for a further discussion of productive labor in chapter Sixteen, 287:2.

und Arbeitsgegenstand, als Produktionsmittel⁶ und die Arbeit selbst als produktive Arbeit⁷.

⁶ Es scheint paradox, z.B. den Fisch, der noch nicht gefangen ist, ein Produktionsmittel für den Fischfang zu nennen. Bisher ist aber noch nicht die Kunst erfunden, Fische in Gewässern zu fangen, in denen sie sich nicht vorfinden.

⁷ Diese Bestimmung produktiver Arbeit, wie sie sich vom Standpunkt des einfachen Arbeitsprozesses ergibt, reicht keineswegs hin für den kapitalistischen Produktionsprozeß.

Question 645 *Is there labor which does not produce a product?*

[Products as Inputs into Production Processes]

↓ Products not only come out of labor process but also enter them.

287:3 Though a use-value, in the form of a product, issues from the labor-process, yet other use-values, products of previous labor, enter into it as means of production. The same-use-value is both the product of a previous process, and a means of production in

196:2 Wenn ein Gebrauchswert als Produkt aus dem Arbeitsprozeß herauskommt, gehn andre Gebrauchswerte, Produkte früherer Arbeitsprozesse, als Produktionsmittel in ihn ein. Derselbe Gebrauchswert, der das Produkt dieser, bildet das Produktionsmittel

a later process. Products are therefore not only results, but also conditions of labor.

↓ It is not only possible but the rule, with very few exceptions, that the means of production of a production process are already the products of a previous production process. Marx first shows this with respect to the object of labor:

287:4/o With the exception of the extractive industries, in which the material for labor is provided immediately by Nature, such as mining, hunting, fishing, and agriculture (so far as the latter is confined to breaking up virgin soil), all branches of industry manipulate raw material, objects already filtered through labor, already products of labor. Such is seed in agriculture. Animals and plants, which we are accustomed to consider as products of nature, are in their present form, not only products of, say last year's labor, but the result of a gradual transformation, continued through many generations, under man's superintendence, and by means of his labor.

↑ This passage re-introduces the term "raw material," first defined in 284:2/o, for an object of labor which is itself the product of an earlier labor process. With some objects of labor (farm animals) it is not obvious that they are already the product of earlier production processes. ↓ But regarding the instruments of labor, it is usually very obvious that they are the products of earlier production processes:

But in the great majority of cases, instruments of labor show, even to the most superficial observer, traces of the labor of past ages.

↑ This recursivity of the production process is an important aspect of the production process: it turns it into an inherently social process. Even labor itself needs skills which are developed and transmitted over many generations.

[For the Labor Process, it is Irrelevant Whether a Material Input is a Products]

The next four paragraphs say more about raw materials, i.e., about products entering the labor process.

↓ (1) According to the double role of *nature* in the labor process, which acts on the one

jener Arbeit. Produkte sind daher nicht nur Resultat, sondern zugleich Bedingung des Arbeitsprozesses.

196:3 Mit Ausnahme der extraktiven Industrie, die ihren Arbeitsgegenstand von Natur vorfindet, wie Bergbau, Jagd, Fischfang usw. (der Ackerbau nur, soweit er in erster Instanz die jungfräuliche Erde selbst aufbricht), behandeln alle Industriezweige einen Gegenstand, der Rohmaterial, d.h. bereits durch die Arbeit filtrierter Arbeitsgegenstand, selbst schon Arbeitsprodukt ist. So z.B. der Samen in der Agrikultur. Tiere und Pflanzen, die man als Naturprodukte zu betrachten pflegt, sind nicht nur Produkte vielleicht der Arbeit vom vorigen Jahr, sondern, in ihren jetzigen Formen, Produkte einer durch viele Generationen unter menschlicher Kontrolle, vermittelt menschlicher Arbeit, fortgesetzten Umwandlung.

Was aber die Arbeitsmittel insbesondere betrifft, so zeigt ihre ungeheure Mehrzahl dem oberflächlichsten Blick die Spur vergangener Arbeit.

hand as the object of labor and on the other as the instrument of labor, there are two kinds of raw material—principal substance and accessory.

288:1 Raw material may either form the principal substance of a product, or it may only enter into its formation as an accessory. An accessory may be consumed by the instruments of labor, as coal under a boiler, oil by a wheel, hay by draft-horses, or it may be mixed with the raw material in order to produce some modification thereof, as chlorine into unbleached linen, coal with iron, dye-stuff with wool, or again, it may help to carry on the work itself, as in the case of the materials used for heating and lighting workshops. The distinction between principal substance and accessory vanishes in the true chemical industries, where none of the raw material re-appears, in its original composition, as the substance of the product.⁸

⁸ Storch calls the raw materials properly speaking "matières," and accessory material "matériaux." Cherbuliez describes accessories as "matières instrumentales."

Question 646 *What is the difference between raw materials properly speaking and accessories?*

↓ (2) Since the same use-value can be used in many different ways, the same product can be means of production in different production processes. It often even enters its own production.

288:2 Every object possesses various properties, and is thus capable of being applied to different uses. One and the same product may therefore serve as raw material in very different labor processes. Corn, for example, is a raw material for millers, starch-manufacturers, distillers, and cattle-breeders. It also enters as raw material into its own production in the shape of seed. Coal, too, is at the same time the product of, and a means of production in, coal-mining.

196:4 Das Rohmaterial kann die Hauptsubstanz eines Produkts bilden oder nur als Hilfsstoff in seine Bildung eingehn. Der Hilfsstoff wird vom Arbeitsmittel konsumiert, wie Kohle von der Dampfmaschine, Öl vom Rade, Heu vom Zugpferd, oder dem Rohmaterial zugesetzt, um darin eine stoffliche Veränderung zu bewirken, wie Chlor zur ungebleichten Leinwand, Kohle zum Eisen, Farbe zur Wolle, oder er unterstützt die Verrichtung der Arbeit selbst, wie z.B. zur Beleuchtung und Heizung des Arbeitslokals verwandte Stoffe. Der Unterschied zwischen Hauptstoff und Hilfsstoff verschimmt in der eigentlich chemischen Fabrikation, weil keines der angewandten Rohmaterialien als die Substanz des Produkts wieder erscheint.⁸

⁸ Storch unterscheidet das eigentliche Rohmaterial als „matière“ von den Hilfsstoffen als „matériaux“; Cherbuliez bezeichnet die Hilfsstoffe als „matières instrumentales“.

197:1 Da jedes Ding vielerlei Eigenschaften besitzt und daher verschiedner Nutzen besitz und daher verschiedner Anwendung fähig ist, kann dasselbe Produkt das Rohmaterial sehr verschiedner Arbeitsprozesse bilden. Korn z.B. ist Rohmaterial für Müller, Stärkefabrikant, Destillateur, Viehzüchter usw. Es wird Rohmaterial seiner eignen Produktion als Samen. So geht die Kohle als Produkt aus der Minenindustrie hervor und als Produktionsmittel in sie ein.

(3) It is also possible that the same product enters one process as raw material and a different process, or even the same process, as instrument of labor:

288:3 Again, a particular product may be used in one and the same process, both as an instrument of labor and as raw material. Take, for instance, the fattening of cattle, where the animal is the raw material, and at the same time an instrument for the production of manure.

(4) In a few cases, products ready for consumption can also be raw materials in the production of other products. But most raw materials cannot be used for final consumption or as means of labor.

288:4/o A product, though ready for immediate consumption, may yet serve as raw material for a further product, as grapes when they become the raw material for wine. On the other hand, labor may give us its product in such a form, that we can use it only as raw material, as is the case with cotton, thread, and yarn. Such a raw material, though itself a product, may have to go through a whole series of different processes: in each of these in turn, it serves, with constantly varying form, as raw material, until the last process of the series leaves it a perfect product, ready for individual consumption, or for use as an instrument of labor.

197:2 Dasselbe Produkt mag in demselben Arbeitsprozeß als Arbeitsmittel und Rohmaterial dienen. Bei der Viehmast z.B., wo das Vieh, das bearbeitete Rohmaterial, zugleich Mittel der Düngerbereitung ist.

197:3 Ein Produkt, das in einer für die Konsumtion fertigen Form existiert, kann von neuem zum Rohmaterial eines andren Produkts werden, wie die Traube zum Rohmaterial des Weins. Oder die Arbeit entläßt ihr Produkt in Formen, worin es nur wieder als Rohmaterial brauchbar ist. Rohmaterial in diesem Zustand heißt Halbfabrikat und hieße besser Stufenfabrikat, wie z.B. Baumwolle, Faden, Garn usw. Obgleich selbst schon Produkt, mag das ursprüngliche Rohmaterial eine ganze Staffel verschiedner Prozesse zu durchlaufen haben, worin es in stets veränderter Gestalt stets von neuem als Rohmaterial funktioniert bis zum letzten Arbeitsprozeß, der es als fertiges Lebensmittel oder fertiges Arbeitsmittel von sich abstößt.

Question 647 Does it depend on the use-value of a product if it is used as instrument of labor or as object of labor, or for final consumption?

Question 648 Give examples for each of the following situations:

- (a) a use-value is object of labor in its own production process,
- (b) a use-value is both instrument of labor and object of labor in the same production process
- (c) a finished product ready for individual consumption is the object of labor in the production of a different product.

289:1 Hence we see, that whether a use-value is to be regarded as raw material, as in-

197:4 Man sieht: Ob ein Gebrauchswert als Rohmaterial, Arbeitsmittel oder Produkt

strument of labor, or as product, this is determined entirely by its function in the labor-process, by the position it there occupies: as this position varies, so do these determinations.

Conclusion: A product entering a labor process acts in this process as object or instrument of labor, not as a product. (If it reminds us of its character as a product, then only through its imperfections). This legitimizes Marx's order of presentation, which discussed the labor process first without paying much attention to the fact that instruments and object of labor are already products.

289:2 Whenever therefore a product enters as a means of production into a new labor-process, it thereby loses its character of product, and becomes a mere factor in the process. A spinner treats spindles only as implements for spinning, and flax only as the material that he spins. Of course it is impossible to spin without material and spindles; and therefore the existence of these things as products, at the commencement of the spinning operation, must be presumed: but in the process itself, the fact that they are products of previous labor, is a matter of utter indifference; just as in the digestive process, it is of no importance whatever, that bread is the produce of the previous labor of the farmer, the miller, and the baker.

↑ It is the product itself, not the past labor process producing the product, which matters for the consumption of the product, whether it be final consumption or productive consumption. ↓ Only the flaws in the product remind of the producer.

On the contrary, it is generally by their imperfections as products, that the means of production in any process assert themselves in their character of products. A blunt knife or weak thread forcibly remind us of Mr. A, the cutler, or Mr. B, the spinner. In the finished product, the labor by means of which it has acquired its useful qualities is extinguished.

erscheint, hängt ganz und gar ab von seiner bestimmten Funktion im Arbeitsprozeß, von der Stelle, die er in ihm einnimmt, und mit dem Wechsel dieser Stelle wechseln jene Bestimmungen.

197:5 Durch ihren Eintritt als Produktionsmittel in neue Arbeitsprozesse verlieren Produkte daher den Charakter des Produkts. Sie funktionieren nur noch als gegenständliche Faktoren der lebendigen Arbeit. Der Spinner behandelt die Spindel nur als Mittel, womit, den Flachs nur als Gegenstand, den er spinnt. Allerdings kann man nicht spinnen ohne Spinnmaterial und Spindel. Das Vorhandensein dieser Produkte ist daher vorausgesetzt beim Beginn des Spinnens. In diesem Prozeß selbst aber ist es ebenso gleichgültig, daß Flachs und Spindel Produkte vergangner Arbeit sind, wie es im Akt der Ernährung gleichgültig ist, daß Brot das Produkt der vergangenen Arbeiten von Bauer, Müller, Bäcker usw.

Umgekehrt. Machen Produktionsmittel im Arbeitsprozeß ihren Charakter als Produkte vergangner Arbeit geltend, so durch ihre Mängel. Ein Messer, das nicht schneidet, Garn, das beständig zerreißt usw., erinnern lebhaft an Messerschmied A und Garnwischer E. Im gelungenen Produkt ist die Vermittlung seiner Gebrauchseigenschaften durch vergangne Arbeit ausgelöscht.

Question 649 Explain Marx's sentence: "Whenever a product enters as a means of production into a new labor-process, it thereby loses its character of product, and becomes a

mere factor in the process."

[Productive Consumption]

It is common understanding that the labor process produces its products and consumes its inputs. However this consumption is also a preservation. Many use-values are such that they would spoil if they did not enter a production process. Productive consumption vs. individual consumption.

289:3/o A machine which does not serve the purposes of labor, is useless. In addition, it falls prey to the destructive influence of natural forces. Iron rusts and wood rots. Yarn with which we neither weave nor knit, is cotton wasted. Living labor must seize upon these things and rouse them from their death-sleep, change them from mere possible use-values into actual and effective ones. Bathed in the fire of labor, appropriated as part and parcel of labor's organism, and, as it were, made alive for the performance of their functions in the process, they are consumed but consumed with a purpose, as constitutive elements of new use-values, of new products, ever ready as means of subsistence for individual consumption, or as means of production for some new labor-process.

290:1 If then, on the one hand, finished products are not only results, but also necessary conditions, of the labor-process, on the other hand, their assumption into that process, their contact with living labor, is the sole means by which they can be made to retain their character of use-values, and be utilised.

Here it becomes apparent how right Marx was when he wrote, in 126:1, that objects realize their use-values in consumption. Without this consumption these use-values would vanish.

290:2 Labor uses up its material factors, its object and its instruments, consumes them, and is therefore a process of consumption. Such productive consumption is distinguished from individual consumption

198:1 Eine Maschine, die nicht im Arbeitsprozeß dient, ist nutzlos. Außerdem verfällt sie der zerstörenden Gewalt des natürlichen Stoffwechsels. Das Eisen verrostet, das Holz verfault. Garn, das nicht verwebt oder verstrickt wird, ist verdorbene Baumwolle. Die lebendige Arbeit muß diese Dinge ergreifen, sie von den Toten erwecken, sie aus nur möglichen in wirkliche und wirkende Gebrauchswerte verwandeln. Vom Feuer der Arbeit beleckt, als Leiber derselben angeeignet, zu ihren begriffs- und berufsmäßigen Funktionen im Prozeß begeistert, werden sie zwar auch verzehrt, aber zweckvoll, als Bildungselemente neuer Gebrauchswerte, neuer Produkte, die fähig sind, als Lebensmittel in die individuelle Konsumtion oder als Produktionsmittel in neuen Arbeitsprozeß einzugehen.

198:2 Wenn also vorhandne Produkte nicht nur Resultate, sondern auch Existenzbedingungen des Arbeitsprozesses sind, ist andererseits ihr Hineinwerfen in ihn, also ihr Kontakt mit lebendiger Arbeit, das einzige Mittel, um diese Produkte vergangner Arbeit als Gebrauchswerte zu erhalten und zu verwirklichen.

198:3 Die Arbeit verbraucht ihre stofflichen Elemente, ihren Gegenstand und ihr Mittel, verspeist dieselben und ist also Konsumtionsprozeß. Diese produktive Konsumtion unterscheidet sich dadurch von der in-

tion by this, that the latter uses up products, as means of subsistence for the living individual; the former, as means whereby alone, labor, the labor-power of the living individual, is enabled to act. The product, therefore, of individual consumption, is the consumer himself; the result of productive consumption, is a product distinct from the consumer.

[Summary]

Bringing everything together one arrives at a characterization of the labor process as a process which uses products to produce products.

290:3 In so far then, as its instruments and objects are themselves products, labor consumes products in order to create products, or in other words, consumes one set of products by turning them into means of production for another set.

↑ This characterization of the labor process is quite different from, one might even say the opposite of, its initial characterization given in 283:2/o, that it is a process between humans and nature in which humans mediate their metabolism with nature through their own conscious actions. ↓ Echoes of this initial characterization can be found (1) in history, since originally, the objective factors of the labor process were given by nature, and (2) even today in the extractive industries, in which the object of labor is still given by nature.

But, just as in the beginning, the only participators in the labor-process were man and the earth, which latter exists independently of man, so even now we still employ in the process many means of production, provided directly by Nature, that do not represent any combination of natural substances with human labor.

dividuellen Konsumtion, daß letztere die Produkte als Lebensmittel des lebendigen Individuums, erstere sie als Lebensmittel der Arbeit, seiner sich betätigenden Arbeitskraft, verzehrt. Das Produkt der individuellen Konsumtion ist daher der Konsument selbst, das Resultat der produktiven Konsumtion ein vom Konsumenten unterschiedenes Produkt.

198:4 Sofern ihr Mittel und ihr Gegenstand selbst schon Produkte sind, verzehrt die Arbeit Produkte, um Produkte zu schaffen, oder vernutzt Produkte als Produktionsmittel von Produkten.

Wie der Arbeitsprozeß aber ursprünglich nur zwischen dem Menschen und der ohne sein Zutun vorhandenen Erde vorgeht, dienen in ihm immer noch auch solche Produktionsmittel, die von Natur vorhanden, keine Verbindung von Naturstoff und menschlicher Arbeit darstellen.

7.1.c. [The Capitalist's Role in the Production of Use-Values]

290:4/o The labor-process, resolved as above into its simple elementary factors, is human action with a view to the production of use-values, appropriation of natural substances to human requirements; it is the

198:5/o Der Arbeitsprozeß, wie wir ihn in seinen einfachen und abstrakten Momenten dargestellt haben, ist zweckmäßige Tätigkeit zur Herstellung von Gebrauchswerten, Aneignung des Natürlichen für menschli-

necessary condition for effecting exchange of matter between man and Nature; it is the everlasting Nature-imposed condition of human existence, and therefore is independent of every social phase of that existence, or rather, is common to every such phase.

Labor is always necessary, regardless of the social relations. The general structure of the labor process, as just described, does not depend on society.

It was, therefore, not necessary to represent our laborer in connexion with other laborers; man and his labor on one side, Nature and its materials on the other, sufficed. As the taste of the porridge does not tell you who grew the oats, no more does this simple process tell you of itself what are the social conditions under which it is taking place, whether under the slave-owner's brutal lash, or the anxious eye of the capitalist, whether Cincinnatus carries it on in tilling his modest farm or a savage in killing wild animals with stones.⁹

⁹ By a wonderful feat of logical acumen, Colonel Torrens has discovered, in this stone of the savage the origin of capital. "In the first stone which he [the savage] flings at the wild animal he pursues, in the first stick that he seizes to strike down the fruit which hangs above his reach, we see the appropriation of one article for the purpose of aiding in the acquisition of another, and thus discover the origin of capital." (R. Torrens: "An Essay on the Production of Wealth," etc., pp. 70–71.)

↓ Marx comments on Torrens by adding another explanation which is just as absurd. This joke uses the fact that the German word for "stick" is "stock," therefore it has to be formulated differently in English than in German:

^{9 ctd} Since the German word for "stick" is "stock," this "first stick" would undoubtedly also explain why "stock" is synonymous with "capital."

This whole paragraph concludes the discussion that started with 283:1, but it is also sets the stage for a new turn. Right after emphasizing that the social order is irrelevant for the basic determinations of the production process, Marx discusses the role of the capitalist in it.

che Bedürfnisse, allgemeine Bedingung des Stoffwechsels zwischen Mensch und Natur, ewige Naturbedingung des menschlichen Lebens und daher unabhängig von jeder Form dieses Lebens, vielmehr allen seinen Gesellschaftsformen gleich gemeinsam.

Wir hatten daher nicht nötig, den Arbeiter im Verhältnis zu andren Arbeitern darzustellen. Der Mensch und seine Arbeit auf der einen, die Natur und ihre Stoffe auf der andren Seite genügten. So wenig man dem Weizen anschmeckt, wer ihn gebaut hat, so wenig sieht man diesem Prozeß an, unter welchen Bedingungen er vorgeht, ob unter der brutalen Peitsche des Sklavenaufsehers oder unter dem ängstlichen Auge des Kapitalisten, ob Cincinnatus ihn verrichtet in der Bestellung seiner paar jugera oder der Wilde, der mit einem Stein eine Bestie erlegt.⁹

⁹ Aus diesem höchst logischen Grund entdeckt wohl Oberst Torrens in dem Stein des Wilden—den Ursprung des Kapitals. „In dem ersten Stein, den der Wilde auf die Bestie wirft, die er verfolgt, in dem ersten Stock, den er ergreift, um die Frucht niederzuziehen, die er nicht mit den Händen fassen kann, sehn wir die Aneignung eines Artikels zum Zweck der Erwerbung eines andren und entdecken so—den Ursprung des Kapitals.“ (R. Torrens, „An Essay on the Production of Wealth etc.“, p. 70, 71.)

^{9 ctd} Aus jenem ersten Stock ist wahrscheinlich auch zu erklären, warum stock im Englischen synonym mit Kapital ist.

We are not yet in the section about the creation of value, therefore Marx is not yet discussing the capitalist's function as the representative of the creation of surplus-value, but right now he is looking at the capitalist's function as the director of the production of use-values.

The first task of the capitalist concerning the use-value of the labor process is to buy the right kind of labor-power and means of production.

291:1 Let us now return to our would-be capitalist. We left him just after he had purchased, in the open market, all the necessary factors of the labor-process—its objective factors, the means of production, as well as its subjective factor, labor-power. With the cunning eye of an expert, he has selected the means of production and the kind of labor-power best adapted to his particular trade, be it spinning, bootmaking, or any other kind.

↑ This was described in 279:2. The word "cunning" is a reference to Hegel's "cunning of reason," see footnote 2 to paragraph 285:1/o. ↓ The capitalist is "cunning" because he uses the general nature of the labor-process for his own goals:

He then proceeds to consume the commodity, the labor-power that he has just bought, by causing the laborer, the impersonation of that labor-power, to consume the means of production by his labor. The general character of the labor-process is evidently not changed by the fact, that the laborer works for the capitalist instead of for himself.

↑ The fact that this production process is a capitalistic production process does not alter the *general* nature of the labor process. ↓ At first, the entry of the capitalist into the production process also does *not yet* change its *specific* mode, since the early capitalists simply took the labor as it had evolved from the previous modes of production.

But also the particular methods and operations employed in bootmaking or spinning are not immediately changed by the intervention of the capitalist. He must begin by taking the labor-power as he finds it in the market, and consequently be satisfied with labor of such a kind as would be found in the period immediately preceding the rise of capitalists.

199:1 Kehren wir zu unsrem Kapitalisten in spe zurück. Wir verließen ihn, nachdem er auf dem Warenmarkt alle zu einem Arbeitsprozeß notwendigen Faktoren gekauft hatte, die gegenständlichen Faktoren oder die Produktionsmittel, den persönlichen Faktor oder die Arbeitskraft. Er hat mit schlauem Kennerblick die für sein besonderes Geschäft, Spinnerei, Stiefelfabrikation usw., passenden Produktionsmittel und Arbeitskräfte ausgewählt.

Unser Kapitalist setzt sich also daran, die von ihm gekaufte Ware, die Arbeitskraft, zu konsumieren, d.h., er läßt den Träger der Arbeitskraft, den Arbeiter, die Produktionsmittel durch seine Arbeit konsumieren. Die allgemeine Natur des Arbeitsprozesses ändert sich natürlich nicht dadurch, daß der Arbeiter ihn für den Kapitalisten, statt für sich selbst verrichtet.

Aber auch die bestimmte Art und Weise, wie man Stiefel macht oder Garn spinnt, kann sich zunächst nicht ändern durch die Dazwischenkunft des Kapitalisten. Er muß die Arbeitskraft zunächst nehmen, wie er sie auf dem Markt vorfindet, also auch ihre Arbeit, wie sie in einer Periode entsprang, wo es noch keine Kapitalisten gab.

We are discussion at this point how the capitalist is taking advantage of the general nature of the labor-process. ↓ The question how this capitalist framework acts back on the labor-process and changes its specific nature can only be discussed after we know what this framework is.

Changes in the methods of production by the subordination of labor to capital, can take place only at a later period, and therefore will have to be treated of in a later chapter.

↓ Even without a change in the labor process itself, the capitalist framework has the following two implications:

291:2 The labor-process, turned into the process by which the capitalist consumes labor-power, exhibits two characteristic phenomena.

↓ Not the laborer, but the capitalist has command and control over the labor process. (We are so familiar with this that it is no longer easy for us to appreciate how absurd and contradictory this situation is.)

291:3 First, the laborer works under the control of the capitalist to whom his labor belongs; the capitalist taking good care that the work is done in a proper manner, and that the means of production are used with intelligence, so that there is no unnecessary waste of raw material, and no wear and tear of the implements beyond what is necessarily caused by the work.

↓ From the point of view of the capitalist, the labor process is the consumption of the commodity labor-power which he bought.

292 Secondly, the product is the property of the capitalist and not that of the laborer, its immediate producer. Suppose that a capitalist pays for a day's labor-power at its value; then the right to use that power for a day belongs to him, just as much as the right to use any other commodity, such as a horse that he has hired for the day. To the purchaser of a commodity belongs its use, and the seller of labor-power, by giving his labor, does no more, in reality, than part with the use-value that he has sold. From

Die Verwandlung der Produktionsweise selbst durch die Unterordnung der Arbeit unter das Kapital kann sich erst später ereignen und ist daher erst später zu betrachten.

199:2 Der Arbeitsprozeß, wie er als Konsumtionsprozeß der Arbeitskraft durch den Kapitalisten vorgeht, zeigt nun zwei eigentümliche Phänomene.

199:3/o Der Arbeiter arbeitet unter der Kontrolle des Kapitalisten, dem seine Arbeit gehört. Der Kapitalist paßt auf, daß die Arbeit ordentlich vonstatten geht und die Produktionsmittel zweckmäßig verwandt werden, also kein Rohmaterial vergeudet und das Arbeitsinstrument geschont, d.h. nur so weit zerstört wird, als sein Gebrauch in der Arbeit ernötigt.

200:1 Zweitens aber: Das Produkt ist Eigentum des Kapitalisten, nicht des unmittelbaren Produzenten, des Arbeiters. Der Kapitalist zahlt z.B. den Tageswert der Arbeitskraft. Ihr Gebrauch, wie der jeder andren Ware, z.B. eines Pferdes, das er für einen Tag gemietet, gehört ihm also für den Tag. Dem Käufer der Ware gehört der Gebrauch der Ware, und der Besitzer der Arbeitskraft gibt in der Tat nur den von ihm verkauften Gebrauchswert, indem er seine Arbeit gibt. Von dem Augenblicke, wo er in die Werk-

the instant he steps into the workshop, the use-value of his labor-power, and therefore also its use, which is labor, belongs to the capitalist.

↓ The capitalist also owns the means of production:

By the purchase of labor-power, the capitalist incorporates labor, as a living ferment, with the lifeless constituents of the product, which belong to him as well. From his point of view, the labor-process is nothing more than the consumption of the commodity purchased, *i.e.*, of labor-power; but this consumption cannot be effected except by supplying the labor-power with the means of production. The labor-process is a process between things that the capitalist has purchased, things that have become his property. The product of this process belongs, therefore, to him, just as much as does the wine which is the product of a process of fermentation completed in his cellar.¹⁰

↓ Therefore the product belongs to the capitalist as well.

¹⁰ "Products are appropriated before they are converted into capital; this conversion does not secure them from such appropriation." (Cherbuliez: "Richesse ou Pauvreté," edit. Paris, 1841, p. 54.) "The Proletarian, by selling his labor for a definite quantity of the necessities of life, renounces all claim to a share in the product. The mode of appropriation of the products remains the same as before; it is in no way altered by the bargain we have mentioned. The product belongs exclusively to the capitalist, who supplied the raw material and the necessities of life; and this is a rigorous consequence of the law of appropriation, a law whose fundamental principle was the very opposite, namely, that every laborer has an exclusive right to the ownership of what he produces." (I. c., p. 58.) "When the laborers receive wages for their labor . . . the capitalist is then the owner not of the capital only" (he means the means of production) "but of the labor also. If what is paid as wages is included, as it com-

stätte des Kapitalisten trat, gehörte der Gebrauchswert seiner Arbeitskraft, also ihr Gebrauch, die Arbeit, dem Kapitalisten.

Der Kapitalist hat durch den Kauf der Arbeitskraft die Arbeit selbst als lebendigen Gärungsstoff den toten ihm gleichfalls gehörigen Bildungselementen des Produkts einverleibt. Von seinem Standpunkt ist der Arbeitsprozeß nur die Konsumtion der von ihm gekauften Ware Arbeitskraft, die er jedoch nur konsumieren kann, indem er ihr Produktionsmittel zusetzt. Der Arbeitsprozeß ist ein Prozeß zwischen Dingen, die der Kapitalist gekauft hat, zwischen ihm gehörigen Dingen. Das Produkt dieses Prozesses gehört ihm daher ganz ebensosehr als das Produkt des Gärungsprozesses in seinem Weinkeller.¹⁰

¹⁰ „Die Produkte sind appropriiert, bevor sie in Kapital verwandelt werden; diese Verwandlung entzieht sie nicht jener Appropriation.“ (Cherbuliez, „Richesse ou Pauvreté“, édit. Paris 1841, p. 54.) „Indem der Proletarier seine Arbeit gegen ein bestimmtes Quantum Lebensmittel (approvisionnement) verkauft, verzichtet er vollständig auf jeden Anteil am Produkt. Die Appropriation der Produkte bleibt dieselbe wie vorher; sie ist in keiner Weise durch die erwähnte Konvention verändert. Das Produkt gehört ausschließlich dem Kapitalisten, der die Rohstoffe und das Approvisionnement geliefert hat. Es ist dies eine strenge Konsequenz des Gesetzes der Appropriation, dessen Fundamentalprinzip umgekehrt das ausschließliche Eigentumsrecht jedes Arbeiters an seinem Produkte war.“ (ibid., p. 58.) James Mill, „Elements of Pol. Econ. etc.“, p. 70, 71: „Wenn die Arbeiter für Arbeitslohn arbeiten, ist der Kapitalist Eigentümer nicht nur des Kapitals“ (meint hier die Produktionsmittel), „sondern

monly is, in the term capital, it is absurd to talk of labor separately from capital. The word capital as thus employed includes labor and capital both.” (James Mill: “Elements of Pol. Econ.,” etc., Ed. 1821, pp. 70, 71.)

To recapitulate these two points:

(1) The laborer works under the control of the capitalist (as opposed to working only under the necessities imposed by the labor process itself, or else as opposed to a free commodity producer)

(2) The product belongs to the capitalist, because he owns all the ingredients going into production.

7.2. Valorization Process

Marx begins his discussion of the valorization process not with the laborer engaged in the labor process, but with the capitalist—and not with the actions of the capitalist, but with his intentions what to do with the product he owns. He intends to earn a profit from the sale of the product. This intention puts the value aspect of the production process into the foreground.

293:1 The product appropriated by the capitalist is a use-value, such as yarn, for example, or boots. But, although boots are, in one sense, the basis of all social progress, and our capitalist is a decided “progressist,” yet he does not manufacture boots for their own sake. Use-value is, by no means, the thing “which one loves for its own sake” in the production of commodities.

Although the product of the labor-process is a use-value, the purpose of the capitalist is not the use-value but the social relations attached to this use-value. (This is like going to the store and buying something not for the sake of the thing itself but for the packaging in which this thing comes.)

Use-values are only produced by capitalists, because, and in so far as, they are the material substratum, the carriers of exchange-value. Our capitalist has two objects in view: in the first place, he wants to produce a use-value that has a value in exchange, that is to say, an article destined to be sold, a commodity; and secondly, he de-

auch der Arbeit (of the labour also). Wenn man das, was für Arbeitslohn gezahlt wird, wie dies gebräuchlich, in den Begriff Kapital einschließt, ist es abgeschmackt, von der Arbeit getrennt vom Kapital zu sprechen. Das Wort Kapital in diesem Sinn schließt beides ein, Kapital und Arbeit.“

200:2/o Das Produkt—das Eigentum des Kapitalisten—ist ein Gebrauchswert, Garn, Stiefel usw. Aber obgleich Stiefel z.B. gewissermaßen die Basis des gesellschaftlichen Fortschritts bilden und unser Kapitalist ein entschiedener Fortschrittsmann ist, fabriziert er die Stiefel nicht ihrer selbst wegen.

Der Gebrauchswert ist überhaupt nicht das Ding qu’on aime pour lui-même in der Warenproduktion. Gebrauchswerte werden hier überhaupt nur produziert, weil und sofern sie materielles Substrat, Träger des Tauscherts sind. Und unsrem Kapitalisten handelt es sich um zweierlei. Erstens will er einen Gebrauchswert produzieren, der

sires to produce a commodity whose value shall be greater than the sum of the values of the commodities used in its production, that is, of the means of production and the labor-power, that he purchased with his good money in the open market. His aim is to produce not only a use-value, but a commodity also; not only use-value, but value; not only value, but at the same time surplus-value.

einen Tauschwert hat, einen zum Verkauf bestimmten Artikel, eine Ware. Und zweitens will er eine Ware produzieren, deren Wert höher als die Wertsumme der zu ihrer Produktion erheischten Waren, der Produktionsmittel und der Arbeitskraft, für die er sein gutes Geld auf dem Warenmarkt vorschöß. Er will nicht nur einen Gebrauchswert produzieren, sondern eine Ware, nicht nur Gebrauchswert, sondern Wert, und nicht nur Wert, sondern auch Mehrwert.

↑ It is the goal of the capitalist to make surplus-value. This is not only his goal but also his expectation, and we will see later on in this chapter that the capitalist becomes very angry if this expectation is not met. What is the basis for this so strongly held expectation?

Two different kinds of mechanisms are at work. In order to create surplus-value, the capitalist must first of all create value—and this is achieved by the simple fact that he produces commodities. Marx first says a word about this. Then Marx asks: what, in addition to selling commodities, must the capitalist do in order to gain surplus-value?

7.2.a. [Creation of Value]

As to the creation of value, this goal of the capitalist is satisfied simply because capitalist production is commodity production:

293:2 And indeed, since we are dealing with the production of commodities here, we obviously have only considered one aspect of the process so far. Just as commodities are at the same time use-values and values, so the process of producing them must be a labor-process, and at the same time, a process of creating value.^{10a}

201:1 In der Tat, da es sich hier um Warenproduktion handelt, haben wir bisher offenbar nur eine Seite des Prozesses betrachtet. Wie die Ware selbst Einheit von Gebrauchswert und Wert, muß ihr Produktionsprozeß Einheit von Arbeitsprozeß und Wertbildungsprozeß sein.

Marx already argued in chapter One that the labor producing commodities has a double character, i.e., that the immaterial value substance is produced during the production process along with the use-value of the commodity. Now he looks at the implications of this general social fact under the present situation where the production process is a capitalist production process.

^{10a} As has been stated in a previous note, the English language has two different expressions for these two different aspects of labor: in the Simple Labor-process, the process of producing Use-Values, it is *Work*; in the process of creation

[No footnote in the German edition]

of Value, it is *Labor*, taking the term in its strictly economic sense.—F. E.

Question 651 *How does the double character of labor discussed in chapter One, section 1.2, differ from the double character of the production process discussed in chapter Seven?*

293:3 Let us now examine production as a creation of value.

Since this two-edged character of the labor-process has already been discussed in chapter One, section 1.2, Marx emphasizes only those aspects which are especially relevant for the question at hand. The things he says here about the value transfer of the means of production will be elaborated on more systematically in the next chapter.

293:4a We know that the value of each commodity is determined by the amount of labor materialised in it, by the working time necessary, under given social conditions, for its production. This rule also holds good for the product that accrued to our capitalist, as the result of the labor-process carried on for him. Our first step is to calculate the quantity of labor objectified in it.

He looks at the process quantitatively only, and he looks in detail at the role of the means of production.

293:4b Let us assume this product is 10 lbs. of yarn.

The labor-time in the product consists of two parts: the labor materialized in the means of production, and the new labor. First Marx looks at the labor materialized in the means of production.

293:5/o For spinning the yarn, raw material is required; suppose in this case 10 lbs. of cotton. There is no need to investigate the value of this cotton, for our capitalist has, we will assume, bought it at its full value, say of \$2.40. In this price the labor required for the production of the cotton is already expressed in terms of the average labor of society. We will further assume that the wear and tear of the spindle, which, for our present purpose, may represent all other instruments of labor employed, amounts to the value of 48 cents. If, then, twenty-four hours' labor, or two working-days, are re-

201:2 Betrachten wir den Produktionsprozeß nun auch als Wertbildungsprozeß.

201:3 Wir wissen, daß der Wert jeder Ware bestimmt ist durch das Quantum der in ihrem Gebrauchswert materialisierten Arbeit, durch die zu ihrer Produktion gesellschaftlich notwendige Arbeitszeit. Dies gilt auch für das Produkt, das sich unsrem Kapitalisten als Resultat des Arbeitsprozesses ergab. Es ist also zunächst die in diesem Produkt vergegenständlichte Arbeit zu berechnen.

201:4 Es sei z.B. Garn.

201:5 Zur Herstellung des Garns war zuerst sein Rohmaterial nötig, z.B. 10 Pfund Baumwolle. Was der Wert der Baumwolle, ist nicht erst zu untersuchen, denn der Kapitalist hat sie auf dem Markt zu ihrem Wert, z.B. zu 10 sh. gekauft. In dem Preise der Baumwolle ist die zu ihrer Produktion erheischte Arbeit schon als allgemein gesellschaftliche Arbeit dargestellt. Wir wollen ferner annehmen, daß die in der Verarbeitung der Baumwolle verzehrte Spindelmasse, die uns alle andren aufgewandten Arbeitsmittel repräsentiert, einen Wert von 2 sh. besitzt. Ist eine Goldmasse von 12

quired to produce the quantity of gold represented by \$2.88, we have here, to begin with, two days' labor already incorporated in the yarn.

↑ These two labor-days only represent the value transferred by the spinning labor from the instruments and materials, not yet the value newly created by the spinning labor. ↓ Next Marx justifies why the value of the materials is indeed transferred in the production process. Compare also the discussion of this issue in the next chapter, from p. 314:1/o onward.

(1) His first argument does not yet give a concrete explanation, but it addresses an objection. One should not be disturbed that value goes from one use-value to the other, because in the exchange, value also migrates from one use-value to another.

294:1 We must not let ourselves be misled by the circumstance that the cotton has taken a new shape while the substance of the spindle has to a certain extent been used up.

↑ If value is intrinsic in the commodity, the question arises: how can the value of the spindle be preserved if the spindle itself is used up? ↓ Marx argues that spinning is not an activity which destroys the value of the things it uses:

By the general law of value, if the value of 40 lbs. of yarn = the value of 40 lbs. of cotton + the value of a whole spindle, *i.e.*, if the same working time is required to produce the commodities on either side of this equation, then 10 lbs. of yarn are an equivalent for 10 lbs. of cotton, together with one-fourth of a spindle. In the case we are considering the same working time is materialised in the 10 lbs. of yarn on the one hand, and in the 10 lbs. of cotton and the fraction of a spindle on the other. Therefore it makes no difference to the value whether it appears in cotton, in a spindle, or in yarn. If spindle and cotton, instead of resting quietly side by side, join together in the spinning process, which alters their forms and turns them into yarn, their value is no more affected by this than it would be if they had been simply exchanged for their equivalent in yarn.

↓ (2) After having clarified that value can take different use-value forms, the value transfer from the means of production to the end product can be argued by comparison with one

sh. das Produkt von 24 Arbeitsstunden oder zwei Arbeitstagen, so folgt zunächst, daß im Garn zwei Arbeitstage vergegenständlicht sind.

202:1 Der Umstand, daß die Baumwolle ihre Form verändert hat und die aufgezehrte Spindelmasse ganz verschwunden ist, darf nicht beirren.

Nach dem allgemeinen Wertgesetz sind z.B. 10 Pfund Garn ein Äquivalent für 10 Pfund Baumwolle und 1/4 Spindel, wenn der Wert von 40 Pfund Garn = dem Wert von 40 Pfund Baumwolle + dem Wert einer ganzen Spindel, d.h., wenn dieselbe Arbeitszeit erfordert ist, um beide Seiten dieser Gleichung zu produzieren. In diesem Fall stellt sich dieselbe Arbeitszeit das eine Mal in dem Gebrauchswert Garn, das andre Mal in den Gebrauchswerten Baumwolle und Spindel dar. Der Wert ist also gleichgültig dagegen, ob er in Garn, Spindel oder Baumwolle erscheint. Daß Spindel und Baumwolle, statt ruhig nebeneinander zu liegen, im Spinnprozeß eine Verbindung eingehn, welche ihre Gebrauchsformen verändert, sie in Garn verwandelt, berührt ihren Wert ebensowenig, als wenn sie durch einfachen Austausch gegen ein Äquivalent von Garn umgesetzt worden wären.

“vertically integrated” production process in which some kinds of labor are spent first and different kinds of labor afterwards:

294:2 The labor required for the production of the cotton, the raw material of the yarn, is part of the labor necessary to produce the yarn, and is therefore contained in the yarn. The same applies to the labor embodied in the spindle, without whose wear and tear the cotton could not be spun.¹¹

¹¹ Not only the labor applied immediately to commodities affects their value, but the labor also which is bestowed on the implements, tools, and buildings, with which such labor is assisted.

Question 652 *In chapter Seven, Marx gives two different explanations why the value of the means of production is transferred in the production process. Briefly summarize these two explanations. Which one is the right explanation?*

↓ Now Marx is ready to explain how the value of the means of production is transferred in the production process: production of means of production can just be considered an earlier phase of the same production process.

294:3/o Hence, in determining the value of the yarn, or the labor-time required for its production, all the special processes carried on at various times and in different places, which were necessary, first to produce the cotton and the wasted portion of the spindle, and then with the cotton and spindle to spin the yarn, may together be looked on as different and successive phases of one and the same process. The whole of the labor in the yarn is past labor; and it is a matter of no importance that the operations necessary for the production of its constituent elements were carried on at times which, referred to the present, are more remote than the final operation of spinning. If a definite quantity of labor, say thirty days, is requisite

202:2 Die zur Produktion der Baumwolle erheischte Arbeitszeit ist Teil der zur Produktion des Garns, dessen Rohmaterial sie bildet, erheischten Arbeitszeit und deshalb im Garn enthalten. Ebenso verhält es sich mit der Arbeitszeit, die zur Produktion der Spindelmasse erheischt ist, ohne deren Verschleiß oder Konsum die Baumwolle nicht versponnen werden kann.¹¹

¹¹ „Nicht nur die auf Waren unmittelbar angewandte Arbeit beeinflusst ihren Wert, sondern auch die Arbeit, die auf Geräte, Werkzeuge und Gebäude verwendet worden ist, welche die unmittelbar verausgabte Arbeit unterstützen.“ (Ricardo, l.c. p. 16.)

202:3/o Soweit also der Wert des Garns, die zu seiner Herstellung erheischte Arbeitszeit, in Betrachtung kommt, können die verschiedenen besondern, der Zeit und dem Raum nach getrennten Arbeitsprozesse, die durchlaufen werden müssen, um die Baumwolle selbst und die vernutzte Spindelmasse zu produzieren, endlich aus Baumwolle und Spindel Garn zu machen, als verschiedene aufeinander folgende Phasen eines und desselben Arbeitsprozesses betrachtet werden. Alle im Garn enthaltne Arbeit ist vergangne Arbeit. Daß die zur Produktion seiner Bildungselemente erheischte Arbeitszeit früher vergangen ist, im Plusquamperfektum steht, dagegen die zum Schlußprozeß, dem Spinnen, unmittelbar verwandte Arbeit

to build a house, the total amount of labor incorporated in it is not altered by the fact that the work of the last day is done twenty-nine days later than that of the first. Therefore the labor contained in the raw material and the instruments of labor can be treated just as if it were labor expended in an earlier stage of the spinning process, before the labor of actual spinning commenced.

↓ The value transfer is therefore justified.

295:1 The values of the means of production, i.e., the cotton and the spindle, which values are expressed in the price of \$4.88, are therefore constituent parts of the value of the yarn, or, in other words, of the value of the product.

So far it sounds as if the production of value was automatic. Since the yarn is a commodity bought on the market, it has already passed the test of the market, therefore its value is socially recognized. Does this mean the capitalist cannot do anything wrong? Marx gives now two conditions for this value transfer, which the capitalist must watch over: (1) product must be a use-value, and (2) production must be such that it uses no more than the socially necessary labor-time, i.e., no waste of materials etc.

295:2 Two conditions must nevertheless be fulfilled. First, the cotton and spindle must concur in the production of a use-value; they must in the present case become yarn. Value is independent of the particular use-value by which it is borne, but it must be embodied in a use-value of some kind. Secondly, the time occupied in the labor of production must not exceed the time really necessary under the given social conditions of the case. Therefore, if no more than 1 lb. of cotton be requisite to spin 11 lbs. of yarn, care must be taken that no more than this weight of cotton is consumed in the produc-

dem Präsens näher, im Perfektum steht, ist ein durchaus gleichgültiger Umstand. Ist eine bestimmte Masse Arbeit, z.B. von 30 Arbeitstagen, zum Bau eines Hauses nötig, so ändert es nichts am Gesamtquantum der dem Hause einverleibten Arbeitszeit, daß der 30. Arbeitstag 29 Tage später in die Produktion einging als der erste Arbeitstag. Und so kann die im Arbeitsmaterial und Arbeitsmittel enthaltne Arbeitszeit ganz so betrachtet werden, als wäre sie nur in einem früheren Stadium des Spinnprozesses verausgabt worden, vor der zuletzt unter der Form des Spinnens zugesetzten Arbeit.

203:1 Die Werte der Produktionsmittel, der Baumwolle und der Spindel, ausgedrückt in dem Preise von 12 sh., bilden also Bestandteile des Garnwerts oder des Werts des Produkts.

203:2 Nur sind zwei Bedingungen zu erfüllen. Einmal müssen Baumwolle und Spindel wirklich zur Produktion eines Gebrauchswerts gedient haben. Es muß in unsrem Fall Garn aus ihnen geworden sein. Welcher Gebrauchswert ihn trägt, ist dem Wert gleichgültig, aber ein Gebrauchswert muß ihn tragen. Zweitens ist vorausgesetzt, daß nur die unter den gegebenen gesellschaftlichen Produktionsbedingungen notwendige Arbeitszeit verwandt wurde. Wäre also nur 1 Pfund Baumwolle nötig, um 1 Pfund Garn zu spinnen, so darf nur 1 Pfund Baumwolle verzehrt sein in der Bildung von 1 Pfund

tion of 11 lbs. of yarn; and similarly with regard to the spindle. Though the capitalist have a hobby, and use a gold instead of a steel spindle, yet the only labor that counts for anything in the value of the yarn is that which would be required to produce a steel spindle, because no more is necessary under the given social conditions.

We know now how much value was transferred to the yarn from spindles and cotton. Now Marx discusses the value newly added by spinning labor.

295:3 We now know what portion of the value of the yarn is owing to the cotton and the spindle. It amounts to \$4.88 or the materialization of two days of labor. The next point for our consideration is, what portion of the value of the yarn is added to the cotton by the labor of the spinner.

The Moore-Aveling translation has "value of two days' work;" which is an unfortunate formulation since

labor has no value. The above translation adopted Fowkes's "materialization of two days of

labor."

Labor must now be considered under a different angle than in the labor process.

295:4/o We have now to consider this labor under a very different aspect from that which it had during the labor-process.

First Marx briefly recaps the labor process, in a passage very similar to 132:2. There, we viewed it solely as that particular kind of human activity which changes cotton into yarn; there, the more the labor was suited to the work, the better the yarn, other circumstances remaining the same. The labor of the spinner was then viewed as specifically different from other kinds of productive labor, different on the one hand in its special aim, viz., spinning, different, on the other hand, in the special character of its operations, in the special nature of its means of production and in the special use-value of its product. For the operation of spinning, cotton and spindles are a necessity, but for

Garn. Ebenso verhält es sich mit der Spindel. Hat der Kapitalist die Phantasie, goldne statt eiserner Spindeln anzuwenden, so zählt im Garnwert dennoch nur die gesellschaftlich notwendige Arbeit, d.h. die zur Produktion eiserner Spindeln notwendige Arbeitszeit.

203:3 Wir wissen jetzt, welchen Teil des Garnwerts die Produktionsmittel, Baumwolle und Spindel, bilden. Er ist gleich 12 sh. oder die Materiatur von zwei Arbeitstagen. Es handelt sich also nun um den Wertteil, welchen die Arbeit des Spinners selbst der Baumwolle zusetzt.

203:4/o Wir haben diese Arbeit jetzt von einem ganz andren Gesichtspunkte zu betrachten, als während des Arbeitsprozesses.

Dort handelte es sich um die zweckmäßige Tätigkeit, Baumwolle in Garn zu verwandeln. Je zweckmäßiger die Arbeit, desto besser das Garn, alle andren Umstände als gleichbleibend vorausgesetzt. Die Arbeit des Spinners war spezifisch verschieden von andren produktiven Arbeiten, und die Verschiedenheit offenbarte sich subjektiv und objektiv, im besondern Zweck des Spinnens, seiner besondern Operationsweise, der besondern Natur seiner Produktionsmittel, dem besondern Gebrauchswert seines Produkts. Baumwolle und Spindel dienen als Lebensmittel der Spinnarbeit, aber

making rifled cannon they would be of no use whatever.

Although this last sentence seems a blatant truism, it is no longer true now that we are concerned with value-creating labor:

Here, on the contrary, where we consider the labor of the spinner only so far as it is value-creating, *i.e.*, a source of value, his labor differs in no respect from the labor of the man who bores cannon, or (what here more nearly concerns us), from the labor of the cotton-planter and spindle-maker incorporated in the means of production.

↓ Due to this homogeneity of labor, the different labors performed during the various stages of production of the finished product can be added together in order to form the value of this product.

It is solely by reason of this identity, that cotton planting, spindle making and spinning, are capable of forming the component parts differing only quantitatively from each other, of one whole, namely, the value of the yarn. Here, we have nothing more to do with the quality, the nature and the specific character of the labor, but merely with its quantity.

In real life, this quantity would be a weighted sum. But for simplicity, Marx assumes here that all labor is simple labor, therefore a simple addition is sufficient.

This quantity is to be counted as that of simple labor. We assume that spinning is simple, unskilled labor, the average labor of the given society. Hereafter we shall see that the contrary assumption would not change the matter at hand.

↑↑ To recapitulate: Labor process: quality counts, qualitatively different from other labors. Process of valorization: qualitatively identical with other labors, only quantity counts. The properties of the process of the creation of value are therefore exactly the opposite of those of the labor process.

Differences between labor process and valorization process regarding their quantitative measure.

↓ Only labor-time counts:

296:1 While the laborer is at work, his labor constantly undergoes a transforma-

man kann mit ihnen keine gezogenen Kanonen machen.

man kann mit ihnen keine gezogenen Kanonen machen.

Sofern die Arbeit des Spinners dagegen wertbildend ist, d.h. Wertquelle, ist sie durchaus nicht verschieden von der Arbeit des Kanonenbohrers, oder, was uns hier näher liegt, von den in den Produktionsmitteln des Garns verwirklichten Arbeiten des Baumwollpflanzers und des Spindelmachers.

Nur wegen dieser Identität können Baumwollpflanzen, Spindelmachen und Spinnen bloß quantitativ verschiedene Teile desselben Gesamtwerts, des Garnwerts, bilden. Es handelt sich hier nicht mehr um die Qualität, die Beschaffenheit und den Inhalt der Arbeit, sondern nur noch um ihre Quantität.

Diese ist einfach zu zählen. Wir nehmen an, daß die Spinnarbeit einfache Arbeit, gesellschaftliche Durchschnittsarbeit ist. Man wird später sehn, daß die gegenteilige Annahme nichts an der Sache ändert.

204:1 Während des Arbeitsprozesses setzt sich die Arbeit beständig aus der Form der

tion: from being motion, it becomes an object without motion; from being the laborer working, it becomes the thing produced. At the end of one hour's spinning, that act is represented by a definite quantity of yarn; in other words, a definite quantity of labor, namely that of one hour, has become embodied in the cotton.

Two things always happen: (1) Yarn is produced, and (2) labor-power is used up. If the yarn is a commodity, then also a third thing happens: (3) the labor-power used up in the production of the yarn is congealed in the yarn and forms its value.

We say labor, *i.e.*, the expenditure of his vital force by the spinner, and not spinning labor, because the special work of spinning counts here only so far as it is the expenditure of labor-power in general, and not in so far as it is the specific work of spinning.

↑ This "congelation" is not a physical but a social process. ↓ Its elusive social character is brought home by the fact that not the actual labor-time but the socially necessary labor-time counts in this congelation.

296:2 In the process we are now considering it is of extreme importance, that no more time be consumed in the work of transforming the cotton into yarn than is necessary under the given social conditions. If under normal, *i.e.*, average social conditions of production, a pounds of cotton ought to be made into b pounds of yarn by one hour's labor, then a day's labor does not count as 12 hours' labor unless 12 a pounds of cotton have been made into 12 b pounds of yarn; for in the creation of value, the time that is socially necessary alone counts.

↓ Also means of labor and product appear now in a different light, in which their properties are turned into their opposites. Means of labor are absorbers of labor, and the product is only a measure for the absorbed labor.

296:3/o Not only the labor, but also the raw material and the product now appear in quite a new light, very different from that in which we viewed them in the labor-process

Unruhe in die des Seins, aus der Form der Bewegung in die der Gegenständlichkeit um. Am Ende einer Stunde ist die Spinnbewegung in einem gewissen Quantum Garn dargestellt, also ein bestimmtes Quantum Arbeit, eine Arbeitsstunde, in der Baumwolle vergegenständlicht.

Wir sagen Arbeitsstunde, d.h. die Verausgabung der Lebenskraft des Spinners während einer Stunde, denn die Spinnarbeit gilt hier nur, soweit sie Verausgabung von Arbeitskraft, nicht soweit sie die spezifische Arbeit des Spinnens ist.

204:2 Es ist nun entscheidend wichtig, daß während der Dauer des Prozesses, d.h. der Verwandlung von Baumwolle in Garn, nur die gesellschaftlich notwendige Arbeitszeit verzehrt wird. Müssen unter normalen, d.h. durchschnittlichen gesellschaftlichen Produktionsbedingungen, a Pfund Baumwolle während einer Arbeitsstunde in b Pfund Garn verwandelt sein, so gilt nur der Arbeitstag als Arbeitstag von 12 Stunden, der $12 \times a$ Pfund Baumwolle in $12 \times b$ Pfund Garn verwandelt. Denn nur die gesellschaftlich notwendige Arbeitszeit zählt als wertbildend.

204:3 Wie die Arbeit selbst, so erscheint hier auch Rohmaterial und Produkt in einem ganz andren Licht als vom Standpunkt des eigentlichen Arbeitsprozesses. Das Roh-

pure and simple. The raw material serves now merely as an absorbent of a definite quantity of labor. By this absorption it is in fact changed into yarn, because it is spun, because labor-power in the form of spinning is added to it; but the product, the yarn, is now nothing more than a measure of the labor absorbed by the cotton. If in one hour $1 \frac{2}{3}$ lbs. of cotton can be spun into $1 \frac{2}{3}$ lbs. of yarn, then 10 lbs. of yarn indicate the absorption of 6 hours' labor. Definite quantities of product, these quantities being determined by experience, now represent nothing but definite quantities of labor, definite masses of crystallised labor-time. They are nothing more than the materialisation of so many hours or so many days of social labor.

↓ The specific character of the product is irrelevant, and it is also irrelevant that the means of labor may already be products.

297:1 We are here no more concerned about the facts, that the labor is the specific work of spinning, that its object is cotton and its product yarn, than we are about the fact that the object itself is already a product and therefore raw material. If the spinner, instead of spinning, were working in a coal mine, the object of his labor, the coal, would be supplied by Nature; nevertheless, a definite quantity of extracted coal, a hundredweight for example, would represent a definite quantity of absorbed labor.

While concrete labors are very different from each other, and they need special attention because of all the unforeseen circumstances, the abstract value-creating labor is homogeneous. Whether the product is linen or coal, both represent abstract human labor.

material gilt hier nur als Aufsauger eines bestimmten Quantums Arbeit. Durch diese Aufsaugung verwandelt es sich in der Tat in Garn, weil die Arbeitskraft in der Form der Spinnerei verausgabte und ihm zugesetzt wurde. Aber das Produkt, das Garn, ist jetzt nur noch Gradmesser der von der Baumwolle eingesaugten Arbeit. Wird in einer Stunde $1 \frac{2}{3}$ Pfund Baumwolle versponnen oder in $1 \frac{2}{3}$ Pfund Garn verwandelt, so zeigen 10 Pfund Garn 6 eingesaugte Arbeitsstunden an. Bestimmte und erfahrungsmäßig festgestellte Quanta Produkt stellen jetzt nichts dar als bestimmte Quanta Arbeit, bestimmte Masse festgeronnener Arbeitszeit. Sie sind nur noch Materiatue von einer Stunde, zwei Stunden, einem Tag gesellschaftlicher Arbeit.

204:4 Daß die Arbeit grade Spinnarbeit, ihr Material Baumwolle und ihr Produkt Garn, wird hier ebenso gleichgültig, als daß der Arbeitsgegenstand selbst schon Produkt, also Rohmaterial ist. Wäre der Arbeiter, statt in der Spinnerei, in der Kohlengrube beschäftigt, so wäre der Arbeitsgegenstand, die Kohle, von Natur vorhanden. Dennoch stellte ein bestimmtes Quantum aus dem Bett losgebrochener Kohle, z.B. ein Zentner, ein bestimmtes Quantum aufgesaugter Arbeit dar.

7.2.b. [Creation of Surplus-Value]

After having discussed how value is created and how its quantity is measured, Marx looks now at the creation of surplus-value. For this he must compare the value created with the capitalist's costs. In his initial attempt, Marx considers the value product of 6 hours of labor,

because the wages given to the laborer represent 6 labor hours. This assumption is fair to the worker—why should he or she work more than 6 hours if the pay is only an equivalent of 6 hours? However it turns out that the capitalist is not satisfied with this assumption, because no surplus-value is created. Let us follow this argument step by step:

297:2 We assumed, on the occasion of its sale, that the value of a day's labor-power is 72 cents, and that six hours' labor is incorporated in that sum; and consequently that this amount of labor is requisite to produce the necessities of life daily required on an average by the laborer. If now our spinner by working for one hour, can convert 1 2/3 lbs. of cotton into 1 2/3 lbs. of yarn,¹² it follows that in six hours he will convert 10 lbs. of cotton into 10 lbs. of yarn. Hence, during the spinning process, the cotton absorbs six hours' labor. The same quantity of labor is also embodied in a piece of gold of the value of 72 cents. Consequently by the mere labor of spinning, a value of 72 cents is added to the cotton.

¹² These figures are quite arbitrary.

↑ Although the figures are arbitrary, the assumption which Marx makes here is very natural, as natural as the other assumptions made: namely, that the worker's wage represents an equivalent of the value he or she produces. ↓ In this situation, the transition from the labor process to the valorization process consists again, as before, in a simple re-interpretation of the same actual process; the value of the product equals the sum of the capitalists' outlays.

297:3 Let us now consider the total value of the product, the 10 lbs. of yarn. Two and a half days' labor has been embodied in it, of which two days were contained in the cotton and in the substance of the spindle worn away, and half a day was absorbed during the process of spinning. This two and a half days' labor is also represented by a piece of gold of the value of \$3.60. Hence, \$3.60 is an adequate price for the 10 lbs. of yarn, or the price of one pound is 36 cents.

↓ But this result does not meet the capitalist's expectations.

297:4/o Our capitalist stares in astonishment. The value of the product is exactly

205:1 Beim Verkauf der Arbeitskraft ward unterstellt, daß ihr Tageswert = 3 sh., und in den letzten 6 Arbeitsstunden verkörpert sind, dies Arbeitsquantum also erheischt ist, um die Durchschnittssumme der täglichen Lebensmittel des Arbeiters zu produzieren. Verwandelt unser Spinner nun während einer Arbeitsstunde 1 2/3 Pfund Baumwolle in 1 2/3 Pfund Garn,¹² so in 6 Stunden 10 Pfund Baumwolle in 10 Pfund Garn. Während der Dauer des Spinnprozesses saugt die Baumwolle also 6 Arbeitsstunden ein. Dieselbe Arbeitszeit stellt sich in einem Goldquantum von 3 sh. dar. Der Baumwolle wird also durch das Spinnen selbst ein Wert von 3 sh. zugesetzt.

¹² Die Zahlen hier sind ganz willkürlich.

205:2 Sehn wir uns nun den Gesamtwert des Produkts, der 10 Pfund Garn, an. In ihnen sind 2 1/2 Arbeitstage vergegenständlicht, 2 Tage enthalten in Baumwolle und Spindelmasse, 1/2 Tag Arbeit eingesaugt während des Spinnprozesses. Dieselbe Arbeitszeit stellt sich in einer Goldmasse von 15 sh. dar. Der dem Wert der 10 Pfund Garn adäquate Preis beträgt also 15 sh., der Preis eines Pfundes Garn 1 sh. 6 d.

205:3 Unser Kapitalist stutzt. Der Wert des Produkts ist gleich dem Wert des vor-

equal to the value of the capital advanced. The value so advanced has not expanded, no surplus-value has been created, and consequently money has not been converted into capital. The price of the yarn is fifteen shillings, and fifteen shillings were spent in the open market upon the constituent elements of the product, or, what amounts to the same thing, upon the factors of the labor-process; ten shillings were paid for the cotton, two shillings for the substance of the spindle worn away, and three shillings for the labor-power. The swollen value of the yarn is of no avail, for it is merely the sum of the values formerly existing in the cotton, the spindle, and the labor-power: out of such a simple addition of existing values, no surplus-value can possibly arise.¹³ These separate values are now all concentrated in one thing; but so they were also in the sum of fifteen shillings, before it was split up into three parts, by the purchase of the commodities.

↓ The capitalist's business is just as sterile as the physiocrats had argued manufacturing to be:

¹³ This is the fundamental proposition on which is based the doctrine of the Physiocrats as to the unproductiveness of all labor that is not agriculture: it is irrefutable for the orthodox economist. "Cette façon d'imputer à une seule chose la valeur de plusieurs autres" (par exemple au lin la consommation du tisserand), "d'appliquer, pour ainsi dire, couche sur couche, plusieurs valcurs sur une seule, fait que celle-ci grossit d'autant ... Le terme d'addition peint très-bien la manière dont se forme le prix des ouvrages de main d'oeuvre; ce prix n'est qu'un total de plusieurs valeurs consommées et additionnées ensemble; or, additionner n'est pas multiplier." ("Mercier de la Rivière," l.c., p. 599.)

↓ Why is the capitalist surprised at what seems to be a perfectly logical result?

geschossenen Kapitals. Der vorgeschossene Wert hat sich nicht verwertet, keinen Mehrwert erzeugt, Geld sich also nicht in Kapital verwandelt. Der Preis der 10 Pfund Garn ist 15 sh., und 15 sh. wurden verausgabt auf dem Warenmarkt für die Bildungselemente des Produkts oder, was dasselbe, die Faktoren des Arbeitsprozesses: 10 sh. für Baumwolle, 2 sh. für die verzehrte Spindelmasse und 3 sh. für Arbeitskraft. Der aufgeschwollene Wert des Garns hilft nichts, denn sein Wert ist nur die Summe der früher auf Baumwolle, Spindel und Arbeitskraft verteilten Werte, und aus einer solchen bloßen Addition vorhandener Werte kann nie und nimmermehr ein Mehrwert entspringen.¹³ Diese Werte sind jetzt alle auf ein Ding konzentriert, aber so waren sie in der Geldsumme von 15 sh., bevor diese sich durch drei Warenkäufe zersplitterte.

¹³ Dies ist der Fundamentalsatz, worauf die Lehre der Physiokraten von der Unproduktivität aller nicht agrikolen Arbeit beruht, und er ist unumstößlich für den Ökonomen—von Fach. „Diese Art, einem einzigen Gegenstand den Wert mehrerer anderer zuzurechnen“ (z.B. dem Flachs den Lebensunterhalt des Leinwebers), „also sozusagen verschiedene Werte schichtweise auf einen einzigen aufzuhäufen, bewirkt, daß dieser in gleichem Umfang anwächst ... Der Ausdruck Addition bezeichnet sehr gut die Art, wie der Preis der handwerklichen Erzeugnisse gebildet wird; dieser Preis ist nur die Gesamtsumme mehrerer verbrauchter und zusammengezählter Werte; addieren jedoch bedeutet nicht multiplizieren.“ (Mercier de la Rivière, l.c. p. 599.)

298:1 There is nothing strange in this result taken by itself. The value of one pound of yarn being 36 cents, if our capitalist buys 10 lbs. of yarn in the market, he must pay \$3.60 for them. It is clear that, whether a man buys his house ready built, or gets it built for him, in neither case will the mode of acquisition increase the amount of money laid out on the house.

↓ The capitalist, who knows from experience that he makes profits, gropes for arguments that would explain why he should be making these profits:

298:2/oo Our capitalist, who is at home in his vulgar economy, exclaims: “*Oh! but I advanced my money for the express purpose of making more money.*”

↑ If the capitalist says that it was his intention to make surplus-value, ↓ he will get a double answer: first of all, intent alone does not make things happen, and secondly, many capitalists also have the intention of making money *without* producing (two examples are given in footnote 14).

The way to Hell is paved with good intentions, and he might just as easily have intended to make money, without producing at all.¹⁴

¹⁴ Thus from 1844–47 he withdrew part of his capital from productive employment, in order to throw it away in railway speculations; and so also, during the American Civil War, he closed his factory, and turned his work-people into the streets, in order to gamble on the Liverpool cotton exchange.

He threatens all sorts of things. He won’t be caught napping again. In future he will buy the commodities in the market, instead of manufacturing them himself.

↑ His threat that he will quit producing and buy the finished product ↓ cannot be generalized:

But if all his brother capitalists were to do the same, where would he find his commodities in the market? And his money he cannot eat.

He advertises his virtue. “*Consider my ab-*

205:4/o An und für sich ist dies Resultat nicht befremdlich. Der Wert eines Pfund Garn ist 1 sh. 6 d., und für 10 Pfund Garn müßte unser Kapitalist daher auf dem Warenmarkt 15 sh. zahlen. Ob er sein Privathaus fertig auf dem Markt kauft oder es selbst bauen läßt, keine dieser Operationen wird das im Erwerb des Hauses ausgelegte Geld vermehren.

206:1/o Der Kapitalist, der in der Vulgärökonomie Bescheid weiß, sagt vielleicht, er haben sein Geld mit der Absicht vorge-schossen, mehr Geld daraus zu machen.

Der Weg zur Hölle ist jedoch mit guten Absichten gepflastert, und er konnte ebensogut der Absicht sein, Geld zu machen, ohne zu produzieren.¹⁴

¹⁴ So z.B. entzog er 1844–1847 [einen] Teil seines Kapitals dem produktiven Geschäft, um es in Eisenbahnaktien zu verspekulieren. So, zur Zeit des amerikanischen Bürgerkriegs, schloß er die Fabrik und warf den Fabrikarbeiter aufs Pflaster, um auf der Liverpools Baumwollbörse zu spielen.

Er droht. Man werde ihn nicht wieder ertappen. Künftig werde er die Ware fertig auf dem Markt kaufen, statt sie selbst zu fabrizieren.

Wenn aber alle seine Brüder Kapitalisten desgleichen tun, wo soll er Ware auf dem Markt finden? Und Geld kann er nicht essen.

Er katechisiert. Man soll seine Abstinenz

stinence; I might have played ducks and drakes with the \$3.60; but instead of that I consumed it productively, and made yarn with it.”

↑ If he claims reward for his abstinence, since he used his capital outlays not for his own consumption, ↓ the answer is fourfold: (1) he does have the yarn now as reward for his capital outlays, (2) we have seen earlier the problems with miserly behavior, (3) where should the reward come from? There is not enough value in the end product to pay him such a reward. (4) He should therefore consider virtue its own reward.

Very well, and by way of reward he is now in possession of good yarn instead of a bad conscience; and as for playing the part of a miser, it would never do for him to relapse into such bad ways as that; we have seen before to what results such asceticism leads. Besides, where nothing is, the king has lost his rights; whatever may be the merit of his abstinence, there is nothing wherewith specially to remunerate it, because the value of the product is merely the sum of the values of the commodities that were thrown into the process of production. Let him therefore console himself with the reflection that virtue is its own reward.

But no, he becomes importunate. He says: “*The yarn is of no use to me: I produced it for sale.*”

↑ If he points to his altruism, having produced the yarn for others, ↓ the answer is that he therefore should sell it to those others, or maybe in the future only produce for himself (with a hint that his mode of production suffers from overproduction anyway).

In that case let him sell it, or, still better, let him for the future produce only things for satisfying his personal wants, a remedy that his physician MacCulloch has already prescribed as infallible against an epidemic of over-production.

He now gets obstinate. “*Can the laborer,*” he asks, “*merely with his arms and legs, produce commodities out of nothing? Did I not supply him with the materials, by means of which, and in which alone, his labor could*

bedenken. Er konnte seine 15 sh. verprassen. Statt dessen hat er sie produktiv konsumiert und Garn daraus gemacht.

Aber dafür ist er ja im Besitz von Garn statt von Gewissensbissen. Er muß beileibe nicht in die Rolle des Schatzbildners zurückfallen, der uns zeigte, was bei der Asketik herauskommt. Außerdem, wo nichts ist, hat der Kaiser sein Recht verloren. Welches immer das Verdienst seiner Entsagung, es ist nichts da, um sie extra zu zahlen, da der Wert des Produkts, der aus dem Prozeß herauskommt, nur gleich der Summe der hineingeworfenen Warenwerte. Er beruhige sich also dabei, daß Tugend Lohn.

Statt dessen wird er zudringlich. Das Garn ist ihm unnütz. Er hat es für den Verkauf produziert.

So verkaufe er es, oder, noch einfacher, produziere in Zukunft nur Dinge für seinen eignen Bedarf, ein Rezept, das ihm bereits sein Hausarzt MacCulloch als probates Mittel gegen die Epidemie der Überproduktion verschrieben hat.

Er stellt sich trutzig auf die Hinterbeine. Sollte der Arbeiter mit seinen eignen Gliedmaßen in der blauen Luft Arbeitsgebilde schaffen, Waren produzieren? Gab er ihm nicht den Stoff, womit und worin er allein

be embodied? And as the greater part of society consists of such ne'er-do-wells, have I not rendered society incalculable service by my instruments of production, my cotton and my spindle, and not only society, but the laborer also, whom in addition I have provided with the necessities of life? And am I to be allowed nothing in return for all this service?"

↑ If he enumerates how much he benefited the laborer, ↓ the answer is that the laborer benefited him just as much.

Well, but has not the laborer rendered him the equivalent service of changing his cotton and spindle into yarn? Moreover, there is here no question of service.¹⁵ A service is nothing more than the useful effect of a use-value, be it of a commodity, or be it of labor.¹⁶ But here we are dealing with exchange-value. The capitalist paid to the laborer a value of 72 cents, and the laborer gave him back an exact equivalent in the value of 72 cents, added by him to the cotton: he gave him value for value.

¹⁵ "Extol thyself, put on finery and adorn thyself ... but whoever takes more or better than he gives, that is usury, and is not service, but wrong done to his neighbour, as when one steals and robs. All is not service and benefit to a neighbour that is called service and benefit. For an adulteress and adulterer do one another great service and pleasure. A horseman does an incendiary a great service, by helping him to rob on the highway, and pillage land and houses. The papists do ours a great service, in that they don't drown, burn, murder all of them, or let them all rot in prison; but let some live, and only drive them out, or take from them what they have. The devil himself does his servants inestimable service ... To sum up, the world is full of great, excellent, and daily service and benefit." (Martin Luther: "An die Pfarrherrn wider den Wucher zu predigen," Wittenberg, 1540.)

seine Arbeit verleiblichen kann? Da nun der größte Teil der Gesellschaft aus solchen Habenichtsen besteht, hat er nicht der Gesellschaft durch seine Produktionsmittel, seine Baumwolle und seine Spindel, einen unermesslichen Dienst erwiesen, nicht dem Arbeiter selbst, den er obendrein noch mit Lebensmitteln versah? Und soll er den Dienst nicht berechnen?

Hat der Arbeiter ihm aber nicht den Gegen-dienst erwiesen, Baumwolle und Spindel in Garn zu verwandeln? Außerdem handelt es sich hier nicht um Dienste.¹⁵ Ein Dienst ist nichts als die nützliche Wirkung eines Gebrauchswerts, sei es der Ware, sei es der Arbeit.¹⁶ Hier aber gilt's den Tauschwert. Er zahlte dem Arbeiter den Wert von 3 sh. Der Arbeiter gab ihm ein exaktes Äquivalent zurück in dem der Baumwolle zugesetzten Wert von 3 sh. Wert für Wert.

¹⁵ „Las du rühmen, schmücken und putzen ... Wer aber mehr oder besseres nimpt“ (als er gibt), „das ist Wucher, und heisst, nicht Dienst, sondern Schaden gethan seinem Nehesten, als mit stelen und rauben geschieht. Es ist nicht alles Dienst und wolgethan dem Nehesten, was man heisst, Dienst und wolgethan. Denn eine Ehebrecherin und Ehebrecher thun einander grossen Dienst und wolgefallen. Ein Reuter thut einem Mordbrenner grossen reuterdienst, das er im hilfft auff der strassen rauben, Land und Leute bevehden. Die Papisten thun den unsern grossen Dienst, das sie nicht alle ertrenken, verbrennen, ermorden, im Gefengnis verfaulen lassen, sondern lassen doch etliche leben, und verjagen sie, oder nemen jnen was sie haben. Der Teuffel thut selber seinen Dienern grossen, unermesslichen Dienst ... Summa, die Welt ist vol grosser, trefflicher teglicher Dienst und wohlthaten.“ (Martin Luther,

¹⁶ In "Zur Kritik der Pol. Oek.," p. 14, I make the following remark on this point—"It is not difficult to understand what 'service' the category 'service' must render to a class of economists like J. B. Say and F. Bastiat."

Our friend, up to this time so purse-proud, suddenly assumes the modest demeanour of his own workman, and exclaims: "Have I myself not worked? Have I not performed the labor of superintendence and of overlooking the spinner? And does not this labor, too, create value?"

↑ If he says that he is a laborer himself, ↓ Marx subtly hints at it that he has hired managers and overlookers to do this work for him.

His overlooker and his manager try to hide their smiles.

↓ Suddenly the capitalist changes his script:

Meanwhile, after a hearty laugh, he re-assumes his usual mien. Though he chanted to us the whole creed of the economists, in reality, he says, he would not give a brass farthing for it. He leaves this and all such like subterfuges and juggling tricks to the professors of Political Economy, who are paid for it. He himself is a practical man; and though he does not always consider what he says outside his business, yet in his business he knows what he is about.

↑ This is Marx's colorful way of saying that one should not listen to the excuses of the capitalists or their apologists, but one should examine more closely what the capitalists do.

300:1/o Let us examine the matter more closely.

↓ Since the value of the daily labor-power can be produced in six hours, we assumed that the workers work only six hours long. This assumption was not justified. The capitalist does not have to send the workers home after six hours. If he pays their means of subsistence for the day he has the right to make them work a normal working-day.

The value of a day's labor-power amounts to 72 cents, because on our assumption half a day's labor is embodied in that quantity of

„An die Pfarrherrn, wider den Wucher zu predigen etc.“, Wittenberg 1540.)

¹⁶ Ich bemerke darüber in „Zur Kritik der Pol. Oek.“, p. 14 u.a.: „Man begreift, welchen „Dienst“ die Kategorie „Dienst“ (service) einer Sorte Ökonomen wie J. B. Say und F. Bastiat leisten muß.“

Unser Freund, eben noch so kapitalübermütig, nimmt plötzlich die anspruchslose Haltung seines eignen Arbeiters an. Hat er nicht selbst gearbeitet? nicht die Arbeit der Überwachung, der Oberaufsicht über den Spinner verrichtet? Bildet diese seine Arbeit nicht auch Wert?

Sein eigner overlooker und sein Manager zucken die Achseln.

Unterdes hat er aber bereits mit heitrem Lächeln seine alte Physiognomie wieder angenommen. Er foppte uns mit der ganzen Litanei. Er gibt keinen Deut darum. Er überläßt diese und ähnliche faule Ausflüchte und hohle Flausen den dafür eigens bezahlten Professoren der politischen Ökonomie. Er selbst ist ein praktischer Mann, der zwar nicht immer bedenkt, was er außerhalb des Geschäfts sagt, aber stets weiß, was er im Geschäft tut.

207:1/o Sehn wir näher zu.

Der Tageswert der Arbeitskraft betrug 3 sh., weil in ihr selbst ein halber Arbeitstag gegenständlich ist, d.h. weil die täglich zur

labor-power, *i.e.*, because the means of subsistence that are daily required for the production of labor-power, cost half a day's labor. But the past labor that is embodied in the labor-power, and the living labor that it can call into action; the daily cost of maintaining it, and its daily expenditure in work, are two totally different things. The former determines the exchange-value of the labor-power, the latter is its use-value. The fact that half a day's labor is necessary to keep the laborer alive during 24 hours, does not in any way prevent him from working a whole day. Therefore, the value of labor-power, and the value which that labor-power creates in the labor-process, are two entirely different magnitudes.

Not only is the value produced by labor-power during a normal working-day different from labor-power's own value, but the capitalist purchased labor-power exactly because of this difference.

This difference of the two values was what the capitalist had in view, when he was purchasing the labor-power. The useful qualities that labor-power possesses, and by virtue of which it makes yarn or boots, were to him nothing more than a *conditio sine qua non*; for in order to create value, labor must be expended in a useful manner. What really influenced him was the specific use-value which this commodity possesses of being *a source not only of value, but of more value than it has itself*. This is the special service that the capitalist expects from labor-power.

↓ Although the capitalist gets something for nothing, he is not violating the laws of commodity exchange.

In this transaction he acts in accordance with the "eternal laws" of the exchange of commodities. The seller of labor-power, like the seller of any other commodity, realises its exchange-value, and parts with its

Produktion der Arbeitskraft nötigen Lebensmittel einen halben Arbeitstag kosten. Aber die vergangne Arbeit, die in der Arbeitskraft steckt, und die lebendige Arbeit, die sie leisten kann, ihre täglichen Erhaltungskosten und ihre tägliche Verausgabung, sind zwei ganz verschiedene Größen. Die erstere bestimmt ihren Tauschwert, die andre bildet ihren Gebrauchswert. Daß ein halber Arbeitstag nötig, um ihn während 24 Stunden am Leben zu erhalten, hindert den Arbeiter keineswegs, einen ganzen Tag zu arbeiten. Der Wert der Arbeitskraft und ihre Verwertung im Arbeitsprozeß sind also zwei verschiedene Größen.

Diese Wertdifferenz hatte der Kapitalist im Auge, als er die Arbeitskraft kaufte. Ihre nützliche Eigenschaft, Garn oder Stiefel zu machen, war nur eine *conditio sine qua non*, weil Arbeit in nützlicher Form verausgabte werden muß, um Wert zu bilden. Was aber entschied, war der spezifische Gebrauchswert dieser Ware, Quelle von Wert zu sein und von mehr Wert, als sie selbst hat. Dies ist der spezifische Dienst, den der Kapitalist von ihr erwartet.

Und er verfährt dabei den ewigen Gesetzen des Warenaustausches gemäß. In der Tat, der Verkäufer der Arbeitskraft, wie der Verkäufer jeder andren Ware, realisiert ihren Tauschwert und veräußert ihren Ge-

use-value. He cannot take the one without giving the other. The use-value of labor-power, or in other words, labor, belongs just as little to its seller, as the use-value of oil after it has been sold belongs to the dealer who has sold it. The owner of the money has paid the value of a day's labor-power; his, therefore, is the use of it for a day; a day's labor belongs to him. The circumstance, that on the one hand the daily sustenance of labor-power costs only half a day's labor, while on the other hand the very same labor-power can work during a whole day, that consequently the value which its use during one day creates, is double what he pays for that use, this circumstance is, without doubt, a piece of good luck for the buyer, but by no means an injustice to the seller.

brauchswert. Er kann den einen nicht erhalten, ohne den andren wegzugeben. Der Gebrauchswert der Arbeitskraft, die Arbeit selbst, gehört ebensowenig ihrem Verkäufer, wie der Gebrauchswert des verkauften Öls dem Ölhändler. Der Geldbesitzer hat den Tageswert der Arbeitskraft gezahlt; ihm gehört daher ihr Gebrauch während des Tages, die tagelange Arbeit. Der Umstand, daß die tägliche Erhaltung der Arbeitskraft nur einen halben Arbeitstag kostet, obgleich die Arbeitskraft einen ganzen Tag wirken, arbeiten kann, daß daher der Wert, den ihr Gebrauch während eines Tags schafft, doppelt so groß ist als ihr eigner Tageswert, ist ein besonderes Glück für den Käufer, aber durchaus kein Unrecht gegen den Verkäufer.

Question 653 *Does it violate the laws of commodity exchange that the capitalist makes the laborer work longer than would be necessary for producing an equivalent of the wage?*

Question 654 *Why does Marx put quotation marks around "eternal laws" when he says: the capitalist acts in accordance with the "eternal laws" of the exchange of commodities?*

Question 655 *What is the difference between the purchase of a service and the purchase of labor-power?*

↓ One of the conditions for valorization is that enough constant capital must be present.

301:1 Our capitalist foresaw this state of things, and that was the cause of his laughter.

208:1/o Unser Kapitalist hat den Kasus, der ihn lachen macht, vorge-sehn.

The capitalist never thought that he can only employ the laborer for 6 hours because the price of labor-power corresponds to 6 hours of labor. If the normal working-day is 12 hours, the laborer will have to work for 12 hours, since he was paid the means of subsistence for one day.

The laborer therefore finds, in the workshop, the means of production necessary for working, not only during six, but during twelve hours.

Der Arbeiter findet daher in der Werkstatt die nötigen Produktionsmittel nicht nur für einen sechsstündigen, sondern für einen zwölfstündigen Arbeitsprozeß.

↓ If we do the math in this situation, it turns out that surplus-value has been created:

Just as during the six hours' process our 10 lbs. of cotton absorbed six hours' labor, and became 10 lbs. of yarn, so now, 20 lbs. of cotton will absorb 12 hours' labor and be changed into 20 lbs. of yarn. Let us now examine the product of this prolonged process. There is now materialised in this 20 lbs. of yarn the labor of five days, of which four days are due to the cotton and the lost steel of the spindle, the remaining day having been absorbed by the cotton during the spinning process. Expressed in gold, the labor of five days is \$7.20. This is therefore the price of the 20 lbs. of yarn, giving, as before, 36 cents as the price of each pound. But the sum of the values of the commodities that entered into the process amounts to \$6.48. The value of the yarn is \$7.20. Therefore the value of the product is 1/9 greater than the value advanced for its production; \$6.48 have been transformed into \$7.20; a surplus-value of 72 cents has been created. The trick has at last succeeded; money has been converted into capital.

↓ In the next summary paragraph, Marx looks at the process of valorization in production together with the purchase of labor-power and means of production. He shows that this is the resolution of the task set in 268:4/o. Surplus-value has been created without violating the laws of commodity exchange.

301:2/o Every condition of the problem is satisfied, while the laws that regulate the exchange of commodities, have been in no way violated. Equivalent has been exchanged for equivalent. For the capitalist as buyer paid for each commodity, for the cotton, the spindle and the labor-power, its full value. He then did what is done by every purchaser of commodities; he consumed their use-value. The consumption of the labor-power, which was also the process of producing commodities, resulted in 20 lbs. of yarn, having a value of \$7.20. The

Saugten 10 Pfund Baumwolle 6 Arbeitsstunden ein und verwandelten sich in 10 Pfund Garn, so werden 20 Pfund Baumwolle 12 Arbeitsstunden einsaugen und in 20 Pfund Garn verwandelt. Betrachten wir das Produkt des verlängerten Arbeitsprozesses. In den 20 Pfund Garn sind jetzt 5 Arbeitstage vergegenständlicht, 4 in der verzehrten Baumwoll- und Spindelmasse, 1 von der Baumwolle eingesaugt während des Spinnprozesses. Der Goldausdruck von 5 Arbeitstagen ist aber 30 sh. oder 1 Pfd.St. 10 sh. Dies also der Preis der 20 Pfund Garn. Das Pfund Garn kostet nach wie vor 1 sh. 6 d. Aber die Wertsumme der in den Prozeß geworfenen Waren betrug 27 sh. Der Wert des Garns beträgt 30 sh. Der Wert des Produkts ist um 1/9 gewachsen über den zu seiner Produktion vorgeschößten Wert. So haben sich 27 sh. in 30 sh. verwandelt. Sie haben einen Mehrwert von 3 sh. gesetzt. Das Kunststück ist endlich gelungen. Geld ist in Kapital verwandelt.

209:1 Alle Bedingungen des Problems sind gelöst und die Gesetze des Warenaustausches in keiner Weise verletzt. Äquivalent wurde gegen Äquivalent ausgetauscht. Der Kapitalist zahlte als Käufer jede Ware zu ihrem Wert, Baumwolle, Spindelmasse, Arbeitskraft. Er tat dann, was jeder andre Käufer von Waren tut. Er konsumierte ihren Gebrauchswert. Der Konsumtionsprozeß der Arbeitskraft, der zugleich Produktionsprozeß der Ware, ergab ein Produkt von 20 Pfund Garn mit einem Wert von 30 sh. Der Kapitalist kehrt nun zum Markt zurück

capitalist, formerly a buyer, now returns to market as a seller, of commodities. He sells his yarn at 36 cents a pound, which is its exact value. Yet for all that he withdraws 72 cents more from circulation than he originally threw into it.

The whole process takes place in circulation and not in circulation (the first act in circulation and the second act not in circulation).

This metamorphosis, this conversion of money into capital, takes place both within the sphere of circulation and also outside it; within the circulation, because conditioned by the purchase of the labor-power in the market; outside the circulation, because what is done within it is only a stepping-stone to the production of surplus-value, a process which is entirely confined to the sphere of production. Thus "tout est pour le mieux dans le meilleur des mondes possibles."

und verkauft Ware, nachdem er Ware gekauft hat. Er verkauft das Pfund Garn zu 1 sh. 6 d., keinen Deut über oder unter seinem Wert. Und doch zieht er 3 sh. mehr aus der Zirkulation heraus, als er ursprünglich in sie hineinwarf.

Dieser ganze Verlauf, die Verwandlung seines Geldes in Kapital, geht in der Zirkulationssphäre vor und geht nicht in ihr vor. Durch die Vermittlung der Zirkulation, weil bedingt durch den Kauf der Arbeitskraft auf dem Warenmarkt. Nicht in der Zirkulation, denn sie leitet nur den Verwertungsprozeß ein, der sich in der Produktionssphäre zuträgt. Und so ist „tout pour le mieux dans le meilleur des mondes possibles“

Question 656 Explain how the transformation of money into capital at the same time does and does not take place in circulation.

↑ This not only solves the contradictory conditions of 268:4/o, ↓ but this combination of production and circulation at the same time generates a new powerful causal agent.

302:1 By turning his money into commodities that serve as the material elements of a new product, and as factors in the labor-process, by incorporating living labor with their dead substance, the capitalist at the same time converts value, i.e., past, materialised, and dead labor into capital, into value big with value, a live monster that is fruitful and multiplies.

209:2 Indem der Kapitalist Geld in Waren verwandelt, die als Stoffbildner eines neuen Produkts oder als Faktoren des Arbeitsprozesses dienen, indem er ihrer toten Gegenständlichkeit lebendige Arbeitskraft einverleibt, verwandelt er Wert, vergangne, vergegenständlichte, tote Arbeit in Kapital, sich selbst verwertenden Wert, ein beseeltes Ungeheuer, das zu „arbeiten“ beginnt, als hätt' es Lieb' im Leibe.

7.2.c. [Differences Between Production of Value, Production of Surplus-Value, and the Labor Process]

↓ The difference between the production of value and the production of surplus-value is only quantitative.

302:2 If we now compare the process of producing value with that of producing surplus-value, we see that the latter is nothing but the continuation of the former beyond a definite point. If on the one hand the process be not carried beyond the point, where the value paid by the capitalist for the labor-power is replaced by an exact equivalent, it is simply a process of producing value; if, on the other hand, it be continued beyond that point, it becomes a process of producing surplus-value.

↑ In other words, the production of surplus-value is not an integral part of the production of value itself (surplus-value is not produced by machinery or growing out of the ground). Instead, surplus-value arises from the prolongation of the production of value beyond a point which is not discernible in the production of value itself, but which is determined from the outside.

Question 657 Marx writes in 302:2: “The process of producing surplus-value is nothing but the continuation of the process of producing value beyond a definite point.” (This is not a literal quote, the sentence is rearranged for simplicity.) Does this mean that profits come from the capitalist producing beyond his break-even point?

Question 658 How do vulgar economists “explain” that surplus-value comes out of the process of producing value? Which difference between the process of producing value and the process of producing surplus-value are they trying to explain away?

↓ Next, Marx gives an explicit rundown of the differences between the process of producing value and the labor process, which were implicitly already contained in his presentation of the process of producing value. Marx shows here that the production of value is the same process as the labor process, but considered under a different point of view.

302:3/o If we proceed further, and compare the process of producing value with the labor-process, pure and simple, we find that the latter consists of the useful labor, the work, that produces use-values. Here we contemplate the labor as producing a particular article; we view it under its qualitative aspect alone, with regard to its end and aim. But viewed as a value-creating process, the same labor-process represents itself under its quantitative aspect alone. The only

209:3 Vergleichen wir nun Wertbildungsprozeß und Verwertungsprozeß, so ist der Verwertungsprozeß nichts als ein über einen gewissen Punkt hinaus verlängerter Wertbildungsprozeß. Dauert der letztere nur bis zu dem Punkt, wo der vom Kapital gezahlte Wert der Arbeitskraft durch ein neues Äquivalent ersetzt ist, so ist er einfacher Wertbildungsprozeß. Dauert der Wertbildungsprozeß über diesen Punkt hinaus, so wird er Verwertungsprozeß.

209:4/o Vergleichen wir ferner den Wertbildungsprozeß mit dem Arbeitsprozeß, so besteht der letztere in der nützlichen Arbeit, die Gebrauchswerte produziert. Die Bewegung wird hier qualitativ betrachtet, in ihrer besondern Art und Weise, nach Zweck und Inhalt. Derselbe Arbeitsprozeß stellt sich im Wertbildungsprozeß nur von seiner quantitativen Seite dar. Es handelt sich nur noch um die Zeit, welche die Arbeit zu ihrer Operation braucht, oder um die Dauer, während

thing that still matters here is the time occupied by the laborer in doing the work; the period during which the labor-power is usefully expended.

↑ The overall process of producing values is no longer considered qualitatively but only quantitatively. ↓ The means of production are no longer factors involved in the production process but merely additional values.

Here, the commodities that take part in the process, do not count any longer as necessary adjuncts of labor-power in the production of a definite, useful object. They count merely as depositories of so much absorbed or materialised labor.

↓ Labor itself, whether living or materialized, counts only according to its duration.

That labor, whether previously embodied in the means of production, or incorporated in them for the first time during the process by the action of labor-power, counts in either case only according to its duration; it amounts to so many hours or days as the case may be.

↓ An important caveat is that the quantity counts only to the extent that the labor is socially necessary labor.

303:1 However, only so much of the time spent in the production of any article is counted, as, under the given social conditions, is necessary. This implies various things.

↓ Conditions of labor must be normal:

In the first place, it becomes necessary that the labor should be carried on under normal conditions. If a self-acting mule is the implement in general use for spinning, it would be absurd to supply the spinner with a distaff and spinning wheel. The cotton too must not be such rubbish as to cause extra waste in being worked, but must be of suitable quality. Otherwise the spinner would be found to spend more time in producing a pound of yarn than is socially necessary, in which case the excess of time would create neither

deren die Arbeitskraft nützlich verausgabt wird.

Hier gelten auch die Waren, die in den Arbeitsprozeß eingehn, nicht mehr als funktionell bestimmte, stoffliche Faktoren der zweckmäßig wirkenden Arbeitskraft. Sie zählen nur noch als bestimmte Quanta vergegenständlichter Arbeit.

Ob in den Produktionsmittel enthalten oder durch die Arbeitskraft zugesetzt, die Arbeit zählt nur noch nach ihrem Zeitmaß. Sie beträgt so viel Stunden, Tage usw.

Ob in den Produktionsmittel enthalten oder durch die Arbeitskraft zugesetzt, die Arbeit zählt nur noch nach ihrem Zeitmaß. Sie beträgt so viel Stunden, Tage usw.

210:1 Sie zählt jedoch nur, soweit die zur Produktion des Gebrauchswerts verbrauchte Zeit gesellschaftlich notwendig ist. Es umfaßt dies Verschiedenes.

Die Arbeitskraft muß unter normalen Bedingungen funktionieren. Ist die Spinnmaschine das gesellschaftlich herrschende Arbeitsmittel für die Spinnerei, so darf dem Arbeiter nicht ein Spinnrad in die Hand gegeben werden. Statt Baumwolle von normaler Güte muß er nicht Schund erhalten, der jeden Augenblick reißt. In beiden Fällen würde er mehr als die gesellschaftlich notwendige Arbeitszeit zur Produktion eines Pfundes Garn verbrauchen, diese überschüssige Zeit aber nicht Wert

value nor money. But whether the material factors of the process are of normal quality or not, depends not upon the laborer, but entirely upon the capitalist.

↓ Labor-power itself must be normal too: Then again, the labor-power itself must be of average efficacy. In the trade in which it is being employed, it must possess the average skill, handiness and quickness prevalent in that trade, and our capitalist took good care to buy labor-power of such normal goodness.

↓ Labor-power must be applied continuously and with normal intensity: This power must be applied with the common measure of exertion, with the usual degree of intensity; and the capitalist is as careful to see that this is done, as that his workmen are not idle for a single moment. He has bought the use of the labor-power for a definite period, and he insists upon his rights. He has no intention of being robbed.

↓ Means of labor must be used in a normal way: Lastly, and for this purpose our friend has a penal code of his own, all wasteful consumption of raw material or instruments of labor is strictly forbidden, because what is so wasted, represents labor superfluously expended, labor that does not count in the product or enter into its value.¹⁷

↓ Interesting and detailed footnote about slavery:

¹⁷ This is one of the circumstances that makes production by slave labor such a costly process. The laborer here is, to use a striking expression of the ancients, distinguishable only as instrumentum vocale, from an animal as instrumentum semi-vocale, and from an implement as instrumentum mutum. But he himself takes care to let both beast and implement feel that he is none of them, but is a man. He convinces himself with immense satisfaction, that he is a different being,

oder Geld bilden. Der normale Charakter der gegenständlichen Arbeitsfaktoren hängt jedoch nicht vom Arbeiter, sondern vom Kapitalisten ab.

Fernere Bedingung ist der normale Charakter der Arbeitskraft selbst. In dem Fach, worin sie verwandt wird, muß sie das herrschende Durchschnittsmaß von Geschick, Fertigkeit und Raschheit besitzen. Aber unser Kapitalist kaufte auf dem Arbeitsmarkt Arbeitskraft von normaler Güte.

Diese Kraft muß in dem gewöhnlichen Durchschnittsmaß der Anstrengung, mit dem gesellschaftlich üblichen Grad von Intensität verausgabt werden. Darüber wacht der Kapitalist ebenso ängstlich, als daß keine Zeit ohne Arbeit vergeudet wird. Er hat die Arbeitskraft für bestimmte Zeitfrist gekauft. Er hält darauf, das Seine zu haben. Er will nicht bestohlen sein.

and purposeful way:

Endlich—und hierfür hat derselbe Herr einen eignen code pénal—darf kein zweckwidriger Konsum von Rohmaterial und Arbeitsmitteln stattfinden, weil vergeudetes Material oder Arbeitsmittel überflüssig verausgabte Quanta vergegenständlichter Arbeit darstellen, also nicht zählen und nicht in das Produkt der Wertbildung eingehn.¹⁷

¹⁷ Dies ist einer der Umstände, die auf Sklaverei gegründete Produktion verteuern. Der Arbeiter soll sich hier, nach dem treffenden Ausdruck der Alten, nur als instrumentum vocale von dem Tier als instrumentum semivocale und dem toten Arbeitszeug als instrumentum mutum unterscheiden. Er selbst aber läßt Tier und Arbeitszeug fühlen, daß er nicht ihresgleichen, sondern ein Mensch ist. Er verschafft sich das Selbstgefühl seines Unterschieds von ihnen, indem er

by treating the one unmercifully and damaging the other con amore.

↑ This is an amazing foray into psychology!

^{17 ctd} Hence the principle, universally applied in this method of production, only to employ the rudest and heaviest implements and such as are difficult to damage owing to their sheer clumsiness. In the slave-states bordering on the Gulf of Mexico, down to the date of the civil war, ploughs constructed on old Chinese models, which turned up the soil like a hog or a mole, instead of making furrows, were alone to be found. Conf. J. E. Cairnes. "The Slave Power," London, 1862, p. 46 sqq. In his "Sea Board Slave States," Olmsted tells us: "I am here shown tools that no man in his senses, with us, would allow a laborer, for whom he was paying wages, to be encumbered with; and the excessive weight and clumsiness of which, I would judge, would make work at least ten per cent greater than with those ordinarily used with us. And I am assured that, in the careless and clumsy way they must be used by the slaves, anything lighter or less rude could not be furnished them with good economy, and that such tools as we constantly give our laborers and find our profit in giving them, would not last out a day in a Virginia cornfield—much lighter and more free from stones though it be than ours. So, too, when I ask why mules are so universally substituted for horses on the farm, the first reason given, and confessedly the most conclusive one, is that horses cannot bear the treatment that they always must get from negroes; horses are always soon foundered or crippled by them, while mules will bear cudgelling, or lose a meal or two now and then, and not be materially injured, and they do not take cold or get sick, if neglected or overworked. But I do not need to go further than to the window of the room in which I am writing, to see at almost any time, treatment of cattle that would ensure the immediate discharge of the driver by almost any farmer owning them in the North."

sie mißhandelt und con amore verwüstet.

^{17 ctd} Es gilt daher als ökonomisches Prinzip in dieser Produktionsweise, nur die rohesten, schwerfälligsten, aber grade wegen ihrer unbehilflichen Plumpheit schwer zu ruinierenden Arbeitsinstrumente anzuwenden. Bis zum Ausbruch des Bürgerkrieges fand man daher in den am Meerbusen von Mexiko liegenden Sklavenstaaten Pflüge altchinesischer Konstruktion, die den Boden aufwühlen wie ein Schwein oder Maulwurf, aber ihn nicht spalten und wenden. Vgl. J. E. Cairnes, „The Slave Power“, London 1862, p. 46 sqq. In seinem „Seaboard Slave States“ [p. 46, 47] erzählt Olmsted u.a.: „Man hat mir hier Werkzeuge gezeigt, mit denen bei uns kein vernünftiger Mensch seinen Arbeiter belasten würde, dem er Lohn zahlt. Ihr außerordentliches Gewicht und ihre Plumpheit müssen nach meiner Ansicht die Arbeit mit ihnen um mindestens 10 Prozent schwerer machen als mit den gewöhnlich bei uns verwendeten. Wie man mir jedoch versichert, ist es bei der fahrlässigen und klobigen Art, in der sie von den Sklaven anscheinend benutzt werden, nicht möglich, ihnen mit gutem Erfolg leichtere oder weniger derbe Werkzeuge anzuvertrauen; solche Werkzeuge, wie wir sie ständig, und zwar mit gutem Gewinn für uns, unseren Arbeitern anvertrauen, würden auf einem Kornfeld in Virginia nicht einen Tag überdauern—obwohl der Boden leichter und steinfreier ist als der unsere. Gleichfalls wurde mir auf meine Frage, warum auf den Farmen so allgemein Pferde durch Maultiere ersetzt werden, als erster und zugestandenermaßen ausschlaggebender Grund angegeben, daß Pferde die Behandlung nicht ertragen, die sie von den Negeren ständig und zwangsläufig erfahren. Pferde werden von ihnen nach kurzer Zeit lahm gemacht und zu Krüppeln geschlagen, während Maultiere Prügel und hie und da den Ausfall von ein oder zwei Fütterungen aushalten, ohne körperlich geschädigt zu werden. Sie erkälten sich auch nicht und werden nicht krank, wenn sie

vernachlässigt und überarbeitet werden. Doch ich brauche gar nicht weiter zu gehen als zum Fenster des Zimmers, in dem ich schreibe, um fast zu jeder Zeit eine Behandlung des Viehs zu sehen, die wohl bei jedem Farmer im Norden zur sofortigen Entlassung des Treibers führen würde.“

⇓ The double character of labor, which was previously derived as a theoretical result, as something that must be the case for commodity production to be possible, is directly visible if one simply looks at the different sides of the production process itself:

304:1 One sees: the difference between labor, considered on the one hand as producing use-values, and on the other hand as producing value, a difference which we arrived at by our analysis of the commodity, represents itself now as a distinction between the different aspects of the process of production.

211:1 Man sieht: der früher aus der Analyse der Ware gewonnene Unterschied zwischen der Arbeit, soweit sie Gebrauchswert, und derselben Arbeit, soweit sie Wert schafft, hat sich jetzt als Unterscheidung der verschiedenen Seiten des Produktionsprozesses dargestellt.

Question 659 *What is the relationship between the double character of labor and the double character of the capitalist production process?*

⇓ All this applies both to simple commodity production and to capitalist production:

304:2 The process of production, considered on the one hand as the unity of the labor-process and the process of producing value, is production of commodities; considered on the other hand as the unity of the labor-process and the process of producing surplus-value, it is the capitalist process of production, or capitalist production of commodities.

211:2 Als Einheit von Arbeitsprozeß und Wertbildungsprozeß ist der Produktionsprozeß Produktionsprozeß von Waren; als Einheit von Arbeitsprozeß und Verwertungsprozeß ist er kapitalistischer Produktionsprozeß, kapitalistische Form der Warenproduktion.

7.2.d. [Simple and Complicated Labor]

The chapter ends with a passage about the reduction of complicated to simple labor:

304:3/o We stated, on a previous page, that in the creation of surplus-value it does not in the least matter, whether the labor appropriated by the capitalist be simple unskilled labor of average quality or more complicated skilled labor. All labor of a

211:3/o Es wurde früher bemerkt, daß es für den Verwertungsprozeß durchaus gleichgültig, ob die vom Kapitalisten angeeignete Arbeit einfache, gesellschaftliche Durchschnittsarbeit oder kompliziertere Arbeit, Arbeit von höherem spezifischen Gewicht

higher or more complicated character than average labor is expenditure of labor-power of a more costly kind, labor-power whose production has cost more time and labor, and which therefore has a higher value, than unskilled or simple labor-power.

⇓ This labor-power not only *has* a higher value than simple labor-power, but it also *creates* more value per hour:

While the value of this power is higher, also its consumption is labor of a higher class, labor that creates in equal times proportionally higher values than unskilled labor does. Whatever difference in skill there may be between the labor of a spinner and that of a jeweller, the portion of his labor by which the jeweller merely replaces the value of his own labor-power, does not in any way differ in quality from the additional portion by which he creates surplus-value. In the making of jewellery, just as in spinning, the surplus-value results only from a quantitative excess of labor, from a lengthening-out of one and the same labor-process, in the one case, of the process of making jewels, in the other of the process of making yarn.¹⁸

ist. Die Arbeit, die als höhere, kompliziertere Arbeit gegenüber der gesellschaftlichen Durchschnittsarbeit gilt, ist die Äußerung einer Arbeitskraft, worin höhere Bildungskosten eingehen, deren Produktion mehr Arbeitszeit kostet und die daher einen höheren Wert hat als die einfache Arbeitskraft.

Ist der Wert dieser Kraft höher, so äußert sie sich daher auch in höherer Arbeit und vergegenständlicht sich daher, in denselben Zeiträumen, in verhältnismäßig höheren Werten. Welches jedoch immer der Gradunterschied zwischen Spinnarbeit und Juwelierarbeit, die Portion Arbeit, wodurch der Juwelenarbeiter nur den Wert seiner eigenen Arbeitskraft ersetzt, unterscheidet sich qualitativ in keiner Weise von der zusätzlichen Portion Arbeit, wodurch er Mehrwert schafft. Nach wie vor kommt der Mehrwert nur heraus durch einen quantitativen Überschuß von Arbeit, durch die verlängerte Dauer desselben Arbeitsprozesses, in dem einen Fall Prozeß der Garnproduktion, in dem andren Fall Prozeß der Juwelenproduktion.¹⁸

↑ On the one hand, the labor of the skilled worker has a higher reproduction cost than the labor of the unskilled worker. But on the other, skilled labor counts as “multiplied” simple labor, i.e., it creates more value per hour. Although Marx writes “therefore,” I do not think that it creates more value *because* it has higher reproduction cost. I think Marx had the following causality in mind: Skilled labor is labor of higher order. This has two implications: (1) it has a higher value because of its higher reproduction cost, and (2) it creates more value per hour because the labor-time required to gain these skills is pro-rated over the time when the skilled labor is performed. Since both cost and yield are higher, the mechanism by which surplus-value is created is the same for skilled and unskilled labor: in both cases, surplus-value arises from the extension of the length of the labor-process beyond the point where it reproduces its own value. ⇓ Although the mechanism with the proration of the time required to acquire skills explains most of the qualitative differences in labor-powers, it does not explain all of them. Footnote 18 makes important remarks about skilled and unskilled labor:

¹⁸ The distinction between skilled and unskilled labor rests in part on pure illusion or, to say the least, on distinctions that have long since ceased to be real, and that survive only by virtue of a traditional convention; in part on the helpless condition of some groups of the working-class, a condition that prevents them from exacting equally with the rest the value of their labor-power. Accidental circumstances here play so great a part, that these two forms of labor sometimes change places. Where, for instance, the physique of the working-class has deteriorated, and is, relatively speaking, exhausted, which in the case in all countries with a well developed capitalist production, the lower forms of labor, which demand great expenditure of muscle, are in general considered as skilled, compared with much more delicate forms of labor; the latter sink down to the level of unskilled labor. Take as an example the labor of a bricklayer, which in England occupies a much higher level than that of a damask-weaver. Again, although the labor of a fustian cutter demands great bodily exertion, and is at the same time unhealthy, yet it counts only as unskilled labor. And then, we must not forget, that the so-called skilled labor does not occupy a large space in the field of national labor. Laing estimates that in England (and Wales) the livelihood of 11,300,000 people depends on unskilled labor. If from the total population of 18,000,000 living at the time when he wrote, we deduct 1,000,000 for the "genteel population," and 1,500,000 for paupers, vagrants, criminals, prostitutes, etc., and 4,650,000 who compose the middle-class, there remain the above mentioned 11,000,000. But in his middle-class he includes people that live on the interest of small investments, officials, men of letters, artists, schoolmasters and the like, and in order to swell the number he also includes in these 4,650,000 the better paid portioti of the factory operatives! The bricklayers, too, figure amongst them. (S. Laing: "National Distress," etc., London, 1844). "The great class who have nothing to give for food but ordinary labor, are the great bulk of the people."

¹⁸ Der Unterschied zwischen höherer und einfacher Arbeit, „skilled“ und „unskilled labour“, beruht zum Teil auf bloßen Illusionen oder wenigstens Unterschieden, die längst aufgehört haben, reell zu sein, und nur noch in traditioneller Konvention fortleben; zum Teil auf der hilflosen Lage gewisser Schichten der Arbeiterklasse, die ihnen minder als andern erlaubt, den Wert ihrer Arbeitskraft zu ertrotzen. Zufällige Umstände spielen dabei so große Rolle, daß dieselben Arbeitsarten den Platz wechseln. Wo z.B. die physische Substanz der Arbeiterklasse abgeschwächt und relativ erschöpft ist, wie in allen Ländern entwickelter kapitalistischer Produktion, verkehren sich im allgemeinen brutale Arbeiten, die viel Muskelkraft erfordern, in höher gegenüber viel feineren Arbeiten, die auf die Stufe einfacher Arbeit herabsinken, wie z.B. die Arbeit eines bricklayer (Maurer) in England eine viel höhere Stufe einnimmt als die eines Damastwirkers. Auf der andren Seite figurirt die Arbeit eines fustian cutter (Baumwollsamtscherers), obgleich sie viel körperliche Anstrengung kostet und oben drein sehr ungesund ist, als „einfache“ Arbeit. Übrigens muß man sich nicht einbilden, daß die sogenannte „skilled labour“ einen quantitativ bedeutenden Umfang in der Nationalarbeit einnimmt. Laing rechnet, daß in England (und Wales) die Existenz von über 11 Millionen auf einfacher Arbeit beruht. Nach Abzug einer Million von Aristokraten und anderthalb Millionen Paupers, Vagabunden, Verbrecher, Prostituierte usw. von den 18 Millionen der Bevölkerungszahl, zur Zeit seiner Schrift, bleiben 4 650 000 Mittelklasse mit Einschluß kleinerer Rentner, Beamten, Schriftsteller, Künstler, Schulmeister usw. Um diese 4 2/3 Millionen herauszubekommen, zählt er zum arbeitenden Teil der Mittelklasse, außer Bankiers usw., alle besser bezahlten „Fabrikarbeiter“! Auch die bricklayers fehlen nicht unter den „potenzierten Arbeitern“. Bleiben ihm dann die besagten 11 Millionen. (S. Laing, „National Distress etc.“, London 1844, [p. 49–52 passim].) „Die große Klasse, die für Nahrung nichts zu geben vermag als gewöhnliche Arbeit, ist die

(James Mill, in art.: "Colony," Supplement to the Encyclop. Brit., 1831.)

306 But on the other hand, in every process of producing value, the reduction of skilled labor to average social labor, e.g., one day of skilled to x days of unskilled labor, is unavoidable.¹⁹ We therefore save ourselves a superfluous operation, and simplify our analysis, by the assumption, that the labor of the workman employed by the capitalist is unskilled average labor.

¹⁹ "Where reference is made to labor as a measure of value, it necessarily implies labor of one particular kind ... the proportion which the other kinds bear to it being easily ascertained." ("Outlines of Pol. Econ.," Lond., 1832, pp. 22 and 23.)

This argument is much elaborated in the French edition, 163:1:

On the other hand, whenever the production of value is the issue, higher labor must always be reduced to average social labor, for instance one day of complicated labor to two days of simple labor. If the mainstream economists are full of indignation about this "arbitrary assertion," isn't this an occasion to say, according to the German proverb, that the trees prevent them from seeing the forest! What they claim to be an artifact of the analysis is simply a procedure which is practiced every day in every corner of the world. Everywhere, the values of the most diverse commodities are indistinctly expressed in money, that means, in a certain amount of gold or silver. By this very act, the different kinds of labor represented in these values have been reduced in various proportions to determinate amounts of one and the same kind of social labor, the labor which produces gold and silver.

große Masse des Volkes." (James Mill in Art. „Colony“. „Supplement to the Encyclop. Brit.“, 1831.)

213 Andererseits muß in jedem Wertbildungsprozeß die höhere Arbeit stets auf gesellschaftliche Durchschnittsarbeit reduziert werden, z.B. ein Tag höherer Arbeit auf x Tage einfacher Arbeit.¹⁹ Man erspart also eine überflüssige Operation und vereinfacht die Analyse durch die Annahme, daß der vom Kapital verwandte Arbeiter einfache gesellschaftliche Durchschnittsarbeit verrichtet.

¹⁹ „Wo von Arbeit als Maßstab des Wertes gesprochen wird, versteht man darunter notwendigerweise Arbeit einer bestimmten Art ... das Verhältnis, in dem die andren Arten von Arbeit zu ihr stehen, ist leicht zu ermitteln.“ ([J. Cazenove,] „Outlines of Polit. Economy“, London 1832, p. 22, 23.)

D'un autre côté, quand il s'agit de production de valeur, le travail supérieur doit toujours être réduit à la moyenne du travail social, une journée de travail complexe, par exemple, à deux journées de travail simple. Si des économistes comme il faut se sont récriés contre cette « assertion arbitraire », n'est ce pas le cas de dire, selon le proverbe allemand, que les arbres les empêchent de voir la forêt ! Ce qu'ils accusent d'être un artifice d'analyse, est tout bonnement un procédé qui se pratique tous les jours dans tous les coins du monde. Partout les valeurs des marchandises les plus diverses sont indistinctement exprimées en monnaie, c'est à dire dans une certaine masse d'or ou d'argent. Par cela même, les différents genres de travail, représentés par ces valeurs, ont été réduits, dans des proportions différentes, à des sommes déterminées d'une seule et même espèce de travail or-

| dinaire, le travail qui produit l'or ou l'argent.

Gold producing labor is not the same as simple labor. But Marx does not say here that all complicated labor is reduced to gold producing labor. He argues that in the production of commodities, the qualitative differences between concrete labors are reduced to mere quantitative differences in abstract labor, with simple abstract labor, as it is possessed by every worker in the given country, being the numeraire. In order to support his claim that such a reduction takes place, he shows that in circulation, all commodities are reduced to gold, therefore the labor in them is reduced to gold-producing labor. But this is in circulation, not in production; from the second peculiarity of the equivalent form, 150:3, we know that in circulation, “concrete labor” (i.e., the labor producing gold) “becomes the form of manifestation of its opposite, abstract human labor.”

Question 660 *What is the difference between production as the creation of use-value and production as the process of producing value? Compare especially the relationship between labor and the objective factors of the labor process.*

8. Constant Capital and Variable Capital

Chapter Eight is one of the tedious chapters where Marx dwells endlessly on seemingly pedantic, trivial, and obvious things. It is so verbose that it is easy to lose sight of the points Marx is trying to make here.

Yet this is a significant chapter, since it discusses one of the basic contradictions of capitalism. Capital engages in the production process because it must *expand* its value. But only a part of the capital is in fact able to expand its value during the production process; the rest of the value must take a shape in which its value remains *constant*. This contradiction can lead to crises.

The first half of this chapter until 313:2/o discusses the different roles which the objective factors (means of labor and object of labor) and the subjective factor (labor) of the *labor* process play in the *creation of the value* of the product.

307:1 The various factors of the labor-process play different parts in the constitution of the product's value.

214:1 Die verschiedenen Faktoren des Arbeitsprozesses nehmen verschiedenen Anteil an der Bildung des Produkten-Werts.

Marx makes three main points: (1) Constant capital does not create value; (2) wages do not reappear as part of the value of the product, i.e., an increase in wages does not raise values, and (3) what I will call “trouble” with constant capital.

In order to develop the first of these three points, Marx argues that the action of the *subjective factor* of the labor process has two quite different results: transfer of value and creation of new value. Since the laborer does not work twice for these two different results, the two-fold nature of the result must come from a two-fold nature of labor:

- Preservation of value comes from the concrete useful labor
- Creation of new value comes abstract general labor

Now let us look at this argument in detail:

307:2 The laborer adds fresh value to the object of his labor by expending upon it a given amount of additional labor, regardless of the specific content, purpose, and technical character of that labor.

214:2 Der Arbeiter setzt dem Arbeitsgegenstand neuen Wert zu durch Zusatz eines bestimmten Quantum von Arbeit, abgesehen vom bestimmten Inhalt, Zweck und technischen Charakter seiner Arbeit.

↑ The production of value is one of the results of the labor process. In chapter Seven, 295:4/o, Marx emphasized that the concrete particularity of labor is irrelevant here, only its quantity counts. ↓ But this same labor process also has a second result:

On the other hand, the values of the means of production used up in the process are preserved, and reappear as constituent parts of the value of the product; the values of the cotton and the spindle, for instance, the value of the yarn. The value of the means of production is therefore preserved, by being transferred to the product.

From the standpoint of modern social sciences, this transfer of value would be considered a plausible assumption that is necessary to make the labor theory of value consistent. The question how this transfer happens does not pose itself. But Marx is a depth realist: he is looking for the real mechanisms by which this transfer of value occurs.

This transfer takes place during the conversion of those means into a product, or in other words, during the labor-process. It is mediated by labor; but how?

First step to answer this question: this two-fold result is not achieved by two different operations on the part of the laborer, but both results come from the same process:

307:3 The laborer does not perform two different operations, one in order to add value to the cotton, the other in order to preserve the value of the means of production, or, what amounts to the same thing, to transfer to the yarn, to the product, the value of the cotton on which he works, and part of the value of the spindle with which he works. But, by the very act of adding new value, he preserves their former values.

↓ Since the same process (the labor process) has two results, these two results must come from two different aspects of the labor process. This kind of argument (if something has two different effects then two different aspects of it must be responsible for these two effects) was already used in 131:2/o.

Since, however, the addition of new value to the object of his labor, and the preservation of its former value, are two entirely different results, produced simultaneously by the laborer, during one and the same operation, it is plain that this two-fold nature of the result

Andrerseits finden wir die Werte der verzehrten Produktionsmittel wieder als Bestandteile des Produkten-Werts, z.B. die Werte von Baumwolle und Spindel im Garnwert. Der Wert der Produktionsmittel wird also erhalten durch seine Übertragung auf das Produkt.

Dies Übertragen geschieht während der Verwandlung der Produktionsmittel in Produkt, im Arbeitsprozeß. Es ist vermittelt durch die Arbeit. Aber wie?

214:3 Der Arbeiter arbeitet nicht doppelt in derselben Zeit, nicht einmal, um der Baumwolle durch seine Arbeit einen Wert zuzusetzen, und das andermal, um ihren alten Wert zu erhalten, oder, was dasselbe, um den Wert der Baumwolle, die er verarbeitet, und der Spindel, womit er arbeitet, auf das Produkt, das Garn, zu übertragen. Sondern durch bloßes Zusetzen von neuem Wert erhält er den alten Wert.

Da aber der Zusatz von neuem Wert zum Arbeitsgegenstand und die Erhaltung der alten Werte im Produkt zwei ganz verschiedene Resultate sind, die der Arbeiter in derselben Zeit hervorbringt, obgleich er nur einmal in derselben Zeit arbeitet, kann diese Doppel-

can be explained only by the two-fold nature of his labor; at one and the same time, it must in one character create value, and in another character preserve or transfer value.

Question 661 *A stand-up comedian makes a joke. Part of the audience laughs, the other part gets upset. Is this a counterexample to Marx's pervasive assumption that the same mechanism cannot have two different effects?*

We already know that the labor process has a twofold character: it is abstract labor and concrete labor. Marx is indeed going to argue that it creates new value as abstract labor, and transfers value as concrete labor.

307:4/o Now, in what manner does every laborer add new labor and consequently new value? Evidently, only by laboring productively in a particular way; the spinner by spinning, the weaver by weaving, the smith by forging. But, while thus incorporating labor generally, that is value, it is by the particular form alone of the labor, by the spinning, the weaving and the forging respectively, that the means of production, the cotton and spindle, the yarn and loom, and the iron and anvil become constituent elements of the product, of a new use-value.²⁰ Each use-value disappears, but only to re-appear under a new form in a new use-value.

²⁰ "Labor gives a new creation for one extinguished." ("An Essay on the Polit. Econ. of Nations," London, 1821, p. 13.)

↑ It is the concrete useful character of the labor which is responsible for turning the means of production into a new product. ↓ Now Marx refers to his detailed argument in chapter Seven, 294:1–295:1, which showed that the value of the means of production is transferred: Now, we saw, when we were considering the process of creating value, that, if a use-value be effectively consumed in the production of a new use-value, the quantity of labor expended in the production of the consumed

seitigkeit des Resultats offenbar nur aus der Doppelseitigkeit seiner Arbeit selbst erklärt werden. In demselben Zeitpunkt muß sie in einer Eigenschaft Wert schaffen und in einer andren Eigenschaft Wert erhalten oder übertragen.

214:4/o Wie setzt jeder Arbeiter Arbeitszeit und daher Wert zu? Immer nur in der Form seiner eigentümlich produktiven Arbeitsweise. Der Spinner setzt nur Arbeitszeit zu, indem er spinnt, der Weber, indem er webt, der Schmied, indem er schmiedet. Durch die zweckbestimmte Form aber, worin sie Arbeit überhaupt zusetzen und daher Neuwert, durch das Spinnen, Weben, Schmieden werden die Produktionsmittel, Baumwolle und Spindel, Garn und Webstuhl, Eisen und Amboß, zu Bildungselementen eines Produkts, eines neuen Gebrauchswerts.²⁰ Die alte Form ihres Gebrauchswerts vergeht, aber nur um in einer neuen Form von Gebrauchswert aufzugehen.

²⁰ „Arbeit ergibt eine neue Schöpfung an Stelle einer vernichteten.“ („An Essay on the Polit. Econ. of Nations“, London 1821, p. 13.)

Bei Betrachtung des Wertbildungsprozesses ergab sich aber, daß, soweit ein Gebrauchswert zweckgemäß vernutzt wird zur Produktion eines neuen Gebrauchswerts, die zur Herstellung des vernutzten Gebrauchswerts

article, forms a portion of the quantity of labor necessary to produce the new use-value; this portion is therefore labor transferred from the means of production to the new product.

↓ Therefore the concrete useful aspect of labor is also responsible for the value transfer:

Hence, the laborer preserves the values of the consumed means of production, or transfers them as portions of its value to the product, not by virtue of his additional labor, abstractedly considered, but by virtue of the particular useful character of that labor, by virtue of its special productive form. In so far then as labor is such specific productive activity, in so far as it is spinning, weaving, or forging, it raises, by mere contact, the means of production from the dead, makes them living factors of the labor-process, and combines with them to form the new products.

↓ On the other hand, the creation of new value comes from human labor in the abstract:

308:1/o If the special productive labor of the workman were not spinning, he could not convert the cotton into yarn, and therefore could not transfer the values of the cotton and spindle to the yarn. Suppose the same workman were to change his occupation to that of a joiner, he would still by a day's labor add value to the material he works upon. Consequently, we see, first, that the addition of new value takes place not by virtue of his labor being spinning in particular, or joinering in particular, but because it is labor in the abstract, a portion of the total labor of society; and we see next, that the value added is of a given definite amount, not because his labor has a special utility, but because it is exerted for a definite time. On the one hand, then, it is by virtue of its general character, as being expenditure of human labor-power in the ab-

notwendige Arbeitszeit einen Teil der zur Herstellung des neuen Gebrauchswerts notwendigen Arbeitszeit bildet, also Arbeitszeit ist, die vom vernutzten Produktionsmittel auf das neue Produkt übertragen wird.

Der Arbeiter erhält also die Werte der vernutzten Produktionsmittel oder überträgt sie als Wertbestandteile auf das Produkt, nicht durch sein Zusetzen von Arbeit überhaupt, sondern durch den besondern nützlichen Charakter, durch die spezifisch produktive Form dieser zusätzlichen Arbeit. Als solche zweckgemäße produktive Tätigkeit, Spinnen, Weben, Schmieden, erweckt die Arbeit durch ihren bloßen Kontakt die Produktionsmittel von den Toten, begeistert sie zu Faktoren des Arbeitsprozesses und verbindet sich mit ihnen zu Produkten.

215:1 Wäre die spezifische produktive Arbeit des Arbeiters nicht Spinnen, so würde er die Baumwolle nicht in Garn verwandeln, also auch die Werte von Baumwolle und Spindel nicht auf das Garn übertragen. Wechselt dagegen derselbe Arbeiter das Metier und wird Tischler, so wird er nach wie vor durch einen Arbeitstag seinem Material Wert zusetzen. Er setzt ihn also zu durch seine Arbeit, nicht soweit sie Spinnarbeit oder Tischlerarbeit, sondern soweit sie abstrakte, gesellschaftliche Arbeit überhaupt, und er setzt eine bestimmte Wertgröße zu, nicht weil seine Arbeit einen besondern nützlichen Inhalt hat, sondern weil sie eine bestimmte Zeit dauert. In ihrer abstrakten, allgemeinen Eigenschaft also, als Verausgabung menschlicher Arbeitskraft, setzt die Arbeit des Spinners den Werten von Baumwolle und Spindel Neuwert zu,

stract, that spinning adds new value to the values of the cotton and the spindle; and on the other hand, it is by virtue of its special character, as being a concrete, useful process, that the same labor of spinning both transfers the values of the means of production to the product, and preserves them in the product. Hence at one and the same time there is produced a two-fold result.

Question 662 Which two effects does labor have in forming the value of the product? Trace these two effects to the twofold character of labor.

Question 663 How does Marx argue that the transfer of value comes from concrete labor, not abstract labor?

↑ Until now Marx has argued for his thesis that the two outcomes of the labor process come from the double character of labor. ↓ Now Marx assumes that this theory is correct, and shows how this invisible fact manifests itself on the surface.

309:1 By the simple addition of a certain quantity of labor, new value is added, and by the quality of this added labor, the original values of the means of production are preserved in the product. This two-fold effect, resulting from the two-fold character of labor, shows itself tangibly in various phenomena.

und in ihrer konkreten, besondern, nützlichen Eigenschaft als Spinnprozeß, überträgt sie den Wert dieser Produktionsmittel auf das Produkt und erhält so ihren Wert im Produkt. Daher die Doppelseitigkeit ihres Resultats in demselben Zeitpunkt.

215:2/o Durch das bloß quantitative Zusetzen von Arbeit wird neuer Wert zugesetzt, durch die Qualität der zugesetzten Arbeit werden die alten Werte der Produktionsmittel im Produkt erhalten. Diese doppelseitige Wirkung derselben Arbeit infolge ihres doppelseitigen Charakters zeigt sich handgreiflich an verschiedenen Erscheinungen.

(1) The first of the tangible phenomena which show clearly that the preservation of value must come from a substantially different aspect of labor than the creation of new value, are changes in productivity (either of the labor process itself or of the process which had produced the objects and instruments of labor). They affect the preservation of value but not the creation of new value. (In 136:4/o, Marx argued that productivity is a quality of concrete useful labor.)

(1a) First Marx discusses the changes in the productive power of the labor producing the finished product.

309:2 Let us assume, that some invention enables the spinner to spin as much cotton in 6 hours as he was able to spin before in 36 hours. His labor is now six times as effective as it was, for the purposes of useful production. The product of 6 hours' work

216:1 Nimm an, irgendeine Erfindung befähige den Spinner, in 6 Stunden so viel Baumwolle zu verspinnen wie früher in 36 Stunden. Als zweckmäßig nützliche, produktive Tätigkeit hat seine Arbeit ihre Kraft versechsfacht. Ihr Produkt ist ein sechsfa-

has increased six-fold, from 6 lbs. to 36 lbs. But now the 36 lbs. of cotton absorb only the same amount of labor as formerly did the 6 lbs. One-sixth as much new labor is absorbed by each pound of cotton, and consequently, the value added by the labor to each pound is only one-sixth of what it formerly was. On the other hand, in the product, in the 36 lbs. of yarn, the value transferred from the cotton is six times as great as before. By the 6 hours' spinning, the value of the raw material preserved and transferred to the product is six times as great as before, although the new value added by the labor of the spinner to each pound of the very same raw material is one-sixth what it was formerly. This shows that the two properties of labor, by virtue of which it is enabled in one case to preserve value, and in the other to create value, are essentially different. On the one hand, the longer the time necessary to spin a given weight of cotton into yarn, the greater is the new value added to the material; on the other hand, the greater the weight of the cotton spun in a given time, the greater is the value preserved, by being transferred from it to the product.

(1b) Now changes in the productivity of the labor producing the materials and instruments of labor:

309:3/o Let us now assume, that the productiveness of the spinner's labor, instead of varying, remains constant, that he therefore requires the same time as he formerly did, to convert one pound of cotton into yarn, but that the exchange-value of the cotton varies, either by rising to six times its former value or falling to one-sixth of that value. In both these cases, the spinner puts the same quantity of labor into a pound of cotton, and therefore adds as much value, as he did before the change in the value: he

ches, 36 statt 6 Pfund Garn. Aber die 36 Pfund Baumwolle saugen jetzt nur so viel Arbeitszeit ein als früher 6 Pfund. Sechsmal weniger neue Arbeit wird ihnen zugesetzt als mit der alten Methode, daher nur noch ein Sechstel des früheren Werts. Andererseits existiert jetzt der sechsfache Wert von Baumwolle im Produkt, den 36 Pfund Garn. In den 6 Spinnstunden wird ein sechsmal größerer Wert von Rohmaterial erhalten und auf das Produkt übertragen, obgleich demselben Rohmaterial ein sechsmal kleinerer Neuwert zugesetzt wird. Dies zeigt, wie die Eigenschaft, worin die Arbeit während desselben unteilbaren Prozesses Werte erhält, wesentlich unterschieden ist von der Eigenschaft, worin sie Wert schafft. Je mehr notwendige Arbeitszeit während der Spinnoperation auf dasselbe Quantum Baumwolle geht, desto größer der Neuwert, der der Baumwolle zugesetzt wird, aber je mehr Pfunde Baumwolle in derselben Arbeitszeit versponnen werden, desto größer der alte Wert, der im Produkt erhalten wird.

216:2 Nimm umgekehrt an, die Produktivität der Spinnarbeit bleibe unverändert, der Spinner brauche also nach wie vor gleich viel Zeit, um ein Pfund Baumwolle in Garn zu verwandeln. Aber der Tauschwert der Baumwolle selbst wechsle, ein Pfund Baumwolle steige oder falle um das Sechsfache seines Preises. In beiden Fällen fährt der Spinner fort, demselben Quantum Baumwolle dieselbe Arbeitszeit zuzusetzen, also denselben Wert, und in beiden Fällen produziert er in gleicher Zeit gleich viel

also produces a given weight of yarn in the same time as he did before. Nevertheless, the value that he transfers from the cotton to the yarn is either one-sixth of what it was before the variation, or, as the case may be, six times as much as before. The same result occurs when the value of the instruments of labor rises or falls, while their useful efficacy in the process remains unaltered.

(1c) At the end, Marx describes a situation where the causality is not apparent on the surface:

310:1 Again, if the technical conditions of the spinning process remain unchanged, and no change of value takes place in the means of production, the spinner continues to consume in equal working-times equal quantities of raw material, and equal quantities of machinery of unvarying value. The value that he preserves in the product is directly proportional to the new value that he adds to the product. In two weeks he incorporates twice as much labor, and therefore twice as much value, as in one week, and during the same time he consumes twice as much material, and wears out twice as much machinery, of double the value in each case: he therefore preserves, in the product of two weeks, twice as much value as in the product of one week.

Since the doubling of time both doubled the value newly created and the value transferred, one might think that they both have the same source, namely, human labor in the abstract (which is measured by time). But this appearance is misleading. The preservation of old value and the creation of new value are proportional to each other not because they depend on each other but because both are proportional to time.

So long as the conditions of production remain the same, the more value the laborer adds by fresh labor, the more value he transfers and preserves; but he does so merely because this addition of new value takes place under conditions that have not varied and are independent of his own labor.

Garn. Dennoch ist der Wert, den er von der Baumwolle auf das Garn, das Produkt, überträgt, das eine Mal sechsmal kleiner, das andre Mal sechsmal größer als zuvor. Ebenso wenn die Arbeitsmittel sich verteuern oder verwohlfeilern, aber stets denselben Dienst im Arbeitsprozeß leisten.

216:3/o Bleiben die technischen Bedingungen des Spinnprozesses unverändert und geht gleichfalls kein Wertwechsel mit seinen Produktionsmitteln vor, so verbraucht der Spinner nach wie vor in gleichen Arbeitszeiten gleiche Quanta Rohmaterial und Maschinerie von gleichbleibenden Werten. Der Wert, den er im Produkt erhält, steht dann in direktem Verhältnis zu dem Neuwert, den er zusetzt. In zwei Wochen setzt er zweimal mehr Arbeit zu als in einer Woche, also zweimal mehr Wert, und zugleich verwendet er zweimal mehr Material von zweimal mehr Wert, und verschleißt zweimal mehr Maschinerie von zweimal mehr Wert, erhält also im Produkt von zwei Wochen zweimal mehr Wert als im Produkt einer Woche.

Unter gegebenen gleichbleibenden Produktionsbedingungen erhält der Arbeiter um so mehr Wert, je mehr Wert er zusetzt, aber er erhält nicht mehr Wert, weil er mehr Wert zusetzt, sondern weil er ihn unter gleichbleibenden und von seiner eignen Arbeit unabhängigen Bedingungen zusetzt.

This last example can be generalized; but it is nevertheless misleading.

310:2 Of course, it may be said in one sense, that the laborer preserves old value always in proportion to the quantity of new value that he adds. Whether the value of cotton rise from one shilling to two shillings, or fall to sixpence, the workman invariably preserves in the product of one hour only one half as much value as he preserves in two hours. In like manner, if the productiveness of his own labor varies by rising or falling, he will in one hour spin either more or less cotton, as the case may be, than he did before, and will consequently preserve in the product of one hour, more or less value of cotton; but, all the same, he will preserve by two hours' labor twice as much value as he will by one.

217:1 Allerdings kann in einem relativen Sinn gesagt werden, daß der Arbeiter stets in derselben Proportion alte Werte erhält, worin er Neuwert zusetzt. Ob die Baumwolle von 1 sh. auf 2 sh. steige oder auf 6 d. falle, er erhält in dem Produkt einer Stunde stets nur halb soviel Baumwollwert, wie der auch wechsle, als in dem Produkt von zwei Stunden. Wechselt ferner die Produktivität seiner eignen Arbeit, sie steige oder falle, so wird er z.B. in einer Arbeitsstunde mehr oder weniger Baumwolle verspinnen als früher, und dementsprechend mehr oder weniger Baumwollwert im Produkt einer Arbeitsstunde erhalten. Mit alledem wird er in zwei Arbeitsstunden zweimal mehr Wert erhalten als in einer Arbeitsstunde.

Question 664 *Is productiveness a property of concrete useful or of general abstract labor? Does a change in productiveness affect this creation of value or the transfer of value?*

(2) Secondly, Marx takes a closer look at the connection between the transfer of value to the product and the loss of value by the objective factors of the labor process. Marx gives an argument here which is very similar to 294:1.

310:3/o Value exists only in articles of utility, in objects, if we leave out of consideration its purely symbolical representation by tokens. (Man himself, viewed as the mere impersonation of labor-power, is a natural object, a thing, although a living conscious thing, and labor is the manifestation of this power residing in him.) If therefore an article loses its utility, it also loses its value.

217:2 Wert, von seiner nur symbolischen Darstellung im Wertzeichen abgesehen, existiert nur in einem Gebrauchswert, einem Ding. (Der Mensch selbst, als bloßes Dasein von Arbeitskraft betrachtet, ist ein Naturgegenstand, ein Ding, wenn auch lebendiges, selbstbewußtes Ding, und die Arbeit selbst ist dingliche Äußerung jener Kraft.) Geht daher der Gebrauchswert verloren, so geht auch der Wert verloren.

↑ Marx begins with the very basic fact about value that an object can have value only if it has use-value. Therefore, if it loses its use-value, then it also loses its value.

↓ Obviously, means of production are used up, i.e., lose their use-value in the production process. But in this case the situation is a little different. If the means of production are considered not in isolation but in the production process, then there is no loss of their use-value; rather their use-value is used in order to shape the use-value of the product.

The reason why means of production do not lose their value, at the same time that they lose their use-value, is this: they lose in the labor-process the original form of their use-value, only to assume in the product the form of a new use-value.

↓ Here we can therefore apply the flip side of the basic fact about value which was our point of departure: although it is imperative for value to exist in a use-value, value is entirely indifferent about it which use-value this is. In production, therefore, the value is transferred from the means of production to the end product. However, (and this can be considered the negation of the negation), a condition for this transfer of value to the product is that the means of production lose their values.

But, however important it may be to value, that it should have some object of utility to embody itself in, yet it is a matter of complete indifference what particular object serves this purpose; this we saw when treating of the metamorphosis of commodities. Hence it follows that in the labor-process the means of production transfer their value to the product only so far as along with their use-value they lose also their exchange-value. They give up to the product that value alone which they themselves lose as means of production.

Die Produktionsmittel verlieren mit ihrem Gebrauchswert nicht zugleich ihren Wert, weil sie durch den Arbeitsprozeß die ursprüngliche Gestalt ihres Gebrauchswerts in der Tat nur verlieren, um im Produkt die Gestalt eines andren Gebrauchswerts zu gewinnen.

So wichtig es aber für den Wert ist, in irgendeinem Gebrauchswert zu existieren, so gleichgültig ist es, in welchem er existiert, wie die Metamorphose der Waren zeigt. Es folgt hieraus, daß im Arbeitsprozeß Wert vom Produktionsmittel auf das Produkt nur übergeht, soweit das Produktionsmittel mit seinem selbständigen Gebrauchswert auch seinen Tauschwert verliert. Es gibt nur den Wert an das Produkt ab, den es als Produktionsmittel verliert.

Question 665 *If something does not lose value through its use (maybe a computer program), does it then add value to the product?*

↓ The big issue Marx is going to discuss in detail now is the following: the value loss of the raw materials and auxiliary materials is different than that of the instruments of labor. But in this respect the material factors of the labor process do not all behave alike.

Die gegenständlichen Faktoren des Arbeitsprozesses verhalten sich aber in dieser Hinsicht verschieden.

Question 666 *Why does a machine which lasts 5 years of production lose 1/5 of its value in the first year? What happens if the machine stands idle?*

↓ In order to develop these differences Marx first looks at it what happens to the use-values in the production process:

311:1/o The coal burnt under the boiler vanishes without leaving a trace; so, too, the

217:3/o Die Kohle, womit die Maschine geheizt wird, verschwindet spurlos, ebenso

tallow with which the axles of wheels are greased. Dye stuffs and other auxiliary substances also vanish but manifest themselves as properties of the product. Raw material constitutes the substance of the product, but it has changed its form.

↓ Already regarding use-values there is an important difference. The object of labor loses its characteristic form in the production process, while the instruments preserve their form.

Hence raw material and auxiliary substances lose the characteristic form with which they are clothed on entering the labor-process. It is otherwise with the instruments of labor. Tools, machines, workshops, and vessels, are of use in the labor-process, only so long as they retain their original shape, and are ready each morning to renew the process with their shape unchanged. And just as during their lifetime, that is to say, during the continued labor-process in which they serve, they retain their shape independent of the product, so, too, they do after their death. The corpses of machines, tools, workshops, etc., are always separate and distinct from the product they helped to turn out.

↓ The period of time in which the instruments of labor lose their entire use-values is also that in which they transfer their entire exchange-values to the end product.

If we now consider the case of any instrument of labor during the whole period of its service, from the day of its entry into the workshop, till the day of its banishment into the lumber room, we find that during this period its use-value has been completely consumed, and therefore its exchange-value completely transferred to the product. For instance, if a spinning machine lasts for 10 years, it is plain that during that working period its total value is gradually transferred to the product of the 10 years.

↓ The problem is now that this value transfer is spread out over many production periods,

das Öl, womit man die Achse des Rades schmiert usw. Farbe und andre Hilfsstoffe verschwinden, zeigen sich aber in den Eigenschaften des Produkts. Das Rohmaterial bildet die Substanz des Produkts, hat aber seine Form verändert.

Rohmaterial und Hilfsstoffe verlieren also die selbständige Gestalt, womit sie in den Arbeitsprozeß als Gebrauchswerte eintreten. Anders mit den eigentlichen Arbeitsmitteln. Ein Instrument, eine Maschine, ein Fabrikgebäude, ein Gefäß usw. dienen im Arbeitsprozeß nur, solange sie ihre ursprüngliche Gestalt bewahren und morgen wieder in ebenderselben Form in den Arbeitsprozeß eingehn wie gestern. Wie sie während ihres Lebens, des Arbeitsprozesses, ihre selbständige Gestalt dem Produkt gegenüber bewahren, so auch nach ihrem Tode. Die Leichen von Maschinen, Werkzeugen, Arbeitsgebäuden usw. existieren immer noch getrennt von den Produkten, die sie bilden halfen.

Betrachten wir nun die ganze Periode, während deren ein solches Arbeitsmittel dient, von dem Tag seines Eintritts in die Werkstatt bis zum Tage seiner Verbannung in die Rumpelkammer, so ist während dieser Periode sein Gebrauchswert von der Arbeit vollständig verzehrt worden und sein Tauschwert daher vollständig auf das Produkt übergegangen. Hat eine Spinnmaschine z.B. in 10 Jahren ausgelebt, so ist während des zehnjährigen Arbeitsprozesses ihr Gesamtwert auf das zehnjährige Produkt übergegangen.

and one does not know how much value is transferred in an individual day. For this, an average calculation is necessary.

The lifetime of an instrument of labor, therefore, is spent in the repetition of a greater or less number of similar operations. Its life may be compared with that of a human being. Every day brings a man 24 hours nearer to his grave: but how many days he has still to travel on that road, no man can tell accurately by merely looking at him. This difficulty, however, does not prevent life insurance offices from drawing, by means of the theory of averages, very accurate, and at the same time very profitable conclusions. So it is with the instruments of labor. It is known by experience how long on the average a machine of a particular kind will last.

↓ The paragraph concludes with a numerical example.

Suppose its use-value in the labor-process to last only six days. Then, on the average, it loses each day one-sixth of its use-value, and therefore parts with one-sixth of its value to the daily product. The wear and tear of all instruments, their daily loss of use-value, and the corresponding quantity of value they part with to the product, are accordingly calculated upon this basis.

Since value transfer comes from value loss, it follows that no means of production can transfer more value than it contains. Applied to means of production which do not cost labor this means: they do not transfer any value.

Question 667 *Do the means of production lose value because they transfer it to the end product, or do they transfer value to the end product because they lose value in the production process?*

312:1 It is thus strikingly clear, that means of production never transfer more value to the product than they themselves lose during the labor-process by the destruction of their own use-value. If such an instrument has no value to lose, if, in other

Die Lebensperiode eines Arbeitsmittels umfaßt also eine größere oder kleinere Anzahl stets von neuem mit ihm wiederholter Arbeitsprozesse. Und es geht dem Arbeitsmittel wie dem Menschen. Jeder Mensch stirbt täglich um 24 Stunden ab. Man sieht aber keinem Menschen genau an, wieviel Tage er bereits verstorben ist. Dies verhindert Lebensversicherungsgesellschaften jedoch nicht, aus dem Durchschnittsleben der Menschen sehr sichere, und was noch viel mehr ist, sehr profitliche Schlüsse zu ziehen. So mit dem Arbeitsmittel. Man weiß aus der Erfahrung, wie lang ein Arbeitsmittel, z.B. eine Maschine von gewisser Art, durchschnittlich vorhält.

Gesetzt, sein Gebrauchswert im Arbeitsprozeß daure nur 6 Tage. So verliert es im Durchschnitt jeden Arbeitstag $\frac{1}{6}$ seines Gebrauchswerts und gibt daher $\frac{1}{6}$ seines Werts an das tägliche Produkt ab. In dieser Art wird der Verschleiß aller Arbeitsmittel berechnet, also z.B. ihr täglicher Verlust an Gebrauchswert und ihr entsprechende tägliche Wertabgabe an das Produkt.

218:1 Es zeigt sich so schlagend, daß ein Produktionsmittel nie mehr Wert an das Produkt abgibt, als es im Arbeitsprozeß durch Vernichtung seines eignen Gebrauchswerts verliert. Hätte es keinen Wert zu verlieren, d.h. wäre es nicht selbst Produkt mensch-

words, it is not the product of human labor, it transfers no value to the product. It helps to create use-value without contributing to the formation of exchange-value. In this class are included all means of production supplied by Nature without human assistance, such as land, wind, water, metals in situ, and timber in virgin forests.

(3) Certain means of production enter the labor process differently than the process of creating value and surplus-value:

312:2 Yet another interesting phenomenon here presents itself. Suppose a machine to be worth £1,000, and to wear out in 1,000 days. Then one thousandth part of the value of the machine is daily transferred to the day's product. At the same time, though with diminishing vitality, the machine as a whole continues to take part in the labor-process. Thus it appears, that one factor of the labor-process, a means of production, continually enters as a whole into that process, while it enters into the process of the formation of value by fractions only. The difference between the two processes is here reflected in their material factors, by the same instrument of production taking part as a whole in the labor-process, while at the same time as an element in the formation of value, it enters only by fractions.²¹

Footnote 21 makes two unrelated remarks.

²¹ The subject of repairs of the implements of labor does not concern us here. A machine that is undergoing repair, no longer plays the part of an instrument, but that of a object of labor. Work is no longer done with it, but upon it. It is quite permissible for our purpose to assume, that the labor expended on the repairs of instruments is included in the labor necessary for their original production. But in the text we deal with that wear and tear, which no doctor can cure, and which little by little brings about death, with "that kind of wear which cannot be repaired from time to

licher Arbeit, so würde es keinen Wert an das Produkt abgeben. Es diene als Bildner von Gebrauchswert, ohne als Bildner von Tauschwert zu dienen. Dies ist daher der Fall mit allen Produktionsmitteln, die von Natur, ohne menschliches Zutun, vorhanden sind, mit Erde, Wind, Wasser, dem Eisen in der Erzader, dem Holze des Urwaldes usw.

labor process differently than the process of

219:1 Ein andres interessantes Phänomen tritt uns hier entgegen. Eine Maschine sei z.B. 1000 Pfd.St. wert und schleiß sich in 1000 Tagen ab. In diesem Fall geht täglich 1/1000 des Werts der Maschine von ihr selbst auf ihr tägliches Produkt über. Zugleich, wenn auch mit abnehmender Lebenskraft, wirkt stets die Gesamtmaschine im Arbeitsprozeß. Es zeigt sich also, daß ein Faktor des Arbeitsprozesses, ein Produktionsmittel, ganz in den Arbeitsprozeß, aber nur zum Teil in den Verwertungsprozeß eingeht. Der Unterschied von Arbeitsprozeß und Verwertungsprozeß reflektiert sich hier an ihren gegenständlichen Faktoren, indem dasselbe Produktionsmittel als Element des Arbeitsprozesses ganz und als Element der Wertbildung nur stückweis in demselben Produktionsprozeß zählt.²¹

(a) First it talks about repair labor:

²¹ Es handelt sich hier nicht um Reparaturen der Arbeitsmittel, Maschinen, Baulichkeiten usw. Eine Maschine, die repariert wird, funktioniert nicht als Arbeitsmittel sondern als Arbeitsmaterial. Es wird nicht mit ihr gearbeitet, sondern sie selbst wird bearbeitet, um ihren Gebrauchswert zu flicken. Solche Reparaturarbeiten kann man für unsren Zweck immer eingeschlossen denken in die zur Produktion des Arbeitsmittels erheischte Arbeit. Im Text handelt es sich um den Verschleiß, den kein Doktor kurieren kann und der allmählich den Tod herbeiführt, um

time, and which, in the case of a knife, would ultimately reduce it to a state in which the cutler would say of it, it is not worth a new blade."

(b) The second half of the footnote discusses the lack of distinction in the literature between the labor process and the valorization process.

^{21 ctd} We have shewn in the text, that a machine takes part in every labor-process as an integral machine, but that into the simultaneous process of creating value it enters only bit by bit. How great then is the confusion of ideas exhibited in the following extract! "Mr. Ricardo says a portion of the labor of the engineer in making [stocking] machines" is contained for example in the value of a pair of stockings. "Yet the total labor, that produced each single pair of stockings . . . includes the whole labor of the engineer, not a portion; for one machine makes many pairs, and none of those pairs could have been done without any part of the machine." ("Obs. on Certain Verbal Disputes in Pol. Econ., Particularly Relating to Value," p. 54.) The author, an uncommonly self-satisfied wiseacre, is right in his confusion and therefore in his contention, to this extent only, that neither Ricardo nor any other economist, before or since him, has accurately distinguished the two aspects of labor, and still less, therefore, the part played by it under each of these aspects in the formation of value.

↓ The discrepancy can also go the other way: some means of production enter the labor process only in part but the valorization process in their entirety.

313:1 On the other hand, a means of production may take part as a whole in the formation of value, while into the labor-process it enters only bit by bit. Suppose that in spinning cotton, the waste for every 115 lbs. used amounts to 15 lbs., which is converted, not into yarn, but into "devil's dust." Now, although this 15 lbs. of cotton never becomes a constituent element of the yarn,

„jene Art der Abnutzung, die nicht von Zeit zu Zeit ersetzt werden kann und die beispielsweise ein Messer schließlich in einen solchen Zustand versetzt, daß der Messerschmied sagt, es sei keine neue Klinge mehr wert“.

^{21 ctd} Man hat im Text gesehen, daß eine Maschine z.B. ganz in jeden einzelnen Arbeitsprozeß, aber nur stückweis in den gleichzeitigen Verwertungsprozeß eingeht. Danach zu beurteilen die folgende Begriffsverwechslung: „Ricardo spricht von der beim Bau einer Strumpfwirkmaschine verausgabten Arbeitsmenge eines Maschinenbauers“, als z.B. enthalten in dem Wert von ein paar Strümpfen. „Jedoch die ganze Arbeit, die jedes einzelne Paar Strümpfe hergestellt hat . . . schließt die ganze Arbeit des Maschinenbauers ein und nicht nur einen Teil; denn eine Maschine macht zwar viele Paare, aber keines dieser Paare hätte unter Verzicht auf irgendeinen Teil der Maschine angefertigt werden können.“ („Observations on certain verbal disputes in Pol. Econ., particularly relating to Value, and to Demand and Supply“, London 1821, p. 54.) Der Verfasser, ein ungemein selbstgefälliger „wiseacre“, hat mit seiner Konfusion und daher mit seiner Polemik nur so weit recht, als weder Ricardo noch irgendein anderer Ökonom, vor oder nach ihm, die beiden Seiten der Arbeit genau geschieden, daher noch weniger ihre verschiedene Rolle in der Wertbildung analysiert hat.

219:2/o Andererseits kann umgekehrt ein Produktionsmittel ganz in den Verwertungsprozeß eingeht, obgleich nur stückweis in den Arbeitsprozeß. Nimm an, beim Verspinnen der Baumwolle fielen täglich auf 115 Pfund 15 Pfund ab, die kein Garn, sondern nur devil's dust bilden. Dennoch, wenn dieser Abfall von 15 Pfund normal, von der Durchschnittsverarbeitung der Baum-

yet assuming this amount of waste to be normal and inevitable under average conditions of spinning, its value is just as surely transferred to the value of the yarn, as is the value of the 100 lbs. that form the substance of the yarn. The use-value of 15 lbs. of cotton must vanish into dust, before 100 lbs. of yarn can be made. The destruction of this cotton is therefore a necessary condition in the production of the yarn. And because it is a necessary condition, and for no other reason, the value of that cotton is transferred to the product. The same holds good for every kind of refuse resulting from a labor-process, so far at least as such refuse cannot be further employed as a means in the production of new and independent use-values. Such an employment of refuse may be seen in the large machine works at Manchester, where mountains of iron turnings are carted away to the foundry in the evening, in order the next morning to re-appear in the workshops as solid masses of iron.

↓ A brief mention of joint production, without answering the question how the value of the end products is determined in this case.

313:2/o We have seen that the means of production transfer value to the new product, so far only as during the labor-process they lose value in the shape of their old use-value. The maximum loss of value that they can suffer in the process, is plainly limited by the amount of the original value with which they came into the process, or in other words, by the labor-time necessary for their production. Therefore, the means of production can never add more value to the product than they themselves possess independently of the process in which they assist. However useful a given kind of raw material, or a machine, or other means of production may be, though it may cost £150, or,

wolle unzertrennlich ist, geht der Wert der 15 Pfund Baumwolle, die kein Element des Garns, ganz ebenso sehr in den Garnwert ein, wie der Wert der 100 Pfund, die seine Substanz bilden. Der Gebrauchswert von 15 Pfund Baumwolle muß verstauben, um 100 Pfund Garn zu machen. Der Untergang dieser Baumwolle ist also eine Produktionsbedingung des Garns. Ebendeswegen gibt sie ihren Wert an das Garn ab. Dies gilt von allen Exkrementen des Arbeitsprozesses, in dem Grad wenigstens, worin diese Exkremente nicht wieder neue Produktionsmittel und daher neue selbständige Gebrauchswerte bilden. So sieht man in den großen Maschinenfabriken zu Manchester Berge von Eisenabfällen, durch zyklische Maschinen gleich Hobelspänen abgeschält, am Abend auf großen Wagen aus der Fabrik in die Eisengießerei wandern, um den andren Tag wieder als massives Eisen aus der Eisengießerei in die Fabrik zurückzuwandern.

220:1 Nur soweit Produktionsmittel während des Arbeitsprozesses Wert in der Gestalt ihrer alten Gebrauchswerte verlieren, übertragen sie Wert auf die neue Gestalt des Produkts. Das Maximum des Wertverlustes, den sie im Arbeitsprozeß erleiden können, ist offenbar beschränkt durch die ursprüngliche Wertgröße, womit sie in den Arbeitsprozeß eintreten, oder durch die zu ihrer eignen Produktion erheischte Arbeitszeit. Produktionsmittel können dem Produkt daher nie mehr Wert zusetzen, als sie unabhängig vom Arbeitsprozeß, dem sie dienen, besitzen. Wie nützlich auch ein Arbeitsmaterial, eine Maschine, ein Produktionsmittel: wenn es 150 Pfd.St., sage 500 Arbeitstage, kostet,

say, 500 days' labor, yet it cannot, under any circumstances, add to the value of the product more than £150. Its value is determined not by the labor-process into which it enters as a means of production, but by that out of which it has issued as a product. In the labor-process it only serves as a mere use-value, a thing with useful properties, and could not, therefore, transfer any value to the product, unless it possessed such value previously.²²

²² From this we may judge of the absurdity of J. B. Say, who pretends to account for surplus-value (Interest, Profit, Rent), by the "services productifs" which the means of production, soil, instruments, and raw material, render in the labor-process by means of their use-values. Mr. Wm. Roscher who seldom loses an occasion of registering, in black and white, ingenious apologetic fancies, records the following specimen:—"J. B. Say (Traité, t. 1, ch. 4) very truly remarks: the value produced by an oil mill, after deduction of all costs, is something new, something quite different from the labor by which the oil mill itself was erected." (l.c., p. 82, note.) Very true, Mr. Professor! the oil produced by the oil mill is indeed something very different from the labor expended in constructing the mill! By value, Mr. Roscher understands such stuff as "oil," because oil has value, notwithstanding that "Nature" produces petroleum, though relatively "in small quantities," a fact to which he seems to refer in his further observation: "It (Nature) produces scarcely any exchange-value." Mr. Roscher's "Nature" and the exchange-value it produces are rather like the foolish virgin who admitted indeed that she had had a child, but "it was such a little one." This "savant sérieux" in continuation remarks: "Ricardo's school is in the habit of including capital as accumulated labor under the head of labor. This is unskilful work (!), because (!), indeed (!), the owner of capital (!), after all (!), had done something more (!) than the mere (!) creation (?) and (??)

setzt es dem Gesamtprodukt, zu dessen Bildung es dient, nie mehr als 150 Pfd.St. zu. Sein Wert ist bestimmt nicht durch den Arbeitsprozeß, worin es als Produktionsmittel eingeht, sondern durch den Arbeitsprozeß, woraus es als Produkt herauskommt. In dem Arbeitsprozeß dient es nur als Gebrauchswert, als Ding mit nützlichen Eigenschaften, und gäbe daher keinen Wert an das Produkt ab, hätte es nicht Wert besessen vor seinem Eintritt in den Prozeß.²²

²² Man begreift daher die Abgeschmacktheit des faden J. B. Say, der den Mehrwert (Zins, Profit, Rente) aus den „services productifs“ ableiten will, welche die Produktionsmittel, Erde, Instrumente, Leder usw., durch ihre Gebrauchswerte im Arbeitsprozesse leisten. Herr Wilhelm Roscher, der es nicht leicht läßt, artige apologetische Einfälle schwarz auf weiß zu registrieren, ruft aus: „Sehr richtig bemerkt J. B. Say, „Traité“, t. I, ch. 4: der durch eine Ölmühle nach Abzug aller Kosten hervorgebrachte Wert sei doch etwas Neues, von der Arbeit, wodurch die Ölmühle selbst geschaffen worden, wesentlich Verschiedenes.“ (l.c. p. 82, Note.) Sehr richtig! Das von der Ölmühle hervorgebrachte „Öl“ ist etwas sehr Verschiedenes von der Arbeit, welche der Bau der Mühle kostet. Und unter „Wert“ versteht Herr Roscher solches Zeug wie „Öl“, da „Öl“ Wert hat, „in der Natur“ aber sich Steinöl vorfindet, wenn auch relativ nicht „sehr viel“, worauf wohl seine andre Bemerkung abzielt: „Tauschwerte bringt sie“ (die Natur!) „fast gar nicht hervor.“ [l.c. p. 79.] Es geht der Roscherschen Natur mit dem Tauschwert wie der törichten Jungfrau mit dem Kind, das nur „ganz klein war“. Derselbe „Gelehrte“ („savant sérieux“) bemerkt noch bei oben erwähneter Gelegenheit: „Die Schule Ricardos pflegt auch das Kapital unter den Begriff Arbeit zu subsumieren als „aufgesparte Arbeit“. Dies ist ungeschickt (!), weil (!) ja (!) der Kapitalbesitzer (!) doch (!) mehr (!) getan hat als die bloße (!) Hervorbringung (?) und (??) Erhaltung desselben (wesselbigen?): eben (!?) die

preservation of the same (which same?): namely (?!?), the abstention from the enjoyment of it, for which he demands, *e.g.* (!!!), interest.” (l.c.) How very “skilful” is this “anatomico-physiological method” of Political Economy, which, “indeed,” converts a mere desire “after all” into a source of value.

Question 668 *Explain each of the question marks and exclamation points inserted by Marx into the Say quote.*

↑ This last sentence of the footnote is a critique of the utility theory of value.

In the beginning of the second half of the chapter, from 314:1/o on, (explain better what is said in 314:1/o), the results which were obtained in the first half are reformulated under the aspect of the flow of value through the production process:

The value of the means of production is transferred to the product. It is preserved, not consumed. The value of the labor-power is consumed but replaced through the creation of value. Very interesting explanation in footnote 25 to paragraph 315:1/o why the value of the labor-power is not transferred to the end product. (In the first half, Marx had not spoken about the value of labor-power.) This basic fact explains why wage increases do not result in price increases.

314:1/o While productive labor is changing the means of production into constituent elements of a new product, their value undergoes a metempsychosis. It deserts the consumed body, to occupy the newly created one. But this transmigration takes place, as it were, behind the back of the laborer. He is unable to add new labor, to create new value, without at the same time preserving old values, and this, because the labor he adds must be of a specific useful kind; and he cannot do work of a useful kind, without employing products as the means of production of a new product, and thereby transferring their value to the new product. The property therefore which labor-power in action, living labor, possesses of preserving value, at the same time that it adds it, is a gift of Nature which costs the laborer nothing, but which is very advantageous to

Enthaltung vom eignen Genusse, wofür er z.B. (!!!) Zinsen verlangt.“ (l.c. [p. 82.]) Wie „geschickt“! diese „anatomisch-physiologische Methode“ der politischen Ökonomie, die aus bloßem „Verlangen“ ja doch eben „Wert“ entwickelt.

221:1 Indem die produktive Arbeit Produktionsmittel in Bildungselemente eines neuen Produkts verwandelt, geht mit deren Wert eine Seelenwandlung vor. Er geht aus dem verzehrten Leib in den neu gestalteten Leib über. Aber diese Seelenwandlung eignet sich gleichsam hinter dem Rücken der wirklichen Arbeit. Der Arbeiter kann neue Arbeit nicht zusetzen, also nicht neuen Wert schaffen, ohne alte Werte zu erhalten, denn er muß die Arbeit immer in bestimmter nützlicher Form zusetzen, und er kann sie nicht in nützlicher Form zusetzen, ohne Produkte zu Produktionsmitteln eines neuen Produkts zu machen und dadurch ihren Wert auf das neue Produkt zu übertragen. Es ist also eine Naturgabe der sich betätigenden Arbeitskraft, der lebendigen Arbeit, Wert zu erhalten, indem sie Wert zusetzt, eine Naturgabe, die dem Arbeiter nichts kostet, aber

8. Constant Capital and Variable Capital

the capitalist inasmuch as it preserves the existing value of his capital.^{22a}

Question 669 *Why does Marx call the preservation of value an effect of labor which takes place “behind its back”?*

↑ Interesting argument: the preservation of value takes place “behind the back” of the labor because the laborer can add new value only in a concrete useful form, and being useful, this labor preserves value. It is an effect which does not cost the laborer extra but which greatly benefits the capitalist.

^{22a} “Of all the instruments of the farmers’ trade, the labor of man ... is that on which he is most to rely for the repayment of his capital. The other two ... the working stock of the cattle and the ... carts, ploughs, spades, and so forth, without a given portion of the first, are nothing at all.” (Edmund Burke: “Thoughts and Details on Scarcity, originally presented to the Right Hon. W. Pitt, in the month of November 1795,” Edit. London, 1800, p. 10.)

↓ These benefits are only visible when they are interrupted:

So long as trade is good, the capitalist is too much absorbed in money-grubbing to take notice of this gratuitous gift of labor. A violent interruption of the labor-process by a crisis, makes him sensitively aware of it.²³

²³ In *The Times* of 26th November, 1862, a manufacturer, whose mill employed 800 hands, and consumed, on the average, 150 bales of East Indian, or 130 bales of American cotton, complains, in doleful manner, of the standing expenses of his factory when not working. He estimates them at £6,000 a year. Among them are a number of items that do not concern us here, such as rent, rates, and taxes, insurance, salaries of the manager, book-keeper, engineer, and others. Then he reckons £150 for coal used to heat the mill occasionally, and run the engine now and then. Besides this, he includes the wages of the people employed at odd times to keep the machinery in working order. Lastly, he puts down £1,200 for depreciation of machinery, because “the weather and the natural principle of

dem Kapitalisten viel einbringt, die Erhaltung des vorhandenen Kapitalwerts.^{22a}

^{22a} „Von allen Hilfsmitteln in der Landwirtschaft ist die Arbeit des Menschen ... dasjenige, auf das der Farmer am meisten zum Ersatz seines Kapitals angewiesen ist. Die beiden anderen—der Bestand an Arbeitsvieh und die ... Karren, Pflüge, Spaten usw.—sind gar nichts ohne eine gewisse Menge des ersten.“ (Edmund Burke, „Thoughts and Details on Scarcity, originally presented to the Rt. Hon. W. Pitt in the Month of November 1795“, edit. London 1800, p. 10.)

Solange das Geschäft flott geht, ist der Kapitalist zu sehr in die Plusmacherei vertieft, um diese Gratisgabe der Arbeit zu sehn. Gewaltsame Unterbrechungen des Arbeitsprozesses, Krisen, machen sie ihm empfindlich bemerkbar.²³

²³ In der „Times“ vom 26. Nov. 1862 jamert ein Fabrikant, dessen Spinnerei 800 Arbeiter beschäftigt und wöchentlich im Durchschnitt 150 Ballen ostindischer oder ungefähr 130 Ballen amerikanischer Baumwolle verzehrt, dem Publikum die jährlichen Stillstandskosten seiner Fabrik vor. Er schlägt sie auf 6000 Pfd.St. an. Unter diesen Unkosten befinden sich viele Posten, die uns hier nichts angehn, wie Grundrente, Steuern, Versicherungsprämien, Salaire für jährlich engagierte Arbeiter, Manager, Buchhalter, Ingenieur usw. Dann aber berechnet er für 150 Pfd.St. Kohlen, um die Fabrik von Zeit zu Zeit zu wärmen und die Dampfmaschine gelegentlich in Gang zu setzen, außerdem Löhne für Arbeiter, die durch gelegentliche Arbeit die Maschinerie „flüssig“ erhalten. Endlich 1200 Pfd.

decay do not suspend their operations because the steam-engine ceases to revolve.” He says, emphatically, he does not estimate his depreciation at more than the small sum of £1,200, because his machinery is already nearly worn out.

St. für Verschlechterung der Maschinerie, da „das Wetter und die natürlichen Ursachen des Verfalls ihr Wirken nicht deshalb einstellen, weil die Dampfmaschine aufhört, sich zu drehen“. Er bemerkt ausdrücklich, diese Summe von 1200 Pfd. St. sei so gering angeschlagen, weil sich die Maschinerie bereits in sehr abgenutztem Zustande befinde.

The value of the means of production is not destroyed and then reproduced, but it is preserved.

315:1/o As regards the means of production, what is really consumed is their use-value, and the consumption of this use-value by labor results in the product. There is no consumption of their value,²⁴ and it would therefore be inaccurate to say that it is reproduced. It is rather preserved; not by reason of any operation it undergoes itself in the process; but because the article in which it originally exists, vanishes, it is true, but vanishes into some other article. Hence, in the value of the product, there is a reappearance of the value of the means of production, but there is, strictly speaking, no reproduction of that value. That which is produced is a new use-value in which the old exchange-value reappears.²⁵

²⁴ “Productive consumption . . . where the consumption of a commodity is a part of the process of production . . . In these instances there is no consumption of value.” (S. P. Newman, l.c., p. 296.)

Footnote 25 already makes the transition to the next topic, what happens to the value of labor-power:

²⁵ In an American compendium that has gone through, perhaps, 20 editions, this passage occurs: “It matters not in what form capital reappears;” then after a lengthy enumeration of all the possible ingredients of production whose value reappears in the product, the passage concludes thus: “The various kinds of food, clothing, and shelter, necessary for the existence and

222:1 Was überhaupt an den Produktionsmitteln verzehrt wird, ist ihr Gebrauchswert, durch dessen Konsumtion die Arbeit Produkte bildet. Ihr Wert wird in der Tat nicht konsumiert,²⁴ kann also auch nicht reproduziert werden. Er wird erhalten, aber nicht weil eine Operation mit ihm selbst im Arbeitsprozeß vorgeht, sondern weil der Gebrauchswert, worin er ursprünglich existiert, zwar verschwindet, aber nur in einem andren Gebrauchswert verschwindet. Der Wert der Produktionsmittel erscheint daher wieder im Wert des Produkts, aber er wird, genau gesprochen, nicht reproduziert. Was produziert wird, ist der neue Gebrauchswert, worin der alte Tauschwert wieder erscheint.²⁵

²⁴ „Produktive Konsumtion: wo die Konsumtion einer Ware Teil des Produktionsprozesses ist . . . In diesen Fällen findet keine Konsumtion von Wert statt.“ (S. P. Newman, l.c. p. 296.)

²⁵ In einem nordamerikanischen Kompendium, das vielleicht 20 Auflagen erlebt hat, liest man: „Es ist nicht von Bedeutung, in welcher Form das Kapital wiedererscheint.“ Nach einer redseligen Aufzählung aller möglichen Produktionsingredienzen, deren Wert im Produkt wiedererscheint, heißt’s schließlich: „Die verschiedenen Arten von Nahrung, Kleidung und

comfort of the human being, are also changed. They are consumed from time to time, and their value re-appears in that new vigour imparted to his body and mind, forming fresh capital, to be employed again in the work of production.” (F. Wayland, l.c., pp. 31, 32.) Without noticing any other oddities, it suffices to observe, that what re-appears in the fresh vigour, is not the bread’s price, but its bloodforming substances. What, on the other hand, re-appears in the value of that vigour, is not the means of subsistence, but their value. The same necessities of life, at half the price, would form just as much muscle and bone, just as much vigour, but not vigour of the same value. This confusion of “value” and “vigour” coupled with our author’s pharisaical indefiniteness, mark an attempt, futile for all that, to thrash out an explanation of surplus-value from a mere re-appearance of pre-existing values.

↓ The opposite is true for labor-power; its value is not transferred to the product, but it creates new value, part of which replaces the capitalist’s advance of the value of labor-power.

316:1 It is otherwise with the subjective factor of the labor-process, with labor-power in action. While the laborer, by virtue of his labor being of a specialised kind that has a special object, preserves and transfers to the product the value of the means of production, he at the same time, by the mere act of working, creates each instant an additional or new value. Suppose the process of production to be stopped just when the workman has produced an equivalent for the value of his own, labor-power, when, for example, by six hours’ labor, he has added a value of 72 cents. This value is the surplus of the total value of the product over the portion of its value that is due to the means of production. It is the only original bit of value formed during this process, the only portion of the value of the

Obdach, die für die Existenz und die Bequemlichkeit des Menschen erforderlich sind, werden ebenfalls verändert. Sie werden von Zeit zu Zeit aufgebraucht, und ihr Wert erscheint wieder in der neuen Kraft, die sie seinem Körper und Geist verleihen, und bildet so neues Kapital, das wieder im Produktionsprozeß angewandt wird.“ (F. Wayland, l.c. p. 31, 32.) Von allen andren Wunderlichkeiten abgesehen, ist es z.B. nicht der Preis des Brotes, der in der erneuten Kraft wiedererscheint, sondern seine blutbildenden Substanzen. Was dagegen als Wert der Kraft wiedererscheint, sind nicht die Lebensmittel, sondern ihr Wert. Dieselben Lebensmittel, wenn sie nur die Hälfte kosten, produzieren ganz ebensoviel Muskel, Knochen usw., kurz dieselbe Kraft, aber nicht Kraft vom selben Wert. Dies Umsetzen von „Wert“ in „Kraft“ und die ganze pharisäische Unbestimmtheit verstecken den allerdings vergeblichen Versuch, aus bloßem Wiedererscheinen vorgeschobener Werte einen Mehrwert herauszudreheln.

223:1 Anders mit dem subjektiven Faktor des Arbeitsprozesses, der sich betätigenden Arbeitskraft. Während die Arbeit durch ihre zweckmäßige Form den Wert der Produktionsmittel auf das Produkt überträgt und erhält, bildet jedes Moment ihrer Bewegung zusätzlichen Wert, Neuwert. Gesetzt, der Produktionsprozeß breche ab beim Punkt, wo der Arbeiter ein Äquivalent für den Wert seiner eignen Arbeitskraft produziert, durch sechsstündige Arbeit z.B. einen Wert von 3 sh. zugesetzt hat. Dieser Wert bildet den Überschuß des Produktenwerts über seine dem Wert der Produktionsmittel geschuldeten Bestandteile. Er ist der einzige Originalwert, der innerhalb dieses Prozesses entstand, der einzige Wertteil des Produkts, der durch den Prozeß selbst produziert ist. Allerdings ersetzt er nur das vom Kapitalisten

product created by this process. It is true, this new value only replaces the money advanced by the capitalist in the purchase of the labor-power, and spent by the laborer on the necessities of life. From the point of view of the 72 cents spent, the new value of 72 cents merely appears as its reproduction. But these 72 cents are really reproduced, unlike the value of the means of production, which only seems reproduced. The replacement of one value by another is here mediated by the creation of new value.

Question 670 *Is the value of the labor-power also transferred to the end product? Does a change in the value of labor-power affect the value of the product?*

↓ Obviously, the surplus-value is new value as well:

316:2/o We know, however, from what has gone before, that the labor-process may continue beyond the time necessary to reproduce and incorporate in the product a mere equivalent for the value of the labor-power. Instead of the six hours that are sufficient for the latter purpose, the process may continue for twelve hours. The action of labor-power, therefore, not only reproduces its own value, but produces value over and above it. This surplus-value is the difference between the value of the product and the value of the elements consumed in the formation of that product, in other words, of the means of production and the labor-power.

Now from the roles of the factors of the labor-process in the transfer and creation of value to the functions of capital. If one understands the flow of value through the production process, one also understands the self-expansion of value in the production process.

317:1 By our representation of the different parts played by the various factors of the labor-process in the formation of the product's value, we have, in fact, characterized of the different functions allotted to the different elements of capital in the process of

beim Kauf der Arbeitskraft vorgeschosne, vom Arbeiter selbst in Lebensmitteln verausgabte Geld. Mit Bezug auf die verausgabten 3 sh. erscheint der Neuwert von 3 sh. nur als Reproduktion. Aber er ist wirklich reproduziert, nicht nur scheinbar, wie der Wert der Produktionsmittel. Der Ersatz eines Werts durch den andren ist hier vermittelt durch neue Wertschöpfung.

223:2 Wir wissen jedoch bereits, daß der Arbeitsprozeß über den Punkt hinaus fort-dauert, wo ein bloßes Äquivalent für den Wert der Arbeitskraft reproduziert und dem Arbeitsgegenstand zugesetzt wäre. Statt der 6 Stunden, die hierzu genügen, währt der Prozeß z.B. 12 Stunden. Durch die Betätigung der Arbeitskraft wird also nicht nur ihr eigener Wert reproduziert, sondern ein überschüssiger Wert produziert. Dieser Mehrwert bildet den Überschuß des Produktenwerts über den Wert der verzehrten Produktbildner, d.h. der Produktionsmittel und der Arbeitskraft.

223:3 Indem wir die verschiedenen Rollen dargestellt, welche die verschiedenen Faktoren des Arbeitsprozesses in der Bildung des Produktenwerts spielen, haben wir in der Tat die Funktionen der verschiedenen Bestandteile des Kapitals in seinem eignen Ver-

expanding its own value. The surplus of the total value of the product, over the sum of the values of its constituent factors, is the surplus of the expanded capital over the capital originally advanced. The means of production on the one hand, labor-power on the other, are merely the different modes of existence which the value of the original capital assumed when from being money it was transformed into the various factors of the labor-process.

↓ Finally, introduction of the concepts constant and variable capital:

317:2 That part of capital then, which is represented by the means of production, by the raw material, auxiliary material and the instruments of labor does not, in the process of production, undergo any quantitative alteration of value. I therefore call it the constant part of capital, or, more shortly, *constant capital*.

317:3 On the other hand, that part of capital, represented by labor-power, does, in the process of production, undergo an alteration of value. It both reproduces the equivalent of its own value, and also produces an excess, a surplus-value, which may itself vary, may be more or less according to circumstances. This part of capital is continually being transformed from a constant into a variable magnitude. I therefore call it the variable part of capital, or, shortly, *variable capital*.

↓ The dividing line between constant and variable capital in the process of creating value and surplus-value is the same as that between objective and subjective factors of the labor process:

The same elements of capital which, from the point of view of the labor-process, present themselves respectively as the objective and subjective factors, as means of production and labor-power, present them-

wertungsprozeß charakterisiert. Der Überschuß des Gesamtwerts des Produkts über die Wertsumme seiner Bildungselemente ist der Überschuß des verwerteten Kapitals über den ursprünglich vorgeschosnen Kapitalwert. Produktionsmittel auf der einen Seite, Arbeitskraft auf der andren sind nur die verschiedenen Existenzformen, die der ursprüngliche Kapitalwert annahm bei Abstreifung seiner Geldform und seiner Verwandlung in die Faktoren des Arbeitsprozesses.

223:4 Der Teil des Kapitals also, der sich in Produktionsmittel, d.h. in Rohmaterial, Hilfsstoffe und Arbeitsmittel umsetzt, verändert seine Wertgröße nicht im Produktionsprozeß. Ich nenne ihn daher konstanten Kapitalteil, oder kürzer: konstantes Kapital.

224:1 Der in Arbeitskraft umgesetzte Teil des Kapitals verändert dagegen seinen Wert im Produktionsprozeß. Er reproduziert sein eignes Äquivalent und einen Überschuß darüber, Mehrwert, der selbst wechseln, größer oder kleiner sein kann. Aus einer konstanten Größe verwandelt sich dieser Teil des Kapitals fortwährend in eine variable. Ich nenne ihn daher variablen Kapitalteil, oder kürzer: variables Kapital.

Dieselben Kapitalbestandteile, die sich vom Standpunkt des Arbeitsprozesses als objektive und subjektive Faktoren, als Produktionsmittel und Arbeitskraft unterscheiden, unterscheiden sich vom Standpunkt des Ver-

selves, from the point of view of the process of creating surplus-value, as constant and variable capital.

In the last three paragraphs of the chapter, Marx says that this coincidence (that only the subjective factors of the labor process fall under the concept of variable capital) is not disturbed even if the value of the objective factors of the labor process varies. This variation can be taken in two meanings: (1) a variation over time in the value of the objective factors, and (2) a variation in the proportion between objective and subjective factors of the labor process.

↓ (1) A change in the values of object of labor and instruments of labor does not alter the fact that they are constant capital. Why not? This change does not originate in the labor process where they function as means of labor but in the labor process where they are produced.

317:4/o The definition of constant capital given above by no means excludes the possibility of a change of value in its elements. Suppose the price of cotton to be one day sixpence a pound, and the next day, in consequence of a failure of the cotton crop, a shilling a pound. Each pound of the cotton bought at sixpence, and worked up after the rise in value, transfers to the product a value of one shilling; and the cotton already spun before the rise, and perhaps circulating in the market as yarn, likewise transfers to the product twice its, original value. It is plain, however, that these changes of value are independent of the increment or surplus-value added to the value of the cotton by the spinning itself. If the old cotton had never been spun, it could, after the rise, be resold at a shilling a pound instead of at sixpence. Further, the fewer the processes the cotton has gone through, the more certain is this result. We therefore find that speculators make it a rule when such sudden changes in value occur, to speculate in that material on which the least possible quantity of labor has been spent: to speculate, therefore, in yarn rather than in cloth, in cotton itself, rather than in yarn. The change of value in the case we

wertungsprozesses als konstantes Kapital und variables Kapital.

224:2/o Der Begriff des konstanten Kapitals schließt eine Wertrevolution seiner Bestandteile in keiner Weise aus. Nimm an, das Pfund Baumwolle koste heute 6 d. und steige morgen, infolge eines Ausfalls der Baumwollernte, auf 1 sh. Die alte Baumwolle, die fortfährt, verarbeitet zu werden, ist zum Wert von 6 d. gekauft, fügt aber jetzt dem Produkt einen Wertteil von 1 sh. zu. Und die bereits versponnene, vielleicht schon als Garn auf dem Markt zirkulierende Baumwolle fügt dem Produkt ebenfalls das Doppelte ihres ursprünglichen Werts zu. Man sieht jedoch, daß diese Wertwechsel unabhängig sind von der Verwertung der Baumwolle im Spinnprozeß selbst. Wäre die alte Baumwolle noch gar nicht in den Arbeitsprozeß eingegangen, so könnte sie jetzt zu 1 sh. statt zu 6 d. wieder verkauft werden. Umgekehrt: Je weniger Arbeitsprozesse sie noch durchlaufen hat, desto sicherer ist dies Resultat. Es ist daher Gesetz der Spekulation, bei solchen Wertrevolutionen auf das Rohmaterial in seiner mindest verarbeiteten Form zu spekulieren, also eher auf Garn als auf Gewebe und eher auf die Baumwolle selbst als auf das Garn. Die Wertänderung entspringt hier in dem

8. Constant Capital and Variable Capital

have been considering, originates, not in the process in which the cotton plays the part of a means of production, and in which it therefore functions as constant capital, but in the process in which the cotton itself is produced. The value of a commodity, it is true, is determined by the quantity of labor contained in it, but this quantity is itself limited by social conditions. If the time socially necessary for the production of any commodity alters—and a given weight of cotton represents, after a bad harvest, more labor than after a good one—all previously existing commodities of the same class are affected, because they are, as it were, only individuals of the species,²⁶ and their value at any given time is measured by the labor socially necessary, *i.e.*, by the labor necessary for their production under the then existing social conditions.

²⁶ “Toutes les productions d’un même genre ne forment proprement qu’une masse, dont le prix se détermine en général et sans égard aux circonstances particulières.” (Le Trosne, l.c., p. 893.)

↓ Now the same argument for the instruments rather than the objects of labor:

318:1 As the value of the raw material may change, so, too, may that of the instruments of labor, of the machinery, etc., employed in the process; and consequently that portion of the value of the product transferred to it from them, may also change. If in consequence of a new invention, machinery of a particular kind can be produced by a diminished expenditure of labor, the old machinery becomes depreciated more or less, and consequently transfers so much less value to the product. But here again, the change in value originates outside the process in which the machine is acting as a means of production. Once engaged in this

Prozeß, der Baumwolle produziert, nicht in dem Prozeß, worin sie als Produktionsmittel und daher als konstantes Kapital funktioniert. Der Wert einer Ware ist zwar bestimmt durch das Quantum der in ihr enthaltenen Arbeit, aber dies Quantum selbst ist gesellschaftlich bestimmt. Hat sich die gesellschaftlich zu ihrer Produktion erheischte Arbeitszeit verändert—und dasselbe Quantum Baumwolle z.B. stellt in ungünstigen Ernten größeres Quantum Arbeit dar, als in günstigen—, so findet eine Rückwirkung auf die alte Ware statt, die immer nur als einzelnes Exemplar ihrer Gattung gilt,²⁶ deren Wert stets durch gesellschaftlich notwendige, also auch stets unter gegenwärtigen gesellschaftlichen Bedingungen notwendige Arbeit gemessen wird.

²⁶ „Alle Erzeugnisse der gleichen Art bilden eigentlich nur eine Masse, deren Preis allgemein und ohne Rücksicht auf die besonderen Umstände bestimmt wird.“ (Le Trosne, l.c. p. 893.)

225:1 Wie der Wert des Rohmaterials, mag der Wert bereits im Produktionsprozeß dienender Arbeitsmittel, der Maschinerie usw., wechseln, also auch der Wertteil, den sie dem Produkt abgeben. Wird z.B. infolge einer neuen Erfindung Maschinerie derselben Art mit verminderter Ausgabe von Arbeit reproduziert, so entwertet die alte Maschinerie mehr oder minder und überträgt daher auch verhältnismäßig weniger Wert auf das Produkt. Aber auch hier entspringt der Wertwechsel außerhalb des Produktionsprozesses, worin die Maschine als Produktionsmittel funktioniert. In diesem Prozeß gibt sie nie mehr Wert ab, als

process, the machine cannot transfer more value than it possesses apart from the process.

↓ (2) Changing proportions between the objective and subjective factors of the labor process, e.g., an increase of the objective as relatively to the subjective factors, does not alter the fact that the one represents constant capital and the other variable capital.

319 Just as a change in the value of the means of production, even after they have commenced to take a part in the labor-process, does not alter their character as constant capital, so, too, a change in the proportion of constant to variable capital does not affect the respective functions of these two kinds of capital. The technical conditions of the labor-process may be revolutionised to such an extent, that where formerly ten men using ten implements of small value worked up a relatively small quantity of raw material, one man may now, with the aid of one expensive machine, work up one hundred times as much raw material. In the latter case we have an enormous increase in the constant capital, that is represented by the total value of the means of production used, and at the same time a great reduction in the variable capital, invested in labor-power. Such a revolution, however, alters only the quantitative relation between the constant and the variable capital, or the proportions in which the total capital is split up into its constant and variable constituents; it has not in the least degree affected the essential difference between the two.

sie unabhängig von diesem Prozeß besitzt.

225:2 Wie ein Wechsel im Wert der Produktionsmittel, ob auch rückwirkend nach ihrem bereits erfolgten Eintritt in den Prozeß, ihren Charakter als konstantes Kapital nicht verändert, ebensowenig berührt ein Wechsel in der Proportion zwischen konstantem und variablem Kapital ihren funktionellen Unterschied. Die technischen Bedingungen des Arbeitsprozesses mögen z.B. so umgestaltet werden, daß, wo früher 10 Arbeiter mit 10 Werkzeugen von geringem Wert eine verhältnismäßig kleine Masse von Rohmaterial verarbeiteten, jetzt 1 Arbeiter mit einer teuren Maschine das hundertfache Rohmaterial verarbeitet. In diesem Fall wäre das konstante Kapital, d.h. die Wertmasse der angewandten Produktionsmittel, sehr gewachsen und der variable Teil des Kapitals, der in Arbeitskraft vorgeschossen, sehr gefallen. Dieser Wechsel ändert jedoch nur das Größenverhältnis zwischen konstantem und variablem Kapital oder die Proportion, worin das Gesamtkapital in konstante und variable Bestandteile zerfällt, berührt dagegen nicht den Unterschied von konstant und variabel.

Question 671 *Why do materials and supplies already go as prices into the end product?*

Question 672 *Show how the value of a product, e.g. of 10 lbs of yarn, can be calculated. (I should give a list with what is needed to produce it.)*

Question 673 *Why is one part of the capital called constant capital and the other variable capital? Into which factor of the production process is the constant capital transformed, and into which the variable capital?*

8. Constant Capital and Variable Capital

Question 674 *What is fixed and circulating capital and what is their relation to constant and variable capital? Why do bourgeois economists always confuse these two concepts?*

Question 675 *Which contradictions of capitalist production are connected with the fact that technical progress increases the constant capital in relation to the variable capital?*

Question 676 *Why is the value of a given commodity not determined by the amount of labor actually contained in it but by the labor necessary for its reproduction?*

Question 677 *Why do the means of production remain constant capital even if their value changes over time?*

9. The Rate of Surplus-Value

9.1. The Degree of Exploitation of Labor-Power

In 250:4/oo, surplus-value is defined as the “increment in capital.” It is the excess of the value of the capital flowing back over the value of the capital advanced. In section 9.1 of chapter Nine, Marx massages this definition in order to get a description of surplus-value which tells us how this increment came about. The first step is here that in the case of productive capital surplus-value is the excess of the value of the product over the value of the elements of production.

9.1.a. [Rate of Surplus-Value]

320:1 The surplus-value generated in the production process by C , the capital advanced, i.e., the valorization of the value of the capital C , represents itself at first as the amount by which the value of the product exceeds the value of the elements entering its production.

This definition clearly points to the production process as the source of surplus-value. Marx calls it the first representation of surplus-value.

↓ Next Marx looks at the elements entering the production of the finished product, and at their values:

320:2 The capital C splits into two components, one, the sum of money c laid out upon the means of production, and the other, the sum of money v expended upon the labor-power; c represents the portion that has become constant capital, and v the portion that has become variable capital. At first then, $C = c + v$: for example, if £500 is the capital advanced, its components may be such that the £500 = £410 const. + £90 var. When the process of production is finished, we get a commodity whose value =

226:1 Der Mehrwert, den das vorgeschobne Kapital C im Produktionsprozeß erzeugt hat, oder die Verwertung des vorgeschobnen Kapitalwerts C stellt sich zunächst dar als der Überschuß des Werts des Produkts über die Wertsumme seiner Produktionselemente.

226:2 Das Kapital C zerfällt in zwei Teile, eine Geldsumme c , die für Produktionsmittel, und eine andre Geldsumme v , die für Arbeitskraft verausgabt wird; c stellt den in konstantes, v den in variables Kapital verwandelten Wertteil vor. Ursprünglich ist also $C = c + v$, z.B. das vorgeschobne Kapital von 500 Pfd.St. = 410 Pfd.St. + 90 Pfd.St. Am Ende des Produktionsprozesses kommt Ware heraus, deren Wert = $c + v + m$, wo m der Mehrwert, z.B. 410 Pfd.St. + 90 Pfd.St. + 90 Pfd.St. Das ursprüngliche Kapital C

9. The Rate of Surplus-Value

$c + v + s$, where s is the surplus-value; or taking our former figures, the value of this commodity may be (£410 const. + £90 var.) + £90 surpl. The original capital has now changed from C to C' , from £500 to £590. The difference is s or a surplus-value of £90.

↓ In order to understand the next passage the reader should bear in mind that Marx distinguishes here between depth categories and surface categories. The surface category of interest here is the valorization of the advanced capital: the capitalist advances C at the beginning and gets back the bigger C' at the end. How did C become C' ? As long as the period is exactly the production period, and as long as the capital advanced is equal to the value of the elements of production, i.e., of the cost of the product, this valorization is equal to the ratio of value of the product over the cost of the product. This points to the production process as the source of surplus-value. I.e., the surplus-value originates in a sphere beneath the circulation process in which the surplus-value first becomes visible. However this seems a very small step, Marx calls it here a tautology:

Since the value of the constituent elements of the product is equal to the value of the advanced capital, it is indeed a tautology to say, that the excess of the value of the product over the value of its constituent elements, is equal to the expansion of the capital advanced or to the surplus-value produced.

↓ However already this first step beneath the surface is not as straightforward as it may seem: if fixed capital is present, then one can only then get an accurate representation of the hidden processes mediating this increase in value, if one compares the value of the finished product not with the entire capital advanced, but only counts the depreciation of the fixed capital instead of the entire value of the fixed capital.

320:3/o Nevertheless, we must examine this tautology a little more closely. The two things compared are, the value of the product and the value of its constituents consumed in the process of production. Now we have seen how that portion of the constant capital which consists of the instruments of labor, transfers to the production only a fraction of its value, while the remainder of that value continues to reside in those instruments. Since this remainder plays no part in the formation of value, we may at present

hat sich in C' verwandelt, aus 500 Pfd.St. in 590 Pfd.St. Die Differenz zwischen beiden ist = m , einem Mehrwert von 90.

Da der Wert der Produktionselemente gleich dem Wert des vorgeschobnen Kapitals, so ist es in der Tat eine Tautologie, daß der Überschuß des Produktenwerts über den Wert seiner Produktionselemente gleich der Verwertung des vorgeschobnen Kapitals oder gleich dem produzierten Mehrwert.

226:3/o Indes erfordert diese Tautologie eine nähere Bestimmung. Was mit dem Produktenwert verglichen wird, ist der Wert der in seiner Bildung aufgezehrten Produktionselemente. Nun haben wir aber gesehen, daß der aus Arbeitsmitteln bestehende Teil des angewandten konstanten Kapitals nur ein Stück seines Werts an das Produkt abgibt, während ein andres Stück in seiner alten Existenzform fort dauert. Da das letztere keine Rolle in der Wertbildung spielt, ist hier davon zu abstrahieren.

leave it on one side.

↑ The transition from the entire fixed capital advanced to that portion of the fixed capital which is depreciated is an abstraction, i.e., it amounts to disregarding an irrelevant factor. ↓ Such an abstraction is only then legitimate if the omission of the irrelevant factor does indeed not make a difference. Marx checks therefore what the calculation must look like if one does not make this abstraction: in this case C' would have to be the value of the finished products *plus* the not yet depreciated part of the value of the fixed capital.

To introduce it into the calculation would make no difference. For instance, taking our former example, $c = £410$: suppose this sum to consist of £312 value of raw material, £44 value of auxiliary material, and £54 value of the machinery worn away in the process; and suppose that the total value of the machinery employed is £1,054. Out of this latter sum, then, we reckon as advanced for the purpose of turning out the product, the sum of £54 alone, which the machinery loses by wear and tear in the process; for this is all it parts with to the product. Now if we also reckon the remaining £1,000, which still continues in the machinery, as transferred to the product, we ought also to reckon it as part of the value advanced, and thus make it appear on both sides of our calculation.^{26a} We should, in this way, get £1,500 on one side and £1,590 on the other. The difference of these two sums, or the surplus-value, would still be £90.

^{26a} "If we reckon the value of the fixed capital employed as a part of the advances, we must reckon the remaining value of such capital at the end of the year as a part of the annual returns." (Malthus, "Princ. of Pol. Econ." 2nd. ed., Lond., 1836, p. 269.)

↑ The magnitude of the surplus-value is the same in both calculations. ↓ But the first calculation is to be preferred, because the undepreciated value of the fixed capital does not play a role for the value of the finished product:

Throughout this Book therefore, by constant capital advanced for the production of value, we always mean, unless the context is re-

Sein Hineinziehen in die Rechnung würde nichts ändern. Nimm an, $c = 410$ Pfd. St. bestehe aus Rohmaterial zu 312 Pfd.St., Hilfsstoffen zu 44 Pfd.St. und im Prozeß verschleißender Maschinerie von 54 Pfd. St., der Wert der wirklich angewandten Maschinerie betrage aber 1054 Pfd.St. Als vorgeschossen zur Erzeugung des Produktenwerts berechnen wir nur den Wert von 54 Pfd.St., den die Maschinerie durch ihre Funktion verliert und daher dem Produkt abgibt. Rechneten wir die 1000 Pfd. St. mit, die in ihrer alten Form fortexistieren als Dampfmaschine usw., so müßten wir sie auf beiden Seiten mitrechnen, auf Seite des vorgeschossenen Werts und auf Seite des Produktenwerts,^{26a} und erhielten so resp. 1500 Pfd.St. und 1590 Pfd.St. Die Differenz oder der Mehrwert wäre nach wie vor 90 Pfd.St.

^{26a} „Wenn wir den Wert des angewandten fixen Kapitals als Teil des vorgeschossenen Kapitals rechnen, müssen wir am Ende des Jahres den verbliebenen Wert dieses Kapitals als einen Teil der Jahreseinnahme rechnen.“ (Malthus, „Princ. of Pol. Econ.“, 2nd ed., London 1836, p. 269.)

Unter dem zur Wertproduktion vorgeschossenen konstanten Kapital verstehn wir daher, wo das Gegenteil nicht aus dem Zusammen-

pugnant thereto, the value of the means of production actually consumed in the process, and that value alone.

↑ By the way, the modern mathematical treatment of the nondepreciated fixed capital as a joint product uses exactly the method rejected here by Marx.

↓ Now Marx begins a new thread arguing that, in order to get the mechanisms which are really responsible for the expansion of the value advanced, one must also abstract from the constant capital.

321:1/o This being so, let us return to the formula $C = c + v$, which we saw was transformed into $C' = (c + v) + s$, C becoming C' . We know that the value of the constant capital is transferred to, and merely re-appears in the product.

↑ The formulation "merely" in this last sentence confirms that Marx is looking for the source of surplus-value. This source cannot lie in c . Only v grows, c remains constant.

↓ I.e., c is not part of the value created in the process.

The new value actually created in the process, the value produced, or value-product, is therefore not the same as the value of the product; it is not, as it would at first sight appear $(c + v) + s$ or £410 const. + £90 var. + £90 surpl.; but $v + s$ or £90 var. + £90 surpl., not £590 but £180.

↓ Now Marx looks at the counterfactual case that $c = 0$, and comes to the conclusion that the valorization process is not affected.

If $c = 0$, or in other words, if there were branches of industry in which the capitalist could dispense with all means of production made by previous labor, whether they be raw material, auxiliary material, or instruments of labor, employing only labor-power and materials supplied by nature, in that case, there would be no constant capital to transfer to the product. This component of the value of the product, i.e., the £410 in our example, would be eliminated, but the sum of £180, the amount of new value created, or the value produced, which contains £90 of surplus-value, would remain just as great as if c represented the highest value

hang erhellt, stets nur den Wert der in der Produktion verzehrten Produktionsmittel.

227:1/o Dies vorausgesetzt, kehren wir zurück zur Formel $C = c + v$, die sich in $C' = c + v + m$ und eben dadurch C in C' verwandelt. Man weiß, daß der Wert des konstanten Kapitals im Produkt nur wieder erscheint.

Das im Prozeß wirklich neu erzeugte Wertprodukt ist also verschieden von dem aus dem Prozeß erhaltenen Produktenwert, daher nicht, wie es auf den ersten Blick scheint, $c + v + m$ oder 410 Pfd.St. + 90 Pfd.St. + 90, sondern $v + m$ oder 90 Pfd.St. + 90 Pfd.St., nicht 590 Pfd.St., sondern 180 Pfd.St.

Wäre c , das konstante Kapital, = 0, in anderen Worten, gäbe es Industriezweige, worin der Kapitalist keine produzierten Produktionsmittel, weder Rohmaterial noch Hilfsstoffe, noch Arbeitsinstrumente, sondern nur von Natur vorhandne Stoffe und Arbeitskraft auszuwenden hätte, so wäre kein konstanter Wertteil auf das Produkt zu übertragen. Dies Element des Produktenwerts, in unsrem Beispiel 410 Pfd.St., fiel fort, aber das Wertprodukt von 180 Pfd.St., welches 90 Pfd.St. Mehrwert enthält, bliebe ganz ebenso groß, als ob c die größte Wertsumme darstellte. Wir hätten $C = 0 + v = v$, und C' , das verwertete Kapital, = $v + m$,

imaginable. We should have $C = (0 + v) = v$ or C' the expanded capital $= v + s$ and therefore $C' - C = s$ as before.

↓ On the other hand, if $s = 0$, i.e., if v is either itself zero, or v does not grow but its value is constant, then the observed valorization could not have occurred.

On the other hand, if $s = 0$, or in other words, if the labor-power, whose value is advanced in the form of variable capital, were to produce only its equivalent, we should have $C = c + v$ or C' the value of the product $= (c + v) + 0$ or $C = C'$. The capital advanced would, in this case, not have expanded its value.

↑ This again underlines the importance of the variable capital and the irrelevance of the constant capital. ↓ But we know that already anyway:

322:1 From what has gone before, we know that surplus-value is purely the result of a variation in the value of v , of that portion of the capital which is transformed into labor-power; consequently, $v + s = v + \Delta v$, or v plus an increment of v .

↓ Since only v grows and c remains constant, the analysis of the process in its pure form requires that we set $c = 0$.

But the true change in value, and the rate of that variation, are obscured by the circumstance that in consequence of the increase in the variable component of the capital, there is also an increase in the sum total of the advanced capital. It was originally £500 and becomes £590. Therefore in order that our investigation may lead to accurate results, we must make abstraction from that portion of the value of the product, in which constant capital alone appears, and consequently must equate the constant capital to zero or make $c = 0$. This is merely an application of a mathematical rule, employed whenever we operate with constant and variable magnitudes, related to each other by the symbols of addition and subtraction only.

↑ The mathematical law referred to here by Marx is: if one adds a constant to a variable

$C' - C$ nach wie vor $= m$.

Wäre umgekehrt $m = 0$, in andren Worten, hätte die Arbeitskraft, deren Wert im variablen Kapital vorgeschossen wird, nur ein Äquivalent produziert, so $C = c + v$, und C' (der Produktenwert) $= c + v + 0$, daher $C = C'$. Das vorgeschossne Kapital hätte sich nicht verwertet.

228:1 Wir wissen in der Tat bereits, daß der Mehrwert bloß Folge der Wertveränderung ist, die mit v , dem in Arbeitskraft umgesetzten Kapitalteil vorgeht, daß also $v + m = v + \Delta v$ (v plus Inkrement von v) ist.

Aber die wirkliche Wertveränderung und das Verhältnis, worin sich der Wert ändert, werden dadurch verdunkelt, daß infolge des Wachstums seines variierenden Bestandteils auch das vorgeschossne Gesamtkapital wächst. Es war 500, und es wird 590. Die reine Analyse des Prozesses erheischt also von dem Teil des Produktenwerts, worin nur konstanter Kapitalwert wieder erscheint, ganz zu abstrahieren, also das konstante Kapital $c = 0$ zu setzen, und damit ein Gesetz der Mathematik anzuwenden, wo sie mit variablen und konstanten Größen operiert und die konstante Größe nur durch Addition oder Subtraktion mit der variablen verbunden ist.

magnitude, one gets something which looks like a variable magnitude, even though not every part of it is variable.

Question 678 *The value of the constant capital reappears in the product. A change in the value of the constant capital has not effect on the surplus-value. Is the same true for the value of the variable capital and its changes?*

↓ Now that we have zeroed in on the variable capital as the true agent of change in the overall capital value, the next step is to define the rate at which this v expands its value. Marx will give this definition in 323:3/o, but first he makes three additional remarks.

Question 679 *What is the name for the value difference by which the value of the product exceeds the value of the elements of production? From the point of view of the capitalist it looks like his value begets more value. Explain where this difference really comes from.*

(1) There is the contradiction that this variable capital is a fixed amount of money, i.e., it is not variable.

322:2/o A further difficulty is caused by the original form of the variable capital. In our example, $C' = £410$ constant capital + £90 variable capital + £90 surplus-value. But £90 is a given and therefore a constant quantity; hence it seems absurd to treat it as variable.

↓ Solution of this contradiction:

But in fact, the term £90 variable capital is here merely a symbol to show that this value undergoes a process. The portion of the capital invested in the purchase of labor-power is a definite quantity of materialised labor, a constant value like the value of the labor-power purchased. But in the process of production the place of the £90 is taken by the labor-power in action, dead labor is replaced by living labor, something stagnant by something flowing, a constant by a variable. The result is the reproduction of v plus an increment of v . From the standpoint then of capitalist production, the whole process is the self-motion of the value that is transformed into labor-power, and which was

228:2 Eine andre Schwierigkeit entspringt aus der ursprünglichen Form des variablen Kapitals. So im obigen Beispiel ist $C' = 410$ Pfd.St. konstantes Kapital + 90 Pfd. St. variables Kapital + 90 Pfd.St. Mehrwert. Neunzig Pfd.St. sind aber eine gegebne, also konstante Größe, und es scheint daher ungeeignet, sie als variable Größe zu behandeln.

Aber 90 Pfd.St. oder 90 Pfd.St. variables Kapital ist hier in der Tat nur Symbol für den Prozeß, den dieser Wert durchläuft. Der im Ankauf der Arbeitskraft vorgeschossne Kapitalteil ist ein bestimmtes Quantum vergegenständlichter Arbeit, also konstante Wertgröße, wie der Wert der gekauften Arbeitskraft. Im Produktionsprozeß selbst aber tritt an die Stelle der vorgeschossnen 90 Pfd.St. die sich betätigende Arbeitskraft, an die Stelle toter, lebendige Arbeit, an die Stelle einer ruhenden eine fließende Größe, an die Stelle einer konstanten eine variable. Das Resultat ist die Reproduktion von v plus Inkrement von v . Vom Standpunkt der kapitalistischen Produktion ist dieser gan-

originally constant. Both the process and its result are therefore assigned to this value. If, therefore, the formula “£90 variable capital,” or “so much self-expanding value”, appears contradictory, this is only because they bring to the surface a contradiction immanent in capitalist production.

↑ Marx digs out here yet another non-obvious contradiction of the daily practical activity in capitalism. It is contradictory to consider the advanced £ 90, which is a constant magnitude, as variable capital. But this is a contradiction inherent to capitalist production: capital claims the value created by living labor as its own product. Although the surplus-value does not come from the *value* of labor-power, it is credited to the capitalist who paid this value.

Question 680 Why does Marx write here “the formula appears contradictory” instead “the formula seems contradictory”?

↓ (2) Second remark: Setting $c = 0$ is an everyday procedure whenever someone subtracts the costs of materials in order to find out the net production of value in a certain industry.

323:1 At first sight it appears a strange proceeding, to equate the constant capital to zero. Yet it is what we do every day. If, for example, we wish to calculate the amount of England’s profits from the cotton industry, we first of all deduct the sums paid for cotton to the United States, India, Egypt and other countries; in other words, the value of the capital that merely re-appears in the value of the product, is put = 0.

↓ (3) Ratio of profits to total advanced capital has important economic meaning as well. This will be discussed in book 3, but it will be abstracted away here.

323:2 Of course the ratio of the surplus-value not only to that portion of the capital from which it immediately springs, and whose change of value it represents, but also to the sum total of the capital advanced is economically of very great importance. We shall, therefore, in the third book, treat of this ratio exhaustively. In order to enable one portion of a capital to expand its value by being converted into labor-power, it is necessary that another portion be con-

ze Verlauf Selbstbewegung des in Arbeitskraft umgesetzten, ursprünglich konstanten Werts. Ihm wird der Prozeß und sein Resultat zugut geschrieben. Erscheint die Formel 90 Pfd.St. variables Kapital oder sich verwertender Wert daher widerspruchsvoll, so drückt sie nur einen der kapitalistischen Produktion immanenten Widerspruch aus.

229:1 Die Gleichsetzung des konstanten Kapitals mit 0 befremdet auf den ersten Blick. Indes vollzieht man sie beständig im Alltagsleben. Will jemand z.B. Englands Gewinn an der Baumwollindustrie berechnen, so zieht er vor allem den an die Vereinigten Staaten, Indien, Ägypten usw. gezahlten Baumwollpreis ab; d.h., er setzt im Produktenwert nur wiedererscheinenden Kapitalwert = 0.

229:2 Allerdings hat das Verhältnis des Mehrwerts nicht nur zum Kapitalteil, woraus er unmittelbar entspringt und dessen Wertveränderung er darstellt, sondern auch zum vorgeschossenen Gesamtkapital seine große ökonomische Bedeutung. Wir behandeln dies Verhältnis daher ausführlich im dritten Buch. Um einen Teil des Kapitals durch seinen Umsatz in Arbeitskraft zu verwerten, muß ein anderer Teil des Kapitals in Produktionsmittel verwandelt wer-

verted into means of production. In order that variable capital may perform its function, constant capital must be advanced in proper proportion, a proportion given by the special technical conditions of each labor-process. The circumstance, however, that retorts and other vessels, are necessary to a chemical process, does not compel the chemist to notice them in the result of his analysis. If we look at the means of production, in their relation to the creation of value, and to the variation in the quantity of value, apart from anything else, they appear simply as the material in which labor-power, the value-creator, incorporates itself. Neither the nature, nor the value of this material is of any importance. The only requisite is that there be a sufficient supply to absorb the labor expended in the process of production. That supply once given, the material may rise or fall in value, or even be, as land and the sea, without any value in itself; but this will have no influence on the creation of value or on the variation in the quantity of value.²⁷

↑ Marx compares the constant capital to the test tube in which a chemical reaction takes place; right now we are interested in the reaction itself.

↓ The footnote clarifies that the word “value creation” does not refer to a creation out of nothing.

²⁷ What Lucretius says is self-evident; “nil posse creari de nihilo,” out of nothing, nothing can be created. Creation of value is transformation of labor-power into labor. Labor-power itself is energy transferred to a human organism by means of nourishing matter.

↓ After these three side remarks Marx continues in the main current of the argument. Setting $c = 0$ one gets the rate at which that part of the capital expands that is responsible for the expansion of the entire capital. Marx calls this the rate of surplus-value.

323:3/o In the first place then we equate the constant capital to zero. The capital ad-

den. Damit das variable Kapital funktioniere, muß konstantes Kapital in entsprechenden Proportionen, je nach dem bestimmten technischen Charakter des Arbeitsprozesses, vorgeschossen werden. Der Umstand jedoch, daß man zu einem chemischen Prozeß Retorten und andre Gefäße braucht, verhindert nicht, bei der Analyse von der Retorte selbst zu abstrahieren. Sofern Wertschöpfung und Wertveränderung für sich selbst, d.h. rein betrachtet werden, liefern die Produktionsmittel, diese stofflichen Gestalten des konstanten Kapitals, nur den Stoff, worin sich die flüssige, wertbildende Kraft fixieren soll. Die Natur dieses Stoffes ist daher auch gleichgültig, ob Baumwolle oder Eisen. Auch der Wert dieses Stoffes ist gleichgültig. Er muß nur in hinreichender Masse vorhanden sein, um das während des Produktionsprozesses zu verausgabende Arbeitsquantum einsaugen zu können. Diese Masse gegeben, mag ihr Wert steigen oder fallen, oder sie mag wertlos sein, wie Erde und Meer, der Prozeß der Wertschöpfung und Wertveränderung wird nicht davon berührt.²⁷

²⁷ Note zur 2. Ausg. Es versteht sich von selbst mit Lucretius „nil posse creari de nihilo“. Aus nichts wird nichts. „Wertschöpfung“ ist Umsatz von Arbeitskraft in Arbeit. Ihrerseits ist die Arbeitskraft vor allem in menschlichen Organismus umgesetzter Naturstoff.

229:3/o Wir setzen also zunächst den konstanten Kapitalteil gleich Null. Das vor-

vanced is consequently reduced from $c + v$ to v , and instead of the value of the product $c + v + s$ we have now the value produced $v + s$. Given the new value produced = £180, which sum consequently represents the whole labor expended during the process, then subtracting from it £90 the value of the variable capital, we have remaining £90, the amount of the surplus-value. This sum of £90 or s expresses the absolute quantity of surplus-value produced. The relative quantity produced, or the increase per cent of the variable capital, is determined, it is plain, by the ratio of the surplus-value to the variable capital, or is expressed by s/v . In our example this ratio is $90/90$, which gives an increase of 100%. This relative increase in the value of the variable capital, or the relative magnitude of the surplus-value, I call, "The rate of surplus-value."²⁸

²⁸ In the same way that the English use the terms "rate of profit," "rate of interest." We shall see, in Book III, that the rate of profit is no mystery, so soon as we know the laws of surplus-value. If the process is reversed, neither the one nor the other is comprehensible.

↑ Very strong epistemological statement: if approached in the wrong order, things become incomprehensible.

9.1.b. [Rate of Exploitation]

So far Marx was concerned about how the surface appearance of surplus-value as the excess of sales price over cost should be read. The important quantitative relationship is that between v and s . In the next two paragraphs he discusses an equally important quantitative relationship in the production process. Now we are no longer on the level of surface appearances, but we are analyzing a process that is taking place behind closed doors.

↓ Marx begins with the introduction of the concept "necessary labor" as distinct from "surplus labor." Although the word "necessary labor" was used previously, this is a new and different meaning of the same word.

324:1/o We have seen that the laborer, during one portion of the labor-process, pro-

geschoßne Kapital reduziert sich daher von $c + v$ auf v , und der Produktenwert $c + v + m$ auf das Wertprodukt $v + m$. Gegeben das Wertprodukt = 180 Pfd.St., worin sich die während der ganzen Dauer des Produktionsprozesses fließende Arbeit darstellt, so haben wir den Wert des variablen Kapitals = 90 Pfd.St. abzuziehen, um den Mehrwert = 90 Pfd.St. zu erhalten. Die Zahl 90 Pfd.St. = m drückt hier die absolute Größe des produzierten Mehrwerts aus. Seine proportionelle Größe aber, also das Verhältnis, worin das variable Kapital sich verwertet hat, ist offenbar bestimmt durch das Verhältnis des Mehrwerts zum variablen Kapital oder ist ausgedrückt in m/v . Im obigen Beispiel also in $90/90 = 100\%$. Diese verhältnismäßige Verwertung des variablen Kapitals oder die verhältnismäßige Größe des Mehrwerts nenne ich Rate des Mehrwerts.²⁸

²⁸ In derselben Weise, wie der Engländer „rate of profits“, „rate of interest“, usw. braucht. Man wird aus Buch III sehen, daß die Profitrate leicht zu begreifen, sobald man die Gesetze des Mehrwerts kennt. Auf dem umgekehrten Weg begreift man ni l'un, ni l'autre.

230:1/o Wir haben gesehen, daß der Arbeiter während eines Abschnitts des Ar-

duces only the value of his labor-power, that is, the value of his means of subsistence. Now since his work forms part of a system, based on the social division of labor, he does not directly produce the actual necessities which he himself consumes; he produces instead a particular commodity, yarn for example, whose value is equal to the value of those necessities or of the money with which they can be bought. The portion of his day's labor devoted to this purpose, will be greater or less, in proportion to the value of the necessities that he daily requires on an average, or, what amounts to the same thing, in proportion to the labor-time required on an average to produce them. If the value of those necessities represent on an average the expenditure of six hours' labor, the workman must on an average work for six hours to produce that value. If instead of working for the capitalist, he worked independently on his own account, he would, other things being equal, still be obliged to labor for the same number of hours, in order to produce the value of his labor-power, and thereby to gain the means of subsistence necessary for his conservation or continued reproduction.

The concept of necessary labor can be defined whenever there is commodity production, even if labor-power is not sold as a commodity. But under capitalism, this necessary labor obtains a specific form; it takes the form of reproduction rather than that of a new production of value:

But as we have seen, during that portion of his day's labor in which he produces the value of his labor-power, say three shillings, he produces only an equivalent for the value of his labor-power already advanced^{28a} by the capitalist; the new value created only replaces the variable capital advanced. It is owing to this fact, that the production of the

beitsprozesses nur den Wert seiner Arbeitskraft produziert, d.h. den Wert seiner notwendigen Lebensmittel. Da er in einem auf gesellschaftlicher Teilung der Arbeit beruhenden Zustand produziert, produziert er seine Lebensmittel nicht direkt, sondern in Form einer besonderen Ware, des Garns z.B., einen Wert gleich dem Wert seiner Lebensmittel oder dem Geld, womit er sie kauft. Der Teil seines Arbeitstags, den er hierzu verbraucht, ist größer oder kleiner, je nach dem Wert seiner durchschnittlichen täglichen Lebensmittel, also je nach der zu ihrer Produktion erheischten durchschnittlichen täglichen Arbeitszeit. Wenn der Wert seiner täglichen Lebensmittel im Durchschnitt 6 vergegenständlichte Arbeitsstunden darstellt, so muß der Arbeiter im Durchschnitt täglich 6 Stunden arbeiten, um ihn zu produzieren. Arbeitete er nicht für den Kapitalisten, sondern für sich selbst, unabhängig, so müßte er, unter sonst gleichbleibenden Umständen, nach wie vor im Durchschnitt denselben aliquoten Teil des Tags arbeiten, um den Wert seiner Arbeitskraft zu produzieren, und dadurch die zu seiner eignen Erhaltung oder beständigen Reproduktion nötigen Lebensmittel zu gewinnen.

Da er in dem Teil des Arbeitstags, worin er den Tageswert der Arbeitskraft, sage 3 sh., produziert, nur ein Äquivalent für ihren vom Kapitalisten bereits gezahlten^{28a} Wert produziert, also durch den neu geschaffnen Wert nur den vorgeschößnen variablen Kapitalwert ersetzt, erscheint diese Produktion von Wert als bloße Reproduktion.

new value of three shillings appears as mere reproduction.

The Moore-Aveling translation says: "It is owing to this fact, that the production of the new value of three shillings takes the semblance of a mere reproduction." This translation is wrong. It not only

seems so, but in the bookkeeping of the capitalist and also the tax laws there is no difference between the value of the raw materials etc. which reappears in the product, and the value of the wages which

is replaced by new value and *not* transferred to the end product. On the level of the surface, the production of necessary means of subsistence has indeed the form of reproduction.

This is not a mere semblance, as the Moore-Aveling translation says, but this is a real relation on the surface. Instead of "reproduction" it is perhaps clearer to use here the word "transfer": The period of the day during which the worker produces an equivalent of his wage takes the form of a mere transfer of the value expended for the wage to the product; however the worker's wage is not transferred to the product, it is consumed by the worker, and the worker creates new value during the work-day which replaces it.

^{28a} Note added in the 3rd German edition.

{The author resorts here to the economic language in current use. It will be remembered that on p. 182 (present edition, p. 174) it was shown that in reality the laborer "advances" to the capitalist and not the capitalist to the laborer.} F. E.

Next Marx introduces the terminology "necessary labor" for this and justifies this wording.

That portion of the working-day, then, during which this reproduction takes place, I call "*necessary*" labor-time, and the labor expended during that time I call "*necessary*" labor²⁹.

The footnote clarifies that this a different meaning of the word "necessary labor" than that used earlier in the book:

²⁹ In this work, we have, up to now, employed the term "necessary labor-time," to designate the time necessary under given social conditions for the production of any commodity. Henceforward we use it to designate also the time necessary for the production of the particular commodity labor-power. The use of one and the same technical term in different senses is inconvenient, but in no science can it be altogether avoided. Compare, for instance, the higher with the lower branches of mathematics.

Necessary, as regards the laborer, because independent of the particular social form of

^{28a} {Note zur 3. Aufl. Der Verfasser gebraucht hier die landläufige ökonomische Sprache. Man erinnert sich, daß auf S. 137 nachgewiesen, wie in Wirklichkeit nicht der Kapitalist dem Arbeiter, sondern der Arbeiter dem Kapitalisten „vorschießt“.—F.E.}

Den Teil des Arbeitstags also, worin diese Reproduktion vorgeht, nenne ich notwendige Arbeitszeit, die während derselben verausgabte Arbeit notwendige Arbeit.²⁹

²⁹ Wir haben bisher in dieser Schrift das Wort „notwendige Arbeitszeit“ angewandt für die zur Produktion einer Ware überhaupt gesellschaftlich notwendige Arbeitszeit. Wir brauchen es von jetzt ab auch für die zur Produktion der spezifischen Ware Arbeitskraft notwendige Arbeitszeit. Der Gebrauch derselben termini technici in verschiedenem Sinn ist mißlich, aber in keiner Wissenschaft ganz zu vermeiden. Man vergleiche z.B. die höheren und niedren Teile der Mathematik.

Notwendig für den Arbeiter, weil unabhängig von der gesellschaftlichen Form seiner Ar-

his labor; necessary, as regards capital, and the world of capitalists, because on the continued existence of the laborer depends their existence also.

↑ Interestingly, Marx uses here a system-transcending criterion: "Necessary for the worker, because independent of the particular social form of his labor."

Question 682 Compare the concept of necessary labor introduced in chapter Nine with the socially necessary labor introduced in chapter One. Is it the same word used for two completely different concepts or are these concepts related somehow, and if so how?

↓ The next paragraph stresses that surplus-value is objectified surplus labor, i.e., it originates in labor performed in excess of that necessary for the maintenance of the worker.

325:1 During the second period of the labor-process, that in which his labor is no longer necessary labor, the workman, it is true, labors, expends labor-power; but his labor, being no longer necessary labor, he creates no value for himself. He creates surplus-value which, for the capitalist, has all the charms of a creation out of nothing. This portion of the working-day, I name surplus labor-time, and to the labor expended during that time, I give the name of surplus-labor. It is every bit as important, for a correct understanding of surplus-value, to conceive it as a mere congelation of surplus labor-time, as nothing but materialised surplus-labor, as it is, for a proper comprehension of value, to conceive it as a mere congelation of so many hours of labor, as nothing but materialised labor.

↓ Surplus-labor exists in all class societies:

The essential difference between the various economic forms of society, between, for instance, a society based on slave-labor, and one based on wage-labor, lies only in the mode in which this surplus-labor is in each case extracted from the actual producer, the laborer.³⁰

³⁰ Herr Wilhelm Thucydides Roscher has found a mare's nest. He has made the impor-

beit. Notwendig für das Kapital und seine Welt, weil das beständige Dasein des Arbeiters ihre Basis.

231:1 Die zweite Periode des Arbeitsprozesses, die der Arbeiter über die Grenzen der notwendigen Arbeit hinaus schantz, kostet ihm zwar Arbeit, Verausgabung von Arbeitskraft, bildet aber keinen Wert für ihn. Sie bildet Mehrwert, der den Kapitalisten mit allem Reiz einer Schöpfung aus Nichts anlacht. Diesen Teil des Arbeitstags nenne ich Surplusarbeitszeit, und die in ihr verausgabte Arbeit: Mehrarbeit (suplus labour). So entscheidend es für die Erkenntnis des Werts überhaupt, ihn als bloße Gerinnung von Arbeitszeit, als bloß vergegenständlichte Arbeit, so entscheidend ist es für die Erkenntnis des Mehrwerts, ihn als bloße Gerinnung von Surplusarbeitszeit, als bloß vergegenständlichte Mehrarbeit zu begreifen.

Nur die Form, worin diese Mehrarbeit dem unmittelbaren Produzenten, dem Arbeiter, abgepreßt wird, unterscheidet die ökonomischen Gesellschaftsformationen, z.B. die Gesellschaft der Sklaverei von der der Lohnarbeit.³⁰

³⁰ Mit wahrhaft Gottschedscher Genialität entdeckt Herr Wilhelm Thucydides Roscher,

tant discovery that if, on the one hand, the formation of surplus-value, or surplus-produce, and the consequent accumulation of capital, is now-a-days due to the thrift of the capitalist, on the other hand, in the lowest stages of civilisation it is the strong who compel the weak to economise. (l.c., p. 78.) To economise what? Labor? Or superfluous wealth that does not exist? What is it that makes such men as Roscher account for the origin of surplus-value, by a mere rechauffé of the more or less plausible excuses by the capitalist, for his appropriation of surplus-value? It is, besides their real ignorance, their apologetic dread of a scientific analysis of value and surplus-value, and of obtaining a result, possibly not altogether palatable to the powers that be.

daß, wenn die Bildung von Mehrwert oder Mehrprodukt, und die damit verbundene Akkumulation, heurigen Tags der „Sparsamkeit“ des Kapitalisten geschuldet, der dafür „z.B. Zins verlangt“, dagegen „auf den niedrigsten Kulturstufen ... die Schwächeren von den Stärkeren zur Sparsamkeit gezwungen werden“. (l.c. p. 82, 78.) Zur Ersparung von Arbeit? oder nicht vorhandener überschüssiger Produkte? Neben wirklicher Ignoranz ist es apologetische Scheu vor gewissenhafter Analyse des Werts und Mehrwerts, und etwas verfänglich-polizeiwidrigem Resultat, die einen Roscher und Kons. zwingt, die mehr oder minder plausiblen Rechtfertigungsgründe des Kapitalisten für seine Aneignung vorhandener Mehrwerte in Entstehungsgründe des Mehrwerts zu verdrehen.

9.1.c. [Rate of Surplus-Value Expresses Rate of Exploitation]

Now the bridge between the surface and the underlying phenomena. Perhaps a better metaphor in the present case would be: the *opening* through which the surface lays bare an important aspect of the underlying process. The rate of surplus-value, easily computed from empirical phenomena, is equal to the proportional division of the labor day into necessary and surplus labor.

326:1 Since, on the one hand, the values of the variable capital and of the labor-power purchased by that capital are equal, and the value of this labor-power determines the necessary portion of the working-day; and since, on the other hand, the surplus-value is determined by the surplus portion of the working-day, it follows that surplus-value bears the same ratio to variable capital, that surplus-labor does to necessary labor, or in other words, the rate of surplus-value (s/v) = (surplus-labor / necessary labor). Both ratios, s/v and surplus-labor/necessary-labor, express the same thing in different ways; in the one case by reference to materialised, incorporated labor, in the other by reference to living, fluent labor.

231:2/o Da der Wert des variablen Kapitals = Wert der von ihm gekauften Arbeitskraft, da der Wert dieser Arbeitskraft den notwendigen Teil des Arbeitstags bestimmt, der Mehrwert seinerseits aber bestimmt ist durch den überschüssigen Teil des Arbeitstags, so folgt: Der Mehrwert verhält sich zum variablen Kapital, wie die Mehrarbeit zur notwendigen, oder die Rate des Mehrwerts m/v = (Mehrarbeit) / (Notwendige Arbeit). Beide Proportionen drücken dasselbe Verhältnis in verschiedner Form aus, das eine Mal in der Form vergegenständlichter, das andre Mal in der Form flüssiger Arbeit.

Two equations for the rate of surplus-value: s/v and surplus labor/necessary labor.

326:2 The rate of surplus-value is therefore an exact expression for the degree of exploitation of labor by capital, or of the laborer by the capitalist.^{30a}

s/v it is an empirically measurable phenomenon, but it expresses what is going on underneath the surface, the exploitation of labor-power. By making the mathematical division one penetrates through the surface.

^{30a} Although the rate of surplus-value is an exact expression for the degree of exploitation of labor-power, it is, in no sense, an expression for the absolute amount of exploitation. For example, if the necessary labor 5 hours and the surplus-labor = 5 hours, the degree of exploitation is 100%. The amount of exploitation is here measured by 5 hours. If, on the other hand, the necessary labor = 6 hours and the surplus-labor = 6 hours, the degree of exploitation remains, as before, 100%, while the actual amount of exploitation has increased 20%, namely from five hours to six.

⇓ Rate of exploitation much higher than profit rate.

326:3/o We assumed in our example, that the value of the product £410 const. + £90 var. + £90 surpl., and that the capital advanced = £500. Since the surplus-value = £90, and the advanced capital = £500, we should, according to the usual way of reckoning, get as the rate of surplus-value (generally confounded with rate of profits) 18%, a rate so low as possibly to cause a pleasant surprise to Mr. Carey and other harmonisers. But in truth, the rate of surplus-value is not equal to s/C or $s/C+v$: thus it is not 90/500 but 90/90 or 100%, which is more than five times the apparent degree of exploitation.

⇓ In the second half of the paragraph Marx emphasizes how extraordinary this “peek” below the surface is.

Although, in the case we have supposed, we are ignorant of the actual length of the working-day, and of the duration in days

232:1 Die Rate des Mehrwerts ist daher der exakte Ausdruck für den Exploitationsgrad der Arbeitskraft durch das Kapital oder des Arbeiters durch den Kapitalisten.^{30a}

^{30a} Note zur 2. Ausg. Obgleich exakter Ausdruck für den Exploitationsgrad der Arbeitskraft, ist die Rate des Mehrwerts kein Ausdruck für die absolute Größe der Exploitation. Z.B. wenn die notwendige Arbeit = 5 Stunden und die Mehrarbeit = 5 Stunden, ist der Exploitationsgrad = 100%. Die Größe der Exploitation ist hier gemessen durch 5 Stunden. Ist dagegen die notwendige Arbeit = 6 Stunden und die Mehrarbeit = 6 Stunden, so bleibt der Exploitationsgrad von 100% unverändert, während die Größe der Exploitation um 20% wächst, von 5 auf 6 Stunden.

232:2 Nach unsrer Annahme war der Wert des Produkts = 410 Pfd.St. + 90 Pfd. St. + 90, das vorgeschobne Kapital = 500 Pfd.St. Da der Mehrwert = 90 und das vorgeschobne Kapital = 500, würde man nach der gewöhnlichen Art der Berechnung herausbekommen, daß die Rate des Mehrwerts (die man mit der Profitrate verwechselt) = 18%, eine Verhältniszahl, deren Niedrigkeit Herrn Carey und andre Harmoniker rühren möchte. In der Tat aber ist die Rate des Mehrwerts nicht = m/C oder $m/(c+m)$, sondern = m/v , also nicht 90/500, sondern 90/90 = 100%, mehr als das Fünffache des scheinbaren Exploitationsgrads.

Obgleich wir nun im gegebenen Fall die absolute Größe des Arbeitstags nicht kennen, auch nicht die Periode des Arbeitsprozesses

or weeks of the labor-process, as also of the number of laborers employed, yet the rate of surplus-value s/v accurately discloses to us, by means of its equivalent expression, surplus-labor/necessary labor the relation between the two parts of the working-day. This relation is here one of equality, the rate being 100%. Hence, it is plain, the laborer, in our example, works one half of the day for himself, the other half for the capitalist.

↑ Although many details about the working day are unknown to us, the empirically accessible s/v reveals exactly the relative magnitude of the two portions of the working day.

9.1.d. [Example]

To conclude this first section, Marx gives in a cookbook fashion the prescription how to calculate the rate of surplus-value, and then two detailed examples. He apparently considered it important that people should be able to make this calculation.

327:1 The method of calculating the rate of surplus-value is therefore, shortly, as follows. We take the total value of the product and put the constant capital which merely re-appears in it, equal to zero. What remains, is the only value that has, in the process of producing the commodity, been actually created. If the amount of surplus-value be given, we have only to deduct it from this remainder, to find the variable capital. And *vice versa*, if the latter be given, and we require to find the surplus-value. If both be given, we have only to perform the concluding operation, viz., to calculate s/v , the ratio of the surplus-value to the variable capital.

327:2 Though the method is so simple, yet it may not be amiss, by means of a few examples, to exercise the reader in the application of the novel principles underlying it.

Example of a spinning mill.

(Tag, Woche usw.), endlich nicht die Anzahl der Arbeiter, die das variable Kapital von 90 Pfd.St. gleichzeitig in Bewegung setzt, zeigt uns die Rate des Mehrwerts m/v durch ihre Konvertibilität in (Mehrarbeit) / (Notwendige Arbeit) genau das Verhältnis der zwei Bestandteile des Arbeitstags zueinander. Es ist 100%. Also arbeitete der Arbeiter die eine Hälfte des Tags für sich und die andre für den Kapitalisten.

232:3 Die Methode zur Berechnung der Rate des Mehrwerts ist also kurzgefaßt diese: Wir nehmen den ganzen Produktenwert und setzen den darin nur wiedererscheinen den konstanten Kapitalwert gleich Null. Die übrigbleibende Wertsumme ist das einzige im Bildungsprozeß der Ware wirklich erzeugte Wertprodukt. Ist der Mehrwert gegeben, so ziehn wir ihn von diesem Wertprodukt ab, um das variable Kapital zu finden. Umgekehrt, wenn letztes gegeben und wir den Mehrwert suchen. Sind beide gegeben, so ist nur noch die Schlußoperation zu verrichten, das Verhältnis des Mehrwerts zum variablen Kapital, m/v , zu berechnen.

233:1 So einfach die Methode, scheint es doch passend, den Leser in die ihr zu Grunde liegende und ihm ungewohnte Anschauungsweise durch einige Beispiele einzuerzieren.

327:3/o First we will take the case of a spinning mill containing 10,000 mule spindles, spinning No. 32 yarn from American cotton, and producing 1 lb. of yarn weekly per spindle. We assume the waste to be 6%: under these circumstances 10,600 lbs. of cotton are consumed weekly, of which 600 lbs. go to waste. The price of the cotton in April, 1871, was 7 3/4 d. per lb.; the raw material therefore costs in round numbers £342. The 10,000 spindles, including preparation-machinery, and motive power, cost, we will assume, £1 per spindle, amounting to a total of £10,000. The wear and tear we put at 10%, or £1,000 yearly = £20 weekly. The rent of the building we suppose to be £300 a year, or £6 a week. Coal consumed (for 100 horse-power indicated, at 4 lbs. of coal per horse-power per hour during 60 hours, and inclusive of that consumed in heating the mill), 11 tons a week at 8s. 6 d. a ton, amounts to about £4 1/2 a week: gas, £1 a week, oil, etc., £4 1/2 a week. Total cost of the above auxiliary materials, £10 weekly. Therefore the constant portion of the value of the week's product is £378. Wages amount to £52 a week. The price of the yarn is 12 1/4 d. per lb. which gives for the value of 10,000 lbs. the sum of £510. The surplus-value is therefore in this case £510 - £430 = £80. We put the constant part of the value of the product = 0, as it plays no part in the creation of value. There remains £132 as the weekly value created, which = £52 var. + £80 surpl. The rate of surplus-value is therefore $80/52 = 153\frac{11}{13}\%$. In a working-day of 10 hours with average labor the result is: necessary labor = $3\frac{31}{33}$ hours, and surplus-labor = $6\frac{2}{33}$.³¹

³¹ The above data, which may be relied upon,

233:2 Zunächst das Beispiel einer Spinnerei von 10 000 Mulespindeln, die Nr. 32 Garn aus amerikanischer Baumwolle spinn und 1 Pfund Garn wöchentlich per Spindel produziert. Der Abfall ist 6%. Also werden 10 600 Pfund Baumwolle wöchentlich in 10 000 Pfund Garn und 600 Pfund Abfall verarbeitet. Im April 1871 kostet diese Baumwolle 7 3/4 d. per Pfund, also für 10 600 Pfund rund 342 Pfd.St. Die 10 000 Spindeln, inklusive Vorspinnmaschine und Dampfmaschine, kosten 1 Pfd.St. per Spindel, also 10 000 Pfd.St. Ihr Verschleiß beträgt 10% = 1000 Pfd.St. oder wöchentlich 20 Pfd.St. Die Miete des Fabrikgebäudes ist 300 Pfd.St. oder 6 Pfd.St. per Woche. Kohlen (4 Pfund per Stunde und Pferdekraft, auf 100 Pferdekraft (Indikator), und 60 Stunden per Woche inklusive Heizung des Gebäudes) 11 tons per Woche, zu 8 sh. 6 d. die Tonne, kosten rund 4 1/2 Pfd. St. per Woche; Gas 1 Pfd.St. per Woche, Öl 4 1/2 Pfd.St. per Woche, also alle Hilfsstoffe 10 Pfd.St. per Woche. Also ist der konstante Wertteil 378 Pfd.St. per Woche. Der Arbeitslohn beträgt 52 Pfd.St. per Woche. Der Garnpreis ist 12 1/4 d. per Pfund oder 10 000 Pfd. = 510 Pfd.St., der Mehrwert also $510 - 430 = 80$ Pfd.St. Wir setzen den konstanten Wertteil von 378 Pfd.St. = 0, da er in der wöchentlichen Wertbildung nicht mitspielt. Bleibt das wöchentliche Wertprodukt von $132 = 52 + 80$ Pfd.St. Die Rate des Mehrwerts also = $80/52 = 153\frac{11}{13}\%$. Bei zehnstündigem durchschnittlichem Arbeitstag ergibt dies: Notwendige Arbeit = $3\frac{31}{33}$ Stunden und Mehrarbeit = $6\frac{2}{33}$ Stunden.³¹

³¹ Note zur 2. Ausg. Das in der ersten Ausga-

were given me by a Manchester spinner. In England the horse-power of an engine was formerly calculated from the diameter of its cylinder, now the actual horse-power shown by the indicator is taken.

be gegebne Beispiel einer Spinnerei für das Jahr 1860 enthielt einige faktische Irrtümer. Die im Text gegebenen durchaus genauen Daten sind mir von einem Manchester Fabrikanten geliefert.— Es ist zu bemerken, daß in England die alte Pferdekraft nach dem Durchschnitt des Zylinders berechnet wurde, die neue nach der wirklichen Kraft zählt, die der Indikator anzeigt.

To follow these calculations note that each £ has 20 shillings, and each shilling 12 d. (pence). The costs of producing 10,000 lbs. of yarn split up into the following components: Raw material cotton: 10,600 lbs of cotton at 7 3/4 d. per lb, whose total cost is £ 342 plus 5 shillings plus 10 d., Marx takes the round number £ 342. Depreciation of the spindles: The 10,000 spindles cost £ 1 each. They last 10 years, and Marx assumes 50 weeks per year. This gives a depreciation of altogether £ 20 each week. Rent of the building: £300 each year, gives £ 6 each week. Coal: 4 lbs for every hour and horse power: 60 hours each week, 100 horse powers, gives 24,000 lbs. He says 11 tons, how many lbs are in a ton? Price of coal is 8 sh 6 d the ton (which is 102 d the ton); for 11 tons it would be 1122 d, or £ 4 plus 13 sh plus 6 d. Marx takes the round number of £ 4 1/2. Gas: £ 1 each week. Oil: £ 4 1/2 each week. All these constant cost elements together give £ 342 + 20 + 6 + 10 = 378. Now the labor: it is £ 52 per week. Finally the sales price of the yarn is 12 1/4 d., therefore the total sales amount is £ 510 plus 8 shillings plus 4 d., Marx rounds it to £ 510.

Therefore we have $378c + 52v + 80s = 510$. Rate of surplus-value is $\frac{s}{v} = \frac{80}{52} = \frac{20}{13}$. Therefore 13/33 of the day is necessary labor and 20/33 of the day is surplus labor. If the day is 10 hours long, this gives 3 31/33 hours of necessary labor and 6 2/33 hours surplus labor.

↓ Is there an error in the wheat example? What is the relationship between a bushel and a quarter? Arithmetic gives: if 22 bushels cost £ 11, then 1 bushel costs 10 shillings. Since Marx says the price is 80 sh. per quarter, this could only be true if 1 quarter is 8 bushels?

328:1 One more example. Jacob gives the following calculation for the year 1815. Owing to the previous adjustment of several items it is very imperfect; nevertheless for our purpose it is sufficient. In it he assumes the price of wheat to be 80 s. a quarter, and the average yield per acre to be 22 bushels.

234:1 Jacob gibt für das Jahr 1815, bei Annahme eines Weizenpreises von 80 sh. per Quarter und eines Durchschnittsertrags von 22 Buschels per acre, so daß der acre 11 Pfd.St. einbringt, folgende durch vorherige Kompensation verschiedner Posten sehr mangelhafte, aber für unsren Zweck genügende Rechnung.

Value Produced Per Acre		
Seed (wheat)	1 Pfd.St.	9 sh.
Manure	2 Pfd.St.	10 sh.
Wages	3 Pfd.St.	10 sh.
Summa:	7 Pfd.St.	9 sh.
Tithes, Rates, Taxes	1 Pfd.St.	1 sh.
Rent	1 Pfd.St.	8 sh.
Farmer's Profit and Interest	1 Pfd.St.	2 sh.
Summa:	3 Pfd.St.	11 sh.

Wertproduktion per acre		
Samen (Weizen)	1 Pfd.St.	9 sh.
Dünger	2 Pfd.St.	10 sh.
Arbeitslohn	3 Pfd.St.	10 sh.
Summa:	7 Pfd.St.	9 sh.
Zehnten, Rates, Taxes	1 Pfd.St.	1 sh.
Rente	1 Pfd.St.	8 sh.
Pächters Profit u. Zins	1 Pfd.St.	2 sh.
Summa:	3 Pfd.St.	11 sh.

The Moore-Aveling translation says it should be 80 s. per acre as says 8 s. per acre, but Alan Sievers in the German.

328:2/o Assuming that the price of the product is the same as its value, we here find the surplus-value distributed under the various heads of profit, interest, rent, etc. We have nothing to do with these in detail; we simply add them together, and the sum is a surplus-value of £3 11s. 0d. The sum of £3 19s. 0d., paid for seed and manure, is constant capital, and we put it equal to zero. There is left the sum of £3 10s. 0d., which is the variable capital advanced: and we see that a new value of £3 10s. 0d + £3 11s. 0d. has been produced in its place. Therefore $s/v = £3 11s. 0d. / £3 10s. 0d.$, giving a rate of surplus-value of more than 100%. The laborer employs more than one half of his working-day in producing the surplus-value, which different persons, under different pretexts, share amongst themselves.^{31a}

234:2 Der Mehrwert, stets unter der Voraussetzung, daß Preis des Produkts = seinem Wert, wird hier unter die verschiedenen Rubriken, Profit, Zins, Zehnten usw. verteilt. Diese Rubriken sind uns gleichgültig. Wir addieren sie zusammen und erhalten einen Mehrwert von 3 Pfd.St. 11 sh. Die 3 Pfd. St. 19 sh. für Samen und Dünger setzen wir als konstanten Kapitalteil gleich Null. Bleibt vorgeschossnes variables Kapital von 3 Pfd.St. 10 sh., an dessen Stelle ein Neuwert von 3 Pfd.St. 10 sh. + 3 Pfd.St. 11 sh. produziert worden ist. Also beträgt $m/v = (3 \text{ Pfd.St. } 11 \text{ sh.}) / (3 \text{ Pfd.St. } 10 \text{ sh.})$, mehr als 100%. Der Arbeiter verwendet mehr als die Hälfte seines Arbeitstags zur Produktion eines Mehrwerts, den verschiedene Personen auf verschiedene Verwände hin unter sich verteilen.^{31a}

^{31a} The calculations given in the text are intended merely as illustrations. We have in fact assumed that prices = values. We shall, however, see, in Book III., that even in the case of average prices the assumption cannot be made in this very simple manner.

Question 683 *What is the rate of surplus-value? In which respect can it be seen as an indicator of the exploitation of the worker?*

Question 684 *What is the rate of profits? Which other factors besides the exploitation of the workers determine the rate of profits? (This question goes somewhat beyond the scope of the reading assignments.)*

Question 685 *What is necessary labor and why is it called necessary? (Don't confuse with the "socially necessary labor-time") Discuss the terms "paid" and "unpaid labor."*

Question 686 *Why is it incorrect to express the rate of exploitation by the proportion surplus-labor/working-day?*

9.2. Representation of the Components Parts of the Value of the Product by Proportional Parts of the Product

329:2 Let us now return to the example by which we were shown how the capitalist converts money into capital. The necessary labor of his spinner was 6 hours, ditto the surplus-labor, the degree of exploitation of labor-power was therefore 100%.

329:3 The product of a working-day of 12 hours is 20 lbs. of yarn, having a value of 30s. No less than 8/10ths of this value, or 24s., is due to mere re-appearance in it, of the value of the means of production (20 lbs. of cotton, value 20s., and spindle worn away, 4s.): it is therefore constant capital. The remaining 2/10ths or 6s. is the new value created during the spinning process: of this one half replaces the value of the day's labor-power, or the variable capi-

^{31a} Die gegebenen Rechnungen gelten nur als Illustration. Es wird nämlich unterstellt, daß die Preise = den Werten. Man wird in Buch III sehn, daß diese Gleichsetzung, selbst für die Durchschnittspreise, sich nicht in dieser einfachen Weise macht.

234:3 Kehren wir nun zum Beispiel zurück, das uns zeigte, wie der Kapitalist aus Geld Kapital macht. Die notwendige Arbeit seines Spinners betrug 6 Stunden, die Mehrarbeit desgleichen, der Exploitationsgrad der Arbeitskraft daher 100%.

234:4/o Das Produkt des zwölfstündigen Arbeitstags sind 20 Pfd. Garn zum Wert von 30 sh. Nicht weniger als 8/10 dieses Garnwerts (24 sh.) sind gebildet durch den nur wieder erscheinenden Wert der verzehrten Produktionsmittel (20 Pfd. Baumwolle zu 20 sh., Spindel usw. zu 4 sh.) oder bestehn aus konstantem Kapital. Die übrigen 2/10 sind der während des Spinnprozesses entstandne Neuwert von 6 sh., wovon eine Hälfte den vorgeschossenen Tageswert der

tal, the remaining half constitutes a surplus-value of 3s. The total value then of the 20 lbs. of yarn is made up as follows:

30s. value of yarn = 24s. const. + 3s. var. + 3s. surpl.

330:1 Since the whole of this value is contained in the 20 lbs. of yarn produced, it follows that the various component parts of this value can be represented as being contained respectively in corresponding parts of the product.

330:2 If the value of 30s. is contained in 20 lbs. of yarn, then 8/10ths of this value, or the 24s. that form its constant part, is contained in 8/10ths of the product or in 16 lbs. of yarn. Of the latter, 13 1/3 lbs. represent the value of the raw material, the 20s. worth of cotton spun, and 2 2/3 lbs. represent the 4s. worth of spindle, etc., worn away in the process.

330:3 Hence the whole of the cotton used up in spinning the 20 lbs. of yarn, is represented by 13 1/3 lbs. of yarn. This latter weight of yarn contains, it is true, by weight, no more than 13 1/3 lbs. of cotton, worth 13 1/3 shillings; but the 6 2/3 shillings additional value contained in it are the equivalent for the cotton consumed in spinning the remaining 6 2/3 lbs. of yarn. The effect is the same as if these 6 2/3 lbs. of yarn contained no cotton at all, and the whole 20 lbs. of cotton were concentrated in the 13 1/3 lbs. of yarn. The latter weight, on the other hand, does not contain an atom either of the value of the auxiliary materials and implements, or of the value newly created in the process.

330:4 In the same way, the 2 2/3 lbs. of yarn, in which the 4s., the remainder of the constant capital, is embodied, represents

Arbeitskraft ersetzt oder das variable Kapital, und die andre Hälfte eine Mehrwert von 3 sh. bildet. Der Gesamtwert der 20 Pfd.

Garn ist also folgendermaßen zusammengesetzt:

Garnwert von 30 sh. = 24 sh. + 3 sh. + 3 sh.

235:1 Da dieser Gesamtwert sich in dem Gesamtprodukt von 20 Pfd. Garn darstellt, müssen auch die verschiedenen Wertelemente in proportionellen Teilen des Produkts darstellbar sein.

235:2 Existiert ein Garnwert von 30 sh. in 20 Pfd. Garn, so 8/10 dieses Werts, oder sein konstanter Teil von 24 sh., in 8/10 des Produkts, oder in 16 Pfd. Garn. Davon stellen 13 1/3 Pfd. den Wert des Rohmaterials dar, der versponnenen Baumwolle zu 20 sh., und 2 2/3 Pfd. den Wert der verzehrten Hilfsstoffe und Arbeitsmittel, Spindel usw. zu 4 sh.

235:3 13 1/3 Pfund Garn stellen also alle im Gesamtprodukt vom 20 Pfd. Garn versponnene Baumwolle vor, das Rohmaterial des Gesamtprodukts, aber auch weiter nichts. In ihnen stecken zwar nur 13 1/3 Pfd. Baumwolle zum Wert von 13 1/3 sh., aber ihr zusätzlicher Wert von 6 2/3 sh. bildet ein Äquivalent für die in den andren 6 2/3 Pfd. Garn versponnene Baumwolle. Es ist, als ob letzteren die Wolle ausgerupft und alle Wolle des Gesamtprodukts in 13 1/3 Pfd. Garn zusammengestopft wäre. Sie enthalten dagegen jetzt kein Atom des Werts der verbrauchten Hilfsstoffe und Arbeitsmittel noch des im Spinnprozeß geschaffnen Neuwerts.

235:4 Ebenso stellen weitere 2 2/3 Pfd. Garn, worin der Rest des konstanten Kapitals (= 4 sh.) steckt, nichts dar außer dem

nothing but the value of the auxiliary materials and instruments of labor consumed in producing the 20 lbs. of yarn.

330:5 We have, therefore, arrived at this result: although eight-tenths of the product, or 16 lbs. of yarn, is, in its character of an article of utility, just as much the fabric of the spinner's labor, as the remainder of the same product, yet when viewed in this connexion, it does not contain, and has not absorbed any labor expended during the process of spinning. It is just as if the cotton had converted itself into yarn, without help; as if the shape it had assumed was mere trickery and deceit: for so soon as our capitalist sells it for 24s., and with the money replaces his means of production, it becomes evident that this 16 lbs. of yarn is nothing more than so much cotton and spindle-waste in disguise.

330:6/o On the other hand, the remaining 2/10 ths of the product, or 4 lbs. of yarn, represent nothing but the new value of 6s., created during the 12 hours' spinning process. All the value transferred to those 4 lbs. from the raw material and instruments of labor consumed, was, so to say, intercepted in order to be incorporated in the 16 lbs. first spun. In this case, it is as if the spinner had spun 4 lbs. of yarn out of air, or, as if he had spun them with the aid of cotton and spindles, that, being the spontaneous gift of Nature, transferred no value to the product.

331:1 Of this 4 lbs. of yarn, in which the whole of the value newly created during the process, is condensed, one half represents the equivalent for the value of the labor consumed, or the 3s. variable capital, the other half represents the 3s. surplus-value.

331:2 Since 12 working-hours of the spinner are embodied in 6s., it follows that in yarn of the value of 30s. there must

Wert der im Gesamtprodukt von 20 Pfd. Garn vernutzten Hilfsstoffe und Arbeitsmittel.

235:5 Acht Zehntel des Produkts, oder 16 Pfd. Garn, obgleich leiblich, als Gebrauchs-wert betrachtet, als Garn, ebensosehr Gebilde der Spinnarbeit wie die restierenden Produktteile, enthalten daher in diesem Zusammenhang keine Spinnarbeit, keine während des Spinnprozesses selbst eingesaugte Arbeit. Es ist, als ob sie sich ohne Spinnen in Garn verwandelt hätten und als wäre ihre Garngestalt reiner Lug und Trug. In der Tat, wenn der Kapitalist sie verkauft zu 24 sh. und damit seine Produktionsmittel zurückkauft, zeigt sich, daß 16 Pfd. Garn—nur verkleidete Baumwolle, Spindel, Kohle usw. sind.

236:1 Umgekehrt stellen die übrigbleibenden 8/10 des Produkts oder 4 Pfd. Garn jetzt nichts dar außer dem im zwölfstündigen Spinnprozeß produzierten Neuwert von 6 sh. Was vom Wert der vernutzten Rohmaterialien und Arbeitsmittel in ihnen steckte, ward bereits ausgeweidet und den ersten 16 Pfd. Garn einverleibt. Die in 20 Pfd. Garn in der Luft gewirkt oder in Baumwolle und mit Spindeln, die ohne Zutat menschlicher Arbeit, von Natur vorhanden, dem Produkt keinen Wert zusetzen.

236:2 Von den 4 Pfd. Garn, worin so das ganze Wertprodukt des täglichen Spinnprozesses existiert, stellt die eine Hälfte nur den Ersatzwert der vernutzten Arbeitskraft dar, also das variable Kapital von 3 sh., die andren 2 Pfd. Garn nur den Mehrwert von 3 sh.

236:3 Da 12 Arbeitsstunden des Spinners sich in 6 sh. vergegenständlichen, sind im Garnwert von 30 sh. 60 Arbeitsstunden ver-

be embodied 60 working-hours. And this quantity of labor-time does in fact exist in the 20 lbs. of yarn; for in 8/10ths or 16 lbs. there are materialised the 48 hours of labor expended, before the commencement of the spinning process, on the means of production; and in the remaining 2/10ths or 4 lbs. there are materialised the 12 hours' work done during the process itself.

331:3 On a former page we saw that the value of the yarn is equal to the sum of the new value created during the production of that yarn plus the value previously existing in the means of production. It has now been shown how the various component parts of the value of the product, parts that differ functionally from each other, may be represented by corresponding proportional parts of the product itself.

331:4 To split up in this manner the product into different parts, of which one represents only the labor previously spent on the means of production, or the constant capital, another, only the necessary labor spent during the process of production, or the variable capital, and another and last part, only the surplus-labor expended during the same process, or the surplus-value; to do this, is, as will be seen later on from its application to complicated and hitherto unsolved problems, no less important than it is simple.

331:5 In the preceding investigation we have treated the total product as the final result, ready for use, of a working-day of 12 hours. We can however follow this total product through all the stages of its production; and in this way we shall arrive at the same result as before, if we represent the partial products, given off at the different stages, as functionally different parts of

gegenständlich. Sie existieren in 20 Pfd. Garn, wovon 8/10 oder 16 Pfd. die Materialur von 48 vor dem Spinnprozeß vergangenen Arbeitsstunden sind, nämlich der in den Produktionsmitteln des Garns vergegenständlichten Arbeit, 2/10 oder 4 Pfd. dagegen die Materialur der im Spinnprozeß selbst verausgabten 12 Arbeitsstunden.

236:4 Früher sahen wir, daß der Garnwert gleich der Summe des in seiner Produktion erzeugten Neuwerts plus der bereits in seinen Produktionsmitteln präexistierenden Werte ist. Jetzt hat sich gezeigt, wie die funktionell oder begrifflich verschiedenen Bestandteile des Produktenwerts in proportionalen Teilen des Produkts selbst darstellbar sind.

236:5 Diese Zerfällung des Produkts—des Resultats des Produktionsprozesses—in ein Quantum Produkt, das nur die in den Produktionsmitteln enthaltne Arbeit oder den konstanten Kapitalteil, ein andres Quantum, das nur die im Produktionsprozeß zugesetzte notwendige Arbeit oder den variablen Kapitalteil, und ein letztes Quantum Produkt, das nur die im selben Prozeß zugesetzte Mehrarbeit oder den Mehrwert darstellt, ist ebenso einfach als wichtig, wie ihre spätre Anwendung auf verwickelte und noch ungelöste Probleme zeigen wird.

236:6 Wir betrachteten eben das Gesamtprodukt als fertiges Resultat des zwölfstündigen Arbeitstags. Wir können es aber auch in seinem Entstehungsprozeß begleiten, und dennoch die Teilprodukte als funktionell unterschiedne Produktenteile darstellen.

the final or total product.

↑ Note that there is more text in the English than the German!

331:6/332 The spinner produces in 12 hours 20 lbs. of yarn, or in 1 hour $1\frac{2}{3}$ lbs.; consequently he produces in 8 hours $13\frac{2}{3}$ lbs., or a partial product equal in value to all the cotton that is spun in a whole day. In like manner the partial product of the next period of 1 hour and 36 minutes, is $2\frac{2}{3}$ lbs. of yarn: this represents the value of the instruments of labor that are consumed in 12 hours. In the following hour and 12 minutes, the spinner produces 2 lbs. of yarn worth 3 shillings, a value equal to the whole value he creates in his 6 hours' necessary labor. Finally, in the last hour and 12 minutes he produces another 2 lbs. of yarn, whose value is equal to the surplus-value, created by his surplus-labor during half a day. This method of calculation serves the English manufacturer for every-day use; it shows, he will say, that in the first 8 hours, or $\frac{2}{3}$ of the working-day, he gets back the value of his cotton; and so on for the remaining hours. It is also a perfectly correct method: being in fact the first method given above with this difference, that instead of being applied to space, in which the different parts of the completed product lie side by side, it deals with time, in which those parts are successively produced. But it can also be accompanied by very barbarian notions, more especially in the heads of those who are as much interested, practically, in the process of making value beget value, as they are in misunderstanding that process theoretically. Such people may get the notion into their heads, that our spinner, for example, produces or replaces in the first 8 hours of his working-day the *value* of the cotton; in the following hour and 36 minutes the *value* of

236:7/o Der Spinner produziert in 12 Stunden 20 Pfd. Garn, daher in einer Stunde $1\frac{2}{3}$ und in 8 Stunden $13\frac{1}{3}$ Pfd., also ein Teilprodukt vom Gesamtwert der Baumwolle, die während des ganzen Arbeitstags versponnen wird. In derselben Art und Weise ist das Teilprodukt der folgenden Stunde und 36 Minuten = $2\frac{2}{3}$ Pfd. Garn und stellt daher den Wert der während der 12 Arbeitsstunden vernutzten Arbeitsmittel dar. Ebenso produziert der Spinner in der folgenden Stunde und 12 Minuten 2 Pfd. Garn = 3 sh., ein Produktenwert gleich dem ganzen Wertprodukt, das er in 6 Stunden notwendiger Arbeit schafft. Endlich produziert er in den letzten $\frac{6}{5}$ Stunden ebenfalls 2 Pfd. Garn, deren Wert gleich dem durch seine halbtägige Mehrarbeit erzeugten Mehrwert. Diese Art Berechnung dient dem englischen Fabrikanten zum Hausgebrauch, und er wird z.B. sagen, daß er in den ersten 8 Stunden oder $\frac{2}{3}$ des Arbeitstags seine Baumwolle ausschlägt usw. Man sieht, die Formel ist richtig, in der Tat nur die erste Formel, übersetzt aus dem Raum, wo die Teile des Produkts fertig nebeneinander liegen, in die Zeit, wo sie aufeinander folgen. Die Formel kann aber auch von sehr barbarischen Vorstellungen begleitet sein, namentlich in Köpfen, die ebenso praktisch im Verwertungsprozeß interessiert sind, als sie ein Interesse haben, ihn theoretisch mißzuverstehen. So kann sich eingebildet werden, daß unser Spinner z.B. in den ersten 8 Stunden seines Arbeitstags den Wert der Baumwolle, in der folgenden Stunde und 36 Minuten den Wert der verzehrten Arbeitsmittel, in der folgenden Stunde und 12 Minuten den Wert des Arbeitslohns produziert oder er-

the instruments of labor worn away; in the next hour and 12 minutes the *value* of the wages; and that he devotes to the production of surplus-value for the manufacturer, only that well known "last hour." In this way the poor spinner is made to perform the two-fold miracle not only of producing cotton, spindles, steam-engine, coal, oil, etc., at the same time that he spins with them, but also of turning one working-day into five; for, in the example we are considering, the production of the raw material and instruments of labor demands four working-days of twelve hours each, and their conversion into yarn requires another such day. That the love of lucre induces an easy belief in such miracles, and that sycophant doctrinaires are never wanting to prove them, is vouched for by the following incident of historical celebrity.

setzt, und nur die vielberühmte „letzte Stunde“ dem Fabrikherrn, der Produktion von Mehrwert widmet. Dem Spinner wird so das doppelte Wunder aufgebürdet, Baumwolle, Spindel, Dampfmaschine, Kohle, Öl usw. in demselben Augenblick zu produzieren, wo er mit ihnen spinnst, und aus einem Arbeitstag von gegebenem Intensitätsgrad fünf solcher Tage zu machen. In unsrem Fall nämlich erfordert die Produktion des Rohmaterials und der Arbeitsmittel $\frac{24}{6}$ = 4 zwölfstündige Arbeitstage und ihre Verwandlung in Garn einen andren zwölfstündigen Arbeitstag. Daß die Raubgier solche Wunder glaubt und nie den doktrinären Sykophanten mißt, der sie beweist, zeige nun ein Beispiel von historischer Berühmtheit.

9.3. Senior's 'Last Hour'

Section 9.3 illustrates how thoroughly Marx analyses even such a blatantly false statement as Senior's. Marx is not satisfied with counterposing a correct statement to it, but he follows Senior's logic on its own terms, shows that it leads to a contradiction, and the resolution of this contradiction is the correction of Senior's logic.

333:1 One fine morning, in the year 1836, Nassau W. Senior, who may be called the bel-esprit of English economists, well known, alike for his economic "science," and for his beautiful style, was summoned from Oxford to Manchester, to learn in the latter place, the Political Economy that he taught in the former. The manufacturers elected him as their champion, not only against the newly passed Factory Act, but against the still more menacing Ten-hours' agitation. With their usual practical acuteness, they had found out that the learned

237:1 An einem schönen Morgen des Jahres 1836 wurde der wegen seiner ökonomischen Wissenschaft und seines schönen Stils berufene Nassau W. Senior, gewissermaßen der Claren unter den englischen Ökonomen, von Oxford nach Manchester zitiert, um hier politische Ökonomie zu lernen, statt sie in Oxford zu lehren. Die Fabrikanten erkoren ihn zum Preisfechter gegen den neulich erlassenen Factory Act und die darüber noch hinausstrebende Zehnstundenagitation. Mit gewohntem praktischen Scharfsinn hatten sie erkannt, daß der Herr Professor

Professor "wanted a good deal of finishing;" it was this discovery that caused them to write for him. On his side the Professor has embodied the lecture he received from the Manchester manufacturers, in a pamphlet, entitled: "Letters on the Factory Act, as it affects the cotton manufacture." London, 1837. Here we find, amongst others, the following edifying passage:

333:2/o Under the present law, no mill in which persons under 18 years of age are employed, ... can be worked more than 11 1/2 hours a day, that is 12 hours for 5 days in the week, and nine on Saturday. Now the following analysis (!) will show that in a mill so worked, the whole net profit is derived *from the last hour*. I will suppose a manufacturer to invest £100,000:—£80,000 in his mill and machinery, and £20,000 in raw material and wages. The annual return of that mill, supposing the capital to be turned once a year, and gross profits to be 15 per cent., ought to be goods worth £15,000... Of this £115,000, each of the twenty-three half-hours of work produces 5—115ths or one twenty-third. Of these 23—23rds (constituting the whole £115,000), twenty, that is to say £100,000 out of the £115,000, simply replace the capital;—one twenty-third (or £5,000 out of the £115,000) makes up for the deterioration of the mill and machinery. The remaining 2—23rds, that is, the last two of the twenty-three half-hours of every day, produce the net profit of 10 per cent. If, therefore (prices remaining the same), the factory could be kept at work thirteen hours instead of eleven and a half, with an addition of about £2,600 to the circulating capital, the net profit would be more than doubled. On the other hand, if the hours of working were reduced by one hour per day (prices remaining the same), the *net* profit would be destroyed—if they were reduced by one hour and a half, even the *gross* profit would be destroyed."³²

„wanted a good deal of finishing“. Sie verschieben ihn daher nach Manchester. Der Herr Professor seinerseits hat die zu Manchester von den Fabrikanten erhaltene Lektion stilisiert in dem Pamphlet: „Letters on the Factory Act, as it affects the cotton manufacture“, London 1837. Hier kann man u.a. folgendes Erbauliche lesen:

238:1 „Unter dem gegenwärtigen Gesetz kann keine Fabrik, die Personen unter 18 Jahren beschäftigt, länger als 11 1/2 Stunden täglich arbeiten, d.h. 12 Stunden während der ersten 5 Tage und 9 Stunden am Sonnabend. Die folgende Analyse (!) zeigt nun, daß in einer solchen Fabrik der ganze Reingewinn von der letzten Stunde abgeleitet ist. Ein Fabrikant legt 100 000 Pfd.St. aus—80 000 Pfd.St. in Fabrikgebäude und Maschinen, 20 000 in Rohmaterial und Arbeitslohn. Der jährliche Umsatz der Fabrik, vorausgesetzt, das Kapital schlage jährlich einmal um und der Bruttogewinn betrage 15%, muß sich auf Waren zum Wert von 115 000 Pfd.St. belaufen ... Von diesen 115 000 Pfd.St. produziert jede der 23 halben Arbeitsstunden täglich 5/115 oder 1/23. von diesen 23/23, die das Ganze der 115 000 Pfd.St. bilden (constituting the whole 115 000 Pfd.St.), ersetzen 20/23, d.h. 100 000 von den 115 000, nur das Kapital; 1/23 oder 5000 Pfd. St. von den 15 000 Brutto-Gewinn (!) ersetzen die Abnutzung der Fabrik und Maschine. Die übrigbleibenden 2/23, d.h. die beiden letzten halben Stunden jedes Tages produzieren den Reingewinn von 10%. Wenn daher bei gleichbleibenden Preisen die Fabrik 13 Stunden statt 11 1/2 arbeiten dürfte, so würde, mit einer Zulage von ungefähr 2600 Pfd.St. zum zirkulierenden Kapital, der Reingewinn mehr als verdoppelt werden. Andererseits, wenn die Arbeitsstunden täglich um 1 Stunde reduziert würden, würde der Reingewinn verschwinden, wenn um 1 1/2 Stunden, auch der Bruttogewinn.“³²

³² Senior, l.c., pp. 12, 13. We let pass such extraordinary notions as are of no importance for our purpose; for instance, the assertion, that manufacturers reckon as part of their profit, gross or net, the amount required to make good wear and tear of machinery, or in other words, to replace a part of the capital. So, too, we pass over any question as to the accuracy of his figures. Leonard Homer has shown in "A Letter to Mr. Senior," etc., London, 1837, that they are worth no more than so-called "Analysis." Leonard Horner was one of the Factory Inquiry Commissioners in 1833, and Inspector, or rather Censor of Factories till 1859. He rendered undying service to the English working-class. He carried on a life-long contest, not only with the embittered manufacturers, but also with the Cabinet, to whom the number of votes given by the masters in the Lower House, was a matter of far greater importance than the number of hours worked by the "hands" in the mills.

The remainder of the footnote gives a cleaner formulation of Senior's mistaken calculation. I.e., Marx does not correct the conceptual mistakes, but he reformulates them in a clearer way, in order to be able to better refute it:

^{32 ctd} Senior's representation is confused, apart from the wrongness of its content. What he really intended to say was this: The manufacturer employs the workman for 11 1/2 hours or for 23 half-hours daily. As the working-day, so, too, the working year, may be conceived to consist of 11 1/2 hours or 23 half-hours, but each multiplied by the number of working-days in the year. On this supposition, the 23 half-hours yield an annual product of £115,000; one half-hour yields $1/23 \times £115,000$; 20 half-hours yield $20/23 \times £115,000 = £100,000$, i.e., they replace no more than the capital advanced. There remain 3 half-hours, which yield $3/23 \times £115,000 = £5,000$ or the gross profit. Of these 3 half-hours, one yields $1/23 \times £115,000 = £5,000$; i.e., it makes up for the wear and tear of the machinery; the remaining 2 half-hours, i.e., the last hour, yield $2/23 \times £115,000 = £10,000$ or the net profit. In the text Senior converts the last 2/23 of the product into portions of the working-day itself.

³² Senior, l.c. p. 12, 13. Wir gehn auf die für unsren Zweck gleichgültigen Kuriosa nicht ein, z.B. die Behauptung, daß die Fabrikanten den Ersatz der verschliffenen Maschinerie usw., also eines Kapitalbestandteils, zum Gewinn, Brutto oder Netto, schmutzig oder rein, rechnen. Auch nicht auf die Richtigkeit oder Falschheit der Zahlenangaben. Daß sie nicht mehr wert sind als die sogenannte „Analyse“, bewies Leonard Horner in „A Letter to Mr. Senior etc“, London 1837. Leonard Horner, einer der Factory Inquiry Commissioners von 1833 und Fabrikinspektor, in der Tat Fabrikzensor, bis 1859, hat unsterbliche Verdienste um die englische Arbeiterklasse gewonnen. Außer mit den erbitterten Fabrikanten führte er einen lebenslangen Kampf mit den Ministern, für die es ungleich wichtiger war, die „Stimmen“ der Fabrikherrn im Unterhaus als die Arbeitsstunden der „Hände“ in der Fabrik zu zählen.

^{32 ctd} Zusatz zur Note 32. Seniors Darstellung ist konfus, ganz abgesehen von der Falschheit ihres Inhalts. Was er eigentlich sagen wollte, war dies: Der Fabrikant beschäftigt die Arbeiter täglich 11 1/2 oder 23/2 Stunden. Wie der einzelne Arbeitstag, so besteht die Jahresarbeit aus 11 1/2 oder 23/2 Stunden (multipliziert mit der Anzahl der Arbeitstage während des Jahrs). Dies vorausgesetzt, produzieren die 23/2 Arbeitsstunden das Jahresprodukt von 115 000 Pfd.St.; 1/2 Arbeitsstunde produziert $1/23 \times 115\,000$ Pfd. St.; 20/2 Arbeitsstunden produzieren $20/23 \times 115\,000$ Pfd.St. = 100 000 Pfd.St., d.h. sie ersetzen nur das vorgeschobne Kapital. Bleiben 3/2 Arbeitsstunden, die $3/23 \times 115\,000$ Pfd.St. = 15 000 produzieren, d.h. den Bruttogewinn. Von diesen 3/2 Arbeitsstunden produziert 1/2 Arbeitsstunde $1/23 \times 115\,000$ Pfd.St. = 5000 Pfd. St., d.h. sie produziert nur den Ersatz für den Verschleiß der Fabrik und der Maschinerie. Die letzten zwei halben Arbeitsstunden, d.h. die letzte

334:1–338:0 And the Professor calls this an “analysis!”

It is amazing how many errors this calculation contains. First Marx remarks that even if one adopts Senior's faulty framework one will not get to the same result as Senior:

If, giving credence to the out-cries of the manufacturers, he believed that the workmen spend the best part of the day in the production, i.e., the reproduction or replacement of the value of the buildings, machinery, cotton, coal, etc., then his analysis was superfluous. His answer would simply have been:—Gentlemen! if you work your mills for 10 hours instead of 11 1/2, then, other things being equal, the daily consumption of cotton, machinery, etc., will decrease in proportion. You gain just as much as you lose. Your work-people will in future spend one hour and a half less time in reproducing or replacing the capital that has been advanced.

But if Senior wanted to apply economic principles, he would first of all have to introduce the distinction between constant and variable capital:

—If, on the other hand, he did not believe them without further inquiry, but, as being an expert in such matters, deemed an analysis necessary, then he ought, in a question that is concerned exclusively with the relations of net profit to the length of the working-day, before all things to have asked the manufacturers, to be careful not to lump together machinery, workshops, raw material, and labor, but to be good enough to place the constant capital, invested in buildings, machinery, raw material, etc., on one side of the account, and the capital advanced in wages on the other side.

The data furnished by the capitalists say that £ 100,000 were advanced as “capital,” i.e.,

Arbeitsstunde, produziert $2/23 \times 115\,000$ Pfd. St. = 10 000 Pfd.St., d.h. den Nettoprofit. Im Text verwandelt Senior die letzten $2/23$ des Produkts in Teile des Arbeitstags selbst.

239:1 Und das nennt der Herr Professor eine „Analyse“!

Glaubte er den Fabrikantenjammer, daß die Arbeiter die beste Zeit des Tags in der Produktion, daher der Reproduktion oder dem Ersatz des Werts von Baulichkeiten, Maschinen, Baumwolle, Kohle usw. vergeuden, so war jede Analyse überflüssig. Er hatte einfach zu antworten: Meine Herren! Wenn ihr 10 Stunden arbeiten laßt statt 11 1/2, wird, unter sonst gleichbleibenden Umständen, der tägliche Verzehr von Baumwolle, Maschinerie usw. um 1 1/2 Stunden abnehmen. Ihr gewinnt also grade so viel, als ihr verliert. Eure Arbeiter werden in Zukunft 1 1/2 Stunden weniger für Reproduktion oder Ersatz des vorgeschobnen Kapitalwerts vergeuden.

Glaubte er ihnen nicht aufs Wort, sondern hielt als Sachverständiger eine Analyse für nötig, so mußte er vor allem, in einer Frage, die sich ausschließlich um das Verhältnis des Reingewinns zur Größe des Arbeitstags dreht, die Herren Fabrikanten ersuchen, Maschinerie und Fabrikgebäude, Rohmaterial und Arbeit nicht kunterbunt durcheinanderzuwirren, sondern gefällt das in Fabrikgebäude, Maschinerie, Rohmaterial usw. enthaltne konstante Kapital auf die eine, das in Arbeitslohn vorgeschobne Kapital auf die andre Seite zu stellen.

labor and materials, corresponding to the product of 10 hours. Assuming that £ 10,000 of this were spent for labor and £ 90,000 for materials, this assumption would give a ratio of 1:1 between wages and surplus-value. Senior, talking as an economist, would be able to say that half of the day was spent to reproduce the wages, and the other half for profits:

If the Professor then found, that in accordance with the calculation of the manufacturers, the workman reproduced or replaced his wages in 2 half-hours, in that case, he should have continued his analysis thus:

According to your figures, the workman in the last hour but one produces his wages, and in the last hour your surplus-value or net profit. Now, since in equal periods he produces equal values, the produce of the last hour but one, must have the same value as that of the last hour. Further, it is only while he labors that he produces any value at all, and the amount of his labor is measured by his labor-time. This you say, amounts to 11 1/2 hours a day. He employs one portion of these 11 1/2 hours, in producing or replacing his wages, and the remaining portion in producing your net profit. Beyond this he does absolutely nothing. But since, on your assumption, his wages, and the surplus-value he yields, are of equal value, it is clear that he produces his wages in $5\frac{3}{4}$ hours, and your net profit in the other $5\frac{3}{4}$ hours. Again, since the value of the yarn produced in 2 hours, is equal to the sum of the values of his wages and of your net profit, the measure of the value of this yarn must be 11 1/2 working-hours, of which $5\frac{3}{4}$ hours measure the value of the yarn produced in the last hour but one, and $5\frac{3}{4}$, the value of the yarn produced in the last hour.

So far Marx has not yet addressed the error committed by the capitalists that they ignore the value transferred from the raw materials but pretend that the labor has to reproduce this value. This error manifests itself now as a contradiction.

We now come to a ticklish point; therefore,

Ergab sich dann etwa, daß nach der Fabrikantenrechnung der Arbeiter in $2/2$ Arbeitsstunden, oder in einer Stunde, den Arbeitslohn reproduziert oder ersetzt, so hatte der Analytiker fortzufahren:

239:2/oo Nach eurer Angabe produziert der Arbeiter in der vorletzten Stunde seinen Arbeitslohn und in der letzten euren Mehrwert oder den Reingewinn. Da er in gleichen Zeiträumen gleiche Werte produziert, hat das Produkt der vorletzten Stunde denselben Wert wie das der letzten. Er produziert ferner nur Wert, soweit er Arbeit verausgabt, und das Quantum seiner Arbeit ist gemessen durch seine Arbeitszeit. Diese beträgt nach eurer Angabe 11 1/2 Stunden per Tag. Einen Teil dieser 11 1/2 Stunden verbraucht er zur Produktion oder zum Ersatz seines Arbeitslohns, den andren zur Produktion eures Reingewinns. Weiter tut er nichts während des Arbeitstags. Da aber, nach Angabe, sein Lohn und der von ihm gelieferte Mehrwert gleich große Werte sind, produziert er offenbar seinen Arbeitslohn in $5\frac{3}{4}$ Stunden und euren Reingewinn in andren $5\frac{3}{4}$ Stunden. Da ferner der Wert des zweistündigen Garnprodukts gleich der Wertsumme seines Arbeitslohns plus eures Reingewinns ist, muß dieser Garnwert durch 11 1/2 Arbeitsstunden gemessen sein, das Produkt der vorletzten Stunde durch $5\frac{3}{4}$ Arbeitsstunden, das der letzten ditto.

Wir kommen jetzt zu einem häklichen Punkt.

attention! The last working-hour but one is, like the first, an ordinary working-hour, neither more nor less. How then can the spinner produce in one hour, in the shape of yarn, a value that embodies $5\frac{3}{4}$ hours' labor? The truth is that he performs no such miracle. The use-value produced by him in one hour, is a definite quantity of yarn. The value of this yarn is measured by $5\frac{3}{4}$ working-hours, of which $4\frac{3}{4}$ were, without any assistance from him, previously embodied in the means of production, in the cotton, the machinery, and so on; the remaining one hour alone is added by him. Therefore since his wages are produced in $5\frac{3}{4}$ hours, and the yarn produced in one hour also contains $5\frac{3}{4}$ hours' work, there is no witchcraft in the result, that the value created by his $5\frac{3}{4}$ hours' spinning, is equal to the value of the product spun in one hour. You are altogether on the wrong track, if you think that he loses a single moment of his working-day, in reproducing or replacing the values of the cotton, the machinery, and so on. On the contrary, it is because his labor converts the cotton and spindles into yarn, because he spins, that the values of the cotton and spindles go over to the yarn of their own accord. This result is owing to the quality of his labor, not to its quantity. It is true, he will in one hour transfer to the yarn more value, in the shape of cotton, than he will in half an hour; but that is only because in one hour he spins up more cotton than in half an hour.

Here is the resolution of this contradiction:

You see then, your assertion, that the workman produces, in the last hour but one, the value of his wages, and in the last hour your net profit, amounts to no more than this, that in the yarn produced by him in

Also aufgepaßt! Die vorletzte Arbeitsstunde ist eine gewöhnliche Arbeitsstunde wie die erste. Ni plus, ni moins. Wie kann der Spinner daher in einer Arbeitsstunde einen Garnwert produzieren, der $5\frac{3}{4}$ Arbeitsstunden darstellt? Er verrichtet in der Tat kein solches Wunder. Was er in einer Arbeitsstunde an Gebrauchswert produziert, ist ein bestimmtes Quantum Garn. Der Wert dieses Garns ist gemessen durch $5\frac{3}{4}$ Arbeitsstunden, wovon $4\frac{3}{4}$ ohne sein Zutun in den stündlich verzehrten Produktionsmitteln stecken, in Baumwolle, Maschinerie usw., $\frac{1}{4}$ oder eine Stunde von ihm selbst zugesetzt ist. Da also sein Arbeitslohn in $5\frac{3}{4}$ Stunden produziert wird und das Garnprodukt einer Spinnstunde ebenfalls $5\frac{3}{4}$ Arbeitsstunden enthält, ist es durchaus keine Hexerei, daß das Wertprodukt seiner $5\frac{3}{4}$ Spinnstunden gleich dem Produktenwert einer Spinnstunde. Ihr seid aber durchaus auf dem Holzweg, wenn ihr meint, er verliere ein einziges Zeitatom seines Arbeitstags mit der Reproduktion oder dem „Ersatz“ der Werte von Baumwolle, Maschinerie usw. Dadurch, daß seine Arbeit aus Baumwolle und Spindel Garn macht, dadurch, daß er spinnt, geht der Wert von Baumwolle und Spindel von selbst auf das Garn über. Es ist dies der Qualität seiner Arbeit geschuldet, nicht ihrer Quantität. Allerdings wird er in einer Stunden mehr Baumwollwert usw. auf Garn übertragen als in $\frac{1}{2}$ Stunde, aber nur weil er in 1 Stunde mehr Baumwolle verspinnt als in $\frac{1}{2}$.

Ihr begreift also: Euer Ausdruck, der Arbeiter produziert in der vorletzten Stunde den Wert seines Arbeitslohns und in der letzten den Reingewinn, heißt weiter nichts, als daß in dem Garnprodukt von zwei Stunden sei-

2 working-hours, whether they are the 2 first or the 2 last hours of the working-day, in that yarn, there are incorporated $11\frac{1}{2}$ working-hours, or just a whole day's work, i.e., two hours of his own work and $9\frac{1}{2}$ hours of other people's. And my assertion that, in the first $5\frac{3}{4}$ hours, he produces his wages, and in the last $5\frac{3}{4}$ hours your net profit, amounts only to this, that you pay him for the former, but not for the latter. In speaking of payment of labor, instead of payment of labor-power, I only talk your own slang. Now, gentlemen, if you compare the working-time you pay for, with that which you do not pay for, you will find that they are to one another, as half a day is to half a day; this gives a rate of 100%, and a very pretty percentage it is. Further, there is not the least doubt, that if you make you "hands" toil for 13 hours, instead of $11\frac{1}{2}$, and, as may be expected from you, treat the work done in that extra one hour and a half, as pure surplus-labor, then the latter will be increased from $5\frac{3}{4}$ hours' labor to $7\frac{1}{4}$ hours' labor, and the rate of surplus-value from 100% to $126\frac{2}{23}\%$. So that you are altogether too sanguine, in expecting that by such an addition of $1\frac{1}{2}$ hours to the working-day, the rate will rise from 100% to 200% and more, in other words that it will be "more than doubled." On the other hand—man's heart is a wonderful thing, especially when carried in the purse—you take too pessimist a view, when you fear, that with a reduction of the hours of labor from $11\frac{1}{2}$ to 10, the whole of your net profit will go to the dogs. Not at all. All other conditions remaining the same, the surplus-labor will fall from $5\frac{3}{4}$ hours to $4\frac{3}{4}$ hours, a period that still gives a very profitable rate of surplus-value, namely $82\frac{14}{23}\%$. But this dread-

nes Arbeitstags, ob sie vorn oder hinten stehen, $11\frac{1}{2}$ Arbeitsstunden verkörpert sind, grade so viel Stunden, als sein ganzer Arbeitstag zählt. Und der Ausdruck, daß er in den ersten $5\frac{3}{4}$ Stunden seinen Arbeitslohn und in den letzten $5\frac{3}{4}$ Stunden euren Reingewinn produziert, heißt wieder nichts, als daß ihr die ersten $5\frac{3}{4}$ Stunden zahlt und die letzten $5\frac{3}{4}$ Stunden nicht zahlt. Ich spreche von Zahlung der Arbeit, statt der Arbeitskraft, um euren slang zu reden. Vergleicht ihr Herren nun das Verhältnis der Arbeitszeit, die ihr zahlt, zur Arbeitszeit, die ihr nicht zahlt, so werdet ihr finden, daß es halber Tag zu halbem Tag ist, also 100%, was allerdings ein artiger Prozentsatz. Es unterliegt auch nicht dem geringsten Zweifel, daß, wenn ihr eure „Hände“ statt $11\frac{1}{2}$ Stunden 13 abschanzt und, was euch so ähnlich sieht wie ein Ei dem anderen, die überschüssigen $1\frac{1}{2}$ Stunden zur bloßen Mehrarbeit schlägt, letztere von $5\frac{3}{4}$ Stunden auf $7\frac{1}{4}$ Stunden wachsen wird, die Rate des Mehrwerts daher von 100% auf $126\frac{2}{23}\%$. Dagegen seid ihr gar zu tolle Sanguiniker, wenn ihr hofft, sie werde durch den Zusatz von $1\frac{1}{2}$ Stunden von 100 auf 200% und gar mehr als 200% steigen, d.h. sich „mehr als voerdoppeln“. Andererseits—des Menschen Herz ist ein wunderlich Ding, namentlich wenn der Mensch sein Herz im Beutel trägt—seid ihr gar zu verrückte Pessimisten, wenn ihr fürchtet, mit der Reduktion des Arbeitstags von $11\frac{1}{2}$ auf $10\frac{1}{2}$ Stunden werde euer ganzer Reingewinn in die Brüche gehn. Beileibe nicht. Alle anderen Umstände als gleichbleibend vorausgesetzt, wird die Mehrarbeit von $5\frac{3}{4}$ auf $4\frac{3}{4}$ Stunden fallen, was immer noch eine ganz erkleckliche Rate des Mehrwerts gibt, nämlich $82\frac{14}{23}\%$. Die verhängnisvolle

ful "last hour," about which you have invented more stories than have the millenarians about the day of judgment, is "all bosh." If it goes, it will cost neither you, your net profit, nor the boys and girls whom you employ, their "purity of mind."^{32a}

^{32a} If, on the one hand, Senior proved that the net profit of the manufacturer, the existence of the English cotton industry, and England's command of the markets of the world, depend on "the last working-hour," on the other hand, Dr. Andrew Ure showed, that if children and young persons under 18 years of age, instead of being kept the full 12 hours in the warm and pure moral atmosphere of the factory, are turned out an hour sooner into the heartless and frivolous outer world, they will be deprived, by idleness and vice, of all hope of salvation for their souls. Since 1848, the factory inspectors have never tired of twitting the masters with this "last," this "fatal hour." Thus Mr. Hovell in his report of the 21st May, 1855: "Had the following ingenious calculation (he quotes Senior) been correct, every cotton factory in the United Kingdom would have been working at a loss since the year 1850." (Reports of the Insp. of Fact., for the half-year, ending 30th April, 1855, pp. 19, 20.) In the year 1848, after the passing of the 10 hours' bill, the masters of some flax spinning mills, scattered, few and far between, over the country on the borders of Dorset and Somerset, foisted a petition against the bill on to the shoulders of a few of their work-people. One of the clauses of this petition is as follows: "Your petitioners, as parents, conceive that an additional hour of leisure will tend more to demoralise the children than otherwise, believing that idleness is the parent of vice." On this the factory report of 31st Oct., 1848, says: The atmosphere of the flax mills, in which the children of these virtuous and tender parents work, is so loaded with dust and fibre from the raw material, that it is exceptionally unpleasant to stand even 10 minutes in the spinning rooms: for you are unable to do so

„letzte Stunde“ aber, von der ihr mehr gefabelt habt als die Chiliasten vom Weltuntergang, ist „all bosh“. Ihr Verlust wird weder euch den „Reingewinn“ noch den von euch verarbeiteten Kindern beiderlei Geschlechts die „Seelenreinheit“ kosten.^{32a}

^{32a} Wenn Senior bewies, daß an „der letzten Arbeitsstunde“ der Reingewinn der Fabrikanten, die Existenz der englischen Baumwollindustrie, Englands Weltmarktgröße hängen, bewies dahin wiederum Dr. Andrew Ure in den Kauf, daß Fabrikanten und junge Personen unter 18 Jahren, welche man nicht volle 12 Stunden in die warme und reine Moralluft der Fabrikstube bannt, sondern „eine Stunde“ früher in die gemütskalte und frivole Außenwelt verstößt, von Müßiggang und Laster um ihr Seelenheil geprellt werden. Seit 1848 werden die Fabrikinspektoren nicht müde, in ihren halbjährlichen „Reports“ die Fabrikanten mit „der letzten“, der „verhängnisvollen Stunde“ zu necken. So sagt Herr Howell in seinem Fabrikbericht vom 31. Mai 1855: „Wäre die folgende scharfsinnige Berechnung“ (er zitiert Senior) „richtig, so hätte jede Baumwollfabrik im Ver. Königreich seit 1850 mit Verlust gearbeitet.“ „Reports of the Insp. of Fact. for the half year ending 30th April 1855“, p. 19, 20.) Als im Jahr 1848 die Zehnstundenbill durchs Parlament ging, oktroyierten die Fabrikanten einigen Normalarbeitern in den ländlichen, zwischen den Grafschaften Dorset und Somerset zerstreut liegenden Flachsspinnereien eine Gegenpetition, worin es u.a. heißt: „Eure Bittsteller, Eltern, glauben, daß eine zusätzliche Mußestunde weiter keinen Erfolg haben kann als die Demoralisation ihrer Kinder, denn Müßiggang ist alles Lasters Anfang.“ Hierzu bemerkt der Fabrikbericht vom 31. Oktober 1848: „Die Atmosphäre der Flachsspinnereien, worin die Kinder dieser tugendhaft-zärtlichen Eltern arbeiten, ist geschwängert mit so unzähligen Staub- und Faserpartikelchen des Rohmaterials, daß es außerordentlich unangenehm ist, auch nur 10 Minuten in den Spinnstuben zuzubringen, denn ihr könnt das nicht ohne die peinlichste

without the most painful sensation, owing to the eyes, the ears, the nostrils, and mouth, being immediately filled by the clouds of flax dust from which there is no escape. The labor itself, owing to the feverish haste of the machinery, demands unceasing application of skill and movement, under the control of a watchfulness that never tires, and it seems somewhat hard, to let parents apply the term "idling" to their own children, who, after allowing for meal-times, are fettered for 10 whole hours to such an occupation, in such an atmosphere... These children work longer than the laborers in the neighbouring villages... Such cruel talk about "idleness and vice" ought to be branded as the purest cant, and the most shameless hypocrisy... That portion of the public, who, about 12 years ago, were struck by the assurance with which, under the sanction of high authority, it was publicly and most earnestly proclaimed, that the whole net profit of the manufacturer flows from the labor of the last hour, and that, therefore, the reduction of the working-day by one hour, would destroy his net profit, that portion of the public, we say, will hardly believe its own eyes, when it now finds, that the original discovery of the virtues of "the last hour" has since been so far improved, as to include morals as well as profit; so that, if the duration of the labor of children, is reduced to a full 10 hours, their morals, together with the net profits of their employers, will vanish, both being dependent on this last, this fatal hour. (See Repts., Insp. of Fact., for 31st Oct., 1848, p. 101.) The same report then gives some examples of the morality and virtue of these same pure-minded manufacturers, of the tricks, the artifices, the cajoling, the threats, and the falsifications, they made use of, in order, first, to compel a few defenceless workmen to sign petitions of such a kind, and then to impose them upon Parliament as the petitions of a whole branch of industry, or a whole country. It is highly characteristic of the present status of so-called economic science, that neither Senior himself, who, at a later period, to his honour be it said, energetically supported the factory legis-

Empfindung, indem Auge, Ohr, Nasenlöcher und Mund sich sofort füllen mit Flachsstaubwolken, vor denen kein Entrinnen ist. Die Arbeit selbst erheischt, wegen der Fieberhast der Maschinerie, rastlosen Aufwand von Geschick und Bewegung, unter der Kontrolle nie ermüdender Aufmerksamkeit, und es scheint etwas hart, Eltern den Ausdruck 'Faulenzerei' auf die eignen Kinder anwenden zu lassen, die, nach Abzug der Essenszeit, 10 volle Stunden an solche Beschäftigung, in einer solchen Atmosphäre, geschmiedet sind... Diese Kinder arbeiten länger als die Ackerknechte in den Nachbardörfern... Solch liebloses Gekohl über „Müßiggang und Laster“ muß als der reinste Cant und die schamloseste Heuchelei gebrandmarkt werden... Der Teil des Publikums, der vor ungefähr zwölf Jahren auffuhr über die Zuversicht, womit man öffentlich und ganz ernsthaft proklamierte, unter der Sanktion hoher Autorität, daß der ganze „Reingewinn“ des Fabrikanten aus „der letzten Stunde“ Arbeit fließt und daher die Reduktion des Arbeitstags um eine Stunde den Reingewinn vernichtet; dieser Teil des Publikums, sagen wir, wird kaum seinen Augen trauen, wenn er nun findet, daß die Original-Entdeckung über die Tugenden der „letzten Stunde“ seitdem so weit verbessert worden ist, „Moral“ und „Profit“ gleichmäßig einzuschließen; so daß, wenn die Dauer der Kinderarbeit auf volle 10 Stunden reduziert wird, die Moral der Kinder zugleich mit dem Nettogewinn ihrer Anwen-der flöten geht, beide abhängig von dieser letzten, dieser fatalen Stunde.“ „Repts. of Insp. of Fact. for 31st Oct. 1848“, p. 101.) Derselbe Fabrikbericht gibt dann Proben von der „Moral“ und „Tugend“ dieser Herrn Fabrikanten, von den Schlichen, Piffen, Lockungen, Drohmitteln, Fälschungen usw., die sie anwandten, um von wenigen ganz verwahrlosten Arbeitern dergleichen Petitionen unterzeichnen zu machen, um sie dann als Petitionen eines ganzen Industriezweigs, ganzer Grafschaften dem Parlament aufzubinden.—Höchst charakteristisch bleibt es für den heutigen Stand der sogenannten ökonomischen „Wissenschaft“, daß weder Senior selbst, der später zu

lation, nor his opponents, from first to last, have ever been able to explain the false conclusions of the "original discovery." They appeal to actual experience, but the why and wherefore remains a mystery.

Whenever your "last hour" strikes in earnest, think of the Oxford Professor. And now, gentlemen, "farewell, and may we meet again in yonder better world, but not before."

Unfortunately, Senior's argument did not go away. It was warmed over, 12 years later, by Wilson:

Senior invented the battle cry of the "last hour" in 1836.³³ In the *London Economist* of the 15th April, 1848, the same cry was again raised by James Wilson, an economic mandarin of high standing: this time in opposition to the 10 hours' bill.

³³ Nevertheless, the learned professor was not without some benefit from his journey to Manchester. In the "Letters on the Factory Act," he makes the whole net gains including "profit" and "interests" and even "something more," depend upon a single unpaid hour's work of the laborer. One year previously, in his "Outlines of Political Economy," written for the instruction of Oxford students and cultivated Philistines, he had also "discovered, in opposition to Ricardo's determination of value by labor, that profit is derived from the labor of the capitalist, and interest from his asceticism, in other words, from his abstinence." The dodge was an old one, but the word "abstinence" "was new. Herr Roscher translates it rightly by "Enthaltung." Some of his countrymen, the Browns, Jones, and Robinsons, of Germany, not so well versed in Latin as he, have, monk-like, rendered it by "Entsagung" (renunciation).

seiner Ehre energisch für die Fabrikgesetzgebung auftrat, noch seine ursprünglichen und spätern Widersacher, die Trugschlüsse der „Originalentdeckung“ aufzulösen wußten. Sie appellierten an die tatsächliche Erfahrung. Das why und wherefore blieb Mysterium.

242:1/o Wenn einmal euer „letztes Stündlein“ wirklich schlägt, denkt an den Professor von Oxford. Und nun: In einer beßren Welt wünsch' ich mir mehr von eurem werthen Umgang. Addio!³³ ...

Das Signal der von Senior 1836 entdeckten „letzten Stunde“ ward am 15. April 1848, polemisch gegen das Zehnstundengesetz, von James Wilson, einem der ökonomischen Hauptmandarine, im „London Economist“ von neuem geblasen.

³³ Indes hatte der Herr Professor doch etwas bei seinem Manchester Ausflug profitiert! In den „Letters on the Factory Act“ hängt der ganze Reingewinn, „Profit“ und „Zins“ und sogar „something more“ an einer unbezahlten Arbeitsstunde des Arbeiters! Ein Jahr zuvor, in seinen zum Gemeinbesten Oxforder Studenten und gebildeter Philister verfaßten „Outlines of Political Economy“ hatte er noch gegenüber Ricardos Wertbestimmung durch die Arbeitszeit „entdeckt“, daß der Profit aus der Arbeit des Kapitalisten und der Zins aus seiner Asketik, seiner „Abstinenz“ herstammte. Die Flause selbst war alt, aber das Wort „Abstinenz“ neu. Herr Roscher verdeutscht es richtig durch „Enthaltung“. Seine minder mit Latein beschlagenen Kompatrioten, Wirte, Schulzen und andre Michels, haben es in „Entsagung“ vermöncht.

338:1/o The portion of the product that represents the surplus-value, (one tenth of the 20 lbs., or 2 lbs. of yarn, in the example given in Sec. 2) we call "surplus-produce." Just as the rate of surplus-value is determined by its relation, not to the sum total of the capital, but to its variable part; in like manner, the relative quantity of surplus-produce is determined by the ratio that this produce bears, not to the remaining part of the total product, but to that part of it in which is incorporated the necessary labor. Since the production of surplus-value is the chief end and aim of capitalist production, it is clear, that the greatness of a man's or a nation's wealth should be measured, not by the absolute quantity produced, but by the relative magnitude of the surplus-produce.³⁴

³⁴ "To an individual with a capital of £20,000, whose profits were £2,000 per annum, it would be a matter quite indifferent whether his capital would employ a 100 or 1,000 men, whether the commodity produced sold for £10,000 or £20,000, provided, in all cases, his profit were not diminished below £2,000. Is not the real interest of the nation similar? Provided its net real income, its rent and profits, be the same, it is of no importance whether the nation consists of 10 or of 12 millions of inhabitants." (Ric. l.c., p. 416.) Long before Ricardo, Arthur Young, a fanatical upholder of surplus-produce, for the rest, a rambling, uncritical writer, whose reputation is in the inverse ratio of his merit, says, "Of what use, in a modern kingdom, would be a whole province thus divided [in the old Roman manner, by small independent peasants], however well cultivated, except for the mere purpose of breeding men, which taken singly is a most useless purpose?" (Arthur Young: "Political Arithmetic, etc." London, 1774, p. 47.)

243:1 Den Teil des Produkts (1/10 von 20 Pfd. Garn oder 2 Pfd. Garn in dem Beispiel sub 2), worin sich der Mehrwert darstellt, nennen wir Mehrprodukt (surplus produce, produit net). Wie die Rate des Mehrwerts durch sein Verhältnis nicht zur Gesamtsumme, sondern zum variablen Bestandteil des Kapitals bestimmt wird, so die Höhe des Mehrprodukts durch sein Verhältnis nicht zum Rest des Gesamtprodukts, sondern zum Produktteil, worin sich die notwendige Arbeit darstellt. Wie die Produktion von Mehrwert der bestimmende Zweck der kapitalistischen Produktion, so mißt nicht die absolute Größe des Produkts, sondern die relative Größe des Mehrprodukts den Höhegrad des Reichtums.³⁴

³⁴ „Für ein Individuum mit einem Kapital von 20 000 Pfd.St., dessen Profite 2000 Pfd.St. jährlich betragen, wäre es ein durchaus gleichgültig Ding, ob sein Kapital 100 oder 1000 Arbeiter beschäftigt, ob die produzierten Waren sich zu 10 000 oder 20 000 Pfd.St. verkaufen, immer vorausgesetzt, daß seine Profite in allen Fällen nicht unter 2000 Pfd.St. fallen. Ist das reale Interesse einer Nation nicht dasselbe? Vorausgesetzt, ihr reales Nettoeinkommen, ihre Renten und Profite bleiben dieselben, so ist es nicht von der geringsten Wichtigkeit, ob die Nation aus 10 oder 12 Millionen Einwohnern besteht.“ (Ricardo, l.c. p. 416.) Lange vor Ricardo sagte der Fanatiker des Mehrprodukts, Arthur Young, ein übrigens schwatzschweifiger, kritikloser Schriftsteller, dessen Ruf in umgekehrtem Verhältnis zu seinem Verdienst steht, u.a.: „von welchem Nutzen würde in einem modernen Königreich eine ganze Provinz sein, deren Boden in altrömischer Manier, von kleinen, unabhängigen Bauern, meinetwegen noch so gut bebaut würde? Von welchem Zwecke, außer dem einzigen, Menschen zu erzeugen (the mere purpose of breeding men), was an und für sich gar keinen Zweck hat (is a

9.4. The Surplus Product

^{34 ctd} Very curious is “the strong inclination . . . to represent net wealth as beneficial to the laboring class . . . though it is evidently not on account of being net.” (Th. Hopkins, “On Rent of Land, etc.” London, 1828, p. 126.)

339:1 The sum of the necessary labor and the surplus-labor, i.e., of the periods of time during which the workman replaces the value of his labor-power, and produces the surplus-value, this sum constitutes the actual time during which he works, *i.e.*, the working-day.

most useless purpose)“. (Arthur Young, „Political Arithmetic etc.“, London 1774, p. 47.)

^{34 ctd} Zusatz zu Note 34. Sonderbar ist „die starke Neigung, das Reineinkommen als vorteilhaft für die arbeitende Klasse hinzustellen, . . . dabei ist aber offensichtlich, daß dieses nicht deshalb vorteilhaft ist, weil es rein ist“. (Th. Hopkins, „On Rent of Land etc.“, London 1828, p. 126.)

244:1 Die Summe der notwendigen Arbeit und der Mehrarbeit, der Zeitabschnitte, worin der Arbeiter den Ersatzwert seiner Arbeitskraft und den Mehrwert produziert, bildet die absolute GröÙe seiner Arbeitszeit—den Arbeitstag (working day).

10. The Working-Day

“The working-day is . . . determinable, but in and for itself indeterminate.” This last sentence of 341:1 can be considered a summary of Marx’s argument in chapter Ten.

- “The length of the working-day is in and for itself indeterminate” means that there are no economic laws prescribing how long the working-day must be. Within certain limits, the capitalist economy functions equally well with a longer or shorter working-day. If one tries to derive the length of the working-day from the laws of commodity exchange, one gets different results if one looks at it from the point of view of the worker than if one looks at it from the point of view of the capitalist. This is discussed in section 10.1.
- But the length of the working-day is “determinable,” i.e., this length can be, and even must be, fixed by extra-economic forces. Since the length of the working-day is not determined by the market, the working-class is forced to take up political struggles as described in this chapter. The sections after section 10.1 give a “historical sketch” (sic in 411:1) of the struggles between capitalist class and working class in England, which led to a *legal* fixation of the working-day.

10.1. The Limits of the Working-Day

Marx’s starting point is the division of the working-day into two parts, necessary labor and surplus labor. “Necessary labor” is the length of time needed by the worker every day to produce an equivalent of his or her daily wage. “Surplus-labor” is the additional time during which the worker produces value appropriated without equivalent by the capitalist. This division of the working-day was already introduced in chapter Seven in a rather dramatic and entertaining fashion, see 297:4/o. The terminology “necessary labor-time” for that part of the working-day in which the worker produces an equivalent of his wages was formally defined in chapter Nine, 324:1/o. This concept should not be confused with that of “socially necessary labor-time” defined in chapter One, 129:2.

Question 687 *Why is the day taken as unit of labor-power, instead of hour or week?*

10.1.a. [Indeterminacy of the Working-Day]

340:1 We started with the assumption that labor-power is bought and sold at its value. The value of labor-power, like that of any other commodity, is determined by the labor-time necessary for its production. If the production of the average daily consumption of the laborer takes up 6 hours, he must work, on the average, 6 hours every day to produce his daily labor-power, or to reproduce the value he received when he sold it. The necessary part of his working-day amounts to 6 hours, and is, therefore, *caeteris paribus*, a given quantity. But with this, the length of the working-day itself is not yet given.

245:1 Wir gingen von der Voraussetzung aus, daß die Arbeitskraft zu ihrem Werte gekauft und verkauft wird. Ihr Wert, wie der jeder andren Ware, wird bestimmt durch die zu ihrer Produktion nötige Arbeitszeit. Erheischt also die Produktion der durchschnittlichen täglichen Lebensmittel des Arbeiters 6 Stunden, so muß er im Durchschnitt 6 Stunden per Tag arbeiten, um seine Arbeitskraft täglich zu produzieren oder den in ihrem Verkauf erhaltenen Wert zu reproduzieren. Der notwendige Teil seines Arbeitstags beträgt dann 6 Stunden und ist daher, unter sonst gleichbleibenden Umständen, eine gegebene Größe. Aber damit ist die Größe des Arbeitstags selbst noch nicht gegeben.

↑ Usually one thinks of the daily or weekly wage as a derived quantity: it is hourly wage times number of hours worked. The hourly wage is determined by economic laws, namely, the productivity of the kind of labor performed. The number of hours worked depends on the agreement between worker and employer. In the background of this is the notion that the worker is selling his or her labor, therefore wages depend on the labor performed. In chapter Nineteen, Marx will discuss in detail the surface appearances giving rise to this illusory notion. The present chapter Ten ignores these surface appearances and uses the simple framework of chapter Six, according to which the worker is not selling labor but labor-power, with the wage being the reimbursement for the costs of reproducing the labor-power. For labor-power, the smallest unit of measurement is the day. The reproduction costs of labor-power can be computed as the daily costs for food, rent, clothing, utilities, transportation, etc. Therefore for Marx the daily wage is a basic quantity, and the hourly wage the derived quantity.

With the daily wage fixed by the laws of chapter Six, the next important question is: “how long is the working-day?” Marx asks this question explicitly in 341:3/o, but this is the main question discussed throughout chapter Ten.

Question 694 According to Marx, the daily wage is determined by the value of the “average daily consumption of the worker.” How is then the biweekly salary of a salaried employee determined, and how is the hourly wage of a hourly worker determined?

It is commonly thought that the length of the working-day is fixed by economic necessity. If the workers were to go home before the usual 8, 10, 12, 14 hours per day, then, it is believed, the economy would break down or the capitalists would have to close the factories. One can presently witness this kind of propaganda in the struggles for a shorter work week

in Europe. Even the workers themselves cannot believe that it is economically possible that they work fewer hours each week and still get the same weekly wage. Mainstream economics perpetuates this myth: usually the length of the working-day is treated as a fixed magnitude. To add insult to injury, this length is said to be the result of free choice: you are stuck with such long hours because all other workers want it this way.

Marx, by contrast, says: the labor day consists of two parts, the necessary part and the surplus part. Only the necessary part is fixed by economic laws; the surplus part is variable. Marx is using here the day as unit of measurement of labor-power, not the hour. The daily wage is determined by the value of the “average daily means of subsistence” of the laborer. If the work day is 8 hours long, then perhaps only 3 hours are needed to reproduce this daily wage. These 3 hours are given by economic necessity: the working-day cannot be shorter than 3 hours. But the second part, consisting here of 5 hours, is variable. This part might be shorter or longer, according to the balance of forces between workers and capitalists. The factors determining this variable part are discussed in the remainder of section 10.1.

10.1.b. [The Inherent Limits of Surplus Labor]

340:2/o Let us assume that the line A—B represents the length of the necessary working time, say 6 hours. If the labor be prolonged 1, 3, or 6 hours beyond A—B, we have 3 different lines

working-day I A—B—C,
working-day II A—B—C,
working-day III A—B—C,
representing 3 different working-days of 7, 9, and 12 hours. The extension B—C of the line A—B represents the length of the surplus-labor. As the working-day is A—B + B—C or A—C, it varies with the variable quantity B—C.

This is a very simple relationship, and it might seem pedantic to go through it in such detail. However Marx’s emphasis is justifiable because this simple relationship is *not* part of the common consciousness! The limits of necessary labor are not visible to the surface agents. No bell rings in the factories at 11 am to indicate that now the (unpaid) surplus labor begins. Also the fact that wages are paid per hour, not per day, is confusing here. The length of the necessary labor is part of the hidden social relations of production which chain us all together through invisible chains. Although it is not readily apparent in the surface interactions, it is real and its quantity is well-defined; Marx says in the next sentence that it is “given”:

245:2/o Nehmen wir an, die Linie *a*—*b* stelle die Dauer oder Länge der notwendigen Arbeitszeit vor, sage 6 Stunden. Je nachdem die Arbeit über *ab* um 1, 3 oder 6 Stunden usw. verlängert wird, erhalten wir die 3 verschiednen Linien:

Arbeitstag I *a*—*b*—*c*,
Arbeitstag II *a*—*b*—*c*,
Arbeitstag III *a*—*b*—*c*,
die drei verschiedne Arbeitstage von 7, 9 und 12 Stunden vorstellen. Die Verlängerungslinie *bc* stellt die Länge der Mehrarbeit vor. Da der Arbeitstag = *ab* + *bc* oder *ac* ist, variiert er mit der variablen Größe *bc*.

Since $A-B$ is given, the ratio of $B-C$ to $A-B$ can always be calculated. In working-day I, it is $1/6$, in working-day II, $3/6$, in working-day III $6/6$ of $A-B$.

The ratio $\frac{\text{surplus working time}}{\text{necessary working time}}$ is sometimes called the “rate of exploitation.” This invisible rate of exploitation determines the rate of surplus-value, which is visible. Compare chapter Nine, 326:1.

Since further the ratio $\frac{\text{surplus working time}}{\text{necessary working time}}$ determines the rate of the surplus-value, the latter is given by the ratio of $B-C$ to $A-B$. It amounts in the 3 different working-days respectively to $162/3$, 50, and 100 per cent.

↓ This representation of the underlying relations of production on the surface however has holes: certain aspects of these relations are not visible.

On the other hand, the rate of surplus-value alone would not give us the extent of the working-day. If this rate, *e.g.*, were 100 per cent, the working-day might be of 8, 10, 12, or more hours. It would indicate that the two constituent parts of the working-day, necessary-labor and surplus-labor-time, were equal in extent, but not how long each of these two constituent parts was.

↑ This simple observation is relevant because Marx assumes that competition between workers and capitalists tends to equalize the rate of exploitation: an equal rate of exploitation can accommodate different lengths of the working-day.

341:1 The working-day is thus not a constant, but a variable quantity.

↑ By “variable” Marx means that there is no economic law which would force the total working-day to be a certain length. The basic structure of capitalism does not make this length a function of productivity or such; rather, it is “up for grabs.”

Although one of its parts is determined by the working time required for the reproduction of the labor-power of the laborer himself, its total length varies with the duration of the surplus-labor. The working-day is, therefore, determinable, but in and for itself indeterminate.³⁵

³⁵ “A day’s labour is vague, it may be long or short.” (“An Essay on Trade and Commerce,

Da ab gegeben ist, kann das Verhältnis von bc zu ab stets gemessen werden. Es beträgt in Arbeitstag I $1/6$, in Arbeitstag II $3/6$ und im Arbeitstag III $6/6$ von ab .

Da ferner die Proportion $\frac{\text{Mehrarbeitszeit}}{\text{notwendige Arbeitszeit}}$ die Rate des Mehrwerts bestimmt, ist letztere gegeben durch jenes Verhältnis. Sie beträgt in den drei verschiedenen Arbeitstagen respektive $162/3$, 50 und 100%.

Umgekehrt würde die Rate des Mehrwerts allein uns nicht die Größe des Arbeitstags geben. Wäre sie z.B. gleich 100%, so könnte der Arbeitstag 8-, 10-, 12stündig usw. sein. Sie würde anzeigen, daß die zwei Bestandteile des Arbeitstags, notwendige Arbeit und Mehrarbeit, gleich groß sind, aber nicht, wie groß jeder dieser Teile.

246:1 Der Arbeitstag ist also keine konstante, sondern eine variable Größe.

Einer seiner Teile ist zwar bestimmt durch die zur beständigen Reproduktion des Arbeiters selbst erheischte Arbeitszeit, aber seine Gesamtgröße wechselt mit der Länge oder Dauer der Mehrarbeit. Der Arbeitstag ist daher bestimmbar, aber an und für sich unbestimmt.³⁵

³⁵ „Ein Arbeitstag ist eine unbestimmte Größe, er kann lang oder kurz sein.“ („An Essay on Tra-

Containing Observations on Taxes, etc.” London 1770, p. 73.)

↑ After all this emphasis that the working-day is *indeterminate*, Marx adds the remark at the end, without further explanation, that the working-day is *determinable*. My interpretation of this is that the length of the working-day can be fixed by extra-economic forces (for instance by law). Such a fixation will not come in conflict with the economic laws of capitalism but, on the contrary, this chapter shows that capitalism itself needs the working-day to be fixed. The subject of this chapter is exactly how this in and for itself indeterminate quantity finds its determination.

Question 695 Explain Marx’s sentence: “The working-day is determinable but in and for itself indeterminate.”

The discussion of the variability of the working-day is not yet finished. Marx’s next point is: the working-day can only vary within certain bounds. (These bounds might be considered the negation of the variability, i.e., the negation of the negation of the determination.)

341:2 The working-day is therefore not a fixed, but a fluid quantity. On the other hand, it can only vary within certain bounds.

↓ But the minimum bound eludes us again. there isn’t:

The minimum bound, however, is not determinable. Of course, if we make the extension line $B-C$ or the surplus-labor = 0, we have a minimum bound, *i.e.*, the part of the day which the laborer must necessarily work for his own maintenance. On the basis of capitalist production, however, this necessary labor must always only form a part of the working-day; the working-day itself can never be reduced to this minimum.

de and Commerce, containing Observations on Taxation etc.”, London 1770, p. 73.)

246:2/o Obgleich nun der Arbeitstag keine feste, sondern eine fließende Größe ist, kann er andererseits nur innerhalb gewisser Schranken variieren.

On the one hand, there is one, on the other,

Seine Minimalschranke ist jedoch unbestimmbar. Allerdings, setzen wir die Verlängerungslinie bc , oder die Mehrarbeit, = 0, so erhalten wir eine Minimalschranke, nämlich den Teil des Tags, den der Arbeiter notwendig zu seiner Selbsterhaltung arbeiten muß. Auf Grundlage der kapitalistischen Produktionsweise kann die notwendige Arbeit aber immer nur einen Teil seines Arbeitstages bilden, der Arbeitstag sich also nie auf dies Minimum verkürzen.

↑ Isn’t this hairsplitting? Why does Marx make so much ado about the simple fact that the labor-time must always be longer than the minimum? To answer this we need a concept Marx has just introduced two sentences earlier: this simple fact prevents the minimum of the labor-day from being *determinable*. In other words, there is no length of the work day which could be imposed on the capitalist economy *as a maximum* (in order to get a minimally exploitative capitalism). In *Value, Price and Profit*, [mecw20]145:5/o, Marx says that there is no minimum rate of profit because there is no maximum level of wages.

Perhaps Marx viewed this as another secret critique of Hegel, comparable to 132:3. If a minimum bound cannot be determined, although the working-day must be longer than

necessary labor itself, then Hegel's pronouncement is incorrect that every negation is a determination. (Bhaskar [Bha93, p. 240:1] also criticizes this principle which, as he says, "is simply not true.")

Question 696 Give other secret critiques of Hegel in Marx's Capital.

Question 697 Could one not say that the minimum bound for the surplus-labor is enough surplus-labor that the capitalists can survive?

The maximum bound, by contrast, is determinable. It is even *multiply* determined, i.e., different mechanisms kick in if the working-day is extended beyond certain threshold values: On the other hand, the working-day has a maximum bound. It cannot be prolonged beyond a certain point. This maximum bound is determined in two different ways. First, by the physiological bounds of labor-power. Within the 24 hours of the natural day a man can expend only a definite quantity of his vital force. Just as a horse can only work, from day to day, 8 hours. During part of the day this force must rest, sleep; during another part the man has to satisfy other physiological needs, to feed, wash, and clothe himself. Besides these purely physiological limits, the extension of the working-day encounters moral ones. The laborer needs time to satisfy his intellectual and social wants, the extent and number of which are conditioned by the general state of social advancement.

Dagegen besitzt der Arbeitstag eine Maximumschränke. Er ist über eine gewisse Grenze hinaus nicht verlängerbar. Diese Maximumschränke ist doppelt bestimmt. Einmal durch die physische Schranke der Arbeitskraft. Ein Mensch kann während des natürlichen Tags von 24 Stunden nur ein bestimmtes Quantum Lebenskraft verausgaben. So kann ein Pferd tagaus, tagein nur 8 Stunden arbeiten. Während eines Teils des Tags muß die Kraft ruhen, schlafen, während eines andren Teils hat der Mensch andere physische Bedürfnisse zu befriedigen, sich zu nähren, reinigen, kleiden usw. Außer dieser rein physischen Schranke stößt die Verlängerung des Arbeitstags auf moralische Schranken. Der Arbeiter braucht Zeit zur Befriedigung geistiger und sozialer Bedürfnisse, deren Umfang und Zahl durch den allgemeinen Kulturzustand bestimmt sind.

The two mechanisms enforcing a maximum bound of the working-day are located in different layers of reality:

- Physiological: the continuous functioning of the labor-power is compatible only with a certain number of hours daily.
- Cultural: the laborer needs time to satisfy intellectual and social needs.

One page later, in 342:2/o, Marx formulates the physiological limit differently: the length of the work day must be such that it does not rob the laborer of his health or shorten his life. I will call these two sides of the physiological bounds the physiological bounds I and II. In 389:2/o Marx mentions a third mechanism which limited the working-day in pre-industrial times, namely, daylight.

Exam Question 698 What are the minimal and maximal bounds for the length of the working-day, and how are they determined?

The variation of the working-day takes place, therefore, within physiological and social bounds. But both these bounds are of a very elastic nature, and allow the greatest latitude.

Die Variation des Arbeitstags bewegt sich daher innerhalb physischer und sozialer Schranken. Beide Schranken sind aber sehr elastischer Natur und erlauben den größten Spielraum.

↑ At the end, Marx adds yet another level of negation: the minimum and maximum bounds are not only far apart, but they themselves are also elastic. This would be the negation of the negation of the negation. ↓ All this explains the great differences in the length of working-days that can be observed empirically.

So we find working-days of 8, 10, 12, 14, 16, 18 hours, i.e., of the most different lengths.

So finden wir Arbeitstage von 8, 10, 12, 14, 16, 18 Stunden, also von der verschiedensten Länge.

10.1.c. [Point of view of the Capitalist]

So far, Marx has discussed to what extent the length of the working-day is or is not determined by its inner anatomy. In other words, he identified the economic necessities affecting the number of hours workers have to work in a capitalist economy. Next he is asking whether and how the surface transactions between capitalist and laborer on the market *enforce* this inherent length of the working-day. The dialogue between capitalist and laborer which follows now must be taken metaphorically: the arguments given here verbally are acted out on the market place and in direct struggles (although the arguments themselves can also be found in the literature, as the footnotes demonstrate).

Throughout chapter Ten, Marx maintains the fiction that the daily wage is agreed upon first, and then afterwards capitalist and worker argue about it how long the worker has to work for this wage. Of course, the details of the transactions between worker and capitalist on the surface of the economy seem to be different: the wage is paid as hourly wage or piece wage, therefore it seems as if the daily wage was not fixed but that it was proportional to the amount of labor performed.

On the other hand, the employee usually cannot decide how many hours of labor he or she is to perform: the length of the work day is given, and therefore the daily wage is given once we know what the hourly wage is. In practice, today's procedure with a fixed hourly wage but no substantial choice regarding the number of hours worked has therefore the same outcome as Marx's daily-wage bargain. If one looks at the data one will also not find proportionality between labor-time and wages; on the contrary, there are many low wage jobs which "compensate" for their low wages by long hours (see 688:1).

Marx claims that this is not an accident. The connection between labor and wage is not that wages are proportional to labor performed, but wages are an amount determined by the worker's cost of living, and the length of the work day is, just as the precise definition

of the worker's cost of living, the result of struggles between capitalists and the working class. The hourly wage can then be computed by dividing the daily wage by the daily work requirement resulting from these class struggles. This theory of wages will be developed in chapter Nineteen.

Marx's fiction that worker and capitalist first decide on a daily wage and then argue how long the worker has to work is therefore justified: although it contradicts the details of the surface transactions, it captures the structure of the underlying processes mediated by these surface transactions better than the actual surface transactions themselves.

341:3/o The capitalist has bought the labor-power at its day-rate. To him its use-value belongs during one working-day. He has thus acquired the right to make the laborer work for him during one day. But, what is a working-day?³⁶

³⁶ This question is far more important than the celebrated question of Sir Robert Peel to the Birmingham Chamber of Commerce: What is a pound? A question that could only have been proposed, because Peel was as much in the dark as to the nature of money as the "little shilling men" of Birmingham.

Marx answers this important question in several steps.

At all events, less than a natural day. By how much?

If the working-day amounted to 24 hours this would be slavery. Capitalism is not slavery but it is based on commodity exchange, a transaction to which both parties voluntarily agree. Marx discusses therefore now the motivations of the two exchange partners, first those of the capitalist.

The capitalist has his own views of this *ultima Thule*, the necessary limit of the working-day.

The capitalist's reasons for the exchange are different than the worker's. But before the reader can get the impression that Marx is giving a too sinister view of the inhumane goals of the capitalist, Marx interjects that the capitalist's motivations do not stem from human motives but from the tendencies of the social entity he or she represents:

As capitalist, he is only capital personified. His soul is the soul of capital.

↑ This is reminiscent of 92:1. ↓ The driving force is capital, not the capitalist.

Capital, in turn, has one single-minded life impulse, the drive to create value and surplus-value, to make its constant portion,

247:1 Der Kapitalist hat die Arbeitskraft zu ihrem Tageswert gekauft. Ihm gehört ihr Gebrauchswert während eines Arbeitstags. Er hat also das Recht erlangt, den Arbeiter während eines Tags für sich arbeiten zu lassen. Aber was ist ein Arbeitstag?³⁶

³⁶ Diese Frage ist unendlich wichtiger als die berühmte Frage Sir Robert Peels an die Birminghamer Handelskammer „What is a pound?“ eine Frage, die nur gestellt werden konnte, weil Peel über die Natur des Geldes ebenso unklar war als die „little shilling men“ von Birmingham.

Jedenfalls weniger als ein natürlicher Lebenstag. Um wieviel?

Der Kapitalist hat seine eigne Ansicht über dies *ultima Thule*, die notwendige Schranke des Arbeitstags.

Der Kapitalist's reasons for the exchange are different than the worker's. But before the reader can get the impression that Marx is giving a too sinister view of the inhumane goals of the capitalist, Marx interjects that the capitalist's motivations do not stem from human motives but from the tendencies of the social entity he or she represents:

Als Kapitalist ist er nur personifiziertes Kapital. Seine Seele ist die Kapitalseele.

Das Kapital hat aber einen einzigen Lebenstrieb, den Trieb, sich zu verwerten, Mehrwert zu schaffen, mit seinem konstanten

the means of production, absorb the greatest possible amount of surplus-labor.³⁷ Capital is dead labor, that, vampire-like, only lives by sucking living labor, and lives the more, the more labor it sucks.

³⁷ "It is the aim of the capitalist to obtain with his expended capital the greatest possible quantity of labor (d'obtenir du capital dépensé la plus forte somme de travail possible). J. G. Courcelle-Seneuil. "Traité théorique et pratique des entreprises industrielles." 2nd ed., Paris, 1857, p. 63.

Notice that the capitalist is not greedy; he represents the social force of value in motion, self-aggrandizing value. He does not say to the worker: "I have come to steal as much surplus labor as I can from you," or "I am the vampire who needs your blood to come to life" or "I am stronger than you, you have to work for me." On the contrary, he comes with the surprising claim that it is the *worker* who is robbing the capitalist and not the other way around—whenever the worker uses any of his disposable time for himself:

The time during which the laborer works is the time during which the capitalist consumes the labor-power he has purchased of him.³⁸ If the laborer consumes his disposable time for himself, he robs the capitalist.³⁹

Marx is not making this up. The footnotes show that it has actually been said that the worker is robbing the capitalist:

³⁸ "An hour's labor lost in a day is a prodigious injury to a commercial State." "There is a very great consumption of luxuries among the laboring poor of this kingdom: particularly among the manufacturing populace, by which they also consume their time, the most fatal of consumptions." [Ano70, pp. 47, 153]

³⁹ If the free worker rests for an instant, the base and petty management which watches over him with wary eyes claims he is stealing from it. N. Linguet, "Théorie des Lois Civiles. etc." London, 1767, t. II., p. 466.

The capitalist is robbing the worker under such circumstances that he can find reasons to say and think that it is the worker who is robbing the capitalist. What are these circum-

Teil, den Produktionsmitteln, die größtmögliche Masse Mehrarbeit einzusaugen.³⁷ Das Kapital ist verstorbene Arbeit, die sich nur vampyrmäßig belebt durch Einsaugung lebendiger Arbeit und um so mehr lebt, je mehr sie davon einsaugt.

³⁷ „Es ist die Aufgabe des Kapitalisten, mit dem verausgabten Kapital die größtmögliche Summe Arbeit herauszuschlagen.“ („D'obtenir du capital dépensé la plus forte somme de travail possible.“) (J.-G. Courcelle-Seneuil, „Traité théorique et pratique des entreprises industrielles“, 2ème édit., Paris 1857, p. 62.)

Die Zeit, während deren der Arbeiter arbeitet, ist die Zeit, während deren der Kapitalist die von ihm gekaufte Arbeitskraft konsumiert.³⁸ Konsumiert der Arbeiter seine disponible Zeit für sich selbst, so bestiehlt er den Kapitalisten.³⁹

³⁸ „Der Verlust einer Arbeitsstunde pro Tag stellt einen außerordentlich großen Schaden für einen Handelsstaat dar.“ „Der Konsum von Luxusgütern unter den arbeitenden Armen dieses Königsreichs ist sehr groß; besonders unter dem Manufakturpöbel: dabei konsumieren sie aber auch ihre Zeit, ein Verbrauch, verhängnisvoller als jeder andre.“ [Ano70, p. 47 u. 153]

³⁹ „Wenn sich der freie Tagelöhner einen Augenblick ausruht, behauptet die schmutzige Ökonomie, die ihn mit unruhigen Augen verfolgt, daß er sie bestehle.“ (N. Linguet, „Théorie des Loix Civiles etc.“, London 1767, t. II, p. 466.)

stances? The supposedly free and equal exchange on the market:

342:1 In other words, the capitalist appeals to the law of the exchange of commodities. He, like all other buyers, seeks to get the greatest possible benefit out of the use-value of his commodity.

247:2/o Der Kapitalist beruft sich also auf das Gesetz des Warenaustausches. Er, wie jeder andre Käufer, sucht den größtmöglichen Nutzen aus dem Gebrauchswert seiner Ware herauszuschlagen.

Of course, the capitalist's intentions have weight only because he has the resources to back them with action. If he does not make profits, he has the option to close down the factory. He has the monopoly over the means of production.

Question 699 *What is the source of the paradox that on the surface, the worker robs the capitalist during every minute he rests, while in reality the capitalist robs the worker?*

Question 700 *How long is the working-day from the point of view of the capitalist?*

10.1.d. [Point of view of the Worker]

The worker replies only after a delay:

Suddenly the voice of the laborer, which had been silenced in the storm and stress of the process of production, rises:

Plötzlich aber erhebt sich die Stimme des Arbeiters, die im Sturm und Drang des Produktionsprozesses verstummt war:

It often takes a sustained attack by the capitalist class before the working class, which is at first overwhelmed by the onslaught of capital, rallies and begins to fight back. Compare 390:1. The working class is also reactive on a deeper level: it uses the commodity form with much less enthusiasm than the capitalist class because this is not the form by which it can attain its goals. The market place is a battlefield which the workers would not choose, because there is no hope for a level playing field.

As in the case of the capitalist, Marx first looks at the worker's goals before asking how the market transaction can be used to attain these goals. These goals are formulated most succinctly in *Value, Price, and Profit*, [mecw20]141:1:

He sells his laboring power in order to maintain it, apart from its natural wear and tear, not in order to destroy it.

Question 701 *Isn't it the motive of the worker, like that of the capitalist, to get as much money as possible?*

In *Capital*, the worker does not state his goals at the beginning, but first describes how he is affected by the actions of the capitalists. Additional profits for the capitalist mean more labor for him:

342:2/o The commodity that I have sold you differs from the crowd of other commodities, in that its use creates value, and a

248:1/o Die Ware, die ich dir verkauft habe, unterscheidet sich von dem andren Warenpöbel dadurch, daß ihr Gebrauch Wert

value greater than its own. That is why you bought it. That which on your side appears as the valorization of capital, is on mine extra expenditure of labor-power.

schafft und größeren Wert, als sie selbst kostet. Dies war der Grund, warum du sie kauftest. Was auf deiner Seite als Verwertung von Kapital erscheint, ist auf meiner Seite überschüssige Verausgabung von Arbeitskraft.

↑ But the worker is not allowed to criticize the capitalist for getting more value out of the use of his labor-power than the value of the labor-power. He acknowledges that the capitalist has bought his labor-power exactly for that reason, and by selling his labor-power he agrees to his exploitation. ↓ This exploitation does not violate the laws of the commodity exchange. The buyer of the labor-power has the right to use his commodity as he sees fit:

You and I know on the market only one law, that of the exchange of commodities. And the consumption of the commodity belongs not to the seller who parts with it, but to the buyer, who acquires it. To you, therefore, belongs the use of my daily labor-power.

Du und ich kennen auf dem Marktplatz nur ein Gesetz, das des Warenaustausches. Und der Konsum der Ware gehört nicht dem Verkäufer, der sie veräußert, sondern dem Käufer, der sie erwirbt. Dir gehört daher der Gebrauch meiner täglichen Arbeitskraft.

The laws of commodity exchange forbid the worker to argue with the capitalist how to use his labor-power, since he sold it to him. Nevertheless he derives, from the laws of commodity exchange, a limit to the use of his labor-power by the capitalist.

But by means of the price that you pay for it each day, I must be able to reproduce it daily, and to sell it again. Apart from natural exhaustion through age, etc., I must be able on the morrow to work with the same normal amount of force, health and freshness as today.

Aber vermittelst ihres täglichen Verkaufspreises muß ich sie täglich reproduzieren und daher von neuem verkaufen können. Abgesehen von dem natürlichen Verschleiß durch Alter usw., muß ich fähig sein, morgen mit demselben Normalzustand von Kraft, Gesundheit und Frische zu arbeiten, wie heute.

Here the worker defines the use-value he is selling: only as much use of his labor-power as can be reproduced fully so that he can sell an identical labor-power on the next day. To justify this, he can use to his advantage the capitalist's frequent admonitions to be thrifty:

You preach to me constantly the gospel of "saving" and "abstinence." Good! I will, like a sensible saving owner, husband my sole wealth, labor-power, and abstain from all foolish waste of it. I will each day spend, set in motion, put into action only as much of it as is compatible with its normal duration and healthy development.

Du predigst mir beständig das Evangelium der „Sparsamkeit“ und „Enthaltung“. Nun gut! Ich will wie ein vernünftiger, sparsamer Wirt mein einziges Vermögen, die Arbeitskraft, haushalten und mich jeder tollen Verschwendung derselben enthalten. Ich will täglich nur soviel von ihr flüssig machen, in Bewegung, in Arbeit umsetzen, als sich mit ihrer Normaldauer und gesunden Entwicklung verträgt.

“My sole wealth” is a brief allusion at the class difference.

By an unlimited extension of the working-day, you may in one day use up a quantity of labor-power greater than I can restore in three. What you gain in labor I lose in substance.

Durch maßlose Verlängerung des Arbeitstags kannst du in einem Tage ein größeres Quantum meiner Arbeitskraft flüssig machen, als ich in drei Tagen ersetzen kann. Was du so an Arbeit gewinnst, verliere ich an Arbeits-substanz.

↑ So far, Marx has argued that this contract violates the law of value because the capitalist is taking something the worker has not agreed to give. The worker has agreed to sell the normal use of his labor-power but not his own “substance.” ↓ Next Marx asks the hypothetical question: what if the worker agreed to sell his or her own substance? In a pinch, many workers may think this is the only option they have. Here Marx makes another point: the sale of this substance at a regular wage is really “spoliation” because a regular wage is a much too low price for this substance:

The use of my labor-power and the spoliation of it are quite different things. If the average time that (doing a reasonable amount of work) an average laborer can live, is 30 years, the value of my labor-power, which you pay me from day to day, is $\frac{1}{365 \times 30}$ or 1/10950 of its total value. But if you consume it in 10 years, you pay me daily 1/10950 instead of 1/3650 of its total value, *i.e.*, only 1/3 of its daily value, and you rob me, therefore, every day of 2/3 of the value of my commodity. You pay me for one day’s labor-power, whilst you use that of 3 days. That is against our contract and the law of exchanges.

Die Benutzung meiner Arbeitskraft und die Beraubung derselben sind ganz verschiedene Dinge. Wenn die Durchschnittsperiode, die ein Durchschnittsarbeiter bei vernünftigen Arbeitsmaß leben kann, 30 Jahre beträgt, ist der Wert meiner Arbeitskraft, den du mir einen Tag in den andren zahlst, $\frac{1}{365 \times 30}$ oder 1/10950 ihres Gesamtwerts. Konsumierst du sie aber in 10 Jahren, so zahlst du mir täglich 1/10950 statt 1/3650 ihres Gesamtwerts, also nur 1/3 ihres Tageswerts, und stiehst mir daher täglich 2/3 des Werts meiner Ware. Du zahlst mir eintägige Arbeitskraft, wo du dreitägige verbrauchst. Das ist wider unsren Vertrag und das Gesetz des Warenaustausches.

This additional argument comes to the same 1 for 3 ratio which appeared for the first time at the end of the previous paragraph.

Question 703 *How does the worker derive from the laws of commodity exchange a limit to the use of his labor-power by the capitalist?*

This concludes the worker’s argument, which derives purely from the laws of commodity exchange, not from any other consideration, that capitalist is allowed to drive the worker to full exhaustion every day.

I demand, therefore, a working-day of normal length, and I demand it without any ap-

Ich verlange also einen Arbeitstag von normaler Länge, und ich verlange ihn ohne Ap-

peal to your heart, for in money matters sentiment is out of place.

The worker ends his plea with an allusion to the “humanitarian” image in which the capitalist likes to see himself. But instead of saying: you picture yourself as good but are really cruel, he abstains from moralizing. He merely points out that the capitalist represents principles which have nothing to do with human considerations.

You may be a model citizen, perhaps a member of the Society for the Prevention of Cruelty to Animals, and in the odor of sanctity to boot; but the thing that you represent against me has no heart in its breast.

pell an dein Herz, denn in Geldsachen hört die Gemütlichkeit auf.

Du magst ein Musterbürger sein, vielleicht Mitglied des Vereins zur Abschaffung der Tierquälerei und obendrein im Geruch der Heiligkeit stehn, aber dem Ding, das du mir gegenüber repräsentierst, schlägt kein Herz in seiner Brust.

Despite the irony regarding the capitalist’s saintness, the worker importantly distinguishes between the capitalist as person, about whose morality he is agnostic, and the capitalist as the character mask of capital.

That which seems to throb there is my own heart-beating.

Was darin zu pochen scheint, ist mein eigener Herzschlag.

Capital has so much vitality that it seems to have a heart throbbing in its chest: but it draws its energy not from its own heart, it is rather the worker’s heart which gives life to capital.

I demand the normal working-day because I, like every other seller, demand the value of my commodity.⁴⁰

Ich verlange den Normalarbeitstag, weil ich den Wert meiner Ware verlange, wie jeder andre Verkäufer.⁴⁰

⁴⁰ During the great strike of the London builders, 1860–61, for the reduction of the working-day to 9 hours, their Committee published a manifesto that contained, to some extent, the plea of our worker. The manifesto alludes, not without irony, to the fact, that the greatest profit-monger amongst the building masters, a certain Sir M. Peto, was in the odour of sanctity (This same Peto, after 1867, came to an end a la Strousberg.)

⁴⁰ Während des großen strike der London builders, 1860–1861, zur Reduktion des Arbeitstags auf 9 Stunden, veröffentlichte ihr Komitee eine Erklärung, die halb und halb auf das Plaidoyer unsres Arbeiters hinausläuft. Die Erklärung spielt nicht ohne Ironie darauf an, daß der Profitwütigste der „building masters“—ein gewisser Sir M. Peto—im „Geruch der Heiligkeit“ stehe. (Derselbe Peto kam nach 1867 zu einem Ende mit—Strousberg!)

Question 704 *Why did the worker in this whole argument never say to the capitalist “you are exploiting me”?*

Question 705 *According to mainstream economics, one of the most important factors influencing the worker’s choice how long he or she wants to work is the hourly wage. Which role does the hourly wage pay in Marx’s working-day chapter?*

10.1.e. [Conclusion: Right Against Right]

Although capitalist exploitation is squarely based on commodity exchange (it owes its effectiveness and resiliency to it), one important aspect of exploitation, the length of the working-day, is left indeterminate by the laws of commodity exchange:

344:1 We see, then: the nature of commodity exchange itself imposes no limits on the working-day, i.e., no limits on surplus labor, except for extremely elastic bounds.

↑ Marx writes “nature of the commodity exchange *itself*” because he is talking about the surface of the economy, the sphere of exchange, as opposed to the core relations governing production. ↓ On the market, capital and labor interact as buyers and sellers of commodities. The capitalist maintains his rights as a purchaser when he tries to make the working-day as long as possible, and to make, whenever possible, two working-days out of one. On the other hand, the peculiar nature of the commodity sold implies a limit to its consumption by the purchaser, and the laborer maintains his right as seller when he wishes to reduce the working-day to one of definite normal duration. There is here, therefore, an antinomy, right against right, both equally bearing the seal of the law of exchanges.

Question 706 Which “peculiarity” in the nature of labor-power implies a limit to its consumption by the capitalist?

Question 707 How can rights get into contradiction with each other?

This vacuum is filled by class struggle (and institutionalized congelations of class struggle: trade unions and the state).

Between equal rights force decides. Hence is it that in the history of capitalist production, the determination of what is a working-day, presents itself as a struggle, a struggle between collective capital, i.e., the class of capitalists, and collective labor, i.e., the working-class.

249:1 Man sieht: Von ganz elastischen Schranken abgesehen, ergibt sich aus der Natur des Warenaustausches selbst keine Grenze des Arbeitstags, also keine Grenze der Mehrarbeit.

Der Kapitalist behauptet sein Recht als Käufer, wenn er den Arbeitstag so lang als möglich und womöglich aus einem Arbeitstag zwei zu machen sucht. Andererseits schließt die spezifische Natur der verkauften Ware eine Schranke ihres Konsums durch den Käufer ein, und der Arbeiter behauptet sein Recht als Verkäufer, wenn er den Arbeitstag auf eine bestimmte Normalgröße beschränken will. Es findet hier also eine Antinomie statt, Recht wider Recht, beide gleichmäßig durch das Gesetz des Warenaustausches besiegelt.

Zwischen gleichen Rechten entscheidet die Gewalt. Und so stellt sich in der Geschichte der kapitalistischen Produktion die Normierung des Arbeitstags als Kampf um die Schranken des Arbeitstags dar—ein Kampf zwischen dem Gesamtkapitalisten, d.h. der Klasse der Kapitalisten, und dem Gesamtarbeiter, oder der Arbeiterklasse.

Question 708 Discuss the points of view of capitalist and laborer in the dispute around the length of the working-day. Why can this dispute only be resolved by force?

Question 709 Why is a struggle of classes, not of competing individuals, necessary to define the working-day?

10.2. The Thirst for Surplus Labor. Manufacturer and Boyard

344:2/o Capital has not invented surplus-labor. Wherever a part of society possesses the monopoly of the means of production, the laborer, free or not free, must add to the working time necessary for his own maintenance an extra working time in order to produce the means of subsistence for the owners of the means of production,⁴¹ whether this proprietor be the Athenian καλὸς κ'ἀγαθός, Etruscan theocrat, civis Romanus, Norman baron, American slave-owner, Wallachian Boyard, modern landlord or capitalist.⁴²

⁴¹ “Those who labor . . . in reality feed both the pensioners . . . [called the rich] and themselves.” Edmund Burke [Bur00, p. 2, 3]

According to footnote 42, evidence of this exploitation are the “astounding” use-values produced by the surplus labor:

⁴² Niebuhr in his “Roman History” says very naively: “It is evident that works like the Etruscan, which in their ruins astound us, presuppose in little (!) states lords and vassals.” Sismondi says far more profoundly that “Brussels lace” pre-supposes wage-lords and wage-slaves.

Surplus labor is not new in capitalism. But capitalism does bring something new:

It is, however, clear that in any given economic formation of society, where not the exchange-value but the use-value of the product predominates, surplus-labor will

249:2/o Das Kapital hat die Mehrarbeit nicht erfunden. Überall, wo ein Teil der Gesellschaft das Monopol der Produktionsmittel besitzt, muß der Arbeiter, frei oder unfrei, der zu seiner Selbsterhaltung notwendigen Arbeitszeit überschüssige Arbeitszeit zusetzen, um die Lebensmittel für den Eigentümer der Produktionsmittel zu produzieren,⁴¹ sei dieser Eigentümer nun atheniensischer καλὸς κ'ἀγαθός, etruskischer Theokrat, civis romanus, normännischer Baron, amerikanischer Sklavenhalter, walachischer Boyar, moderner Landlord oder Kapitalist.⁴²

⁴¹ „Diejenigen, die arbeiten . . . , ernähren in Wirklichkeit sowohl die Pensionäre, genannt die Reichen, als auch sich selbst.“ Edmund Burke [Bur00, p. 2, 3]

⁴² Sehr naiv bemerkt Niebuhr in seiner „Römischen Geschichte“: „Man kann sich nicht verhehlen, daß Werke wie die etruskischen, die in ihren Trümmern erstaunen, in kleinen (!) Staaten Fronherrschaft und Knechte voraussetzen.“ Viel tiefer sagte Sismondi daß „Brüsseler Spitzen“ Lohnherrschaft und Lohndiener voraussetzen.

Indes ist klar, daß, wenn in einer ökonomischen Gesellschaftsformation nicht der Tauschwert, sondern der Gebrauchswert des Produkts vorwiegt, die Mehrarbeit durch

be circumscribed by a given set of wants which may be greater or less, that therefore no boundless thirst for surplus-labor arises from the characteristic form of production itself.

In the one situation where production in antiquity was motivated by exchange-value instead of use-value, the exploitation of slaves was much more barbaric and horrible than elsewhere:

Hence in antiquity over-work becomes horrible only when the object is to obtain exchange-value in its specific independent money-form; in the production of gold and silver. Compulsory working to death is here the recognised form of over-work. Just read Diodorus Siculus.⁴³

⁴³ "One cannot see these unfortunates (in the gold mines between Egypt, Ethiopia, and Arabia) who cannot even have their bodies clean, or their nakedness clothed, without pitying their miserable lot. There is no indulgence, no forbearance for the sick, the feeble, the aged, for woman's weakness. All must, forced by blows, work on until death puts an end to their sufferings and their distress." ("Diod. Sic. Bibl. Hist.," lib. 2, c. 13, [p. 260].)

↑ The gold mines are evidence that production for value rather than use-value leads to overwork. ↓ In antiquity, production for value was only an exception. Yet these are exceptions in antiquity.
